MEDICAL SOCIETY OF LONDON

ACCESSION NUMBER

PRESS MARK

BLACKMORE, Sir R.

BOOKS Printed for J. Pemberton.

I. SYNOPSIS MEDICINÆ; or, a Summary View of the whole Practife of Phyfick. Being the Sentiments of the most celebrated Authors in all Ages, relating to Difeases, their Causes and Cures; with most Cases in Surgery and Midwisery. To which are annex'd, fome Observations very rare and uncommon; and a curious Treatife on all Sorts of Poisons. By John Allen, M. D. and F. R. S. Translated by himself from the last Edition of his Latin Synops, with large Improvements.

The Third Edition of

II. The ART of MIDWIFERY improv'd. Fully and plainly laying down whatever Instructions are requifite to make a compleat Midwife; and the many Errors in all the Books hitherto written upon this Subject clearly refuted. Illustrated with 38 Cuts curioufly engraven on Copper Plates, reprefenting in their due Proportion the feveral Positions of a Fœtus: Alfo a new Method demonstrating how Infants ill fituated in the Womb, whether obliquely or in a ftrait Pofture, may, by the Hand only, without the Use of an Inftrument, be turn'd into their right Polition, without hazarding the Life either of the Mother or Child. Written in Latin, by Henry a'Daventer ; made Englifh. To which is added, A Preface, giving fome Account of this Work, by an eminent Phyfician. Price 6s.

As alfo the Second Edition of

III. The whole Works of Dr. Archibald Pitcairn; publish'd by himfelf. Wherein are discover'd the true Foundations and Principles of the Art of Physick; with Cafes and Observations on most Distempers and Medicines: Also the Method of curing the Small-Pox. Written in the Year 1714 for the Use of the Noble and Honourable Family of March. Done from the Latin Original, by George Sewel, M.D. and J. T. Desaguliers, L.L.D. and F.R.S. with some Account of the Author. Price 4 s. 6 d.

THE

PREFACE.

F the Natives of this Island, either from the peculiar Constitution of the Air they breathe, or

the immoderate Quantity of Flefh-Meats they eat, or of the Malt Liquors they drink, or any other fecret Caufes, are more difpofed to Coughs, Catarrhs, and Confumptions, than the neighbouring Nations; they are no lefs obnoxious to Hypocondriacal and Hyfterick Affections, vulgarly called the Spleen A 2 and

and Vapours, in a superior and distinguishing Degree. And of all the Chronical Distempers that afflict the Body, or difturb the Mind, these two, Confumptions and the Spleen, are in this Kingdom the most rife and prevalent; and either directly by their own Power, or by introducing other Diseases, make the greatest Havock and Destruction among the People. As by the various Kinds of Fevers, if Dr. Willis judges right, a third Part of the People are taken off; so it is reasonable to suppose that the like Proportion of those that escape the Fury of inflammatory and malignant Fevers, are destroyed or made miserable by the Diseases of which I am speaking. And therefore as I have published lately a Treatise on the Nature of Coughs and Confumptions, and the Method of Curing them, for the Service of my Countrymen ;

iv

V

trymen; fo in the fame View I have now attempted to account for the Nature and Caufes of the Spleen and Vapours, and have fet down the Method and Medicines, which in my Judgment are the most effectual for the Relief of the afflicted Patients.

If a Phthifis is justly called by Foreigners Tabes Anglica, or the Englist Consumption, because it is most predominant, and in a manner peculiar to this Country; I am well affured there is no less Reason to give to the Distemper I have chosen for the Subject of this Treatife, the Appellation of the English Spleen; fince it has here gained fuch a universal and tyrannical Dominion over both Sexes, as incomparably exceeds its Power in other Nations: for though in foreign Climates, especially those nearer the Sun, Disorders of Mind, Lunacy, and disturb-A 3 ed

ed Imagination, are very frequent; yet the *Englifb* Spleen, as I have now named it, and as I have defcribed it in the following Pages, is comparatively but feldom found among the Inhabitants of other Countries.

An Author that aims at the general Benefit of Mankind, and would extend the Usefulness of his Works to all that read them, should reflect, that Perspicuity is a Persection of Writing fo necessary to this end, that without it the Senfe and Meaning of the Author is in a great meafure lost, even to attentive Readers; while the greatest Part of Men will not peruse, but lay by and reject those Writings, because of the Difficulty of understanding them; for Man by Nature is fuch a flothful Animal, that he cares not for Knowledge and Instruction, that is not communicated in an easy manner; such as gives him no Trouble, and requires but

VI

V11

but little Application. For this Reafon I have endeavoured to convey my Sentiments to the Reader in clear and obvious Expression, not only to the Sons of Art, but to all intelligent Perfons, though not great Scho= lars, or Students in Phyfick; and I hope there will not appear to Perfons of a competent Capacity any thing intricate or obscure, for want of fignificant and intelligible Words; though sometimes it may happen otherwise, when the Subject-Matter it felf is superior to their Apprehenfion, who have been wholly unacquainted with fuch Ideas.

Since all Difeafes are Deviations from the natural Rectitude of the Conftitution; and therefore break the Symmetry, and fubvert the regular Coherence and Subordination of the various Parts, they cannot but introduce inteftine Difcord and Commotions, that tend to the Diffo-A 4 lution

viij The Preface.

lution of the whole Structure : It is therefore reafonable to examine what Principles the human Body is compounded of, what Order, Connexion and Dependence is obferved in a perfect Composition ; that fo Difeafes that are the Errors or Defects of those Principles, and in fome degree subvert their Harmony, due Mixture and Combination, may be discovered.

After Aristotle's ill-managed Syftem, supported neither by Reason nor Experiment, had the good Fortune to become the Philosophy in Fashion, the Physicians generally gave into the Doctrine of his School, and formed their Notions of Difeases and their Cure, in Conformity to the Peripatetick Principles, that by a swift Growth acquired great Power and Authority : and now the Errors of this crude and lazy Philosophy being admitted into the *Æscula-*

Æsculapian Colleges, and mingling with their Conceptions, corrupted and depraved the Simplicity of the Art of Physick, as it was carried on before by the experimental Pra-Aifers. But at length a great Revolution happened in the Commonwealth of Learning, when the Authority of Aristotle, who had gained an Empire of vaft Extent and long Duration over the Schools and Colleges of Knowledge, began to decline and grow out of Credit. And it is indeed wonderful that an Hypothesis of Philosophy should continue fo long in great Reputation, that had only imaginary Foundations to rest upon. And now the Peripatetick Scheme began to be difgraced by many, that, from a generous Principle to affert their natural Right to the free Exercise of Reason, upon an impartial Examination of Things, threw off the Yoke of 2

X

of Servitude and Aristotelian Bigotry. And soon after, when the Colleges and Schools, that were defended by the Adherents of this Philosopher, had revolted and rebelled against the Prince of Science, which was then his Title, the greatest Part of the Heads of this Defection restored the Atomical or Corpuscularian Doctrine; and then the Physicians turning about with the Times, espoused this Hypothes, and framed their Notions in Conformity to it.

But Carolus Pifo, a French Doctor of confiderable Reputation, endeavoured to revive the Philosophy of Anaxamenes, one of the first Masters of the Ionick School in Greece, who taught his Scholars, that Water was the fertile Parent of all compound Bodies; while others of equal Fame ascribed their Production to Air or Earth, or Fire; for each Philosopher had his favourite Element, on which he

he conferred the Honour of being the sole Principle that constituted all the Varieties of corporeal Beings. Now the Author I have named, in his Poem before his Book de Morbis Serosis, declares for the Doctrine above-mentioned, that all Things are produced from Water ; and therefore in Congruity to that Hypothesis, labours to shew in his Treatise, that Water, or Serum, in its defective and degenerate State, whether that confifts in an excellive and disproportionate Quantity, or a depraved and putrefactive Quality, is the fatal Fountain whence Difeafes of all Denominations are derived.

It is true, that this Notion is extended to an unreafonable Compafs; for it is certain, that the ill Conftitution either natural or acquired of the folid Parts, the relaxed Tone of the Fibres, the Glands and other organical Parts of the Body, or the Obftru-

X1]

Obstruction of the Minute Vessels by various Impurities and Concretions, are evidently the Caufes of many and great Distempers; but if that Author had confined his Notion to Fluids, and charged the Production of the greatest Part of Diseases, to which Mankind are obnoxious, on the vitiated State of those Fluids, his Hypothesis might have been looked upon as very justifiable: Since it is reasonable to believe, that the Distempers that affect the Head, the System of the Nerves and the Animal Spirits, all proceed from the depraved serous Streams, that irritate and provoke the nervous Fibres, and drive the Spirits into Disorder and Confusion, as will appear at large in the following Pages.

But the Truth is, the ill Conformation of the folid Parts, and inordinate Dispositions of the Juices or Serum, often conspire as partial and confede-

confederate Causes in the Constitution of Distempers, and by affecting the Nerves, those irregular noxious Humours must have yet a wider Province, than appears at first fight. It is reasonable to suppose, that all kinds of Feavers take their Rife from the Nerves, fince they all make their first Infult and Impressions on those Parts; as appears by the Rigours, Shiverings and convultive Catchings and Tremblings, that introduce all kinds of this Disease, whether putrid or inflammatory; and when the Matter of the Distemper is difcharged from the Nerves and received into the Blood, the Symptoms mentioned before, that belong to the Genus Nervosum in the milder Sort of Fevers, disappear, and are fucceeded by a boiling Heat in the Blood, and usually a great Thirst. And it is very evident, that in Fevers attended with the greatest Putrefaction

xiv The Preface.

trefaction and Malignity, the Blood is not at all infected; but the destructive Matter convey'd by the Air, as it were a poisonous Gals, a pestilential Damp or deadly Exhalation, like that which is fometimes let out by Delvers from metallick Veins, abolishes in a Moment all vital Motion, by extinguishing at once the System of the Animal Spirits : Thus in the Times of a raging Plague, Perfons walking in the Streets have fallen down dead in an Instant, as if ftruck with a Flash of Lightning; and others have lived but few Hours after they were attacked : whence it is plain, that this worst fort of Fevers affect the Spirits and Nerves only, fince they deftroy the Patient, before they can communicate their Poifon to the Blood, or produce any Symptoms there.

Now it is certain, that Hypocondriacal and Hyfterick Patients very I often

XV

often fuffer the fame Symptoms that introduce a malignant Fever; and fo much refemble each other, that they are not eafily diftinguished; and therefore they often impose even upon Physicians, as well as the Friends of the Patients, as I have observed in my Treatise on Fevers.

While I agree with Pifo, that the Diseases which affect human Bodies generally proceed from the Depravity and ill Disposition of the Serum, or Fluids, distinguished from the Blood, I must explain my Meaning, which I suppose was the Sense likewife of the Author I have named; that is, that the Serum, which waters the Traces of the Brain, and passes through the Medulla Spinalis, and the minute Tracts of the Nerves, is not fimple and unmixed elemental Water, but fuch as contains the generous and active Principles of refined Sulphur, Spirit, and volatile Salt,

xvj The Preface.

Salt, feparated from the Blood by the Ministry of the Glands, or the fine Pores of the Brain; and then I conceive that the degenerate and vitiated State of such Serum is, according to the Opinion of our Author, the true Cause of most Difeases; and that it is so, particularly of the Maladies I have difcoursed upon in the following Treatise, will be shewn afterwards.

Since this Diftemper has gone by the Name of the Spleen from the primitive Ages of Phyfick to this Time, one would think it reafonable to conclude, that fome Defect in the Function of that Bowel had occafroned that Appellation; but on attentive Enquiry into the Office of that Organ, it evidently appears to me, that it was not formed for the Benefit and Prefervation of the Animal, of which it is a Part; and that therefore it is of no use at all in refpect

The Preface. xvij

fpect of the Individual. Phyficians and Anatomifts in all Ages, and in all Nations, have endeavoured to difcover and fettle the minifterial Duty of that organical Part; but notwithftanding the great Variety of Schemes laid down for a due Explanation of it, the Ufe of the Spleen is still a Secret that has eluded the Search of the most penetrating and fagacious Enquirers.

Nor does it continue lefs a Myftery, or involved in fewer Difficulties, fince the late Attempt of a learned Phyfician and skilful Anatomift to unfold it. It does not however caft any Difhonour on that ingenious Gentleman, that he has not found out the Ufe of the Spleen, which the greateft Phyficians and Anatomifts in all Ages have laboured in vain to difcover; for those that undertake an impossible Task, are fure to mifcarry. And that this (b)

xviij The Preface.

is fuch, I conceive I have made evident, by demonstrating that the Spleen is of no use to any Individual that enjoys it, which I have done in my Essay on the Spleen. But that which is surprizing in his Conduct, is, that he should attempt, after this, to discover a new Way of accounting for the Usefulness of that Bowel, without confuting the Evidence I have produced to prove that it is of little or no Service at all in respect of the particular Animal in which it is found.

The Extirpation of the Spleen, without any confequent Mifchief, is an uncontefted Matter of Fa& down to this Time from the eldeft Ages, even before the Art of Anatomy or Diffection of human Bodies was well cultivated, and brought to fuch Degrees of Perfection as it afterwards acquired. And the Experiments of the Antients in this Cafe have been abun-

abundantly confirmed, by the concurring Teftimonies of the moft eminent modern Anatomifts, particularly the celebrated *Malpighius* has recorded in his excellent Writings, many Inftances of this Nature, in which himfelf was concerned, at leaft as a Director and an Eye-witnefs of the Operation.

If the Spleen then may be taken out entirely from the Bodies of Animals, and those Animals continue without any Marks of Injury or Diminution of Health in any respect whatsoever, but in the Possession of as full Vigour and Alacrity as before; then will it clearly follow, that this is an unneceffary or unufeful Organ of the Body, in respect to the Individual that is possessed of it: the Consequence is as clear as Noon-day. Now it evidently appears by repeated Experiments, as I have faid, that the Spleen may be taken out of the (b 2) Body,

xx The Preface.

Body, without the leaft Detriment to the Animal; and I my felf have opened the Side of a Dog, and torn off with my Fingers the Spleen from the Parts to which it grew; yet without fo much as tying up the Veffels, the Wound in the Side being fowed up, the Creature foon recovered, and fhewed no fign of any Damage, or lofs of Strength and Spirit, and continued in this healthful State more than a Year after, and much longer, as far as I know.

It is in vain then for Anatomifts to proceed in an obftinate Oppofition to the cleareft Evidence, and lofe their Time and Labour in fearching after the Ufe of the Spleen ; which if the Arguments I have publifted are conclusive, is unneceffary to Individuals. And that my Arguments are unanfwerable, I hence conclude, that they having been abroad feveral Years in my Effay on the Spleen,

XXI

Spleen, cited before, no Phyfician or Anatomist has attempted to difprove them: And therefore I cannot but think that they look upon it as too hard a Task ; for if they judged themselves able, I have no Reason to believe they are unwilling to confute my Polition. And if any learned Physician or Anatomist, that thinks he can invalidate my Reafoning, and subvert my Hypothesis, would do me the Favour to detect my Error, by fhewing the unconvincing Weakness of my Arguments, I will give him fincere Thanks, and retract my Mistake: And it may likewise be a Motive yet more prevalent with him to do this good Office, when he reflects, that by his clear and rational Discourse on this Subject, he may prevent others from falling into the fame Error with my felf, which they may be apt to do, fince so much may be faid in Vindication of my (b_{3}) Affer-

xxij The Preface.

Affertion; for it is past all Controverfy, from repeated Experiments, as before-mentioned, that the Spleen may be wholly spared; and that after Exfection, it will not be missed by the furviving Animal. And furely if it is fo very unufeful to the Individual, that it neither contributes to the Preservation of his Health, Vigour and Vivacity, nor to the Beauty and Strength of its Structure, nor the Exercise of any one of its Faculties, we may then fafely conclude, (for no Demonstration can be more evident) that this Bowel, like other organical Parts, contrived for Procreation, is infignificant and unserviceable to particular Animals; and then it follows undeniably from thence, that it must be formed and designed for some Office in promoting the Propagation of the Species; for no Man that acknowledges the Perfections of the Divine Author,

The Preface. xxiij

thor of Nature, can imagine that an intelligent Agent would act without an End; that he, that has appointed fome Service and Use to the minutest Fibres and Glands of the Body, would contrive fuch an ample and admirable Organ, that takes up fo much room in the Abdomen, and by its large Dimension and curious Fabrick, demands fuch Attention and Regard, should notwithstanding be subservient to no considerable Purpose whatsoever : and yet this must be the unavoidable Confequence, if it be not formed and intended for the End which I have named, fince it must be destined either for the Service of the Species or the Individual.

It is impossible to inspect and contemplate this large Organ, without concluding, that it must have some important Office in the animal Adminifiration, and that it is not a superfluous (b 4) and

xxiv The Preface.

and impertinent Fungus, or an Error or Sport of Nature; and then it will leave in the Mind no Ground or Reason of doubting, no not the least Hesitation about granting this Conclusion, that the Duty of the Spleen, which is little, if at all, concerned about the Preservation of the Individual, must almost wholly regard the Continuation of the Kind. If it be faid, that there may be other Uses of the Spleen regarding the Individual, though they are not yet discovered by any Author; and that it is not just Arguing to affert, that there is no fuch Use, because it is unknown, which is the Cafe of Multitudes of Phænomena; nor that it is allowable for me to afcertain any Use meerly from this, that others have miscarried in their Attempts to discover it :

To this I answer, that I do not affert any Use of the Spleen, but on the

The Preface. XXV

the contrary, have proved that it has none at all, as to the Individual, which is the Point in Controversy. And my Arguments are equally conclusive against all the Uses of the Spleen, which Authors have hitherto ascribed to it, and any others whatfoever, that may be imagined to be yet undiscovered. For if it is certain that the Spleen may be cut or torn from the Side, without the least Hurt to the Health of the Animal, the Truth of which is established by undeniable Experiments, as abovementioned; then what can be more clear than this, that in respect of the Animal, whence it is taken, it is an idle or superfluous Organ; so that whatsoever Use may be supposed to be so hidden, that it eludes the Obfervation of the most penetrating and fagacious Men, it is plain that it can have no Office or Function of any Moment or Importance to the Creature,

xxvj The Preface.

ture, which can live very comfortably, and perform all the Functions of Nature, as well without it as with it; it follows then from what has been faid, that the Propagation of the Kind, by fome way or other, was the End aimed at in the Formation of this curious Bowel, and by what Ways it contributes to it, I have expressed my Sentiments in my Effay on the Spleen, at the end of thefe Pages, to which I refer the Reader.

But here I must declare, that if I have not been fuccefsful, as I hope I have been, in explaining the Way and Method by which it contributes to Procreation; yet still I affirm, that whatever Use it has, it must regard the Continuation of the Species, and not the Individual : And therefore if I have not sufficiently unfolded the Manner how it is performed, yet my first and main Position

The Preface. XXVII

tion is not affected by it; for still it must be allowed an undeniable and established Truth from the unanfwerable Arguments that enforce it, that the Use of the Spleen principally, if not wholly, respects the multiplying of Individuals.

These Arguments appeared so conclusive to several learned and judicious Gentlemen, that they told me, they looked upon my Hypothefis as established on good Reasons; nor have I heard of any Objection made against it, except that one ingenious and learned Phyfician told me, he thought it was too much to build an Hypothesis upon a single Experiment. But this Infinuation, that I have really built an Opinion in Anatomy upon a fingle Experiment, must arife from Inattention or Difingenuity; the main Hypothefis I have advanced is, that the Use of the Spleen little concerns the Individual, and therefore

xxviij The Preface.

fore it must respect the Species. To evince the Truth of the Proposition, I have alledged my own Experience, and cited others from the most accurate and skilful Anatomists, that fufficiently prove that this Bowel may be entirely spared, fince the Animal feels no want of it in any Respect whatsoever : And if so, my Position stands unshaken, that this Bowel was formed for the Service of Generation, fince it contributes little or nothing to the Benefit of Individuals; otherwise here is an eminent Bowel made for no Purpose, since it is neither useful to the Individual nor the Species. This is my Argument, founded on numerous and undeniable Experiments on various Animals; and the Way which I have fuggefted how the Spleen is subservient to Procreation, is likewise strengthened by Obfervations. How then can any Gentleman affirm, that my Notions are only 1010

The Preface. xxix

only supported by one Experiment? And what if this last Opinion had been built on no Observation or Experiment at all? Are these always wanting, even when scientifick Evidence may establish the Truth of any Proposition without them? And though it should be granted, that I have not clearly shewn the Way how this Bowel promotes Generation, yet that it does fo, I have clearly proved by unanfwerable Arguments; and so am at least in this Disputation on an equal Foot with the whole Profession, who believe that the Spleen is formed for the Service of the Individual, but are all ignorant how it performs its beneficial Office. And therefore the Truth of my main Polition, that the Spleen is formed and contrived for the fake of the Species, does not stand or fall with that of my last Suggestion concerning the Way of its Usefulnes; the
xxx The Preface.

the first I mention as certain, the last only as probable ; and each Conclusion is deduced from different Premises in my Argumentation.

Notwithstanding I have some Years ago published an Esfay on the Spleen, as said before, together with other Miscellaneous Tracts; yet I have there treated the Subject only as a Philosopher, that enquires into the Works and Operations of Nature : and aiming at the Entertainment and Instruction of politer Readers, I have accommodated that Writing to their Taste, who are not so well pleafed with grave and fevere Difquisitions: But in these Pages I have managed the Subject as a Phyfician, and have faid no more than what prepares my Way for laying down the Method of Cure. I have however added at the latter end the Differtation before-mentioned; which, as it relates to the fame Distemper,

The Preface. xxxj

ftemper, fo it contains many Things that will give more Light into the Nature of it, and its various Symptoms; and fo make this Performance more clear, and the Syftem of my Notions more compleat. Though I have endeavoured to introduce little of that Writing into this, yet fome Repetition of Words, Sentiments, and Matters that often occur, and are co-incident in this Treatife, and the Effay added at the end, being unavoidable in the Conduct I have obferved, will, I imagine, be forgiven by the judicious Reader.

As to the three Difcourfes on the Cholick, Melancholy, and Palfies, that follow this Treatife on Hypocondriacal and Hyfterick Affections, I fhall not anticipate the Reader, by giving any fummary Account of them in this Place. All that I fhall fay is this, that tho' I have not diffufed and extended the Subjects to a great Length,

xxxij The Preface.

Length, by entering into the Confideration of many minute and lefs important Matters, that are fitter to fwell a Volume, than to inftruct and entertain the Reader; I hope, however, that I have fet the Nature and Kinds of each of those Distempers, as well as the Methods of Cure, in fo full and clear a Light, that he will find no Reason to complain of too great Succinceness and Brevity.

Since the writing of this Preface, I have received fome Remarks from an ingenious and learned Phyfician, who did me the Favour to perufe it, for which I return him my hearty Thanks. That which is of the greateft Importance in his Obfervations, is, his Objection to my Pofition, That the Removal or Exfection of the Spleen may be performed, without deftroying the Health of the

The Preface. xxxiij

the Animal. If this, fays he, were plainly demonstrated, I allow (and it would be very strange if he should not) that the Spleen is unneceffary as to the Individual. But then he declares, that in his Opinion the Arguments and Inftances that J have brought in Evidence to establish the Truth of my Affertion, are not fatisfactory ; because, says he, ' there ' is required a greater Space of Time, and a long Series of convincing, ' repeated Experiments, to support ' my Hypothefis.' When I had deliberately reflected on this Remark, I continued settled in my Opinion, that I had made good my Allegation, by fufficient and unanfwerable Reafons, and that I had not left any warrantable Ground of doubting about the Validity of my Proofs. And then I intended in this Preface to fet the Matter in a stronger Light, and add an Answer to the Objection (c) before 7. Q

xxxiv The Preface.

before-mention'd : But afterwards confidering that I should not find room enough in a Preface, without · fwelling it to a very inordinate Size, to do this fo fully and effectually, as not only to remove Objections and Difficulties from the Minds of candid and impartial Enquirers after Truth, but likewise to give them Satisfaction, who shall be the most indifposed to receive it, and thro' the Power of Prejudice or Party-Paffions, have the greatest Reluctance and Displeasure to be undeceived and rightly informed ; I refolved to publish a distinct Differtation on this Subject, that is, that the Spleen may be safely taken out of the Bodies of Animals without any confequent Diseases, or any greater Alterations, than those that happen upon the Exfection of the Organs subservient to the Propagation of the Species, of which my Hypothesis makes the Spleen to be one.

CORDENCE SCORE CORDENCES

OF THE

Spleen and Vapours, &c.

OTHING was ever fo crudely and fo ill imagined as the Hypothesis of the Ancients, which likewife has been espoused by a great

Part of modern Phyficians, concerning the Nature of these Diseases; which I shall afterwards shew, are one and the fame under different Denominations. As the primitive Practicers afcribed Hyfterical Paffions to noxious Fumes and Vapours, afcending I know not how, from the Womb, fo they fancied that Hypocondriacal Affections have their Rife from dark and windy Steams and Exhalations elevated from the Spleen. Now in the first Place to make it evident that this Arm

Of the SPLEEN

2

Account, as well as the Schemes of all other Writers, that charge the Guilt of Hypocondriacal Sufferings upon the Organ before-mentioned, is meerly imaginary, as having no Foundation to fupport it, I will deferibe the Structure of the Spleen, according to the Obfervation of the beft Anatomifts; and then afcertain the Office, which, as it appears to me, that Bowel performs in the animal Oeconomy; and I will then explain its Nature, enumerate its Symptoms, and lay down the Method of Cure. After that I will fhew the Nature and Caufes of Hyfterick Affections.

were concerns and a concern an

Of the STRUCTURE of the Spleen.

THE integral Parts that compose this Fabrick, are not formed of coagulated or condensed Blood, as the Ancients, for want of Skill and just Reflexion, rashly affirmed; but the Spleen is a System of membranaceous Fibres, Nerves, and Blood-Vessels, so closely connected, that they leave only little Cells and narrow Apartments, but no Cavity capacious enough to be the receptacle of any Recrementitious Liquors, supposed to

to be separated by occult Strainers from the Blood : Nor can any fecretory Veffels be difcovered by the most industrious and penetrating Enquirers, defigned for carrying off any fuperfluous or hurtful Humours lodged there. The Kidneys have their papillary Glands to feparate the ferous Parts from the Blood, and the Ureters are form'd to convey them away; fo the Liver, the Pancreas, and the innumerable Family of the Glands are endowed with proper Capacities for Separation, fufficient Receptacles and due Outlets to enable them to depurate the Blood, and free it from noxious or encumbring Humours, which is the Province that Nature has affigned them : But fince no fuch Provisions are made in the Contrivance and Formation of the Spleen, we may as fafely conclude it was not intended for fuch a Task, as that the Hand was not made to fee, or hear, being altogether unprovided of Organs subservient to those Purpofes; and therefore it is evident, that it cannot be an Instrument contrived to refine the Blood, by dividing from it the dark, dreggy and melancholy Parts, and receiving them into its own Bofom. And this Observation leads me to the Contemplation of a very litigated Subject, I mean the Use of the Spleen in the animal Governmenta

3

4

Of the USE of the Spleen.

HE Divine Author of Nature, to humble the Pride and confound the Vanity of arrogant Wits, and conceited Philosophers, who would fain penetrate and comprehend unsearchable Wifdom, and difcover Ways past finding out, has left many inexplicable Subjects and mysterious Appearances, as well in his Works of Creation, as those of Providence. It is true, as the Author of Nature delights to be honoured by various Men, in various Countries and Ages, and has still propagated Knowledge by Degrees, and enabled curious and inquifitive Heads in a flow Succeffion to bring to Light many important Secrets in the Works and Operations of Nature, which were involved in Darknefs, and lay concealed from the Observation of their Anceftors; fo it is evident, that the Philofophers of the prefentAge have been favoured with a great Share of this enlightening Bleffing. But notwithstanding all the Improvements and Advances hitherto made by Anatomists and Physicians, an immense Number of Difficulties are still

be-

behind, which the most fagacious and accomplished Wits are altogether incapable of unriddling.

The Use of this confiderable Bowel is one of the numerous Classes of Phanomena, that remain unexplained. It has eluded the Searches of the tracing Knife, and the acuteft Reafon, and continues the Reproach of Anatomifts, and the Difhonour of Phyficians, while Multitudes of the most eminent Sons of Art have attempted to disclose this great Secret in vain; fo that the Capacities of Men have hitherto proved unequal to the difficult Task.

Some of the eldeft Phyficians looked on the Spleen as a noxious, or at leaft a fuperfluous and ufeless Part, not being able to discover what Function it difcharged, or what Post it possessed in the animal Government: And therefore they thought it best to be rid of it by Force, as a Fungus or Excrescence, not only insignificant but apt to raise great Disorder and feditious Ferments in the Blood. But the far greatest Part believed, that the wife Author of Nature made nothing in vain; and reflecting that the minuteft Parts of the Body have their deftined Use, and are some Way serviceable to the whole, could not believe that a Bow-В 513

el,

5

Of the SPLEEN

el, which made fuch a confpicuous Figure by its Size, and the great Apparatus and Equipage of Membranes, Arteries, Veins, Nerves and bladdery Substances, that attended it, could be formed and contrived by the intelligent Artificer for no End; especially confidering, that this Bowel is found in all perfect Animals except Birds : On the contrary, they declared their Opinion, that an Organ of fuch Dimensions, fuch a wonderful Structure, and fuch a Situation in the Body, must be contrived and defigned by the Divine Author for some important Use. But scarce ever was known a greater Diversity of Opinions upon one Subject, than has happened among the Sons of the healing Art, concerning the Office of the Spleen, and its Ufefulnefs. Moft of the old Fathers of Phyfick made it the Sink of the Body, and affigned to it the Duty of a Spunge to drink up impure Recrements, the melancholy Dregs and Lees of the Blood, without difcovering any Conveyances to carry them off; which therefore by continually receiving and never discharging, such a black and foul Sediment must unavoidably fwell to an immense Size, in what Bodies foever it is found. Others that contemplated the Magnitude, the curious Structure, and the

the Place where it is lodged, refused to debase a Bowel of fuch Distinction to fo low an Office, as that of a meer Scavenger of Nature to carry off the thick Grounds and grofs Juices of the Blood, for the Difcharge of which the Ancients had however provided no Outlet or Secretory Canals, by which means the Spleen, as faid before, must be overwhelmed, and vaftly diftended; and therefore these Moderns started another Notion, to account for the Ufe of this Part. They suppose that the thicker Blood, conveyed to the Spleen by its proper Artery, is refined and exalted there to a proper Confiftency, and a due State of Purity, left the groffer Parts communicated to the reft of the Blood by the Veins, should infect and pollute the whole Mafs. But against this Hypothefis it may be urged, that the Blood that enters into this Organical Bowel by its proper Artery, is not thicker or heavier than other arterial Blood, as Malpighius has shewn by undeniable Experiments; and if it were, yet it must be confidered that Nature, to refine and purify the Blood, always employs her Inftruments the Glands; but here are none that attend the Artery of the Spleen for this End; and if they did, to what Purpose BA would

would they be fubfervient, when the Blood, together with the feparated Humour, must prefently be conveyed to the Veins, and be there again mingled in one Current?

Some have taken a Fancy to affign to this Bowel the Province of another Liver, that converts a Portion of Chyle, communicated to it, into the Nature of Blood, for the Service of the inferior Belly. But if it be confidered, that the Blood conveyed to the Spleen, is as bright and pure as any that flows in the other Arteries; that there is no Infertion of Lacteal Veins to be Inlets for fuch Chyle; and that the Chyle mixed with the Blood in the Heart and Lungs, and afterwards fent to the Spleen, has already been affimilated and converted into the Nature of Blood, as much as that in the other Veffels diffeminated through the Frame of the Body; this Hypothesis must fall to the Ground.

Others affert, that the Use of the Spleen is to convey, by the Vas breve, an auftere or acid Juice, or a fermenting Spirit into the Stomach, as well to affist and compleat its digestive Faculty, as to improve and quicken the Appetite: While fome contend, that its natural Office is to provide a Liquor austere and sharp in a cer-

and VAPOURS, Orc.

9

a certain Proportion, whole Duty, as an active Leven, is to ftimulate and quicken the animal Spirits inhabiting the Nerves, difperfed through this intricate Organ; and by that means exalt them to fuch a Degree of Purity and Swiftnefs, as is required for their proper Functions and the Service of Nature; which Notion I have confuted in my $E \int ay$ on the Spleen.

The celebrated Malpighius, an afliduous and accurate Searcher into Nature, has enumerated thefe various Suppofitions, except the laft, and by folid Reafons, founded upon just Anatomical Observations, fully confuted them; yet he acknowledges, that he is wholly at a lofs what to think of this admirable and artful Organ; he offers, however, his Conjectures, which he imagines are probable ; yet he fpeaks with fuch Modefty, fuch Diffidence and Fluctuation, that will tempt the Reader to believe that he laid no Strefs upon them : He imagines, that from the Arterial Blood conveyed to the Spleen, some Impurities may be separated by the Arteries themfelves, and fo be communicated to the Veins, which may, as he conceives, carry them off. and fo perform the Duty of fecretory Veffels, as the Arteries without the Miniftry of the Glands, had before performed the 007

the Office of Straining and Separation. But this fagacious Anatomift, who has deferved fo well of the World by his Obfervations, has by no means given a fatiffactory Account how the Blood-Veffels in the Spleen can possibly perform these two diffinct Offices: Several of the Arguments he uses to subvert the different Schemes of others, effectually deftroy his own; and it must be confessed, that the proper Duty of this Bowel for the Service of the animal Life, is fo difficult to be accounted for, that it is no wonder fo many eminent Authors have given fo many different Opinions, while they contend in the Dark, and where every one can demolish another's Hypothesis, but none have convincing Evidence to effablish their own. The natural Office then of the Spleen is hitherto a profound Secret, fcreened in impenetrable Obscurity from the Approaches and Views of the moft fubtil Enquirers into the intricate Receifes and Walks of Nature.

I have hitherto difcourfed of the Subftance, Fabrick, and Office of this admirable Organ, the Spleen, that I may prepare a Way to the Difcovery of the Nature of Hypocondriacal and Hyfterick Diftempers, by removing from this Bowel the Guilt that is charged upon it, as the

the Author of those diforderly Affections; fince, as I have evidently proved in my Effay on the Spleen, it is little or nothing concerned about the Health and Confervation of the Animal, of whole Body it is a Part; and tho' when it is it felf diftempered, and contains inordinate, auftere, and too acid Juices, it may ftimulate the Nerves difperfed through its Substance, and agitate the animal Spirits their Inmates, and fo drive them into irregular and convulfive Motions, yet this is no more than what is common with it to all the reft of 'the Bowels, and lefs important Parts of the Body, each of which in its Turn may from the like Caufe produce the like Effect; that is, all the Vifcera and Glands of confiderable Amplitude dispersed through the Body, may fometimes contain fuch a Leven or Ferment, that may fo far grieve the Nerves and irritate the Spirits, as to impel them into fuch irregular Flights and Agitations, as are observed in Hypocondriacal Patients.

I shall first enter upon the Nature and Properties of Hypocondriacal Affections, which in my Judgment evidently confist in the irregular and disturbed Motions of the Spirits, and the irritable Disposition of the Nerves; and this was the Opinion

XX

ot

of Dr. Willis and Dr. Sydenham, and now, I imagine, generally obtains. Upon this Hypothefis the anomalous, inordinate, and fometimes enormous Appearances that accompany this Diftemper, may be effectually accounted for, which cannot by any other Way of thinking be unfolded to the Satisfaction of Perfons of Reason and Reflection; not furely by the extravagant and ill-concerted Scheme of those Physicians, who suppose the Spleen is a Receptacle of grofs Feculencies, feparated from the purer Blood; whence they imagine that dark Reeks and Exhalations rifing to the fuperior Parts, especially the Brain, produce the Diforders that attend this Difease. These Authors, one would think, were in very whimfical Circumstances, and far gone in the Distemper which they endeavour to explain. It was an odd Fancy to make this Bowel the. Ciftern and Sink of the großs Lees and thick Settlements of the Blood, and at the fame time to suppose it to be the Spring of pleafant Humour and Alacrity; Splen ridere facit; that is, to make it at once the Fountain of Mirth and Melancholy, that caufes us by Turns to laugh and cry. This extravagant Conceit may well make the Reader merry; but how the Impurities and foul Dregs in the Spleen

Spleen should cause the Patients profuse Laughter, is an unaccountable Mystery.

Nor are the Symptoms of this Difeafe to be accounted for, by the Hypothefis of Dr. *Highmore*, and others, who fuppofe that it proceeds from Crudities, and depraved auftere Juices in the Stomach, an immoderate Diftention, or relaxed Tone of that Organ, and defective Digeftion; which Supposition the learned Dr. *Willis* has abundantly confuted.

Nor is Veltbusius more fuccessful in his Attempt to explain the Caufe of this Distemper, who has formed an Hypothesis with greater Ingenuity than convincing Light and Solidity, as our Countryman before-named has evidently fhewn : Nor is this celebrated Author himfelf more happy in difcovering the Caufe of this He supposes that the more Difeafe. earthy and melancholy Parts of the Blood conveyed by the Artery of the Spleen into that Bowel, being feparated and lodging a while there, are exalted into the Nature of a Leven or Ferment, which in a healthful Constitution inspires the rest of the Blood, and enlivens the Spirits in the Nerves in fuch a Degree, as conduces to the regular Discharge of their Duty in the animal Oeconomy; and if this Leven is too much exalted, and degene. rates

14 Of the SPLEEN

rates into a State too fowre and auftere, he fays that then it overdoes the Defign of Nature, and becomes very hurtful, and ftimulating the Nerves and Spirits, produces Hypocondriacal Symptoms: This he fays in his Book *de Fermentatione*; though afterwards, in other Writings, he feems not to appropriate this Effect to the Spleen, but allows fuch Diforders may proceed from depraved Humours in the reft of the Bowels.

These are arbitrary and precarious Hypothefes, the Inventions of Fancy and Imagination, unfupported by Reafon and Anatomical Observation; for, as Malpigbius, cited before, has shewn by plain Experiments, that the arterial Blood entering into the Spleen, is as pure and florid as that in the other Parts of the Body; fo if muddy and dark Impurities are mixed with it, yet as there are no glandulous Strainers to make a Separation, and if there were, no Conveyances to carry off what is separated, for want of which the dreggy and grofs Parts, constantly flowing in, and yet finding no Outlet or Conveyance to the Veins, the Spleen must be augmented, and fwell to an enormous Size, as before has been observed. It is in vain then for Anatomifts and Phyficians to fpend their Time, and rack their Imaginations

IS

nations in fearching after the Caufe of this great and common Diftemper, in a Bowel unconcern'd with the Health and Prefervation of the Animal, but is framed and deftined for another Ufe; they may as well feek after the Caufe of the Small-Pox, or a Pleurify, in other organical Parts, evidently contrived for the Propagation of the Species.

<u>น้ำสักขักขักขักขักขักขักสักชิกชักชักชักชักชักขักขักขักขักขักขักขัดสักชั</u>

Of the SYMPTOMS, &c.

Ypocondriacal Men are, for the most part, meagre, thin, and unmulcular; of a pale, almost livid, and faturnine Complexion, and a dark, fufpicious and fevere Afpect; nor unlike to this is their Temperament and Difpolition, fuch Perfons being very fcrupulous, touchy, humourfome, and hard to pleafe : their Pulfe is ufually weak, and below the Standard of Nature in other Men, and often too fwift, like that in a hectick Fever. As to their Urine, there is feldom any remarkable Appearances that diftinguish it from that of others in a healthful State, except this, that it is thin, pale and infipid, and flows in a profuse Quantity

tity in a Fit of the Spleen, like that occafioned by a Diabetes, or promoted by drinking Wine in an immoderate Degree; or like that of Women labouring with hysterick Passions, called Vapours; or of Perfons, though in Health, when terrify'd and affrighted, or under a violent Apprehension of imminent Danger.

The Seeds of this Diftemper, like those of an hereditary Confumption, Lunacy, and fcrophulous Tumours, are often complicated and interwoven with the first Principles of Life, where they lie quiet and unconcealed, till the active Ferments of Puberty or adult Age unfold them, and gradually difengage them from their Coherence with the Blood, till thus fet at liberty, they begin to exert their noxious Force, and express their growing Cruelty; and then they are undiftinguished from other Distempers in Embryo: for this Proteus, this Posture-Disease, can assume the Shape and Figure, and the Part of many others of different Denominations; and at this time, when the Hypocondriacal Seeds difentangled and let loofe, begin to shoot and come forward, the Spleen, which before was of a red and florid. Colour, becomes now dark and livid.

This Difeafe vulgarly called the Spleen, is attended with a long Train of Complaints,

plaints, and a fad Variety of Sufferings, of which the principal and most constant. are these. First, a deprav'd Disposition of the Stomach, and an impair'd digeftive Faculty, accompanied with an eager Defire to eat, and fome Hours after Meals with great Oppreffions and grievous Pain of the Stomach; which likewife is fometimes fo fill'd and diftended with Storms of Hypocondriacal Winds, that this Receptacle, and the inferior neighbouring Parts, feem a dark and troubled Region of animal Meteors and Exhalations, where opposite Steams and rarify'd Juices contending for Dominion, maintain continual War. Thefe Ferments and flatulent Effluvia, while they infeft the Cavity of the Stomach and Colon, to the great Diffurbance and Suffering of the Patient, ftrive and struggle for Vent with great Noife, like Vapours and Reeks imprifon'd in Caverns under ground : hence proceed those tumultuous Belchings and loud Eructations that accompany this Contention. This explosive Labour of the Stomach, attended with these violent Eruptions, and joined with a founding Convolution of the Intestines, is likewise a notorious Effect of this Diftemper. These crude and offenfive Ejections from the Stomach, are sometimes fowre to that degree, that they corrode

17

rode the Teeth and the Organs of the Gullet, till it becomes very difficult to fwallow, and fometimes they are exceeding hot and painful, afcending from yellow or dark burning Choler.

But this Symptom feems no more than a Branch or Offspring of the former; for it is by reafon of the degenerate concoctive Power of the Ventricle, that the ingefted Foods are imperfectly converted into Nourifhment; and fince for this Reafon, a great Quantity of Crudities and undigefted Leavings afflict the Stomach, it must follow, that the Effluvia or Exhalations breaking from them, must partake of the fame noxious Qualities with the unconcocted Remnants of the Meats in the Stomach; however fometimes thefe Ructations and Explosions are infipid and inoffensive.

From hence likewife arifes an immenfe Production of windy Effluvia and Evaporations, that affembled in the Parts adjacent to the Stomach, fometimes murmur, croak, and grumble ; and fometimes, impatient of Confinement, with a loud and rumbling Noife, roll through the Cavities of the Colon and the hollow Regions in the Belly and the Sides, beneath the Short-Ribs ; and by thefe violent Courfes and Incurfions, they diftend the ambient Parts in

in which they are enclosed, as well as by their Acrimony they vex and vellicate their Membranes, to the great Suffering of the Patient. But the chief Seat of this Uproar and furious Contests of Hypocondriacal Vapours, is the Colon, which often includes these boisterous Guests; and by reason of its crooked Figure in one Part, and its unequal Amplitude in others, is more obnoxious to the Violence of these inteftine Tempests, urging and labouring to be fet at liberty; whence proceed extream Pain, violent Gripes, and tormenting Spafms and Stitches, which, without reason, are vulgarly ascribed to some Defect or ill Ferment in the Spleen. And it ought here to be obferved, that the fwelling of the Spleen in Hypocondriacal Paroxyims, may be nothing elfe than the exceflive Distension of the Colon, that bears with Violence on the Left Side, where the Spleen is feated; which gives occafion to believe that this Bowel it felf is much amplified.

Besides these terrible Diforders in the Colon, fometimes a great Agitation is perceived in the Cavity of the Abdomen, in the Mefentery, and the neighbouring Parts.

The Stomach is likewife often opprefsed with a great Collection of crude, un-C 2 digested

20

digefted Humours, and fowre, bitter, and bilious Juices, which fo much burden and ftimulate its Coats, that after grievous Sicknefs, they eject them by frequent Vomiting; and, as faid before, the Contents are often fo fharp, as to corrode the Teeth, and fo far interrupt the Faculty of Deglution, or the fwallowing Twitch, that the Sufferer fears an imminent Suffocation: the Patient is often troubled with Heartburning, or a Cardialgia, from brown and aduft Choler.

The Symptoms of this Diftemper, in the Subftance of the Spleen, are fometimes by Paroxyfms, Pain, and Sorenefs; but the acid, auftere, and fermentative Juices, fuppofed to inhabit there for Nature's Service or Detriment, are the Effects, and not the Caufes of this Diftemper called the Spleen, as I fhall afterwards fhow; an uneafy Pulfation or Beating of the Cœliac Blood-Veffel is likewife another Appearance relating to this Bowel.

The Heart in this Diffemper is often affected with Palpitation and Trembling. Faintnefs and Sinking of Spirit; and in fome Paroxyfms it arifes to fuch a degree, that the Patient looks upon himfelf as dying, and cannot be perfuaded to the contrary. Sometimes fuch is his unhappy Cafe, while he believes his Fate is imminet

nent and inevitable, he feems certain in himfelf, though not in the leaft Danger, that he fhall expire in a quarter of an Hour. Sometimes he cries out, I am juft going and finking; fometimes, in his Opinion, he is cold, and dead half-way; and though ftanding firm on his Feet, and well-looking, defires to be put to Bed, and laid out as a lifelefs Body: nor is it poffible to raife in thefe Perfons the leaft Sufpicion that all this is no more than a phantaftick, frightful Scene and Hypocondriacal Delufion.

This Difease is often attended in the Region of the Cheft or Thorax, with difficult and uneafy Breathing, fometimes occafion'd by the inordinate Elevation of the Parts included in the Abdomen, preffing the Diaphragm or Midriff upwards, and hindering its due Defcent that is required for the Office of Respiration; and fometimes by the depraved Afthmatical Difposition of the Spirits and Muscles of the Breast, that grown defective, cannot, fufficiently dilate the Cavity of the Thorax, for the Admission of fresh Air to ventilate and revive the Flame of Life, recreate the enfeebled Spirits, and reinforce with its Nitre the Blood returning to the Lungs, and become dull and languid by a long Circulation through a La-C 2 byrinth

byrinth of Veffels: and for the fame Reafon, the Pectoral Mufcles are unable to perform the alternate Contraction and Extension of the Breast, for the Expulsion of the Air before admitted, but now no longer ferviceable, fince it has communicated to the Lungs its nitrous Particles, in which alone its Ufefulnefs confist.

These Sufferers are likewise often troubled with cold clammy Sweats in their Legs and Thighs, as if they had been dipp'd in cold Water and not dried, though fome of these notwithstanding enjoy a comfortable and uleful State of Health. Many frequently awaken from their first Sleep in great Diforder, while their Heads are confused, the Exercise of their Realon and Judgment fuspended, their Imagination disturbed, and no chearful or bright Image appears to the Mind, but all things have a fad and dark Face, while the Heart beats violently, and their Respiration is short and interrupted : in the mean time the Patient lies dejected and defponding, though the melancholy Scene in a fhort time difappears, when the Spirits of themfelves, or affifted by a fmall Draught of Hysterick, or other Cordial-Water, recover their natural Order, and are reftored to their regular State.

The

The Symptoms obferved in the Limbs, are great and frequent Pains, grievous Cramps and Contractions of the Mufcles, univerfal Inquietude, Catchings, and reftlefs Agitations, leaping of the Tendons, and convultive Twitches in the Eye-lids, Brows, Lips, and all the mufcular Parts; and fometimes the Patient feels in his Throat a fuffocating Grafp, or Conftriction, of which the Female Sex more frequently complain.

But the Symptoms that accompany this Diftemper in the Head, are more various and furprizing (i. e.) Pain, Aches, Vertiginous Swimming and Giddinefs, exceflive Lightnefs, or on the contrary, great Dulnefs and Melancholy, dark Spots, Motes, and little Nets dancing in the Air before the Eyes; fometimes a Dimnefs, and a transient Sufpension of the Sight, a ringing Noife in the Ears, fudden Dartings or Shootings, as of fome kindled Vapour or Spirit in the Head; fometimes a Drowfinefs and great Reluctance to open the Eyes, and on the reverse, at other times, au obstinate Wakefulnefs and Inability to fleep ; fometimes tumultuous, fad and monstrous Dreams, accompanied with great Diffress and Horror, when the Patient believes he fees Ghofts and terrible Apparitions, or armed .C4 Villains

Of the SPLEEN

Villains ready to affault and murder him; at other times, with no lefs Affright, he feems to himfelf as falling down fome high Precipice, or plunged and finking in deep Waters : he is likewise often afflicted with an Incubus, or the Diftemper called the Night-Mare, when the miferable Sufferer lies under fuch an oppreflive Load, that he is unable to fpeak or ftir; and while he ftruggles and ftrives with his utmost Efforts to throw off his Burden, and is incapable of doing it, he groans in a fad manner, and makes a lamentable Noife, till at last he awakens in Terror, attended with fhort laborious Breathing and Palpitation of the Heart.

The Symptoms I have hitherto enumerated, are corporeal, and refpect the organical Parts of the human Animal; but there are many befides that affect the Mind, and difturb the fuperior commanding Powers. Hypocondriacal Perfons are at times forgetful and unreflecting, which however proceeds from a tranfient Ablence of Mind, or Sufpenfion of Memory, rather than a Lofs or Decay of that Faculty, for they foon recover the due Exercife of it. Though most of thefe Perfons are endowed with a great Share of Understanding and Judgment, with strong and clear Reason, a quick Apprehension

prehension and Vivacity of Fancy and Imagination, even above other Men, yet a confiderable Inequality is observed in the Operation of their intellectual Faculties; for at fome Seafons they difcover great Impertinence and Incoherence in their Thoughts, and much Obscurity and Confusion in their Ideas, which happens more often, and lafts longer in those who are far gone in this whimfical Diftemper. These Patients are likewife very various and changeable in their Judgment, and unsteady in their Conceptions of Persons and Things, certain of their Politions and Determinations one Day, and as politive in the contrary the next, and condemning and acquitting others with a fwift Vicifiitude and Rotation of Opinion; fuch Levity and Mutability of Judgment arifes from this Disease, as well as a constant Diffidence and groundless Suspicion of all Men, a captious Inclination to take things amifs, to look on innocent and harmlefs Actions and Expressions, as meaning fomething to their Prejudice or Difhonour, and even to interpret the most undefigning Looks and Gestures, as intended to affront them; by which they have an infallible Secret, and a certain Method, to make themfelves for ever uneafy.

Thefe

26 Of the SPLEEN

These unhappy Men are likewise very wavering in the Execution of their Purpofes; they are determin'd over Night what to purfue, but the next Morning the Objections against it appear fo strong, and the Reasons for it fo weak, that they lay aside the Design they had form'd; which however fome Days after, when the Matter is reconfider'd, appears to them as fit to be put in practice as it did at first; yet foon after this Decree, at a new Hearing, is peremptorily reverfed; fuch is the unfortunate Inconstancy and Fluctuation of their Judgment; whence they fpend their Days in contriving Schemes, which they feldom profecute with Steadinefs and Vigor, and are continually employed by alternate Succeffion in fixing and unfixing various Projects, and in making and breaking fhort-lived Refolutions.

And if there is this wavering Instability in their intellectual Faculties, there is no lefs Diverfity and Inconftancy in their Temper and Paffions. Sometimes they are gay, chearful, and in good Humour; and when raifed and animated with Wine, they acquire an extraordinary Degree of Mirth, while they break out into profuse Laughter, and often entertain the Company with a great Eruption of Wit and facetious Conversation. But though these delight-

27

delightful Scenes exhilerate the Hypocondriacal Man, yet when they are paft, his Spirits are exhaufted and funk; and fuddenly relapfing into his dull and lifelefs Melancholy, he pays dear for his tranfient, voluptuous Satisfactions. Thus are his Days varied and checquered with black and white, calm and ftormy, fair and cloudy Seafons, nor ever does his Glafs of Life ftand at a fettled Point.

As they are thus uncertain and mutable in their Temper and Disposition, they are no lefs fo in their Paffions and Tafte of Pleasure ; they are quickly tired with familiar Satisfactions, and while they are uncapable of being long pleafed with the fame Company, the fame Abode, the fame Friends, and the fame happy Circumstances, they purfue Variety of Objects, and pant and gafp after new Enjoyments; which when acquired, grow foon. stale and disagreeable, like the former. These numerous Symptoms attend this unhappy Difease; not that all these are found in every Individual afflicted with this Evil, or in fo high a degree, as what has been defcribed; but they are all found in some measure in one or other Branch of the Species; by which it will evidently appear, fince every one of them is separable, and actually absent in some Patients

28 Of the SPLEEN

Patients of this Clafs; that therefore none of them fingly can be neceffary and effential to the Idea of Hypocondriacal Affections, to which Phyficians have not thought fit to appropriate the peculiar Name of a diftinct Difeafe, though it is allowed by all to be one, and is only called Malum Hypocondriacum.

The Effence and Nature of this Diftemper, fo much controverted, and fo differently accounted for in the Writings of eminent Phyficians, must, in my Opinion, be allowed to confift in the Tendernefs and Delicacy of the nervous Fibres, and the too fine and fugitive Difpolition of the Animal Spirits, by which they are apt to be diffipated, and inclined to run into the Muscles and Bowels in a confused and diforderly manner : And as this Hypothefis is founded on Reafon and Obfervation, as I have demonstrated at large in the Essay annexed, fo will it clearly unfold all Varieties of the dark, furprizing, and mysterious Symptoms, and as a Mafter-Key, unlock and lay open all the difficult Effects and Appearances which accompany this Difeafe.

For Instance, the Diforders that affect the Stomach are fo great and numerous, that Dr. Highmore and Ettmuller; two learned Physicians, were induced by them

them to pronounce the Stomach the original Seat and Fountain of Hypocondriacal Affections; but fince there are fome Patients of this Clafs, that are never afflicted with these Symptoms, but are as free from Complaints in the Stomach as any that enjoy a perfect State of Health, of which Dr. Willis fays he knew fome, and I my felf have known feveral others; this Supposition, that derives the Difease we are difcourfing of from the depraved Ventricle, must fall to the Ground, because it is found in many Perfons in whom that Bowel is not irregular and defective ; and befides, there are many Hypocondriacal Symptoms which cannot be accounted for by that Scheme, as Dr. Willis has thewn against Highmore; and therefore the Pain, Sicknefs, Flatulency, and fowre Eructations, that affect the Stomach in this Diftemper, as well as the Swelling and Sorenefs perceived, as it is thought, in the Substance of the Spleen, and the Distention, noify and troublefome Convolutions in the Colon and the Cavities on each Side, beneath the Ribs, are not the primary Seat or Spring, but indeed the Effects and Productions of Hypocondriacal Affections : But the true Idea and effential Properties, by which this Malady is constituted and distinguished from all other Species
30

Species of Difeafes, is, as before expreffed, the irregular, depraved, and convulfive Difposition of the Nerves and Spirits.

I will now undertake to fhew how the principal Symptoms of the Spleen or Hypocondriacal Affections may be explained by the Hypothesis I have afferted, to the Satisfaction of Men of Reafon and Reflection, that are capable Judges of fuch Theories. A tender and delicate Conftitution of the Nervous System, and an inordinate Fineness and Activity of their Inmates, the Animal Spirits, being first fuppofed, it may be eafily conceived how thefe volatile Guefts may, by various Impressions made upon them, be driven into diforderly Motions and convultive Spafms and Contractions in any Bowel or Part of the Body: for instance, if they are difturbed or agitated by any noxious Humours lodged in the Brain, or by any fudden and violent Impressions made upon them by outward, furprizing Objects; for it often happens, that by the relation of unwelcome News, fad Accidents, a fudden Outcry, or the very opening of a Door, or difagreeable and frightful Ideas prefented to the Fancy or Imagination, when the Patient is awake or alleep, the Spirits are ftimulated, and impelled into confused

1

31

confufed Motions, and their Ranks and Connexion being broken or ruffled, they produce the Symptoms before enumerated belonging to the Head; and if their Motion is continued and communicated to the inferior Parts, through which thefe active Inftruments of Senfe and Motion are difperfed, it occafions the Complaints and hurtful Senfations that are perceived in those Organs, fuch as fhort-breathing in the Cheft, Palpitation of the Heart, Trepidation, or Trembling of the Limbs, and a Profusion of pale Water from the Kidneys.

But the Spirits are more frequently vexed and provoked by fome noxious and peccant Juices, either auftere, fowre, or bilious, in an aduft Degree, harbouring in the Bowels, or other Repositories in the Body, which prick the Nerves and provoke the Spirits communicated to those Parts, and fo drive them into involuntary convulfive Agitations.

And it is not only to the depraved acid Juices contained in the Spleen, that fuch Hypocondriacal Symptoms owe their Rife; for they will equally be produced by the fame or other vitiated Humours, contained in any other Bowels: and therefore the Spleen is very unjuftly charged with the whole Guilt, for it has that

32

that Effect but in common with the other Parts of the Body, as mentiond above; and those Bowels that do not in themfelves feel an Hypocondriacal Disposition of Nerves and Spirits, are often Sufferers by the Influence and hurtful Impressions communicated to them from the first afflicted Part; and this is not only the Fate of the Spleen, but of all other Organs.

Thus the Diftention, fowre and hot Eructations, Oppression and Vomitings, occafioned by an immenfe Collection of Crudities and pungent bilious Juices in the Stomach, owe their Rife to the depraved State of the Nerves and Spirits, that are greatly interefted in the important Bufiness of Digestion; for when the whole Frame of the Nerves and System of the animal Spirits want fufficient Strength and Firmnefs, by their native or acquired bad Conftitution, they will be incapable of doing their Duty in affifting the concoctive Faculty, whence the Stomach is much pained and oppreffed with acid, bitter, and acrimonious Humours, proceeding from Foods imperfectly digefted; and from these irregular Hamours contained in the Stomach, arife those flatulent Vapours that often diftend, and no less grieve this Bowel than the other Symptoms that affect it.

The

33

The aking likewife and forenefs of the Spleen, and the turbulent and painful Commotions in the Colon, and other Parts included in the Abdomen, will rationally and clearly be accounted for this way: for fuppofing that the Spirits, while over agitated and ungovernable, rufh into the Subftance of those Organs with an irregular and exceflive Degree of Motion, there will eafily appear an evident and adequate Caufe of the various Hypocondriacal Sufferings, to which they are obnoxious.

It must however be allow'd, that, as a defective Disposition of the Nerves and Spirits, that is, their Pronenels to excelfive Rarification, Diffipation, and convulfive Contractions, in which the effential Idea of this Distemper confist, is often the Caufe of ill Humours in the Stomach, and other Organs of the Body; fo these in their turn, by provoking and pricking the Nerves, and ftimulating the Spirits too much, frequently produce Hypocondriacal Paroxyfms; and therefore peccant and degenerate Juices contained in any Part, and likewise a Hypocondriacal Difpolition of Spirits and Nerves, are alternate Caufes and Effects of each other, though the last are the original Aggressors which by their depraved State and inordinate Operations, occasion many Cruditiss

34

ties and hurtful Ferments in the Glands and Cavities of the Bowels; which contracting an acrimonious Quality by their Continuance there, affect the Fibres and irritate the Spirits, till they precipitate their Flights, and pass through the Roads of the Nerves with great Hurry and Confufion; and then running into the organical Parts, produce painful Diftention or convulfive Diforders. Thus if the Spirits are diffurbed and ftimulated by noxious and auftere Juices lodged in the Spleen, Stomach, or any other Receptacles, while their irregular Motions are propagated to other diftant Parts, either the Cheft, the Heart, or the Head, they create there the Symptoms peculiar to those Parts; in the Cheft, fhort and interrupted Breathing; in the Heart, Palpitation, Faintnefs, and Sinking of Spirits; in the Head, Swimmings, Lightnefs, and immoderate Wakefulnefs, or an exceffive Inclination to Sleep, with the other Symptoms before enumerated, all evidently caufed by the anomalous, confused, and convulsive Nature of the Principles of Senfe and Motion.

As this immoderate Emotion, Difturbance and Diffipation of Spirits will account for all Corporeal, Hypocondriacal Complaints, they will no lefs explain the Symp-

Symptoms belonging to the Exercife of the intellectual Faculties; for it is eafy to conceive how these depraved, active Instruments of the Mind, by unquiet and feditious Commotions, embroil her Government and Operations; whence proceed Diffidence, Suspicion, Inconstancy, Timidity, Irrefolution, Change of Temper, Judgment and Refolution; as likewife excellive Gaiety of Temper, or the contrary Extreme. For as the Spirits in the Brain have a different, defective Modification, and are agitated in different irregular Ways, this Variety of Errors affects the fuperior Powers, the Judgment and Reason, as well as Fancy and Imagination, and all the Passions of the Heart; whence a great Diverfity of Symptoms must arife. As it would be prolix and tedious to apply from the Hypothesis laid down, a Solution to each of these; fo it will be to distrust the intelligent Reader too much to undertake fuch a Province. I have shewn how some of the principal Hypocondriacal Diforders are produced, according to the Scheme I have formed, and it will not be difficult by the fame Key to open all the reft. I shall not therefore pursue this Subject further, especially fince I have spoken much of it in my Difcourfe 2

35

36

course of the Spleen, that follows this Writing.

Having in the preceding Pages explained the Nature, and enumerated the Effects of this Difease, which I make to confift in the irregular and ungovernable Nature of the animal Spirits in the Brain, and their impetuous and diforderly Flights from and to their Fountain through the minute Passes of the Nerves; and having attributed this indifferently to the Acrimony and Acidity of the Juices lodged in the Cavities of the Stomach and Inteftines, or in the Cells of the Spleen, or detained in any of the Glands that vex or exasperate the Spirits, and put them into a Hurry and Confusion; I shall. now endeavour to account for the general and adequate antecedent Caufe of the Distemper I am treating of, that is, what it is that produces those peccant and noxious Humours in any Bowels, or other organical Parts, which vellicate and bite the nervous Fibres, and communicate to the Spirits an inordinate and convulfive Impulse; and the Hypothesis which I shall lay down, I will endeavour to confirm and establish by Reason and Experience.

Of the Antecedent CAUSE of Hypocondriacal Affections.

T is allowed, that the whole glandu-T is allowed, that the whole gland lous Kind, great and fmall, are formed by Nature to purify the Blood, by feparating from and conveying away the redundant Juices of different forts, which otherwife would opprefs it, and break the regular Subordination of its paffive and lefs active to the fuperior and commanding Principles; and by fo doing, diffurb the animal Oeconomy, and occafion many great and fatal Difeafes. Now as it often happens, that various Mischiefs arise from the excellive Narrownels or Obstruction of these glandulous Organs, by impure and noxious Humours, that by reafon of their improper Size and Figure, are unable to pass through the minute Pores and winding Channels of these fine Strainers; fo no less nor fewer proceed from their immoderate Wideness and Extension. For example; when those planted in the Kidneys have loft their Tone, and are stretched to a Dimension or Capaciousness be-.D 3 yond

yond Nature's Staple, they admit a great Quantity of wholefome Juices, together with the fuperfluous, ferous Parts, and let them pafs promifcuoufly into the Bladder, whence the nutritive Juices are excluded with the Urine, by which Nature is defrauded of due Supplies.

In like manner, and from the fame Defect, the Liver fometimes feparates from the Blood an immoderate Plenty of bilious Juices, or that at leaft become fuch after Separation; by which means, the Receptacle of the Gall pours out into the Inteftines fuch an immoderate Meafure of its bitter Contents, that by a painful Corrofion of their Membranes and Inftigation of their Glands, often produce a great Flux or Loofenefs, and fometimes Dyfenterick Symptoms.

If the Glandules, or fecretory Kernels in the Lungs, becoming flaccid, lofe their Tenfion, and grow exceffively wide, they not only feparate from the Blood more ferous and phlegmatick Humours than the Service of Nature requires fhould be excluded, but likewife many wholefome Juices, which, together with them, rufh through the Channels too much enlarged; whence the Patient, defrauded of Repair, grows lean and meagre: and when the Like faulty Difpofition happens to the Glandu-

39

Glandules planted in the Skin, and difperfed through the whole Surface of the Body, they let an immoderate Quantity of ferous, mixed with wholefome Fluids, evaporate through their too open and gaping Pores both in Sweat and infenfible Transpiration; by which inordinate Evacuation the Blood is impoverished, and the Patient grows feeble, and very obnoxious to taking cold, while the fharper and more pointed Parts of the Air find free Admiffion through fuch wide Inlets to the Blood and Spirits, and make upon them their noxious Impressions; whence Coughs, Defluxions upon the Lungs, and putrid, as well as inflammatory Difeafes, often take their Rife.

Nor is the Event otherwife in the Brain, when the strait and narrow Meshes of that wonderful Structure become too lax and wide; for then, befides the purer, more fubtile, and volatile Parts of the Blood, which are feparated by that exquifite Strainer, to be exalted, fublimed, and converted into animal Spirits, the active Ministers of the Fancy and Imagination, as well as of the inferior and fenfitive Government, an inordinate Meafure of ferous Parts are admitted; and growing acid and auftere in their Receptacles, the Cavities of the Brain, they pro-D 4 duce

duce fatal Convulfions in Children, and often Hypocondriacal and Hyfterick Symptoms in adult Perfons.

The Cafe of the Pancreas is the fame; for when the Holes and Channels of that eminent Philter are extended and relaxed, a Flood of acid Juices is discharged by the fecretory Outlets into the neighbouring Parts, whence the Intestines often receive great Damage, while sharp and fowre Fluids corrode and prick their tender Sides, and caufe fuch diforderly Ebullitions and Conflicts by their meeting with the Bile coming down from the Gall-Bladder, that they fometimes raife great Strife and Hypocondriacal Storms; and therefore Silvius and his Followers make the Depravity of the Pancreas and its Difability to perform its percolating Office in fuch a regular manner, as the animal Oeconomy demands, to be the principal genuine Spring, whence this Diftemper, though called the Spleen, is derived.

Let it now be confider'd, that fhould the Glandules of the Stomach and its Appendages be relaxed, and lofe their Tone, an exceflive and incongruous Quantity of various Humours must flow without Reftraint through the wide Paffages and open Sluices of the Strainers, from the

the Blood, Nerves, and Lympheducts, which discharged into the Cavity of the Stomach or the Inteftines by degrees, grow acid, acrimonious, bitter or auftere. These peccant Juices, by their Incitements and Impressions on the Nerves, and the Inftigation of the animal Spirits, their Inhabitants, produce the Pains and convulfive Agitations which often afflict Hypocondriacal, as well as Hysterick Persons. Let it then be fupposed, that the Glandules of the Stomach, Pancreas, Mefentery, and Inteffines, are weak and relaxed, and that there is likewife the famefaulty Disposition in the minute Channels of the Brain, where the Paroxyfm fometimes first begins; and rushing downward with an impetuous Force, fills the inferior Organs with great Diforder and Confusion, as at other times, beginning at the Abdomen, it murmurs and rolls upwards, till it embroils the fuperior Regions, and fills them with Uproar and Distraction; let this, I fay, be supposed and fettled, and here will appear a genuine and adequate Caufe of Hypocondriack Affections; for granting that the Glands of the Bowels before-named, by reafon of their loofe and patent Orifices, let through many Humours, which should have been kept back, and deposite them in the Receptacles 3

ceptacles provided to contain them; and all the Properties and Symptoms of this Diftemper, arifing from internal Caufes, may clearly and eafily, upon this Suppofition, be accounted for, which I fhall prefently demonstrate.

It has above been fhewn, that the Nature, Effence, or Ratio Formalis, as the Schools express it, of this Difeafe, confifts in the Diffipation and diforderly Flights of the animal Spirits into the Bowels and Organs of the Body, by which they produce there immoderate Diftention or Inflation, and convulfive Senfations: And therefore the primitive Caufes of this Diftemper may justly be afcribed to the too volatile and tender Conftitution of the Spirits themselves, which makes them obnoxious to those Diforders, and the original Formation of the Nerves, which in these Patients are woven by Nature of too delicate and tender Threads ; whence the first are eafily irritated and impelled into anomalous Motions, and the last are as liable to receive convultive and painful Imprefiions; not only by the Inftigation of the noxious Juices lodged in the Body, but likewife by the Impulse and provoking Influence of various Objects from without, which are fometimes the efficient Caufe of Hypocon-

and VAPOURS, O.C. 43.

pocondriacal and Hyfterick Paffions; while by acting upon the animal Spirits, they break their regular Order and Connexion, difcompose and ruffle their Motions, and drive them with Violence into the membranaceous and muscular Fibres, where they produce Spafms and convulfive Symptoms.

Now the univerfal Rife and Spring of all the internal Caufes of this Diftemper, may be juftly fuppofed to be the faulty Difpolition of the glandulous Strainers in the Stomach, Inteftines, Pancreas, and Melentery; that is, when the convulfive Diforder begins in the inferior, and rifes to the upper Parts of the Body; and the like Error and Defect is in the Brain, when Hypocondriacal or Hyfterick Fits begin there, as they often do, occafioned by noxious Juices admitted into its Cells and Vacuities, which a regular Conformation of its minute Pores would have kept back.

It is evident in fact, that in Hypocondriacal Cafes an exorbitant Quantity of acid and bitter Juices is continually communicated to the Stomach from the Glands, that ftrain it from the Blood-Lympheducts and Nerves that terminate there. This immenfe and unnatural Collection of noxious Humours in the Ventricle, I. cannot

44

cannot otherwife be accounted for, than by fuppoling that the Glandules and fecretory Ducts are fo wide and lax, that they do not justly execute their Office of Percolation, but suffer a great Quantity of incongruous and hurtful Fluids to pais through into the Stomach. This is fo notorious, that it needs no Confirmation; it is fo evident, that feveral Phyficians of fuperior Rank, as faid before, have made the Stomach the first Seat and Caufe of Hypocondriacal Affections. In like manner, if the Pancreas, that important fecretory Organ, lofes its native regular Conformation, while the too ample Mouths of the feparating Parts fuffer the acid Juices of the Blood (or fuch at least as become foafter Separation) to pass through its Inlets and Channels, in too great Abundance, into the neighbouring Receivers, the Inteffines are overflown and oppreffed by them; which not only corrode and vellicate their tender Membranes, but meeting with the acrimonious Choler defcending from the Gall-Bladder through the Intestines, they occasion, as mentioned before, great and vexatious Conflicts; and as this is very reafonable to fuppofe, fo the Fact by fome has been looked upon as fo certain, that Silvius and his Followers, as before cited, maintain, that this

and VAPOURS, Orc. 45

this immoderate Secretion of acid Fluids from the Pancreas is the principal Caufe of Hypocondriacal Affections.

Nor is it lefs natural to fuppofe, that the Glandules in the Inteffines, efpecially in the Colon, may, by the like Relaxation of their Orifices, receive and feparate an inordinate Quantity of like Humours, and empty them into their Cavities, by which means they become great Sufferers.

Thus, as when the Tone of the Kidneys, Liver, Lungs, and other Organs of Separation, is perverted from its natural Rectitude, and the Laxity and too great Extension of the Pores of their Glands admit and convey away, as well nutritious Parts, not intended to be exeluded, as too much of the Juices, which in a lower meafure were defigned by Nature to be carried off from the Blood, for its necessary Depuration, various Distempers belonging to these Bowels are the hurtful Confequence of fuch an immoderate Separation; fo the exceffive Secretion of ferous Humours, made by the Glands defective in the fame manner, and depofited in the Stomach and Appendages, or iffuing from the Pancreas into the Intestines, by vellicating the Nerves and infligating the Spirits, produce the Hypocondriacal

condriacal Diforders, that begin in the Stomach and Abdomen, though afterwards they are propagated by the inordinate Flights of the Spirits to the fuperior Parts; for I excufe the Spleen from being the fole or ordinary Caufe of fuch. Complaints, that Bowel being wholly deftitute of glandulous Strainers and Organs of Separation, and is formed and deffined to a different Office, as I have fhewn in another Writing; whence I look upon the Swelling and Diftenfion, as well, as the Pains and Soreness that fometimes afflict that Organ, to be the Effect of an antecedent Difturbance of the Spirits, that rush into it in a diforderly and tumultuous manner, or from the Tenfion and Inflation of the Colon, mistaken for the Spleen.

The Defects of the Ventricle, Inteftines, and Pancreas, may account for this Diftemper, and as partial Caufes confpire for the Production of it, as it is primarily found in the Abdomen ; but neither the Stomach, as fome believe, nor the Pancreas, as others, nor the Colon or Hypocondriacal Regions, taken alone, as others imagine, are the uniform, adequate, and entire Effecter of this Difeafe: but 'tis true, when they are united, they caufe a great Part of those Hypocondriacal Symp-

Symptoms that have their Rife in the inferior Bowels, but they cannot create those that originally begin in the Brain. Now supposing that by reason of the depraved Tone of the Glands, that ferve Nature as Strainers in the Stomach, Intestines, Pancreas, &c. and the lax Difpolition of the Substance of the Brain, many peccant Juices, either in Quantity or Quality, are received into those Bowels, which afterwards irritate the Nerves, and provoke and fcatter the Spirits, there will appear an adequate, antecedent Caufe of this Difease, that is, the Relaxation or immoderate Wideness of the Pores and Meshes in the Organs of Separation in all the Parts before enumerated : nor is it required for the Production of any Hypocondriacal Affection, that noxious and vitiated Juices, strained from the Blood, and lodged in various Bowels, fhould confpire to act upon the Nerves and Spirits all at once; it is fufficient if those hurtful Humours in any one place violently affect them; and therefore we fee by Experience, that these convulsive Diforders begin in different places, and are thence propagated to others at great Distance; so that any one of them, and each of them, in their turn, may be the Fountain and first Scene of these Diforders. And

48

And as I have offer'd nothing in this last Discourse, but what Reason justifies, and Experience confirms, so now let us try how the various Symptoms of this Distemper may be explained from this way of Thinking; and if that be done, it will abundantly establish the Hypothefis I have concerted.

The immoderate Generation of Wind in the Stomach is fo obfervable in Patients of this kind, that the Difease it self, from this prevailing Symptom, is often called Flatus Hypocondriacus; though it does not always accompany this Diftemper, as before observed. This excessive and troublefome Wind is attended with fowre Belchings and noify Eructations, Inflation of the Ventricle, and often with great Pains, which are thus accounted for. The Glands in the Coat of the Stomach, in their regular and healthful State, admit into its Cavity only those Fluids, and only in that Proportion which is useful to that Bowel in its Office of Digeftion; and thefe uniting with others, especially the Salival Juices, mixed and fwallowed with different Foods, become a proper and efficacious Ferment to concoct those Foods, and convert them into wholefome Chyle: But if those Strainers are relaxed, and deviate from their former Rectitude, and grow

49

grow too loofe and capacious, then, as observed before, they suffer a redundant and inordinate Plenty of improper Humours to pais through their Channels, and empty themfelves into the Stomach, which do not affift, but difable the digeftive Faculty, corrupt the Meats and Drinks, and fill the Stomach with crude and noxious Humours; which now, a Receptacle and Sink of Impurities and unconverted Leavings, becomes a confused Chaos, a Seat of Strife and Oppolition; while the acid and bitter, the oily and auftere Contents, by reafon of their difagreeing Quality, contend with each other for Superiority.

And from these violent Contest, the Windiness of the Stomach arises, which is nothing else but the Fumes and Effluvia, caused by the Ebullition and Contrast of repugnant Juices, as is evident in all forts of Fermentations.

This is the Cafe of Exhalations and Vapours, that rarified to a great Degree, and imprifon'd in Vaults and Caverns under Ground, murmur, ftruggle and labour for Vent, till at length they find, or by their impulsive Force, make a Passage to get free from their Confinement, and then they vomit up their vexatious Fumes with great Strife and loud Eructations: 50

tions. This Example will illustrate and confirm the Account I have given of Hypocondriacal Vapours, painful Inflation, and fowre Belchings, which most frequently happen fome Hours after Meals, when the Meat taken in should have been fully digested.

And as the defective Disposition of the glandulous Inlets into the Stomach, is evidently the Caufe of these Diforders in that Bowel, the fame Defect fupposed in the feparating Organs in the Inteffines and the Pancreas, will clearly explain in the fame manner the Hypocondriacal Symptoms in the Regions of the Abdomen; and it is therefore unneceffary to enter upon a particular Discourse about them. The Spafms, Twitches, jumping of the Tendons, and convultive Motions, with which these Patients are often afflicted. being occafioned by the acrimonious and acid Fluids feparated from the Blood in a difproportionate Measure, irritating and urging the Extremities of the Nerves and the animal Spirits, must be owing to the too wide and enlarged Orifices of the Strainers, that fuffered an exorbitant Quantity of Humours to pais through.

And as to the Symptoms of this Difeafe, when it begins in the Head, they being all produced by the Confusion and irregu-

irregular Motions of the Spirits, must be charged on the Relaxation of the due Tone of the Brain, and the confequent Enlargement and widening of its strait Passages and minute Recesses, that admited incongruous and peccant Humours, to which they should have denied Enrance: And by the same way of Reasonng, other Hypocondriacal and Hysterick Symptoms, so far as they depend upon internal Causes, may for the most part be blainly accounted for.

But it must be acknowledged, that the glandulous Organs may be obstructed by mpure and depraved Juices, that being of a difproportionate Size and Figure, annot make their way through their narow Passages, which may be entangled nd detained there, till they contract an cid and acrimonious Quality fufficient to timulate the nervous Fibres, and introluce Hypocondriacal Affections: And. herefore, though generally speaking, those ymptoms arife from a great Abundance f Humours discharged by the too wide 'affes and Channels of the Glands into ne Vacuities of the Bowels, or other oranical Parts; yet fometimes they are roduced by the Vellication and Inciteents of the vitiated and hurtful Huours that obstruct the Organs of Filtra-Ea tion

1

51

tion themfelves; fo that if we take it either way, still the internal Origin of these Symptoms will be derived from defective Glands.

The Sum of the preceding Difcourfe is this: The Nerves of Hypocondriacal, as well as Hyfterick Patients, are from the original Formation of their Stamina Vita, of too fine and delicate a Constitution, and therefore apt to receive convulfive Impreffions; and their animal Spirits are likewife by Nature of a tender and volatile Disposition, easily incited and scattered, till their violent and irregular Flights produce the Symptoms proper to this Difeafe. The acid, fharp, and auftere Juices. admitted by the faulty Structure of the Glands into the Receptacles and Cells of the Bowels, and fometimes contained in the obstructed Strainers themselves, provoke and stimulate the one and the other, till the Spirits in a Hurry and Confusion rush into the folid Parts, and produce immoderate Diftention and involuntary Agitations: Nor is this Diforder occasioned only by the auftere and bilious Contents of the Stomach, or the hurtful Humours fpued out of the Glands of the Intestines, or from the too capacious Channels of the Pancreas, or any other particular Strainer, or lodged and detained in the Substance ot

of any of them; not any one of these being the fole Fountain of Hypocondriacal Affections; but fometimes one and fometimes another may in their turn be the effective Cause of fuch Symptoms; that is, as oft as the glandulous Fibres fhall be defective, and uncapable of doing their Duty in the manner before explained; and if the Glands of the Mesentery, or any other organical Part are thus depraved, the Confequence will be the fame.

And as this Hypothesis accounts for hypocondriacal Symptoms in the inferior Region of the Body, fo it affords an evident Reafon of those that affect the Brain, that is, the Loofeness and too wide Extension of the Pores and narrow Meshes of that curious Strainer, which fuffer degenerate and offenfive Juices to pass thro' into its Cavities, which in a regular Conftitution could not have found a Passage thither. There is therefore but one universal, uniform, and adequate antecedent Caufe of hypocondriacal Diforders, that is, the faulty Disposition of the Glandules appointed as fubfervient to Nature's Administration in separating and excluding from the Blood fuch particular Humours, and in fuch a determinate Proportion, as may keep it pure and active, not impoverish and exhaust it.

E 3

What

53

54

Of the SPLEEN

What has been faid, explains the Spring and Origin of all hypocondriacal Sufferings that arife from internal Caufes. But the like Symptoms, efpecially in hyfte rick Paffions, are frequently the Effect of outward Objects; that by their Impulfes and Impressions on the Spirits in the Brain, continued and propagated by the Mediation of the Nerves to the inferior and more distant Parts, produce Faintings and Swoonings, fhort and difficult Breathing, violent Beating and Palpitation of the Heart, convultive Agitation of the Muscles, and all the other Symptoms of this Difease before enumerated. Such Objects are, both fweet and difagreeable Odours; a sudden great Noife, terrible Sights, calamitous Accidents, furprizing ill News, the fudden Affault of Thieves, the Apprehension of immediate Danger from Storms of Wind, Tempests of Thunder and Lightning by Land or Water, and fometimes crofling of the Patient's Will, Contests, Opposition and Contradiction in Debates. And besides these, even surprizing Objects of great Joy; as the fudden Arrival and Appearance of an unexpected near Relation after long Absence, and the like Incidents, strike the Imagination with fuch Vehemence, that the tender and volatile Spirits

12

rits are unable to fuffain the unequal Force, but are prefently diforder'd and driven by the violent Impulfe into vertiginous Eddies, convulfive Agitations, or beat down in a Defailance or Sufpenfion, and fometimes are utterly extinguished by the refiftles Oppression.

And this leads me to take notice of the Symptoms occafion'd by vehement Ecftafies, when impure apoftate Spirits were permitted to poffefs the Bodies, and infpire the Imagination of heathen Priefts and Priestesses by an impious Imitation of divine Raptures. These Persons thus agitated and governed by Satanical Inftincts before they uttered their Oracles, labour'd with convultive Throws, and were transported out of themselves, by the Fury and Rage that ftimulated their Spirits; the Form of their Countenance was changed, while they gave their Anfwers with an uncouth terrible Voice: Their Behaviour was fo wild and extravagant, that they feemed Lunatick, Maniacal, or distracted with a Frenzy, or overheated and intoxicated with Wine; as may be feen from Virgil's Description of the Sibyl, the manner of whofe Infpiration he relates before she gave her Anfwer to the Trojan Heroe, in the Sixth Book of his Aneids.

-Non

---Non vultus, non color unus, Non comptæmansere comæ, sedPectus anbelum Et rabie fera corda tument, majorq; videri Nec Mortale sonans, afflata est numine quando Jam propiore Dei.----

Ibid. At Phæbi nondum patiens immanis in (antro Bacchatur vates, magnum fi peEtore posset Excussifie Deum.

Thus the Ecstafies and Trances of this Nature, caufed by the Instincts or impulfive Energy of important Scenes compofed of Images exceeding bright and lively, are fo strongly represented on the Theatre of the Brain, that the Spirits unable to bear such violent Impressions, are accompanied with Symptoms refembling those that we see in hysterick or hypocondriacal Paroxysis; so that they mutually illustrate one another.

VERECEDER CONCERCEDER CONCERCENCE

SECT. II.

Of the Method of CURE in Hypocondriacal Affections.

Have above shewn, that this Distenper has not its primary Seat or Refidence in the Stomach, the Spleen, the hollow Places on each Side, or beneath the Ribs, or in any other Part of the Body; but that it is produced in any of them in their turn by the noxious Juices which they contain, either inbred or communicated to them by the Nerves, or Lymphatick Channels difperfed through the Body; and that its effential Idea apparently confifts in an inordinate Temperament, or a fugitive Disposition of the Spirits; whence they are eafily diffipated, and flow with too much Activity, and in a tumultuous manner, into the membranaceous and mufcular Fibres; by which Diforder and Precipitation they ruffle and accelerate the Current of the Blood, occafion Spafms and Convultions. and unhinge the whole animal Administration, while the fibrous Strings and Movements of the living Organ are put out of Tune, and the regular State of Nature

ture is interrupted and embroil'd with Difcord and Confusion; and therefore the Method of Cure must be settled in Conformity to these Notions founded on Reason, anatomical Observations, and the History of hypocondriacal Cases.

Some learned Phyficians believed, that the Scurvy has a great Affinity with the Spleen; and Ettmuller treats of it under the fame Head, as a Branch of that Difeafe. But this Opinion, in my Judgment, is not built upon warrantable and folid Foundations. I rather think that the Scurvy, to which no diffinct Idea anfwers in the Mind, and therefore that Word has no determinate Meaning, but is only a Sound that amufes the Ear, is no one Disease separated and limited from others, but a Complex or Affemblage of the various Symptoms of various chronical Distempers, while they are yet in Embryo and their Infancy. Thus, when the Seeds of Diffempers that lay concealed, fleepy and unactive, being yet enfolded and complicated with the vital Fluids, first exert and stretch themselves, and by degrees break loofe and appear by their Operations, they begin the Prelude to the Tragedy they afterwards act in the mature and confirm'd State, tho' they cannot, while unripe, be diferiminated

nated and laid to the charge of any particular Disease. Thus the Gout, the Stone, Dropfy, Confumptions, Hypocondriacal Maladies, and other chronical Distempers, while they are breeding, are accompanied with Symptoms, that cannot be appropriated to any one Difteniper which is yet unfinished, and without a proper Appellation, but are common to many: And therefore eminent Phyficians, unable in this State of Affairs to trace their Original, and diftinguish the latent and unfashioned Diseases to which they feverally belong, fumming them up, and huddling them together, have made an uncouth and incoherent Aggregate of all, and called it a diftinct Difease, that is, the Scurvy, to which they have accommodated a particular Method of Cure; tho' if things are well confidered, I incline to believe it is not a fingle Difease sui generis, but, as I have faid, the first quickning, unfolding, and shooting out of the Seeds of various chronical Diftempers, that at length are referr'd to their proper and diffind Caufes, as they grow more ripe and prevalent; and then the Difeafes plainly fhew themfelves which were the concealed Springs, whence those Complaints and Symptoms, call'd Scorbutick, took their Rife.

Two

Two Things are to be confidered and attempted, in order to the Cure of Hypocondriacal Patients: The principal Aim is to recover the loofe Tone of the nervous Fibres, and to give greater Strength, Firmnefs and Confiftency to the Spirits; that the first may be enabled to refist the Infligation of hurtful Humours and Ferments lodged in the Bowels, as well as the Impulse of the animal Spirits, when they rush into them in Diforder, and with too great Velocity; and that the last being contracted and fo invigorated, may neither by the Impression of external or internal Caufes be fo eafily fcattered and driven into Confusion; whence, as often faid, arife the various Symptoms of this Difease.

Since it is evident, that in this Diftemper the Stomach with the Appendages are often, tho' not always, full of acid, bitter, and bilious Contents, difcharged upon them chiefly from the Nerves and Lymphæducts; the Method of Cure ought to begin with Evacuation by purging and vomitive Medicines, that the Stomach and neighbouring Inteftines may be freed in a good measure of their degenerate Juices, left they vitiate and damage the alterative and ftrengthening Medicines afterwards to be given, difappoint

and VAPOURS, Erc.

point their genuine Operations, and make their falutary Virtue unfuccessful.

The purging Medicine that agrees with Hypocondriacal Perfons eminently above all others, is Aloes; for it is of fuch a Nature, when given in a juft Proportion, that it operates without diminifhing the Strength, or wafting the Spirits of the Patient, and rather exhilarates and enlivens, than depreffes Nature; which can be affirmed of very few other Purgatives. This Medicine therefore ought generally, in a due meafure, to be an Ingredient in all Compositions prefcribed for the mentioned Purpofe.

The Forms of purging Remedies may be thefe.

- Take of Pilul. Cochia major, a Scruple; of Extractum Rudij, Grains eight: Mix them, and make them into four or five Pills for one Dofe, to be taken in the Morning.
- Or, Take of Pilul. Ruffi, Grains fifteen; of Extractum Rudij, Grains ten: Make it into four Pills; to be given going to Bed.
- Or, Take of the Infusion of the Powder of Hiera Picra, called Tinetura Sacra, two Ounces; of Spirit of Lawender, twenty Drops. Take this Draught going to Bed.

61

Or,

62

Or, Take of the forementioned Infusion, and of Elixir Salutis, each an Ounce; Spirit of Lavender, a Scruple: Make it a Draught, to be given as the former.

Should thefe Forms prove too weak to do their Duty, let there be added to each Dofe of the Pills, of Pil. Coch. maj. Grains fix; or of Pilul. ex duobus, Grains five. Pilul. Coch. may likewife be given by it felf to the Quantity of half a Drachm, more or lefs, according to the Degree of their Operation, that they may purge the Patient five or fix times. For generally Hypocondriacal Perfons are too much difpirited by many Motions, tho' caufed by Aloetick Remedies; which however, of all others, least produce that Effect; fince, as I faid before, it rather animates than finks the Spirits, and for that Reafon is almost the only purging Remedy proper in confirmed Hypocondriacal Cafes; for then the Patient cannot take purging Medicines of a quick and violent Operation, without being extremely ruffled and difordered. 'Tis true, at the first Appearance of the Symptoms that in adult Perfons difcover this Difease, (for Hypocondriacal Boys are feldom feen) when the Patients have ftronger

ftronger Bowels, and enjoy more Activity and Vigour than afterwards, when the Diftemper is fixed and prevalent, the Nerves there being more flackened and unbraced, and the Spirits more difabled; in this Seafon, I fay, ftronger purgative Medicines than those I have mention'd, or larger Dofes, may be most beneficial.

Nor is it once or twice only that the purging Pills or Tincture I have recommended, should be taken, but there will be just Reason for their frequent Repetition, suppose once a Fornight or once a Month: nor need the Patient fear that this often taking of Cathartick Medicines will weaken and relax the Tone of his Stomach or Inteffines; becaufe the Aloes, as faid before, is of that nature, that it comforts and invigorates the Spirits; and operates as a Cordial, as well as a purging Remedy, and is likewife fo agreeable to the nervous System, that this and Steel have better Pretensions to appropriate or fpecifick Vertue, than all other Remedies prescribed for the Cure of this Distemper: and hence it is that fome Patients have taken a fingle Aloetick Pill, where the Quantity of the Drug exceeded not three or four Grains, and others have drank a Spoonful of Tinctura Sacra, or Infusion of Hiera Picra, through the whole Year, and

and that with confiderable Advantage : and if either of these Medicines were given thus for a Month together in such a Proportion, as would little more than keep the Patient open; and then after a Ceffation for the like Interval, he would reassure the use of them, it might prove very serviceable.

Vomitive Medicines are very profitable in this Disease, partly by discharging a Load of noxious and impure Humours, by which they clear and prepare the Stomach for a due Reception of alterative Remedies; and partly by the Shock and Concussion of the Glands and Nerves that frees them from Obstructions: and it must be observed, that Patients of this fort bear these Evacuations with less Dejection of Spirit and Expence of Strength, than they feel by quick and copious Purging. The Reafons of which I conceive are, that the Stomach, which is the organical Part that is principally employed in Vomiting, is of a stronger Texture and narrower Compass, than the voluminous Ambages or Circuit of the Guts; and therefore the Spirits inhabiting there, are not by their explosive Labour in vomiting fo much wafted, as when the purgative Medicine not only affects the Stomach, but descending thence, together with

with acrimonious Humours, through the long winding Roads of the Inteftines, irritate their Sides, and follicit their Glands to discharge their Juices into the Cavity of the Guts : add to this, that vomitive Medicines have quickly done their Duty, but Purgatives continue their Operations many Hours longer, by which means a greater loss of Strength enfues. And this likewife is obferved in the Female Sex, who are able to bear the cafting up the Contents of their Stomachs, as green as Verdigreese, or the Juice of Leeks, for feveral Weeks, and fometimes whole Months together; and notwithstanding they often furvive this long Evacuation, who, however, could not have undergone purging in an equal degree.

When this Difeafe is newly begun, or not far advanced, and the Patient has a competent degree of Strength and Spirit, more active Vomits may be preferibed : for inflance,

Take of Vinum Benedictum, that is, the Infusion of Crocus Metallorum, fix Drachms; of Oxymel Scilliticum an Ounce, and three Ounces of Carduus Water, mingle them for a vomitive Draught, to be taken about five or fix in the Afternoon, and dilute the F Stomach
Stomach during the Operation with plenty of a light Infusion of Carduus Leaves, or plain Posset-Drink, or Tea.

Or, Take of the Indian vomiting Root half a Drachm, of Tartarum Emeticum two or three Grains, of Milkwater three Ounces, of the stronger Cinnamon Water two Drachms; and during the Operation, drink plentifully of either of the Liquors mention'd before, and going to-Bed after either of these Medicines have done their Duty, drink either of the following Draughts. Take of Diascordium two Scruples, of Black-Cherry or Milk-water two Ounces, of strong Cinnamon - Water three Drachms, and an Ounce of Syrup of Diacodium, make it a Draught. Or, Take of Milk-water two Ounces, of

Or, Take of Milk-water two Ounces, of Venice Treacle balf a Drachm, of Compound Piony-Water three Drachms, of liquid Laudanum eighteen Drops, mix them for a Draught.

Such vomitive Medicines ought to be repeated once in a Month or fix Weeks, inafmuch as impure and noxious Juices are continually excluded from the Nerves and Limpheducts, and poured into the Cavity of the Stomach; which contract-

G

67

contracting by lying there greater Acrimony, much disturb its digestive Labour, and difable it in a good measure from executing that important Office; whence, as before observed, a great Load of Crudities, the Relicks of undigested Foods, afflict and oppress the Ventricle; and these ill Humours, in their turn, offend the Stomach, and vitiate its concoctive Faculty yet more. It is therefore advifeable to unload and carry off this exorbitant Collection of hurtful Juices, and after a Seafon, when the Stomach is filled again, to repeat the Evacuation; by which means, befides the Benefits before named, there will be Time gained to administer such strengthening and corrective Remedies, as are most efficacious to recover the Patient, at least to mitigate and reduce the chief Symptoms.

Frequent letting of Blood to ten or twelve Ounces from either Arm, and fometimes cupping on the Neck and between the Shoulders, inftead of using the Lancet, is of great Advantage to Hypocondriacal Patients; and some of them I have known, who have been obliged to open a Vein three or four times a Year, and by that means have preferved a tolerable State of Health; for as oft as their Spirits were too much agitated or expand- F_2 ed, ed, and the Mafs of Blood by that mean became over-heated; whence violent ake ing of the Head, Giddinefs, Pains in the Limbs, and other Symptoms proceeded they found themfelves under a Neceflity of flying to this Refuge, and for fomtime were almost ever relieved. I recom mend therefore this Evacuation freely though the Patient is in a Courfe of othe Remedies, in cafe he has Strength and Activity enough to bear it; for he mul be guided by that Obfervation, whethe he should bleed at all; and if so, how often, and what Quantity he should tak away; and the judicious Repetition of i will be very fuccefsful.

I come now to Remedies that caufe no Evacuation, unless perhaps cutaneous and are therefore called correcting and al terative, and in fome degree specifick that is, fuch as fweeten the acid and au ftere Juices in the Stomach, and the hol low Appendages; for I question whethe there are any fuch in the Blood, which upon Distillation, affords only a volatil Alkali, though the Humours strained from it, may afterwards contract a Sharpne! and Acidity, either by continuing to long in their Cifterns, or by minglin with depraved Juices communicated 1 them from the Nervous and Lymphatic Channels.

68

69

Or elfe they are endowed with a Vertue that reftores the depraved Texture or Crafis of the Blood, or that ftrengthens and invigorates the Syftem of the Nerves, or that imparts Stability, Firmnefs, and Vivacity to the animal Spirits; or laftly, fuch as open the obftructed Glands, and promote a due Mixture, and a regular Circulation of the vital Fluids.

The Remedies that have fufficient Efficacy to reduce and fubdue the Sowrenefs and Aufterity of the Juices in the Stomach, and its Appendages, which often vellicate and provoke the Nerves, and excite inordinate Motions of the Spirits, are in the first place Alkali's, that are endowed with oppofite Qualities, fuch as Powder of Coral, Crab's Eyes, Crab's Claws, Pearl, Chalk, burnt Hartfnorn or Oifterfhells: they may either of them be given fingly in Spring-water to the Quantity of half a Drachm two or three times a Day; Salt of Wormwood, Tartar, or other Vegetables, are likewife very ferviceable to the fame end, and may be given in the fame manner and the fame quantity; and those Medicines may be mixed in Compofition, in the way following,

Take of prepared Coral, Crab's Eyes and Pearl, each half a Scruple, to be ta-F 3 ken

ken three times a Day in Milk-water, or Spring-water alone, or mixed with Wine.

Or, Take of the Conferve of Hipps or Roman Wormwood each an Ounce, of burnt Hartsborn and the whitest Chalk, Crabs Claws and prepared Coral, each a Drachm and half; of volatile Salt of Hartsborn or Vipers, a Drachm; of powdered Nutmeg two Scruples; make it into an Electuary, with a sufficient Quantity of Syrup made of the Liquor of Candied Nutmegs, or the Syrup of Maidenhair, or the red Poppy. Take the quantity of a Drachm twice or thrice a Day; or these Powders may be made into Lozenges, according to Art, which may be frequently diffolved in the Mouth, or fwallowed.

Of the fame Nature and Usefulness are Spirit of Hartshorn, Sal Volatile Oleofum, Dr. Goddard's Drops, &c.

And as thefe fixed and volatile Salts are beneficial for this end, while by their contrary Properties they blunt the fharp Points of acid Juices; or abforbing and clofely combining with them, difarm them of their noxious corrofive Quality; fo convenient Liquors, drunk in great quantity,

quantity, by diluting, and then washing them away, free the Stomach from fharp and fowre Impurities; and fince that Bowel, employed in digeftive Food, does in these Patients overflow with hot and pungent Choler, and no Medicine has been hitherto discovered of a sufficient appropriate Nature to correct and fubdue it, there is no way left, at least fo effectual, to cafe the Stomach of this uneafy Gueft, as copious Dilution by proper Liquors; and the most efficacious are either Purging or Diuretick : of the last fort are the Bath and Briftol Waters, or the foft Springs from chalky Hills, but chiefly those called Chalybeate, fuch as the Waters of the German Spare, Tunbridge, and many others, which abound in this Kingdom; but are rarely found in other Countries that lie to the South, and efpecially purging Springs are almost unknown to the Inhabitants of those Places.

It is true, that fuch purgative Medicines as Infufion of *Hiera Picra* and *Elixir Salutis*, and fuch Vomits as I have before named, are profitable in this Cafe; but nothing is fo advantageous as Steel unprepared, or diffolved in Springs; of which afterwards I fhall difcourfe more at large. Thefe, I fay, are the Medicines, that of all others are the moft pre- F_4 valent 72

valent and fuccefsful in relieving Hypocondriacal Affections.

Various Preparations of Steel are recommended; but in obstinate Cafes, the Filings ground with white Sugar-candy to a fine Powder, have a better Effect than all the Productions of chymical Art. The lowest Preparations are those of MynsinEtb's Drops, and the Tincture of Steel drawn from its Filings by French Whitewine or Sherry. The Patient, after the previous Evacuations mentioned before, may take twenty or twenty-five Drops of MynsinEtb's Drops in a Glass of Whitewine and Water, Bath Water or any Chalybeate Water, or in a Dole of the Infusion of the Tops of Roman Wormwood, Centaury, and the Root of Gentian, or other proper Bitters. After a Week or ten Days, if the Patient finds no Benefit, let him use this Tincture.

Take of Root of Gentian, Virginian Snakeweed, each a Drachm; of the Tops of the leffer Centaury, a Pugil; of Coriander Seeds, two Drachms. Infuse all in three Pints of Spring-Water boiling-hot; and when it is strained, add to it half a Pint of Chalyheate Wine; let the Patient take of the Tincture seven or eight Spoonfuls and VAPOURS, O.C. 73 fuls every Morning, and Afternoon about five a-Clock.

The Preparation of Steel taken in a proper Proportion for a Month together, is yet more efficacious; which may be taken in Form of an Electuary or Pills.

- Take of the Conferve of Roman Wormwood two Ounces; of the Salt of Steel, two Drachms; of the Root of Wake-Robin, a Drachm and half; of Tartar vitriolated, a Drachm; of choice Myrrh and Saffron, each half a Drachm: Make it an Electuary with the compound Syrup of Peony, or any other convenient Juice. Take the Quantity of a Chefnut every Moraing, and Afternoon about five a-Clock, drinking after it a small Glass of bitter Wine, or that of Vipers.
- Or, Take of the Conferve of Orange Peel, two Ounces; of Galangall and Zedoary, each a Drachm and half; of Caftor and Myrrh, each a Drachm; Salt of Amber, half a Drachm; Vitriol of Mars, two Drachms; Syrup of the five opening Roots, a Quantity fufficient: Make it an Electuary, to be taken as the former.

Steel

Of

74

Of the SPLEEN

Steel yet may be given in Substance to a proper Proportion for a Month together, by retaining the Ingredients of either of the Electuaries prefcribed, and leaving out only the Salt of Mars in the first, and the Vitriol of Mars in the last; and fubstitute in their room, to either of them, two Drachms of Steel prepared with Sulphur or Tartar: And if these Remedies prove unfuccefsful, let the Patient have recourfe to the Filings of Steel finely powdered with Sugar-candy; and instead of the Salt and other Preparations before fet down, use this Medicine in the fame Quantity, and in the fame manner, and for as long a time as the former, the Distance of two or three Months being interposed.

And it must be acknowledged, that the opening the Bodies of Minerals or Metals by chymical Operations, and feparating from each other the constituent Parts, does not always, nor often, make it a more profitable Remedy than it was before the Union of it was disfolved, and the Parts feparated; and therefore fome very eminent Physicians have constantly made use of Steel, Mercury, Antimony, Opium, the Jesuit's Bark, &c. in their natural State, without any Preparation by the Chymist; particularly Mr. Bar berack,

berack, a celebrated Physician, that flourished in the South of France about 40 Years ago. And it must be confessed, that Minerals, Metals, and other Medicines unaltered by the Fire, and other penetrating Menstruums, perform their Duty with more Success, as is evident by Experience, than after their original Structure has been broken, and the natural Coherence of their Parts deftroy'd by Art and Labour. And the Reafon of it is, that these Remedies are best prepared, diffolved, and digefted for the Purpofes of Health, by the chymical Power of the Ferments in the Stomach, provided by Nature, not only for the concocting of indigested Foods, but for opening likewife the Body of Medicines, difengaging the Complication of the Parts, and procuring by Digeftion fuch neceffary Changes, as may make them fit for the Service of animal Life: and therefore the Chymist for the most part, for want of Judgment and Observation, takes the Work of Nature out of her Hands, and with great Skill, Labour and Expence of Time, performs it much worfe; and by his unhappy Management at last destroys or diminishes the Virtue of the Remedy, if he does not make it detrimental, Mineral Waters, I mean Chalybeate,

beate, fuch as those of the Spaw, Piermont in Germany, St. Peter's Well at Clermont in France, Tunbridge, Astrop, and many others in England; as likewife the Bath and Aix la Chapel are the most eminent for relieving Hypocondriacal Affedions: And fuch by long Experience is their falutary Virtue found to be in this, and all Cafes called Scorbutick, that in comparison with them all other Remedies, excepting Steel it felf, crude or prepared, are almost infignificant. It proceeds therefore from a want of Knowledge of the Efficacy and Force of Medicines, or from a vain Oftentation of a fuperior and more extensive Acquaintance with the Materia Medica; or a weak Conceit, that the Reputation and Dignity of Phyfick will be much increased by the long Pomp and luxuriant Retinue of Compositions and Receipts, that many celebrated Writers on these Subjects have fet down, for the Cure of these Distempers, fuch a multitude of Remedies made up of various Ingredients in the Forms of Powders, Pills, Electuaries, Decoctions, Infusions, Diet-Drinks, Juices, Clifters, O.c. Among these Ettmuller has diftinguished himself, and shewn an extraordinary Capacity, who for the Cure of this Hypocondriacal Malady and the Scurvy,

Scurvy, which he reckons a Branch of it, has prescribed no less than two hundred compound Medicines in various Forms; of which fome confift of ten, or twenty, or thirty fimple Ingredients, tho' fome are lefs complex; that is, an hundred, when he treats of Hypocondriacal Affections and the Scurvy under the fame Head, and above a hundred more when he attacks the Scurvy alone. Now when a young, unexperienced Phyfician shall fee fuch a Hoft of Remedies drawn in Array, and fuch a terrible Train of Medicinal Artillery ready to be difcharg'd at the Doctor's Signal, he will be apt to cry out, What Difease can stand against fuch a formidable Strength? Be it ever fo obstinate, it must yield to some of these Medicines of superior Efficacy, or at leaft be oppreffed and overpowered by unequal Numbers: but the graver Practitioner will be tempted to ask, why is all this Wafte, why all this Trouble and Expence in levying fo many Forces? Might not two or three choice Remedies, often tried and crowned with Succefs, be detached from these numerous Regiments to combat the Disease, if the Doctor knows which of them he can rely on? But if he does not, he'll in vain attempt to make up with Numbers the Weakness and Infufficiency of

78

of his Preparations; for if none of the fimple Ingredients, that form a complicated Recipe, nor any fingle Recipe, has any Virtue to fuppress and conquer the Distemper, then two hundred listed in the Service will be unavailing, and will continue so, though a Squadron of two hundred more Auxiliaries should be raifed. to join them; for if the Parts have no prevailing Virtue in themfelves, they cannot communicate any to the Compositions; and if all the Compositions prescribed are made up of such infignificant Ingredients, it is in vain to expect they should be successful, as before afferted. This I am well affured of, that Steel prepared or unprepared, and Chalybeate Waters, or those of the Bath, with opiate Remedies and fuch Evacuations, as I have before mentioned, at proper Seasons interpofed, will do more for the Service of Hypocondriacal Patients, than five hundred other Prescriptions.

Chalybeate and other Mineral Waters, not purgative, are very beneficial, for the following Reafons. One I have given before, when I shewed how these Waters operate, by attempering, diluting, and carrying off the noxious Humours collected in the Stomach, that partly issuing from the Outlets of the Nerves and Lympheducts,

79

pheducts, and partly proceeding from a defective Digestion, do yet further deprave that Faculty, from whole previous Imperfection they in some measure took their Rife. But the chief Reafon is this, that Mineral Diuretick Waters, especially Chalybeate, corroborate and reftore by their aftringent Quality the Tone of the Nerves, and the membranaceous Fibres, and contract and confirm the animal Spirits; by which means they are enabled to refift all violent Incitations and Impreflions from outward and inward Caufes, without Diffipation and convulfive Confu-Now Hypocondriacal Affections fion. are founded in the Relaxation of the Nerves, and the weak and fugitive Difpofition of the Spirits, as has been often faid; and therefore these Remedies, that recover the one and the other, by reftoring their due Firmnefs and Confiftency, directly lay the Axe to the Root of this Evil. And another Reafon is this, that the Waters which I am speaking of mingling with the Blood, not only wash away many incongruous and impure Fluids, but infpire it with new Life and Vigor. Add to this, that by their Current they not only open and free the obstructed Glands, and provide a clear Paffage for the Blood in its Circulation, but likewife by their Aftringency,

gency contract the Glands that are relaxed, and by that means draw their Paffages and Mouths to fuch a just Dimension, that they may not discharge an immoderate and superfluous Quantity of serous Humours; which as I have shewn before, is the antecedent and general Cause of Hypocondriacal and Hysterick Sufferings.

The Patient may take the Waters by themselves, from a Pint and half to three Pints at a time, interpoling three quarters or half an Hour between each Glass; and to quicken their Diuretick Qualities, if defective, a Scruple of Salt of Amber, or a half Drachm of purified Nitre, or Sal Prunellæ, may be dissolved and taken in the first Glass, to push the Waters, and facilitate their Separation. Twenty Drops of Mynsineth's Tincture of Steel may be taken likewife, to enforce their alterative Virtue in the first Draught, or fix or feven Spoonfuls of the Chalybeate Tincture, before prescribed, may be taken first in the Morning, and the Dofe of Waters drank after it, and likewife repeated in the Afternoon, washing it down with half a Pint of the Water; or a Dole of the Electuary or Pills mentioned above, may be taken first in the Morning, drinking the Waters after them in the manner directed. If the Patient is bound,

bound, a Scruple of Pill Ruffi, or two Ounces of Infusion of Hiera Picra, should be taken at Night going to Bed, to relieve that Symptom, forbearing the use of the Waters the next Day; and it ought to be renewed when the like Exigence of Nature shall require it. It must be observed here, that all Chalybeate Waters are not equally beneficial to all Hypocondriacal Patients: those of Tunbridge will fometimes relieve those that found the Spare Water infignificant or detrimental, and fo vice versa. The weaker Waters of Islington or Hampsted have been profitable to fome who have been over-heated, and too much animated by those before-mentioned; for the more active and spiritful Waters of Piermont, which Perfons of a more tender and delicate Conflitution cannot bear, may be very beneficial to Perfons of a robust Complexion: and therefore if one fort of Waters does not fucceed, another should be tried at a proper Diftance of Time ; and if no Chalybeate Springs are found to be profitable, the Patient ought to have recourse to those of the Bath, or Aix la Chapelle; and indeed all forts of Mineral Waters are friendly in some degree to Hypocondriacal Perfons: but they fhould drink none of these longer than five or fix Weeks at a time, G

time, except in a fmall Quantity, especially those impregnated with Steel. The manner of drinking these Waters, and the Rules about it, are fo well known, especially at the Places where they rife, that I shall not enter into any more Particularities relating to them: but before I difmifs this Subject, I crave Leave to add, that the use of the Waters I have mentioned, is likewife eminently profitable in fcorbutick Cafes, where it expresses more Efficacy than all other Prefcriptions and Receipts whatfoever; and therefore Dr. Willis, Etmuller, and other learned Phyficians, might have spared their Pains and fuperfluous Pharmacy, in providing and marshalling such endless Catalogues of Forces to engage this obftinate Enemy; for the principal Remedies to subdue or reftrain the Growth of the Scurvy, that is the Beginnings or first Efforts of different Chronical Diseafes yet in Embryo, and unfashioned, are Steel, Chalybeate, and other Mineral Waters; though that which is contracted by Sailors, who have lived long on Salt Meats in their Voyages, is likewise often subdued by green Sallads, and other acid Juices; and the Ways of Operation by which Mineral Waters produce their wholefome Effects, I have before unfolded, in treating of the Cure of Hypocondriacal Affections.

Having

Having explained the Operations of Steel and Mineral Waters, by which they become fo beneficial to Hypocondriacal Patients, I proceed to the last Medicine I shall recommend in this Distemper, and that is Opium, which I mentioned, and only mentioned above: This Medicine is of fingular Advantage in these Cases in feveral Refpects: First, as it calms and fooths the Diforders and Perturbations of the animal Spirits; which, when lulled and charmed by this foporiferous Drug, ceafe their Tumults, and fettle into a Srate of Tranquillity: Wonderful it is, how foon the Hurry and Tempest in the Nerves is composed by the Sollicitation and Intervention of this prevailing Medicine.

I have faid above, that by their Nature and original Conftitution the Spirits of Hypocondriacal and Hysterick Perfons are weak and volatile; and therefore apt of themfelves to fall into Diforders, and to be over agitated, and when they are thus reftlefs and confused, whatever abates their Hurry, and reftores them to a regular and peaceful State, is the Remedy that Nature demands. If Inquietude be the Diftemper, Quiet must be the Cure; and 'tis certain, that many of these Cases have not their Rife from abundance of ill Humours, but G. 2 from

84

from the faulty Difpolition of the Nerves and Spirits themfelves; and therefore frequent and ftrong Purgation, on pretence of carrying off noxious Humours, enfeebles the Spirits, and if purfued, will demolish the Patient: but quieting Medicines compose and strengthen him, by faving his Spirits from Waste and Dissipation, and imparting to them more Firmness and a fedater Motion.

This being premifed, the judicious Reader, who attentively observes the Symptoms, will plainly perceive that these pacifick Medicines must remove or abate them in confirmed Hypocondriacal Affections. Violent Head-akes, want of Sleep, Pains, and Catchings, Inquietude, great Agitations of the Limbs, and Shortbreathing, are the ufual Sufferings. Now Opiates are found to be the only Remedy to relieve these Complaints; and it is a great Mark of Benevolence and Compaffion of the Author of all Things, that he has provided fo eafy and fo prevalent a Medicine, to fupport Mankind under the unfufferable, tormenting Pains, that fometimes accompany Hypocondriacal Affections, as well as the Gout, Stone, and Cholick, which otherwife would be too much for human Patience to bear. Dr. Bernard, who practifed Physick in London about

about thirty Years ago with great Reputation, told me, that he had been obliged to take thirty Drops of liquid Laudanum every Morning in the Winter Seafon, to eafe his laborious Afthmatical Breathing, which afflicted him every Day, without Expectoration; for, faid he, without that Help, I am uncapable of going abroad to visit my Patients.

Nor fhould any one be difcouraged from using this Medicine in the Cafes abovementioned by any Perfons, who tell them with a grave Countenance, that Opiates lock up the Humours of the Body, and therefore must be avoided: but this is a Cant of Words without a Meaning, the dark Production of a cloudy Imagination, and therefore to be exposed and difregarded. It is at other times objected to the use of Opium, that, like Wine and Strong Liquors, it takes off the Edge of the Stomach, and makes the Perfon fottish and stupid. I grant, that this is a frequent Effect of it, if taken wantonly upon finall or no Motives, and that frequently, and in an excellive Quantity: but no fuch pernicious Effects attend the use of it in a moderate Proportion, and then only when fuch violent and unfufferable Pains as I have before mentioned, or continued obstinate Wakefulness, and G 3

great

86

great Inquietudes, shall require it; and under these Limitations, there is no fear of its being injurious to the Stomach, or hurtful to the intellectual Faculties. I have known feveral Hypocondriacal and Hysterick Patients, that took opiate Medicines for many Years under the Reftrictions laid down, without the lofs of Appetite, or the contracting any Dulnefs of Underftanding; but on the contrary, they enjoyed a comfortable State of Health and Eafe, having always at hand the friendly Affiftance of their Remedy, when in good earnest they wanted it; and fuch a Quantity is to be prefcribed, as by Trial is found to fubdue the Symptoms. And the Reafon why these Patients bear the frequent use of this Drug, without Diminution of Appetite, and more than natural Decay of the Mind, is, that the Spirits of these Persons, as I have often faid, are exceeding volatile, and apt to be too much rarified; and therefore Opiates that contract and bring them into narrower Dimenfions, do them great Service, by lowering and reducing them to Nature's Standard; whereas fhould others, of a fluggifh or lefs active Complexion, whofe Spirits are not enough refined and exalted, indulge themselves in the free use of Opium, it would be no wonder if they JEGTS fhould

fhould be Sufferers by it in both the refpects before fuggested.

But others object against the use of quieting Remedies, their imperfect and ineffectual Operation; for, fay they, this Medicine only relieves our Pains and Inquietudes, and gives us Eafe and Reft for a Time, but then all these Sufferings return foon after. But should any Man argue thus against the use of Meat and Drink, aud fay, To what purpose should I dine and fup to Day? This does not totally remove my Hunger and Thirft, but only eafes them for the prefent ; to-morrow they will be renewed, and I shall be obliged to dine and fup again, which will make it fo habitual, that I must be every Day eating and drinking for Health's Sake; and this will prove an unfufferable Burden. And the like may be urged against sleeping this Night, because it will be wanted again the next; if any Man, I fay, should reason thus, would not the Audience conclude, that fome Men may become stupid from other Caufes more than that of the use of Opium? It is a very great Happiness to have a Medicine always at hand, that will eafe our Complaints, when they happen; and though they cannot prevent all future Fits, will however fubdue them as oft as they return. Some BHIL

G 4

Some Perfons further object, that if they take Opiate Medicines, as they shall always be obliged to repeat them on the like Occafions, fo Cuftom and Familiarity will fo far weaken their Operation, that they shall be obliged to repeat the Quantity often, till at length they must rife to an immoderate Dose, otherwise it will be ineffectual. I answer, that I must acknowledge that fome, for want of due Caution, or of Patience to bear fmall Sufferings, or a great Delight to keep themfelves always eafy, pleafant, and in good Humour, indulge themfelves too much in the ufe of Opiates, when there is no just Reason for taking of them fo frequently, nor in fo great a Proportion; as others have recourse too often to strong Wine and cordial Waters for the fame purpole; and then it is no wonder if the one and the other by degrees contract fuch a prevalent Habit, that they cannot forbear thefe Entertainments without great Uneafinefs, nor purfue them without great Danger; but to avoid a prefent Complaint and Diffatisfaction, they generally go on till they arife to a pernicious Quantity : But if the Limitations are observed which I named before, I feldom or never faw thefe ill Confequences in Hypocondriacal or Hysterick Cafes, where there was no Mixture

ture or Touch of Lunacy. I have known many Patients of each Sex, that have for a long Train of Years taken this quieting Medicine, as often as their prefling Symptoms required it, with good Succefs, and without any ill Consequence, or being obliged to increase the Dose higher than thirty Drops of liquid Laudanum, or a Grain and half of Crude Opium; except very feldom, when their extraordinary Inquietude, and exquisite and outragious Pains not yielding to that Proportion, the Patient has been forced after two or three Hours to take as much, or half as much more; which, with the former Dofe, has seldom or never missed the defired Effect.

Blifters are ufually hurtful in this Cafe while they ftimulate and provoke the Nerves and Spirits, too volatile and irritable of themfelves. But if these Diftempers are attended with Heavines in the Head, and a fleeppy Disposition, or a paralytick Numbness or Relaxation of any of the Limbs, they may be applied with great Advantage.

I have now laid down the Method of Cure in this obftinate Difeafe, attended with fuch variety and fo long a Train of Sufferings; but it must be observed, that the lowest Degree of it is rather defirable than

than hurtful; and therefore no Skill or Remedies should be employed to remove it. For it is evident by common Experience, that Men of a fplenetick Complexion (I take the Word in a Phyfical, not in a Metaphorical moral Senfe) in whom no great and confiderable Symptoms appear, are ufually endowed with refined and elevated Parts, quick Apprehenfion, diftinguishing Judgment, clear Reafon, and great Vivacity of Imagination; and in these Perfections they are fuperior to the common Level of Mankind: These they derive from their native Conftitution; as many Hyfterick Women owe their good Senfe, ready Wit, and lively Fancy, to the like Fountain; and therefore a Hypocondriacal Disposition, while the Ferments that feed it are in a low Proportion, is confiftent not only with Health of the Body, but is beneficial to the Faculties and Operations of the Mind; and it may be faid of these Affections, as we fay of Fire and Water, they are good Servants, though bad Mafters; for when they keep their inferior Station, and are directed and governed, they affift the intellectual Powers, and make the animal Spirits more capable Ministers for the Service of the Mind. Some however I have known of a splenetick Constitution, who, notwithftanding

Itanding the great Helps and Afliftance of that Complexion, were unanimated and ftupid, of a flow Conception and muddy Head: but there are Errors of Nature, even in the Formation of odd Complexions and monftrous Individuals of the Hypocondriacal Species; but the Perfons of fuch a flegmatick Conftitution, that all Hypocondriacal Means and Labour have been loft upon them, while they ftill preferved found and entire their invincible Antigenius and Incapacity, are but very few, though enough to ftand Exceptions from the above-mentioned general Rule.

The Reafon why Men of a splenetick. Temperament excel their Neighbours in Cogitation and all intellectual Endowments, is this, that when the Juices strained by the Glands from the Nerves and Lymphatick Canals, and deposited in the Brain, Stomach, Spleen, Pancreas, or any other Receptacles or Lodgings, provided by Nature in the Structure of the Body, retain a moderate Acidity and Acrimony, they only ftimulate, exalt and expand the Spirits to fuch a just degree, as enables them to make their reciprocal Motions with a due Velocity, in Obedience to the Impulse of the Mind, as well as when employed in voluntary vital Offices, and likewife to ferve as more refined

refined Inftruments of the Understanding, by a bright and lively Reprefentation of its Objects, and of the Imagination, in all its lighter Operations, which by this means are flocked with a greater Plenty of clear, furprizing, and beautiful Ideas, than are commonly produced in Perfons of a different Constitution. But if the Juices before mentioned, contained in any of the Bowels, degenerate, and become immoderately acid, fharp, pungent and auftere, then they urge and vellicate the Nerves fo much, and irritate and fcatter the Spirits in fuch a violent manner, that the whole intellectual and animal Administration is violated and disturbed, while the Mind is deprived of proper Inftruments for its Operations, and the Body is filled with Pains, Spafins, and convulfive Diforders, as before has been explained: But till this Period begins, the Spleen, as it is called, is no Difeafe, or at leaft none that one would with to be cured of. The learned Dr. Willis has formed a Theory on this Subject, in part alike, and in part different from what I have laid down; by which he accounts for all these Effects, by the good or bad Disposition of a Leven or Ferment, which he places in the Spleen; and this he fuppofes, while it remains in a regular State, 18

93

is a great Affiftant and Refiner of the animal Spirits, and when it is perverted, and becomes too fowre and auftere, he makes it the chief, if not the fole Caufe of Hypocondriacal Symptoms: But I am fo far from confining them to the Spleen, that I believe all other Organs are in their turn as much concerned, and fome more, as I have before explained.

It must be acknowledged that this Difeafe being ingenite and coeval with the Embryo, and interwoven and complicated with the Principles of Life, it is even at first difficult to be cured ; but after it has by degrees got Ground, enlarged its Power and Dominion, and feized the principal Seats of Life, it is fcarce ever entirely expelled, while the unhappy Patient lives in a continual State of War, and is every Day alarmed and harraffed by furious Incurfions of the animal Spirits from the Brain, and their painful Inroads into the Limbs and Bowels, which they afflict with convulfive Agitations; or while, on the other hand, they rife from the lower Seats of the Abdomen, and climb up with great Diforder, till they reach the fuperior Parts, where they produce the like Symptoms; though it is certain, that many Hypocondriacal Patients, even far gone, have been fo much relieved by Method and

and Medicine, as to live many Years in a comfortable and ufeful, though not a perfect State of Health.

I have hitherto difcourfed of the general Nature of Hypocondriacal and Hyfterick Affections, fimply confidered, and abstracting from the Seeds of other Distempers, that in some Persons adhere to the Principles of the former, and by that Complication, make different Appearances of that Difease: sometimes the Malady of the Spleen is blended and combined with the noxious Ferments of Melancholy, Lunacy, Epilepfies, Palfies, and Confumptions; and by this means Hypocondriacal Patients, from the Conjunction of the Principles of either of the Difeafes beforenamed, will discover great Marks and Tokens peculiar to each: for inftance, fome of a more morofe, referved, and faturnine Constitution, shall appear at times fad, melancholy, and inconfolable; fome fhall express the Signs of a diffurbed Imagination, approaching to Sufpenfion of Reafon, or a lunatick, diffracted State; and therefore the People cry out, oh! he is mad, meaning no more, than that he is an odd, whimfical, hypocondriacal Man. And this is the Cafe, when the Principles of other Diftempers are combined in an inferior degree to hypocondriacal Seeds; for then

then likewife the Patient, in fome meafure, fhews the Symptoms of the adventitious Difeafe.

and VAPOURS, O.C.

95

While these foreign Seeds, of another Clafs and Nature, that strictly cling to and embrace those Hypocondriacal Maladies, are in a much lower Proportion, and the Hypocondriacal Symptoms more prevalent, and much fuperior to the others of a different Species and Extra-Ation, the Patient may continue long in whimfical Circumftances, and under the Dominion only of his proper Difeafe, without being depressed into deep Sadness and Melancholy, or elevated into Lunacy and Diffraction; for there are fome, who though they fluctuate, and hang pendulous a long time between fober and mad, yet never wholly go over to the lunatick Side.

But how this Diftemper is allied to melancholy Diftraction, and other Difeafes, that affect the Spirits and the Syftem of the Nerves; and by what Properties it is diftinguifhed from them, and how fometimes Hypocondriacal Affections are mixed with either of them, and the various Appearances and Effects arifing from fuch Combinations, fhall be treated of afterwards in the Third Section.

USPECIACION CONCERCIÓN (CONCERCIÓN)

Of HYSTERICK AFFECTIONS.

OST Phyficians have looked up-on Hyfterick Affections as a distinct Difease from Hypocondriacal, and therefore have treated of them under different Heads; but though in Conformity to that Cuftom I do the fame; yet, as before affirmed, I take them to be the fame Malady, and not different in Specie. It is true, that the convultive Diforders and Agitations in the various Parts of the Body, as well as the Confusion and Diffipation of the animal Spirits, are more confpicuous and violent in the Female Sex, than in Men; the Reafon of which is, a more volatile, diffipable, and weak Constitution of the Spirits, and a more foft, tender, and delicate Texture of the Nerves in the laft, than in the first; but this proves no Difference in their Nature and effential Properties, but only a higher or lower Degree of the Symptoms conimon to both. Since then they are of the fame Species, the Method of Cure ought to be adapted to this Notion, founded on Reafon

Reafon and Obfervation; though fometimes in prefcribing for Hyfterick Affections, a just Deviation must be allowed from the Rules fet down in splenetick Diforders, not only because they differ in a great Degree, but by reason of many Peculiarities in the Female Sex, that reguire a different Application.

This Difeafe, called Vapours in Women, and the Spleen in Men, is what neither Sex are pleafed to own. A Man cannot ordinarily make his Court worfe, than by fuggefting to fuch Patients the true Nature and Name of their Diftemper; while two Perfons, each of them far gone in Hypocondriacal or Hyfterick Diforders, will reciprocally charge on each other this Difeafe, and with good Reafon, as two Mifers will upbraid one another with Avarice, which however neither of them can difcern, or will acknowledge in themfelves. One great Reafon why these Patients are unwilling their Difease should go by its right Name, is, I imagine, this, that the Spleen and Vapours are, by those that never felt their Symptoms, looked upon as an imaginary and fantaftick Sickness of the Brain, filled with odd and irregular Ideas; and accordingly they make the Complaints of fuch Patients the Subject of Mirth and H Raillery.

Raillery. This Diftemper, by a great Miftake, becoming thus an Object of Derifion and Contempt, the Perfons who feel it are unwilling to own a Difeafe, that will expose them to Difhonour and Reproach; though fome I believe are not themfelves conficious of the Nature of their Diftemper, efpecially when complicated with the Seeds of Melancholy or Lunacy.

I cannot forbear faying on this Occafion, that it is a culpable want of Compassion, and the Mark of a cruel Disposition, when any make themfelves merry with the Miferies or Misfortunes of their Neighbour; for thele are not the proper Subjects of Pleafantry and Ridicule. Take those Perfons that feel this Diftemper in the lowest degree, and are only called, by way of Derifion, whimfical, that is, fluctuating, unequal, and not uniform in their way of Thinking, or the Course of their Actions; yet since these Errors arife from the perverted and degenerate Nature and inordinate Motions of the animal Spirits, they are for that Reafon, a Difeafe that demands other Ufage than Scorn and Raillery. It is certain, that Hypocondriacal Men, as well as Hysterick Women, are often afflicted with various Pains and great Diforders; and could

99

could it be fuppoled that this was nothing but the Effect of Fancy, and a delufive Imagination, yet it must be allowed, that let the Caufe of fuch Symptoms be never fo chimerical and fantaftick, the confequent Sufferings are without doubt real and unfeigned. Terrible Ideas, formed. only in the Imagination, will affect the Brain and the Body with painful Senfations. Thus we find that dreadful Objects presented to the Mind in Dreams; for instance, the empty and unfubstantial Forms of Ghofts and Spectres, will, by their violent Instigation and Impulse on the Spirits, put them into fuch a Hurry and Confusion, as shall cause great Inquietude and grievous Pains. Should then the Spring or Fountain of Hysterick Symptoms be fometimes only imaginary, and not real, this affords no Advantage or Comfort to the afflicted Patients; for the painful Effect is real and fincere; and though they look well in the Face, and eat their Meat with fufficient Appetite, they are often notwithstanding the milerable Objects of Compafiion.

This Difeafe has the Appellation of Vapours from the Opinion of the antient Phyficians, who imagined that it confifted in the Elevation of dark Fumes and Exhalations from the Matrice; which ri-H 2 fing

fing up in fruitful, but unwholfome Clouds, produce Sufferings in various Parts of the Body where they use to fpread their unhappy Influence, which shall prefently be reckoned up. This Opinion has been conveyed to later Ages, and continues among the common People to this Day. Hence this Difeafe is fometimes called Fits of the Mother, fometimes a Suffocation of the Womb, and fometimes Hysterick Affections, from Ssieg, which fignifies the Matrice. Thus, as the primitive Doctors before mentioned, imagined that all Hypocondriacal Symptoms were derived from a Collection of black Dregs and Lees feparated from the Blood, and lodged in the Spleen; whence, as they fuppofed, noxious Reeks and cloudy Evaporations were always afcending to the fuperior Regions (the Cheft, the Heart, and Head, which by turns were made the Seat of Hypocondriacal War, turbulent Conflicts, and feditious Infurrections) to the great Distraction and Confusion of the animal State; fo they took a Fancy that all Hyfterick Paffions proceeded from the rifing up of noxious Steams and Vapours from the Womb, through the Region of the Abdomen to the Thorax, Throat, and Brain, where they appear in different and

and furprizing Shapes: But as there are no Paffages, or proper Conveyances, by which thefe Steams and Exhalations may mount from the inferior to the fuperior Parts, befides other infuperable Difficulties that encumber this Opinion, it is now exploded by learned Men, though retained, at leaft in Name, among the People.

This Diftemper, expressed under various Appellations, is founded, like Hypocondriacal Diforders, in the weak and too delicate Texture of the nervous Syftem, and the volatile and diffipable Temperament of the Spirits; nor are they, as I have faid, two Diseases distinct in Specie, but are only different in Mode and Degree, and fome peculiar Appearances: For the Effence or Nature of each confifts in the irregular Flights and inordinate Agitations of the active Instruments of Senfation and Motion, which being irritated and provoked by degenerate and hurtful Juices inhabiting the Matrice, the Spleen, the Stomach, or any other Receptacles of the Body, pafs through their Channels in Hurry and Confusion; and their Ranks and Order being thus broken, rush into the various Organs, where their Duty is to ferve, and by their immoderate Expansion, or convulsive Grasps and H 3 Conftri-
Conftrictions of the foft and tender Fibres of which those Organs are woven, produce the Hysterick Sufferings peculiar to that Part ; the Solution of all which, in a rational Way, may be accounted for by the Hypothesis laid down in Hypocondriacal Cases.

An Enumeration of Hysterick Symptoms.

I shall chiefly set down the Symptoms that are found in the Female Sex, in a higher Degree or in a different Shape and Appearance from the same in Men.

The first I shall mention, is a painful Elevation of the Abdomen, while the Patient complains that he feels a Motion like that of a Globe or Bowl ftruggling and rolling upwards through that Region; which by degrees mounting to the Midriff, shoves it higher, or at least hinders its Dilatation and Descent, whence short and difficult Breathing; and is much augmented when the afcending Spafms and Convultions reach the Thorax, and affect the pectoral Mufcles, formed by Nature for the reciprocal Office of drawing in and excluding the Air : And when this inordinate Motion, begun in the lower Regions, and propagated through the intervening Parts, afcends

afcends to the Throat, it produces there fuch a ftrangling Grafp or Conftriction, that the Patient labours under a Difficulty of Swallowing, as well as Breathing, to fo high a degree, that fhe feems expiring, from a Sufpenfion of both.

Though this Suffocation of the Throat, and frequent Interruption of the fwallowing Faculty, is not by far fo often to be found in Men, yet fome Examples of it have likewife appeared in that Sex : And it is obfervable, that notwithftanding thefe Sufferings are fo great and frightful, the Patient's Pulfe continue, though low, fedate and regular.

These Persons are likewise by violent Convulsions, caufed by the diforderly and unruly Motions of the Spirits, frequently afflicted with great Pains through all the muscular Parts of the Body, involuntary Catchings up of the Limbs, and a fudden ftriking or ftretching them out, ungovernable Agitation of the Arms, tofling of the Head, and sometimes a stiff and rigid Posture of the Body, in which they continue a while inflexible; and at other times they ftrive and ftruggle with extraordinary Emotion, and are fcarcely held by the Arms of the ftrongeft Perfons; and in their greater Paroxysms, their Eyes are difforted, and fwim and roll H4 1n

in a frightful manner, with Outcries and Vociferations, and repeated Sobs and deep Sighs. Sometimes they break out into an immoderate Fit of Laughing, which is foon fucceeded by Sadnefs, Anxiety, and a plentiful Effufion of Tears; while the Patients complain, that their Heads are as hot as an Oven, and their Bellies, and efpecially their Feet, as cold as Ice.

Sometimes they perceive great Fullnels, Oppression, and Distention of the Stomach and Abdomen; and fometimes they feem to themfelves empty and hollow, as if their Bellies were gone. Thefe, and other odd and anomalous Symptoms, proceed from the convultive and confused Flights of the Spirits, or their unequal Distribution in the different Parts of the Body'; and the laft is the Reafon why the Belly or Abdomen feenis fometimes empty, and as it were evacuated; and fometimes too much diftended, which happens as often as the Spirits flow thither in too great or too little Proportion : And from the fame Inequality the Head is immoderately hot, while the Feet in proportion are as cold. Hence likewife proceed the Suffusions of Heat in particular Places, as the Back, the Breaft, and Shoulders, where often the Patients complain of

of a burning Diforder; where however no Fulnefs or Inflammation, or visible Defect is discoverable.

The Symptoms that appear in the Cheft, are often fhort and unequal Breathing, not like that occafioned by the Oppreffion of a Load of Humours difcharged from the Blood upon the Lungs, but refembling a dry Afthma, to which it bears a great Affinity. An irritating and contumacious Cough, without Expectoration of any digefted or undigefted Humours, is another Affliction caufed by this Diftemper in the Region of the Thorax.

The Symptoms of the Mouth are Suppreflion or Indistinction of Taste, while the Patient scarce discerns one fort of Meat from another; and fometimes the Palate is fo vitiated by the diforderly Spirits, that all Foods impart to it a Sense of Fire or Pepper; besides excessive Spitting, of a thin ferous Humour, even to a Quart, or much more in a Day and Night, frequently affects the Mouth. This immoderate Evacuation, which imitates that excited by Mercurial Medicines in the Salival Channels, proceeds from an inordinate Influx of the Spirits into the Strainers, by which they are irritated, and urged continually to feparate its Moisture from the Blood; and as the irregular

gular Disposition of the Spirits from Affright and Confternation, as well as a Diabetes, will caule a Profusion of pale Water from the Bladder; fo Hyfterick Paffions, as well as Hypocondriacal, will occasion a great Discharge of limpid Urine ; which is likewife effected by fudden Alarms of Danger, or any furprizing Calamity. Frequent Fits of long and vexatious Sneezing, are Sufferings that often afflict these Patients, and fo are Pandiculations, that is, a violent and involuntary ftretching of the Arms and Body in yawning; and they are derived from the fame Fountain as the other Symptoms, that is, the unnatural and perverted Motion of the Spirits; which, stimulated by fome noxious Ferments, are difconcerted, and put into Flight and Confusion; and while thus difarrayed, and unable to rally and recover their Order, they rush into these or those Membranes or Muscles in a tumultuous manner.

The Symptoms that affect the Head, are fometimes Dimnefs, or Diminution of Sight, when the Exercise of the visive Faculties is fuspended for a short or a longer Space; fometimes the Power of Speaking, and the Exercise of Reason, Reflexion, and Memory, are discontinued for

for two or three Days; by which this Diftemper imitates a Fit of an Apoplexy; as fometimes by Diftortions of the Face, Agitation of the Limbs, and Lofs of Understanding, it refembles an Epileptick Paroxyfm.

The Symptoms that difturb the Operations of the Mind and Imagination in Hysterick Women, are the fame with those in Hypocondriacal Men, with fome inconfiderable Variety; that is, Fluctuation of Judgment, and swift Turns in forming and reverfing of Opinions and Refolutions, Inconftancy, Timidity, Absence of Mind, want of felf-determining Power, Inattention, Incogitancy, Diffidence, Suspicion, and an Aptness to take well-meant Things amifs. But though this Difeafe fometimes affects the intellectual Faculties, and interrupts and distracts their Functions in a great degree, yet it feldom entirely fubverts them, or brings on a State of Lunacy; though fometimes when the faulty Ferments that agitate the Spirits, and occasion involuntary Motions, are combined and complicated in some degree with the Seeds and Principles of that unhappy Diftemper remaining in the Blood, or excluded into the Bowels or Glands, they may then infect the Spi-1. R. 1 rits

rits not only with an Hyfterick, but a Lunatick Difposition, which has been and still is the melancholy Case of several of the Female Sex.

Now by the Hypothesis I have laid down, these Complaints and Diforders will be clearly explained : As first, the distracted and confused Motions of the Spirits rifing from the lower Parts of the Abdomen, and imitating, according to the Patient's Perception, the rolling of a Bowl or Globe upwards, may be well understood as the Caufe of fuch an anomalous Effect; as when the Peristaltick, that is, the gentle and unperceived protrusive Motion of the Guts; by which their defcending Contents are pushed forwards, and at length excluded, is inverted; as in Cholical and Iliack Paffions, those Contents are carried and impelled upwards, till being unloaded on the Stomach, they are ejected by violent Vomitings, not to be reftrained till their regular Motion is reftored to the winding. Nerves of the Inteffines; fo in this Cafe the Inquietude and Diffipation of the Spirits afcending contrary to the Defign of Nature and their ufual Function, occasion, by their convultive Agitations, the Symptoms before defcribed; and this Diforder may indifferently happen from any noxious

noxious Humours in the Matrice, the inferior Inteftines or meferaick Glands, that offend and vex the Spirits in those Parts till they are driven into convulfive and hysterick Errors: and in like manner the reason of all the other Symptoms may be unfolded.

These Hysterical Affections, as well as Hypocondriacal, fometimes begin in the Brain, where the Spirits are first irritated and impelled into inordinate Motions, and thence the Tempest drives through the Nerves down to the lower Parts, and carries great Diforder and Confusion where-ever it comes; and if it be confider'd that, as above afferted, Transports and Extafies, produced in Men and Women by Demons, in Imitation of divine prophetick Infpirations, by the impulsive Violence of the Ideas and ftrong Reprefentations in the Brain, the Spirits there were driven with ungovernable Force, and caufed in the Joints, the Breaft, and Abdomen, convulsive Motions; it will facilitate our Conceptions how Hyfterick Fits are produced in the Head. On the contrary, fometimes this Difcord and feditious Tumult in the animal Government has its Rife from the inferior Regions, and mounting upwards, agitates all the Parts in its way, till it climbs to the Brain, and

and communicates to the Spirits that inhabit there a convulfive Difpofition, or immoderate Expansion; and while their natural Order and Cohefion is greatly difturbed, they produce the grievous Train of Symptoms that in the Paroxysms of this Difease afflict the Head, as has been before described.

If the Tragedy begins in the Brain, it is excited fometimes by external, and fometimes by internal Caufes; when the Seeds of this Disease, after they have lain darmant feveral Years interwoven and imprisoned in the first Principles of Life, and at length affifted and promoted by the Ferments of Puberty and maturer Age, begin to stretch themselves, and struggle for Enlargement, a fudden Fright, or any furprizing calamitous Incident, may by the violent Impression made on the Spirits in the Brain, excite the Materia Disposita, and give Birth to Hysterick Affections: And many under the Power of this Diftemper, have informed me, that they never felt any Fit of the Vapours, as they are called, till after fome fuch Accident befell them. But these Symptoms are likewife often produced by internal Caufes; fometimes by degenerate Juices, either acid, acrimonious, or auftere, lodging in the Cells and Vacuities of the

the Brain, in the fame manner as they are fometimes caufed by the like Impurities collected in the Stomach, Spleen, or any other Receptacles within the Abdomen, as has been formerly faid.

This Diftemper, under various Shapes and Appearances, affects by turns all the Organs of the Body, where it perfonates the Difease that peculiarly belongs to each Part; in the Head, it imitates an Apoplectick, and fometimes an Epileptick Paroxysm; in the Tongue, a Paralytick Numbnefs, and Sufpenfion of Speech; and in the Heart, a Syncope; while a Defailance of Spirit, and Ceffation of Motion, with a Stretching out of the Body, make Standers-by think the Patient is dead. In the Breaft, it refembles an Afthma; in the Limbs, a Rheumatifm; and in the lower Back, a Lumbago: But the most confiderable Inftance is, when the Hysterick, irregular Motions of the Spirits, by Shiverings and Rigours, and a low, fwift, and fometimes unequal Pulfe, Oppression of the Heart, frequent Sighs, and Sickness of the Stomach, express fo great a Similitude to a putrid Fever, that it is not eafy to diffinguish the one from the other; of which Subject I have discoursed in my Treatife of the Plague and malignant Fevers. Since therefore this

this Difeafe affects at Seafons fo many organical Parts, and the Mafs of Blood it felf; fince it changes and fhifts its Figure fo often, and appears fo frequently in the Shape of other more dangerous Diftempers, it falls out that the Guilt of those Diftempers is often charged unjuftly upon Hysterick Paffions; while Spectators, by not discerning the Distinction, are apt to cry out, oh! this is nothing but Vapours. It is true, that these Vapours, though grievous and afflictive, are feldom attended with fatal Symptoms; yet it is like-wife true, that at length, by wasting the Spirits and weakening the Conftitution, after an uneasy and uncomfortable Course of Life, they introduce other Difeafes, that prove destructive ; and the Cafe of these Patients till then, deferves the greater Commiferation, inafmuch as they cannot die, nor live in Comfort.

Thus I have enumerated the Properties and Symptoms of Hyfterick Affections; whence it will appear, that they do not differ in Specie, but only in Degree from Hypocondriacal; and that whatever remote Caufes contribute to the Production of these Diftempers, yet their effential and adequate Idea confists in the unequal, convulsive Agitation of the animal Spirits, and that the immediate Seat or Subject of them

them is the System of the Nerves, the fensitive Theatre where all these extravagant Scenes of Uproar and Confusion are transacted.

This Difease is common to all of the Female Sex, Virgins, Married Women, and Widows, without Diffinction of Age, as appears by Attention to the Symptoms above recited; and it may justly be divided into two forts : one confifts in Fits and Paroxyfms, which however are transient, though they return after uncertain Intervals; and in this cafe, the Spirits are often incited and enraged to fuch a degree of Fury and Impetuofity, that they shake the whole Fabrick with enormous Convulfions, and are commonly; but improperly called Fits of the Mother, or Suffocations of the Matrice. The other fort is not fo violent and frightful, but more constant, attended with inferior and milder Symptoms, but evidently Hysterick, that is, Strangulation of the Throat, aking, fwimming, and lightness of the Head, Oppression and Inquietude of the Spirits, frequent Sighings, Trembling, and Falpitation of the Heart, convultive Twitchings of the Muscles, jumping of the Tendons, and Catchings of the Limbs, with Pains and Suffusions of Heat, noify Eructations of Wind from The

the Stomach, Vomitings of fowre and bilious Humours, changed from yellow to a deep Green, by the Mixture of acid Juices : Add to thefe fometimes an immoderate Gaiety of Temper, which however is not lafting, and frequently a profufe Difcharge of pale Urine like Rock-Water.

Later to the second state to the second state to the second state the second state s

Of the METHOD of CURE.

Come now to fet down the Method of Cure, and fhall first discourse of that which is proper in Hysterick Cases of the fecond fort, which never rise to the Height of terrible Paroxysms.

It must be observed, that since this Diftemper agrees with that called Hypocondriacal, in all its essential Properties, the Method and Medicines, at least for the principal Part, that are proper and successful in the last, must likewise be accounted falutary in the first: Therefore Steel and its various Preparations, Chalybeate Waters, Opium, warm Purgatives, and vomitive Remedies, which are eminently useful in the Disease of the Spleen, must

must be very beneficial in Hysterick Affections.

But fince the noxious Humours in other Diftempers peculiar to the Female Sex, may fometimes irritate, and give them an Hysterick Turn, or may unite themfelves to other Impurities in the Cells and Caverns of the Bowels, and with conjunctive Force produce these Spafmodick Diforders, it is reafonable to mingle with the Medicines before mentioned, others, whofe Vertue has been experienced to be fuccessful in reducing the diforderly Difpofition of the Spirits, and reftraining them from flying out in an unruly and tumultuous manner; and fuch are various Gums, as Affafætida, Galbanum, Oppopanax, Myrrh, Caftor, Gum Ammoniac, O.c.

Take of Myrrb, Affafætida, Galbanum, each a Drachm, of Caftor a Drachm and half, of Salt of Amber two Scruples, and Saffron half a Drachm, make all into a Mafs, with a fufficient quantity of Gum Ammoniac diffolved; take four Pills of moderate fize every Morning and Afternoon, drinking after them a Draught of the Infufion of Penyroyal Leaves.

Or, Take of Extract of Gentian a Drachm and half, of Salt of Amber I 2 balf

balf a Drachm, of Root of Virginian Snakeweed a Drachm, Salt of Steel a a Drachm and balf, with a quantity Sufficient of Gum Ammoniac diffolved; form them into a Mass for Pills; make them of a moderate size, and let the Patient take four of them every Morning and Asternoon, drinking aster them a Glass of Wine embittered by Root of Gentian.

If the Form of an Electuary pleases better:

Take of Conferve of Roman Wormwood ten Drachms, of Conferve of the Flowers of Rosemary fix Drachms, of Cinnabar, of Antimony, and Trochisks of Myrrb, each two Drachms, of the Root of Zedoary and Contrayerva, each a Drachm, Seeds of Rhue half a Drachm, of the Salt of Steel or the Vitriol of it, or Steel prepared with Sulphur, or Tartar, two Drachms; make it an Electuary, with the Compound of the Syrup of Piony : take the quantity of a Chestnut every Morning and Afternoon, drinking after it the Infusion 'above named, or instead of it four Spoonfuls of the following Julep, which may be likewife given after the Pills prescribed. Take

Take of Milk Water and that of Black Cherries, each four Ounces; of Rue and Pennyroyal Water, each an Ounce; of compound Briony Water, three Ounces; of Spirit of Lavender, two Drachms. Sweeten the Mixture with Sugar for a Julep.

The Drops of Tincture of Steel, mentioned before, will likewise be useful when taken, as there directed, with Chalybeate or other Mineral Waters. These Waters may be likewise given after a Dose of the Pills or Electuary, every Morning and Afternoon, as above directed, for a Month. 'The Bath Waters and thole of Tunbridge to be drunk on the Place, otherwise their volatile Virtue will much evaporate; tho' the first will be ferviceable in a confiderable degree, when taken at a Distance from the Spring. If a stronger Kind of Water, such as the Spaw, Piermont, Tunbridge, is unfuccefful, let those of a weaker Virtue be tried.

In this Cafe, violent Pains in the Head and Limbs often afflict the Patient, and fometimes an obfinate Wakefulnefs; but especially Diforders in the Abdomen, fuch as flatulent Distensions and cholical Sufferings, a restless and unquiet Dispo-I 3 fition

fition of Spirits, Vonitings or Strainings to vomit, and fometimes an obstinate Loofenefs. During the Continuance of any of these Symptoms, the Patient ought to forbear Steel Medicines and the Mineral Waters, as well as the Gum Pills, and have recourfe to the Ufe of Rhubarb and Opiates; which in these Cases are so neceffary, that there is little to be done without their Affistance. For this Malady being founded in the diffipable Difpolition and convullive Turn of the Spirits, Opiate Remedies are of admirable Service to reftrain their Fury, pacify their feditious Discontents, and confirm their shatter'd System. But this I have treated on before in Hypocondriacal Cafes, and have shewn when and in what Quantity Opiates should be taken; and have answered the common Objections brought against the Use of this most beneficial Remedy, if judicioufly prefcribed, and not by Excels and great Familiarity made hurtful or infignificant. I have laboured likewife in that place to remove the great Prejudices that many of the Female Sex lye under, in respect of quieting Medicines, who however need their Affistance most. And that it is from a groundless Prepossession and imaginary Terror, that fuch Perfons exclaim against Opium

Opium is evident; for when they have taken it without their Knowledge, it has very often done its Duty, and removed the Complaints for which it was prefcribed. It is true, that this excellent Medicine is attended with fome Inconveniencies, both in Hypocondriacal and Hysterick Cafes; for the next Morning the Patients are often troubled with a Lightness and Swimming in the Head, attended with a naufeous Difpolition of the Stomach, like Sea-Sicknefs, and Aptnefs to reach and vomit: To avoid which, the Patient ought to continue in Bed fome Hours longer than at other times; and to forbear, during the Morning at leaft, all Malt Liquors. However, this uneafy Confequence is not to be compared with the Benefit that the Patient receives from this powerful Drug. There are few Things fo good, as not to admit fome Mixture of Ill; but when the Superiority of the Convenience preponderates, and abundantly outweighs the Inconvenience, it should determine our Choice: Which is the Cafe before me, where great and almost intolerable Miferies are removed, and but fmall and tranfient Sufferings fucceed in their place.

Gentle and warm purging Medicines should be fometimes interposed, to carry T off

off the collected Humours in the Stomach and Inteffines; fuch as four Spoonfuls of Elixir Salutis, or of Tincture of the Species of Hiera Picra, or Rhubarb infused in Annifeed Water, or strong Mountain White-wine, either given alone, or mixed with twelve Drops of liquid Laudanum, especially in cholical Pains. The Night after purging, should be taken twenty, or twenty five Drops of Laudanum in any convenient Liquor.

In cafe of a Loofeness before-mentioned, the Infusion of Rhubarb, or a Scruple of the Powder with half a Drachm of Diascordium, will be best taken at Night going to Bed; and the next Night two Scruples of Diascordium, and twenty or twenty-five Drops of Laudanum. Thefe are to be given interchangeably for three Dofes. Nor has the Hyfterick Patient any Reason for her Aversion to take this pacifick Drug in fhort and difficult Breathing, for fear it should thicken the Humours in the Lungs, and by hindring their Expectoration increase the Oppreffion; for this is not the Cafe of Hyfterick Perfons, who struggle with Suffocation and laborious Breathing, not from Catarrhs, Defluxions, and a heavy Load of phlegmatick Humours in the Lungs, but from the Difability of the pectoral Mufeles arifing

arifing from the Constriction of the Nerves, and inordinate Motions of the Spirits.

The Method of Cure I have hitherto laid down regards the Diftemper as chronical, and not accompanied with violent Concuffions, or Hysterick Suffocations; but it is likewife to be purfued when fuch Fits are gone off, as a Prefervative against their Return: And now I shall mention what Method is to be used during fuch acute Paroxyfins, that is, when the Regions of the Thorax and the Abdomen are affected with violent and terrible Convulfions, and the Limbs diffracted with furious Agitations, till the Spirits being fpent, they fall into a Swoon, or a low and lifeless State; when the Eyes are distorted, or roll in the Head ; when the Patient burfts out alternately into involuntary weeping and laughing, or into abfurd and incoherent Talk. The Means proper to relieve these violent Fits, (for as to those of a flight and lower Degree, the Patient left to her felf will foon recover) are these that follow.

Letting Blood, efpecially in younger Women of a more florid and hail Complexion, is beneficial, as tending to compofe the Fury and Orgafms of the Spirits, and by moderating the Velocity of their Flight,

Flight, and contracting their diffipated and too much expanded Syftem. Sweet Odours do often much affect Hysterick Patients, infomuch that fome of the fair Sex are unable to bear Linnen or Gloves in the least perfumed, or fo much as the Smell of Flowers, not only of the Tuberofe or Jonquil, but the Jeffamin and Damask Rofe, tho' at a confiderable Diftance. And therefore outward Remedies of a strong and fætid Scent are frequently ferviceable to the Patient, while admitted by the Noftrils, or rubbed on the Neck and Temples, they put the Spirits into contrary Motions to those excited by odoriferous Objects, which is to reduce them to a Regularity and healthful State. For this purpofe, Spirit of Sal Armoniac prepared with quick Lime, Spirit of Hartshorn and its volatile Salt applied now and then to the Noftrils; as alfo little Knots that include Sal Armoniac, Afsafætida, Galbanum, Flowers of the Lilly of the Valley, Orc. held to the Nofe often, rouze the Spirits, and reftore their Motion. But as to kindled Sulphur, burning Feathers, and fmoking Linnen applied to the Noftrils, which the Nurfes fly to in the first place; it must be owned, that the foetid Particles are fo much exalted in these Compositions, that when let

let loofe by the Fire they ftrike the Spirits with fo much Violence, that they rather enrage them, than reduce their Diforder; and it is certain, that as fome Patients cannot bear these without hazard of Life; fo others fuffer as much under the Operation of excellive Quantities of stinking Oils; and even that of Amber, used upon these Occasions, is for the same Reafon often prejudicial. The drinking of a Glass of cold Water in the Fit has been often advantageous; but the Attempts of Friends and Relations by clafping fast the convulsed Bodies of fuch Patients, to reduce them by Force to their natural Posture; and by holding their Limbs with Violence, to prevent the convulfive Agitations, is rather detrimental than useful. All that in this Cafe ought to be done, is to leave the Patient to her felf, and take care that the Motions of her Limbs be fo managed, that fhe does her felf no Injury. And for the fame Reason I never direct strict and painful Ligatures to compress and restrain the Body or Limbs with Violence, that the Orgafm or Outrage of the Spirits by fuch Constrictions may be composed; for while they are under the Power of fuch ungovernable Agitations, and are furioully driven and fcattered by the Impulse and

and Stimulation of convultive Principles, in this State of Diffraction, they will by no means yield to a violent and direct Attack, nor be obedient to rough Methods: At this Seafon they are better led than driven, and will fooner fubmit to gentle, foothing Remedies, that perfuade and follicit Peace, and by degrees difarm them of their Fiercenels, and bring them to a fedate Temper; and fuch are thefe that follow:

Take a Dose twice a-Day of the Gum Pills mentioned before, or the following Electuary.

Take of Conferve of the Flowers of Rofemary, ten Drachms; Conferve of the Leaves of Rue, fix Drachms; of Trochisks of Myrrh, two Drachms; of Flowers of Sulphur, a Drachm and half; of the Powder of the Leaves of fætid Orrice, two Drachms; of Syrup of the fame, enough to make it an Electuary. Take the Quantity of a Chefnut twice or thrice a-Day, drinking after it of the Hysterick Julep before-mentioned four Spoonfuls, or a Draught of the Infusion of Pennyroyal Leaves.

During

During the Fit or Paroxysm, Plaisters f Galbanum and Tacamahac applied to he Feet, and to the Region of the Abomen and Assafatida, quilted in Linnen, nd worn above the Knees, are uleful; as hey infpire the Nerves with fuch Enanations and Effluvia as are apt, like hole applied to the Nole, or taken invardly, to appeale the Elastick Efforts of he Spirits, controul their rapid Motions, nd introduce Quiet and Tranquillity; a ontrary Effect to that which arifes from weet-finelling Flowers and Perfumes; hough it must be acknowledged, that ometimes in particular Constitutions odoous Drugs taken into the Stomach relieve he Patient; and therefore when the Renedies of an opposite Quality have been ried in vain, the Physician may have reourse to these of a different Nature. For Example,

Take of Civet two Grains, Musk five Grains, Saffron three Grains, Diafcordium half a Drachm, with Syrup of Atriplex Olida; make it a Bolus, and take it twice or thrice a Day, drinking after it any convenient Liquor. During the Fit, rectified Spirit of Hartf-

born, Sal Volatile Oleosium, Dr. Goddard's Drops, or a Spoonful or two of Hysterick

Hysterick or Compound Piony Water, diluted with Spring Water, are beneficial.

But the most prevalent Remedy, as operating directly and immediately on the convulfive Nature of this Diftemper, is crude Opium, and the feveral Preparations of it. And it is observable, that in all the Recipes to be found in the Writings of eminent Phyficians on this Subject, Opium is often one Ingredient of the Composition during the Paroxysm; and out of it, Opium or Steel are almost always a Part of the prefcribed Remedies; which evidently shews that those Authors, who either from an Affectation of shewing their. Fertility and extenfive Knowledge of Pharmacy, or from a Defire to difguise their Prescriptions, by various Complications or fruitless or less effectual Medicines, thought they advanced the Dignity of Phyfick, by making it more pompous and full of Myftery, did however chiefly rely upon the Vertue of Quieting and Chalybeate Remedies; the first, during the Fit, to fupprefs its Infults, and both of them, when the Fit is over, as proper to mend the depraved Habit of Body, and prevent the Return of the Enemy. When, and

and in what Proportion crude Opium, liquid Laudanum, and Diacodium, are to be prefcribed, I have difcourfed under the Head of Hypocondriacal Affections.

It is great Pity that Hypocondriacal and Hysterick Patients should, by unreasonable Prejudices, be defrauded of the great Benefit of this powerful Juice or Extract of the Poppy; which, as I have shewn before, when used with Caution and Judgment, does wonders, unaccompanied with any ill Confequences, but what are far inferior to the good Effects produced by their Operation. But it must be observed, that these quieting Medicines always fucceed beft after Evacuation; and therefore if the Patient is bound, it is requisite that a purgative Clyfter should be administred, or an opening Remedy taken into the Stomach; fuch as twenty-five Grains Pilul. Fatida, or Coch. Maj. or Pil. Ruffi, or Pil. Rudij, or two Ounces of Infusion of Hiera Picra, or four or five Spoonfuls of Elixir Salutis: and it is neceffary that at Night going to Bed after fuch Evacuations, the Patient should always take a quieting Medicine, to compose and allay the Diforders of the Spirits, too much agitated aud ruffled by the Infligation of purgative Medicines.

were and the construction of the second of t

SECT. III.

Of the CHOLICK, MELANCHOLY, and PALSY.

Hefe Diseases have great Affinity to Hypocondriacal and Hysterick Affections, of which I shall discourse in their Order, and explain their Natures, and mention the peculiar Properties by which they are discriminated from each other, and then set down the Method of their Cure.

Of the CHOLICK.

This Diftemper derives its Appellation from the large, crooked, and unequal Inteftine called the Colon, which it chiefly afflicts with convultive Gripes and tormenting Pains, that propagated to the Stomach, create there grievous Sicknefs, accompanied with violent Reachings and frequent Vomitings. It is of two forts, one is more acute, and of thorter continuance, which arifes from a Redundancy of

of acrimonious Choler, that bites and irritates the nervous Fibres, and afflicts them with vehement Diffentions or Contractions, and creates at the fame time a feverish Diforder in the Blood. The cafting up of much bitter, yellow Bile during the Paroxyfm, shews the Caufe of this acute and unfufferable Malady, that is nearly allied to the Difeafe called Cholera Morbus; and feems to differ only in this, that a Cholera Morbus is of a fhorter Duration, and is attended with a great Loofenefs, as well as frequent Ejections upwards; whence it appears they have one common Caufe, that is, an exorbitant Collection of bitter Choler in the Ventricle, and the Intestines, its Appendages; and they are both removed in a few Days by Evacuation, plentiful Dilution, and pacifick Remedies, judicioufly administered, otherwife they foon produce an Inflammation of the Guts, fucceeded by a fatal Mortification or Gangrene.

A nervous Cholick is the other fort, which is not attended with a Fever, or at least but in a low degree. This, from the painful Agitation of the Spirits, fometimes happens to Patients that are not liable to Hypocondriacal Affections, but have however a weak Frame and K Texture Maria 1

Texture of Nerves by Nature in the Parts affected, or at leaft have contracted it by an irregular voluptuous Courfe of Life; by which they have depraved and relaxed the Tone of their Stomachs, impaired the healthful State of the Nerves, and filled their Bodies with degenerate and vitiated Humours.

But most commonly the Distempers vulgarly called the Spleen and Vapours, introduce this Complaint of the Cholick, as I have before explained, where I have given a Description of their Nature and Production; but it must be observed, that Hysterick Patients are more frequently troubled with it than Hypocondriacal; for their Nerves being of a finer and more delicate Thread, and their Spirits more fugitive and apt to lofe their Coherence than those of Men, whose firmer Conftitution enables them to make a greater Refiftance to the Impulse and Inftigation of fowre and bitter Humours, it is no wonder they should be more often afflicted with cholical Sufferings.

The Guts, vulgarly called the Bowels, feated in the Cavity of the Abdomen, are often Eable to acute tormenting Pains, but chiefly the Colon, that, for its Amplitude and protracted Length, may be reckoned the principal Inteftine; and fometimes 2

those of less Dimensions and thinner Coats, especially the Ileon, feel as great, if not greater Torture; whence the Iliack Paffion has its Denomination, and the other smaller Guts in their turn are fenfible of the same Calamity. But the Colon being the most eminent for Extent and Largeneis, has by degrees fo far encroached upon the reft, as to give its Name to all the grievous Sufferings of the neighbouring Parts; fo that now all great and extraordinary Pains in the Contents of the Abdomen, whether in the Melentery, the Ileon, or other Inteftines, are commonly without Difcrimination called the Cholick; though before, they were juftly diffinguished by the different Names of the Guts, which they chiefly affected.

While the winding Volumes of these hollow Tubes, laid and disposed with admirable Art in the Cavity of the Belly, preferve their native Order, Situation, and regular State, they perform their Functions with fo great Quiet and Tranquillity in conveying to the lacteal Veffels the nutritious Juices laboured and concocted in the Stomach, and in fending downwards by their protrusive or peristaltick Motion, and at length excluding the fæculent recrementitious Parts to which K 2 the

the lacteal Veins deny Admiffion, that we are not perceptive or confcious of their Operations; but when they are diffurbed and interrupted in their Duty by incongruous and depraved Juices, we feel the fad Effects of that in violent Diffentions, or unfufferable Pains.

Now, taking the Cholick as a general comprehensive Term, that signifies all these Sufferings in the Intestines and Mefentery, I shall treat of it, as I have above divided it into two forts; one is the bilious or accidental Cholick, produced by an excessive Collection of bitter, acrimonious Juices, mixed however with acid and auftere in the Parts before mentioned; and the other that which arifes from Spafms and convultive Motions of the Spirits, without fuch a Load of bilious or fowre Impurities, though not entirely free from them: and this Species is properly called habitual, nervous, hypocondriacal, hysterick, and scorbutick; and it is frequently named the dry Gripes.

As to the first fort, it proceeds, as faid, from a Fulness of Choler, mingled with other noxious, acid Humours, discharged from the Glands of the Guts and the Pancreas, that meeting in the Cavities of the Intestines, an immoderate Quantity of Bile issuing from the Cistern of the Gall, and

and by their Rencounter caufe fuch Ebullitions, and fuch a Strife and Fermentation, as fill all the Ambages and ferpentine Train of the Guts with Uproar and Diffraction; and while the bilious and acid Particles prick and corrode the membranaceous Fibres, they enrage and impel the Spirits that refide there to perform their peristaltick Duty, into the utmost Confusion and Diforder, whence they take their Flights with the greatest Precipitation; and by their Irregularity and Violence, create reftless Perturbations, lacerating Pains, and unfufferable Torment; infomuch that this fierce Commotion and Infurrection in the animal Commonwealth threatens its Ruin and Destruction. These impetuous Shocks and Concussions are owing to the Fury and Oestrus of the irritated Spirits inhabiting the nervous Branches, diffributed from the Glands of the Mefentery to the Inteffines of the Stomach; by the Mediation of which that Bowel is also affected and provoked to violent and repeated Vomitings.

The Torture of the Inteftines is fometimes fo enormous, that in lefs than twenty Hours they are inflamed and fatally mortified, as well from the noxious Quality of the bilious and other Juices K 3 exalted

exalted to the utmost pungent and corrofive Degree, as the native Debility and too great Tenderness of the Guts themfelves: But this Diftemper is ufually protracted for feveral Days, and in that it differs from a Cholera Morbus, which attacks the Patient with great Fury, but foon conquers or draws off; feldom continuing above two Days and Nights. It is likewife diftinguished from that Diseafe, by its binding the Patient, and preventing the Exclusion of the excrementitious Leavings of the Chyle; for in the other Cafe the Patient is harraffed continually, as well by copious Dejections, as great Sickness and vomiting. I have mentioned this Diftemper, becaufe it fo much refembles the bilious Cholick that I have been defcribing, which arifes from the fame Causes, and is attended with the fame Effects, excepting the Instances before named; nor is there a great Difference in the Method of their Cure.

Sometimes the irritating and corroding Matter of the Difeafe is only flopped and retained by the convulfive Conftriction of the Inteftines, whence the Symptoms before enumerated have in a great meafure their Origin. But when it rages in the most violent manner, the wreathing and spiral Motion of the Guts, that gently fhoves

shoves or protrudes the Recrements downward, is by the convultive and differting Force of the Spirits inflected and turned back upon it felf; and then the Contents of the Intestines are pushed upwards to the Stomach, and exploded through the Mouth with great Violence. The Distemper in this furious State is called the Iliack Paffion, or a Convolution and Twifting of the Guts, as if they were ftrictly complicated, involved and wound about one another; which is not fo, but fome Part only by the inverted Peristaltick Motion recoils upon it felf, and is forced into the next fuperior Cavity, as when the End of the Finger of a Glove is thrust into the hollow of the Part immediately above it; and then it is very difficult by any Remedies to reduce the Inteftines thus inwrapt contrary to their natural Situation, while the exceflive Torment foon introduces an inflammatory State, and a confequent Gangrene or Mortification. I now proceed to

The Method of Cure in the CHOLICK.

Since this Disease takes its rife from an exorbitant Collection of bitter, actimonious, and fowre Juices, as before ex-K 4 plained,

plained, the Evacuation and Dilution of them are demanded in the first place.

Take plentiful and repeated Draughts of a light Infusion of Carduus Leaves, or Sage or Centaury Tops in Spring-Water; or take small Broth of Chicken or Veal, without Otmeal or Bread; or take copiously some purging Mineral Waters with which this Island abounds; such as those of Epsom, Dulwich, Northall, &c. Either of these may be drunk to three or four Quarts, if they are ejected by vomiting, as they often are, and do not pass thro', otherwise two Quarts are enough.

These Liquors are eminently beneficial, not only by their carrying off the impure and fharp Humours, that gaul and grieve the Stomach and Inteffines; but likewife as they dilute and attemper those that remain behind, by which means their pungent and ftimulating Force is abated: For, as fuggested before, there is no peculiar Antidote or specifick Remedy yet known, that can fubdue and extinguish Choler; and fince that is the principal and predominant Humour that caufes this Diffemper, its exorbitant Power must be reduced and brought down by Dilution; as we fee Gall or Spirit of Vitriol lofe

lofe their Force when poured into a Veffel of Spring-Water, far fuperior in Quantity; for the pungent and fharp Particles being difperfed and diffufed thro' fuch a difproportionate Meafure of infipid Liquor, are weakened and enfeebled to that degree, that they are fcarce perceptible to the Tafte.

If the Mineral Waters perform their Duty downwards, fo that there is a plentiful Evacuation, let the Patient take at Night going to Bed, either a Grain of Opium, or twenty-five Drops of liquid Laudanum in any convenient Liquor. But if the Waters do not make their Paffage thro', but are ejected by vomiting, the following Pills may be taken in the Evening, and likewife after Dilution by the Carduus Water, or Broths.

Take of Pil ex duobus, two Scruples; of crude Opium, a Grain and balf, going to Bed; and the Morning following, if they work by Nine a-Clock, drink ifreely of Chicken-Water, that is, finall Chicken Broth; but if they do not operate by that time, drink three or four Pints of purging Waters, or more, till they have their Effect; and the Night after drink the following Draught:

Take
Take of Barley, Cinnamon-water, or Milk-water, two Ounces, of compound Wormwood-water balf an Ounce, of Opium dissolved and strained one Grain, of Syrup of Diacodium three Drachms, make it a Draught.

If the Patient be not relieved, nor the Symptoms difappear, as they often do by this Method, let it be repeated once more; I mean the Pills at Night, and the compofing Draught the Night following; and this way, though not from the Vertue of one fimple Medicine, I have by long Experience found fo fuccefsful, that it may be reckoned almost fure and specifick. It is true, that fometimes the Humours are fo depraved and exalted to that malignant, and almost poisonous Degree, that they will not yield to this generally efficacious Courfe: The Guts are fo implicated and tied fo fast, that no means are able to unlock and loofen them, but a Mortification foon happens in the Intestines, and cuts off all Hopes. But then it must be confidered, that this Method may notwithstanding be called specifick, fince it may as generally be depended on as the two most celebrated Remedies, the Jesuit's Powder and Opium; for the first is not of fuch certain and universal Force

as to conquer all Agues and intermitting Fevers, which are fometimes fo obstinate, that they entirely elude the Vertue of that Medicine, and are fubdued by Remedies of another Nature, and less Fame, as I have experienced; and as to Opium, though an admirable and most beneficial Medicine, when prefcribed with Judgment and due Caution, it is frequently ineffectual, and does not remove Pains, and procure Sleep, according to its ufual Succefs; and more than this, in fome Cafes, and fome Perfons of a peculiar Conftitution, this Remedy will, inftead of calming, enrage and exasperate the Pain ; particularly in certain Women afflicted with the Cholick: and others likewife of each Sex are not only difappointed of the Reft and Sleep they expected from it, but by a reverse Operation, are kept more wakeful; though fometimes its genuine Effect is fuspended to the Night following, which makes amends for the Inquietude and want of Sleep the Night before; and though this Medicine is of all others the most powerful'to stop a Diarrhœa, that is, a Flux of the Belly; yet fometimes however, in Perfons of an uncommon Complexion, it will operate like purging Phyfick, and caufe a Loofenefs, which it generally reftrains. And therefore the Method

thod I have fet down for the Cure of the Cholick, which perhaps does as feldom fail of Succefs as the Jefuit's Bark or Opium, may be accounted a Method as certain and as fpecifick, though not confifting of one Remedy, as either of those moft ufeful Drugs that are dignified by that Title; while by an opposite and controuling Vertue they either deftroy the noxious Qualities of the Juices that feed the Diftemper, and fo become a Counterpoifon to the particular Venom of the Difease; and at length balance and sufpend its Operations, or by copious Dilution take off its Force; by which the Rectitude, Peace and Harmony of the animal Administration is restored.

A Cholera Morbus has a great Affinity to a bilious Cholick, as was before fuggefted, and owes its Rife, like that, to a redundant Quantity of Choler treafured up in the Stomach and Inteftines, from which Humours it takes its Denomination; and therefore both the one and the other are most common and rife in the autumnal Months that follow a fultry Summer, whose immoderate Heat is apt to breed too much bitter and adust Bile: This Difease only differs from the other, in that it is of a shorter Duration, and accompanied with more Dejections downward,

ward, and more violent Ejections upwards. The Method of Cure is however little different; for Dilution, with small Chicken-Broth in great Plenty, being first attempted, a Grain and half of Opium, or thirty Drops of liquid Laudanum, given in any proper Liquor at Night, and Dilution with the fame Liquor repeated the next Morning, and the Night following the quieting Medicine, if the Symptoms do not ceafe, is the true Method of Cure; but if the Vomitings and Loofeness are fo violent, that the Patient grows faint and dispirited, and appears much fpent and beaten down, then, without any previous preparatory Evacuation or Dilution, the Opium or Laudamim must be given; and if the Medicine be presently ejected, it must after an Hour be repeated, and fo on, till it flays, and then not to be directed again, till the return of as violent Symptoms demands it; and when the Symptoms are mitigated, and the Stomach will bear it, gentle and repeated Purging by the Infusion of Rhubarb and the Leaves of Senna will be very proper to carry off the noxious Humours.

The fecond fort of Cholick is what I called nervous, hypocondriacal, hyfterick, or fcorbutick; and this Kind does not depend

pend upon a great Load of cholerick Juices, that bite, pinch, and provoke the Stomach and the Intestines, but upon any fowre and auftere Humours whatfoever, either in the Abdomen, or any other Receptacle, or Bowel, or glandulous Substance, that corrode the nervous Fibres, and by their Inftigation difcompose and difperfe the animal Spirits refiding there; which thus distracted and disarrayed, enter the Coats of the Colon and Inteffines, and rack them with convultive Diffortion and tormenting Pains, in the manner before defcribed : nor is this fort fo often attended with a Loofenefs as the other, and will with less Difficulty be removed. Hypocondriacal Men are obnoxious to these painful Distempers, but Hysterick Women more; which in fome of a very tender Complexion, or a broken Frame of Nerves, are very apt to return.

To fubdue the furious Paroxyfms of this Malady, the fame Method muft be enjoined which I have above prefcribed for the bilious Cholick; but if they are not violent, two Ounces of Infufion of *Hiera Picra*, or one Ounce of it mixed with one of Elixir Salutis, given going to Bed, mixed with twelve or fourteen Drops of liquid Laudanum, and a Grain of Opium given the Night following, will common-

commonly be fuccefsful; and fometimes twenty or twenty-five Drops of Laudanum, without purging, taken in a cordial Liquor, will prevail, and ought to be as often repeated as occasion requires: but if a purging Medicine be directed. first, the quieting one must always be taken the Night following, which is almost a general Rule after that Evacuation. But to protect the Patient against the fevere and frequent Returns of these torturing Pains in the Stomach and Colon, commonly called the Gripes or Belly-ake, the following Method is adviseable, by which the relaxed System of the Nerves may be new braced and corroborated, and the too much expanded and fugitive Dispofition of the Spirits may be contracted and drawn closer together, that fo they may be able to refift the Irritation of acid and auftere Particles, that like minute and pointed Goads or Lancets incite, enrage, and impell them into convulfive Contractions.

The Medicines preferibed for this purpofe are numerous; but all that are of any Merit or Importance, are Steel, Chalybeate Waters and Opiates; and I have before fet down how and in what Proportion these Remedies should be preferibed. And during this prefervative Course, I have

have found by repeated Experience, when Vapours and conflicting Winds, enclosed in the Stomach and Inteftines, murmur and shake the Abdomen, but do not yet arife to a raging Storm, that four or five Spoonfuls of good Ufquebaugh, of which a double Quantity is beneficial for the Gout in the Stomach, has, more than other cordial Liquors, composed the growing Diforder, and relieved the Sufferers : But Patients should be admonished not to make this a familiar Cuftom; nor when they have recourfe to it, fhould they take above two Dofes to eafe the Gripes; for if two will not prevail, they must take the Method above fet down for the Cure of a cholical Paroxyfm.

For if Patients indulge themfelves without Caution or Reftraint, upon every Uneafinefs in the Stomach and its Appendages, in the ufe of that generous Remedy, or of Cologn or Holland Juniper-Water, which is next to it in Vertue, or any Infufions or diftilled Liquors, that confift of feveral active, fpicy, and fiery Ingredients, which are commonly fold in Shops under the Name of Gripe-Waters, the Confequence will be dangerous; for by degrees they will fubvert the Appetite, and deprave the digeftive Faculty of the Stoinach, fill the Liver with fchirrous Tumours,

4

mours, or obstruct the Lungs with pernicious Knobs and Kernels.

Thus I have explained the Nature, and mentioned the Method of Cure of each fort of the Cholick, the bilious and nervous; but after all, if it be attentively confidered, that they both confift in the irregular and violent Motions of the animal Spirits, and the convulfive Gripes and Diftenfion of the Inteffines; which Perturbations are effected in the first by the Incitement and Exagitation of bitter and acrimonious Juices, mixed with an inferior Portion of auftere and eager, which in the laft are as predominant as the cholerick Humours are in the first; if we reflect likewise that the Medicines and Method of Cure acknowledged as most prevalent in the one and the other, are almost the fame, it may be difficult to determine whether they are two, or but one and the fame Discase, with no greater Variation than accompanies a Fever that prevails this Autumn, and that which reigned two or three Years before; which is not another, but the fame Distemper, appearing in another Shape, and under a Diversity of Symptoms; and therefore these two Cholicks differ chiefly, if not only, in Duration, as a Fever of forty Days, from one that ends in a Day or two.

This nervous Cholick rages in the most violent manner in the American Indies, at least in his Majesty's Dominions there, where, by the Contraction of the Fibres of the inferior Intestines, the Patients are fo ftrictly bound, that the ftrongeft Medicines often repeated will with muchado open the Passages; and after it has grievously afflicted the Patient for many Weeks, by a fudden Translation of the Matter of the Difease from the Abdomen to the outward Parts, it will introduce a partial Palfy, and then the Cholick Symptoms difappear. Many of thefe arrive in England from Jamaica, Barbadoes, and other Plantations, to be cured of this grievous Difeafe, which they call the dry Belly-ake, and if I remember right, the Taws or Tawles; and by the use of Steel Medicines, Chalybeate, or Bath-Waters, they are generally reftored, at least in a good measure, to their former Health.

To recapitulate what I have faid of the Nature of the Cholick in each Kind; if indeed they are diffined Difeafes, and not the fame as to all their effential Properties, the fame Hypothefis accounts for the grievous, bilious, and the nervous or hyfterick Cholick, that is, a delicate Texture of Nerves, and volatile and tender Conflitution of Spirits, apt to receive convul-

convultive Imprefiions from incongruous. extimulating Juices lodged in the Inteftines, or in the Cells and fecret Repofitories of any other Parts, whether in the Hypocondria, in the Places beneath or above the umbilical Region, and efpecially in the Mefentery, whole complicated Fibres and Clues of nervous Threads diffuse fo many fensible Branches through almost all the Bowels and Contents of the Abdomen. These pungent, austere, acid. and bitter Humours, vellicate, bite, and as it were wound the Membranes of the Intestines, sometimes in one part of the Belly, and fometimes in another; by which the Spirits are provoked, and become tumultuous, till the growing Tempeft spreads; and rolling on through the Folds and winding Labyrinths of the Guts, afflicts and difturbs their Coats with infufferable Twinges and convulfive Gripes: and though the bilious Cholick is generally diffinguished from the hysterick, as before mentioned; yet why the laft, which will fometimes continue whole Months together, with a daily and copious Ejection by the Mouth of porraceous Fluids, called fo from refembling the Juice of Leeks, which is nothing elfe but Gall, or yellow Choler turned green, by the Mixture of fome Acid; why, I fay, L 2 this IRE'S

this Cholick, accompanied with fuch a prodigious Evacuation of Bile, should not be reputed bilious, I acknowledge I cannot conceive. Thus, as to their Nature or effential Properties, all Cholicks, as well of one Denomination as another, are Diftempers of the convultive Kind, and produced in the fame Manner, and by the fame Caufes as Hypocondriacal and Hyfterick Affections; and the Method of Cure, with little Variation, is alike, as well for removal of their violent Paroxyfms, as for reftoring the Firmnefs of the Spirits and relaxed Tone of the nervous Fibres, which is the fureft Prefervative against the Return; that is, Medicines of Steel, Chalybeate Waters, and Opium by its felf, or in its various Preparations: And hence appears the great Similitude and Affinity between the Cholick, and Hypocondriacal and Hyfterick Paffions; and indeed the nervous Cholicks that are apt to return fo often, feem rather, as I have faid, a Symptom of that Difease, than one of a diffinct Species.

The Relaxation and immoderate Widenefs of the glandulous Kind, diffufed through the whole human Fabrick, as well by letting pafs an exceffive Quantity of the Juices, which it was their Duty to have feparated from the Blood in a certain

tain meafure, as well as many other incongruous Fluids, which should not have been admitted, that afterwards provoke the Nerves, and exafperate the Spirits; by which they occasion great Distension of the Parts, or Spafms and painful convulfive Contractions, may justly, as I have fhewn before, be allowed to be the genuine, univerfal, and adequate Caufe of the Cholick, as well as Hypocondriacal and Hysterick Affections: And this will still be more confirmed, if we confider that the celebrated Medicines which I have named above, for their great Ufefulnefs in these Distempers, are those that have in a good measure an aftringent Quality; fuch as Steel, or the Salt of it, either by itfelf, or diffolved by Nature or Art in Spring-water, which contract and draw clofer together the loofe Orifices and Inlets of the Glands, and fo recover their natural Tone and due Dimension; while Opium, the most effectual Astringent and Bridle of the Spirits, reftrains their violent and inordinate Excursions, and reduces them to a fedate and compofed State, fit for the regular Execution of their feveral Offices; by which means the Spring of cholical, as well as other nervous, convulfive Sufferings in the Stomach and Inteftines, is cut off.

The

The Method I have laid down for the Cure of this Diftemper, I acknowledge is plain and fimple, unattended with Pomp and an endless Luxury of complicated Remedies, which rather diffract and confound, than instruct the young Phyfician, while many unneceffary, and perhaps fome hurtful Prefcriptions, are mingled with the few that are beneficial; for instance, the numerous Forms of Clyfters prescribed when the cholical Pains afflict the Abdomen above the Navel, and rage in the Ileon, the Hypocondria, and the Colon, are fruitlefs and unavailing; for while the periftaltick Motion is inverted, and the Stomach greatly affected, purging or opening Injections, not reaching the Parts affected, must, if they have any Operation, promote the irregular and inflected Motion of the Spirits, and make all things regurgitate and tend more upward, and fo contribute to greater Pain and more violent Vomitings. And as I have felt this my felf by feveral Trials, fo I have often observed the same Event in others; and therefore I have long fince laid afide the ufe of Clyfters in the Cholick, though I know it has been a conftant and establish'd Custom to prefcribe them in the first place in this Disease: and were they not hurtful, as I believe they are,

are, for the Reafons I have alledged ; yet they are impertinent and needlefs, inafmuch as the Difease, by the Method before mentioned, is effectually conquered without them, and they only take up the Time which should be employed in attacking the Disease directly, and therefore with more Success. The Medicines that triumph over the furious Infults of the Cholick, when the Guts are rolled upward, and often entangled and contorted, must be fuch as, when taken into the Stomach, have Power to controul and reftore the inverted Motion of the convulfed Inteftines; and by forcing a Paffage through, to recover their protrufive and vermicular Progression, which the Service of Nature neceffarily requires. And that this may the more effectually be brought about, the opiate Medicines prescribed are mingled in a good Proportion with a quick purging Ingredient, to appeale and quiet the Spirits, and still their convulsive Agitations for a time, that the Remedy may not prefently be ejected; and that after the Opiate has made Nature more calm and eafy, the purging Ingredient may exert its Force, and penetrate through the obstructed and implexed Intestines, by which means their natural Order may be retrieved. But if it happens, as it fome-L. 4 times

times does, that the Pills above-mentioned, confifting of one purging and one quieting Remedy, fhould prefently return by vomiting, let another Dofe be given an Hour after; and if that likewife fhould be ejected, then let the Opium be given alone, and three or four Hours after let the purging Pills be given alone, and then they will generally ftay and produce a good Effect, as I have often experienced.

But if this Method, duly followed, as above directed, fhould prove ineffectual, and the crucifying Pains and Vomitings continue without a Paffage made downwards, the Patient muft fly to purging Mineral Waters, as his laft Refuge; which, notwithftanding they return, muft be repeated and drank on till they have made their way; and after they have done their Duty, and wrought fufficiently, then a Grain of Opium, and eight or ten Drops of liquid *Laudanum* may be prefcribed; and fooner, if the Patient fhould be much funk and difpirited.

And notwithstanding attempering Liquors ingested, should return prefently by vomiting, as not able soon to make their way, yet they should be continued for several Hours; for in obstinate Cases, where there is no Passage downwards through the Roads and winding Meanders of the

Inteffines, by reafon of the convulfive Grafps that invert or firain and draw them clofe together, I have known that by drinking Mineral purging Waters for half a Day together, even to three or four Gallons, the obftructed Paffes have at length been opened, and the Patient delivered from a flubborn Difeafe, that feemed deplorable : but this Method is to be followed when things are come to Extremity, and other Remedies which ufe to prevail, prove ineffectual.

were the the second of the sec

Of MELANCHOLY.

THIS Difeafe is fo nearly related to the Spleen, that it is called by fome Hypocondriack Melancholy; and if in its diffinct and abstract Idea it fo refembles that Diftemper, then while they are complicated in equal or unequal Proportions, the Similitude between them will be more confpicuous, by the infeparable Properties belonging to each.

The effential Notion of Melancholy confifts in a weak, poor, and degenerate Conftitution or Temperament of the animal Spirits, by which they are unable to expedite their reciprocal Flights to and from the Brain with due Vigour and Velocity; and while they are thus depraved and uncapable of darting, like Rays of Light, through the Roads of the Nerves, they become unfit Minifters of Motion and fenfitive Perception, and cannot perform their Duty in regular Order either abroad or within the Brain.

The Caufe of this Debility and low impoverished State of the Spirits, can be no

no other than the want of rich and generous Qualities in the Blood, from which they are separated, and as it were distilled by the Brain; for as flat and palled Liquors, whofe Strength is evaporated, or which are mixed and diluted with too great a Proportion of infipid Fluids, cannot afford by Distillation a great Plenty of refined and exalted Spirits; in like manner a poor, lifeless, and unanimated Mass of Blood, funk below Nature's Standard, for want of a fufficient Proportion of operative and generous Principles, can never communicate to the Head a wealthy Store of bright and elevated Spirits: fo that the remote and antecedent genuine Caufe of Melancholy muft be charged on the low and depressed Condition of the Mass of Blood, inclined to Acidity, which was either in the original Formation of the Stamina Vita or Principles of Life, or was afterwards the Effect of various contingent Caufes.

The Symptoms of this Difeafe are numerous, that either affect the Organs of the Body, or the Exercise of the intellectual Faculties. In the Brain it is accompanied with great Disturbance of the Imagination and Fancy, a continued and uninterrupted Flux or Train of Thoughts fixed upon one fad Object, from which the

the Patient is unable to call them off, and transfer them to another; and therefore this is not what is called Contemplation, Study, or Deliberation, but unguided and reftless Musing; and the Difference between them is this, that when a Man studies or meditates, he commands his Faculty of Thinking, and turns it from one thing to another; but in Musing a Man is governed by his own Thoughts, and unable to reftrain or divert them to other Matters, but they are obstinately employed in poreing on and revolving the fame Images, fometimes in a more regular, and fometimes in a diforderly and incoherent Train, which return and are prefented to the Imagination in a conftant Rotation, like the Pictures painted on Cloth or Paper, and turned round by a Wheel, which Strollers carry as Shows from Town to Town, and expose for the Entertainment and Diversion of the meaner People. But it must be observed, that all the Images formed by a melancholy Imagination, are fad, dark, and frightful; while gay and delightful Objects are always shut out, or very feldom admitted to the Fancy and lighter Faculties of the Mind; for in regard to fuch Ideas, the Mind is under a total and lafting Eclipfe.

By this, Melancholy is diffinguished from Hypocondriack Affections; for Patients obnoxious to the last Distemper, though fometimes fad and penfive, yet have frequent lucid Intervals; and are not only in a chearful, facetious, and pleafant Humour, but are often carried on to so profuse a Pitch of Mirth and Gaiety, that by their too great Wafte and Expence of Spirits, they foon after fink to a low, dull, and uncomfortable Temper. They differ likewise in this, that Hypocondriack Perfons, though fometimes for a Seafon they are unfit for intense Studies, Contemplation or Business, while the Exercise of their Reason and Imagination is difabled and fuspended, during fome odd and whimfical Circumftances, when they ftart afide, and deviate from their ufual regular Way of Thinking; yet for the most part, when their Difease is abstracted from all Complications of a melancholy Difposition, they difcover great Abilities and Endowments of Mind; as a moderate Degree of the Gout, when free from all Conjunction of other Infirmities and Difeafes, is often accompanied with fuperior Understanding, and a great Measure of Bodily Health. So if the Spleen is taken with the Limitations I have mentioned, one would not with

1.

wifh to be deliver'd from this any more than from the other, fince the Benefits arifing from them over-balance all the Sufferings and Inconveniencies that attend them.

As the Thoughts of melancholy Perfons ufually dwell upon fad and gloomy Objects, fo they generally pore and mule upon fuch as have been the ordinary Entertainment of their Minds before they fell into this diffempered State; and therefore when the Imaginations of religious Perfons receive a melancholy Turn, they are always taken up about the important Affairs that concern the Performance of their Duty here, and their Happiness hereafter; hence their Diffidence, Scruples and Fears concerning the Sincerity of their Faith and Repentance, and their everlasting State, are by their Diftemper increased, even sometimes to so deep a Despondence and Self-condemnation, as borders on Despair. This the Atheift, Infidel, and loofe Libertine, foolifhly call fuperstitious Madness; and then offering Violence to Reafon, and indulging a petulant, flagitious Humour, they reproach Religion as the Caufe of this Effect, treating the Perfons that profess and practife it, in Raillery and Ridicule : hence all pious and devout Men are by fuch accounted

counted only Hypocondriacal Enthufiafts, or whimfical Vifionaries. But let thefe Contemners of Heaven, who are fond of all Occasions of bringing Dishonour and Contempt upon Religion, reflect, that as many Men express Zeal for Piety and Vertue, who however are entirely delivered from the Symptoms of this Difease, and have not in their Constitutions the least Infusion of Spleen and Vapours; fo in Multitudes that fall under the Dominion of Melancholy, the Diftemper does not always operate in this manner, nor turn their Thoughts and anxious Cares to religious Objects: but this chiefly, if not only, happens when the Patient, feized with these Diforders, was accuftomed to divine Thoughts and fpiritual Ideas before ; and then it is but natural that a diffurbed Imagination should chiefly entertain fuch Images, as were before well known, and had been long familiar to the Mind. And this falls out in almost all Instances of great Melancholy (while the unhappy Sufferers are more to be pitied than derided and exposed) and the Patients themselves and their Relations should be convinced, that fuch religious Melancholy is as much a bodily Difeafe, as any of another Clafs and a different Nature; and they muft 10

must more depend upon the Art of the Physician, and the Force of Medicine, than the Skill and Reasonings of the Cafuist, for their Recovery : for so fluctuating and unstable are their Minds, that though at this time they seem sedate and calm, yet in a few Hours the Clouds gather again ; the Brain is overcast with Darkness, and the same Anxiety, Scruples, Fears and Terrors return, and reposses the Mind. But perhaps I have purfued this Subject too far, though the Nature and Design of this Discourse led me to it.

This continual musing and turning of the Thoughts upon a Series of fad and afflictive Objects, as well as the lubricous, inconftant, and changeable Disposition of these Persons, must be accounted for from the continual Rotation of their reftlefs and unquiet Spirits; which though poor and weak, are still in a Hurry and perpetual Motion, though that Motion is confined to a narrow Compass. And as the Reafon and Judgment of melancholy Perfons are much fubverted and difabled. who are not receptive of the Force and Light of the clearest and most convincing Arguments against their pre-conceived Opinions, but with an inflexible Obstinacy hold fast their erroneous Conclusions; or

or if they yield them up one Hour, yet refume them the next, and continually relapfe into their former way of Thinking; fo their Imagination is much injured and disturbed: and as I have faid before, the Scenes they form and reprefent, are all mournful and uncomfortable, composed only of fevere, fullen, and unpleafant Figures. Befides, it is observable to all, that they often entertain the most idle, absurd, and ridiculous Fancies; one believes he is unable to move Hand or Foot, and lies as if deprived of all Motive Power; another thinks his Nofe is fwollen to a prodigious Dimension; and though at great Distance, he believes it reaches to the Door, and hinders others from entering the Room. One Man has living Frogs in his Stomach, which he perceives, as he thinks, from their crawling and croaking there; another is as much diffurbed with a Brood of young Chickens in his Belly, which he is perfuaded are really there, by an Opinion that he hears their peculiar Noife, and feels their Motions. Some will by no means be convinced, but that they are entirely formed of Glass, and that by the next Knock or Jog on any folid Objects, they shall break all to pieces; while others are as much concerned to avoid coming M

coming near the Fire, for fear of being melted, being fully affured that they are made of Butter. One has believed himfelf to be Millet-Seed, another a Goofe, or a Goofe-Pye. And once a Man filled with Strong Drink, feared to render it by Urine, left he should drown the World by a Deluge. And feveral Examples there have been of melancholy Perfons, who have believed themfelves to be actually dying, and imagined they were cold half way the Body; and of others, that took themfelves to be really dead, and defired to be laid out, in order to their Funerals: and many of these incredible Examples of Melancholy I have my felf feen, and the others are related by credible Authors.

But the Hiftory of these fanciful Perfons is various and endless; and there is fcarce any thing so extravagant and ridiculous, even to the greatest Admiration, that may not be found among the various Classes of these everlasting, but absurd and impertinent Thinkers, whose animal Spirits, vitiated and perverted, become unapt Instruments for the Operations of the Mind and Imagination.

As a melancholy Conftitution of the Spirits is fruitful of a furprizing and copious Diverfity of odd and ridiculous Phan-

Phantafms, and fills the Imagination with a thousand uncouth Figures, monstrous Appearances, and troublefome Illufions; fo it is no less fertile in producing difquieting and reftlefs Paffions, while they affect the Heart with Anxiety, Sadnefs, Fear and Terror; which Perturbations, no lefs than those of the Mind and Imagination, feem the infeparable and diftinguishing Concomitants of this Diftemper : for notwithstanding in fome very few brighter Seafons, when the dark and melancholy Clouds that overcaft the Brain, are difpersed, these Patients may break out into short, extraordinary Fits of Mirth and Alacrity; however this feldom happens, and then too when there is a Mixture and Complication of a Hypocondriack or Hysterick Temperament with that, which is properly Melancholy; as when these Patients, through great Defpondency and unfufferable Inquietude, discover Marks of a Defign upon their own Lives, their Diftemper exceeds its proper Nature and Extent, and has contracted a Degree of Lunacy. And indeed the Limits and Partitions that bound and diferiminate the highest Hypocondriack and Hyfterick Diforders, and Melancholy, Lunacy, and Phrenzy, are so nice, that it is not easy to distin-M 2 guilt

guish them, and set the Boundaries where one ends, and the other begins: however, continual Thoughtfulness upon the fame Set of Objects always returning to the Mind, accompanied with the Passions of Sadness, Dejection, and Fear, seems to be the genuine and discriminating Idea of proper Melancholy.

Now this Affertion, that a previous poor, and vappid Difpofition of Blood, that cannot afford by the Mediation of the Strainers of the Brain a fufficient Stock of generous and volatile Spirits, is the antecedent Caufe of this Difeafe, is likewife confirmed by this Obfervation, that the most fuccessful Remedies in this cafe, are those that animate and invigorate the Mass of Blood, and inspire it with new enlivening Ferments; by which means the fuperior, active Principles are more exalted, and the paffive prevented from being disproportioned and predominant; whence a greater Plenty of bright, fwift, and vigorous Spirits, are imparted to the Brain, fuch as are capable of being proper Servants of the Mind, and fuitable Instruments of the animal Powers; whence they are enabled to perform their Operations in a regular manner: and thefe are chiefly Steel by it felf, or varioufly prepared by Art, or diffolved by Nature in Waters

OF MELANCHOLY. 165.

Waters isfuing from Springs and Fountains; though other auxiliary Remedies may be taken in and joined with them, to strengthen them and increase their Force. If, as it often happens, these Diseases, founded in a diforderly and defective Constitution of the Nerves and Spirits, are blended with the Principles of one or more of the other Diftempers before named, and accordingly participate of their Properties, and have various Symptoms in common with them; then it is a mixed and complicated Cafe, though the Denomination is given to the fuperior and predominant Power. Thus, as Hypocondriack or Hyfterick Perfons, have often an Adhesion or Tincture of proper Melancholy, and fometimes of Diftraction, and fometimes of both, and the Effects of thefe Mixtures are evidently difcerned in them; fo melancholy Patients are often diversified from one another, by a subordinate Measure of Lunacy, or the Spleen and Vapours combined with their original Principles. And true it is, there is often fuch an Abfence of Mind, fuch Excursions and Starts from right Reason, and fuch an abfurd, incoherent, and ridiculous Train of Thoughts and Actions, discernible in Men afflicted with this Difcafe, that all high Degrees of it feem to Ma have

have more than a Touch of Lunacy adhering to it; and it is notorious, that many celebrated Men of Wit, that derive their fuperior Genius from an Hypocondriacal Conflitution, have fometimes Spirits elevated to a degree above the Standard of fober and uninfected Reafon; whence proceeds that known Expression, nullum magnum Ingenium sine mixtura dementia; for the bright and active Disposition of animal Spirits, requifite to refined and elevated Parts, borders fo clofe upon the Dominions of Lunacy, that an Excursion or Transition from the first to the last is by no means difficult, fince one Heat of the Brain more, might have beat down the Inclofures, and laid their Territories in common, as before observed.

under a concernence of the conce

Of the METHOD of CURE.

Pening of a Vein is feldom to be prefcribed to thefe Patients, whofe Diftemper proceeds from a low and impoverifhed State of Blood and animal Spirits; for that will be a means not to raife and enliven, but to enfeeble and fink them by a hurtful Expence.

Vomitive Remedies are generally ufeful, not only as they empty the Stomach and its Appendages, and carry off their noxious Crudities; but likewife by a strong Concussion, they compel the Glands of the Stomach, the Intestines, and other Organs in the Abdomen, to discharge the peccant Juices that harbour there; and by this means open and unlock their Obstructions, whence they execute their Office as the Oeconomy of Nature requires; but vomitive Remedies are yet farther beneficial, inafmuch as they agitate the Spirits, and by a Counter-motion, give another Turn to their Rotation in one constant Tract; and by that means occasion Diversity of Ideas, and strike out other Roads and ways of Thinking.

- Take of Milk-water two Ounces, of Infusion of Crocus Metallorum six Drachms, Oxymel of Squills an Ounce; mix it for a Vomit: aad to facilitate its Operation, drink a good quantity of Posset-drink, or of the Infusion of Carduus Leaves in Spring-water boiling-bot; and at Night take the following Draught:
- Take of Milk-water two Ounces, two Scruples of Diascordium, balf a Drachm of Gascoign's Powder, and three Drachms of the strongest Cinnamonwater.
- Or, Take of the vomitive Indian Root kalf a Drachm, of Tartarum Emeticum two or three Grains, of Milkwater three Ounces; mix them, and take the Mixture in the Morning or Evening, drinking after it in half an Hour, if it does not operate before, the diluting Liquors before mentioned, or others of the like Nature. When the Operation is past, the Patient may be refreshed with a Cup or two of Red Wine mulled or burnt; and at Night going to Bed, take the Draught before preficibed.

Either

Either of these Vomits that best agrees, and best performs its Duty, may be repeated frequently, if they prove beneficial; and the Quantity must be increased, if the first is not strong enough.

As to alterative and correcting Medicines to reftore the due Crafis and Temperament of the Blood, I have named the principal before, that is, Steel and Chalybeate Waters. I have above fhewn, that as to its antecedent Caufe, this Distemper arifes from a Constitution of the Mass of Blood tending to Acidity, and grown poor and degenerated from fuch a Richnefs and Abundance of active and volatile Principles, as admitted into the Brain, and there refined and exalted, might afford a fufficient Plenty of Spirits, not only to be employed by the Mind and Imagination, but likewife to be fent abroad as fuitable Meffengers in the Service of the animal Government; being capable of flying fwiftly through the minute Paffages of the Nerves, and returning, when they have difpatched their Errands, with equal Celerity to the Brain. And therefore to raife, invigorate, and enrich the Mass of Blood, dispirited and fallen to decay, the Medicines I have named are to be used, as those that chiefly procure this End; not that they are all to be taken at a time.

Take

Take of Mynficth's Tincture of Mars twenty Drops in a Draught of Whitewine, mixed with Spring-water or Milk-water, or any other convenient Liquor, every Morning, and about Five in the Afternoon, for a Fortnight.

Then take of Chalybeate Wine a Spoonful and a half or two Spoonfuls in the fame Liquors, or in a Draught of Chalybeate Mineral Waters in the fame manner; or take the following Prefcription.

Take of the Tops of Roman Wormwood, of Leaves of Germander, each a Pugil, or Root of Gentian and Virginian Snakeweed, each a Drachm; of Seeds of Coriander and Rhue each a Drachm and half; infuse them all in a sufficient quantity of boiling Water, and add to it, when strained, half a Pint of Chalybeate Wine, and two Drachms of Mynsicth's Tincture of Mars; take of it six or seven Spoonfuls every Morning, and about Five in the Afternoon, for a Month.

Or, Take of the Conferve of Roman Wormwood and the Pulp of candied Citron Peel, or the Conferve of Orange Peel, each an Ounce; of candied Nutmegs a Drachm and half, of Virginian Snake-

Snakeweed a Drachm, of Salt of Wormwood a Drachm and half, of Steel prepared with Sulphur or Tartar, two Drachms, of Syrup of Compound Piony, or Clove Gilliflowers, as much as will make an Electuary; take the quantity of a Cheftnut each Morning and Afternoon, drinking after it a Cup or two of Sage-Tea, for a Month.

As to Chalybeate Mineral Waters, let them be taken as above directed in the Method of Cure in Hypocondriacal Affections; and it will be very proper to take in the first Glass in the Morning, and in that in the Afternoon twenty of the Steel Drops; or let fix or feven Spoonfulls of the Chalybeate Tincture be drunk first in the Morning, and after it take a Glass of Spare or Tunbridge, or other Steel Waters; and interposing half an Hour between each Draught, two or three Glaffes more, and repeat the Tincture in the Afternoon, drinking only one Glass after it: and in the fame manner the Chalybeate Waters may be drunk after a Dofe of the Electuary before prefcribed; and if the Patient cannot take Medicines in that Form, let them be administred in the Form of Pills; as thus:

Take

Take of Myrrb, Extract of Gentian, each a Drachm and half; of Caftor a Drachm, of Saffron and Seeds of Rhue each half a Drachm, of Steel prepared with Tartar, and the Salt of Steel, each a Drachm; make it into Pills with the Mucilage of Gum Tragacanth, or the Balfamick Syrup; take four Pills each Morning, and as many in the Afternoon, drinking the Steel Waters after them.

Yet it must be acknowledged, that in many Cases of this kind the Steel unprepared, and only ground to a fine Powder, with Sugar-Candy, is more prevalent and effectual, than when the Body of it is opened by Art.

If the Patient, during the use of these Medicines, is too much bound, let him take going to-Bed twenty-five Grains of Pilul. Stom. cum Gum. or Pil. Ruffi, omitting the other Medicines the next Day.

Vomitive Remedies are the moft efficacious in this Diftemper, as fuggested before, and should be often repeated after due Intervals, and the Dose increased according

cording to the degree of Operation, beginning low. And Purgatives are likewife beneficial, nor do I think that fuch are to be preferred before others, that have a Reputation, but without Caufe, of being Alteratives and Correctors of melancholy Humours, as well as Purges: for it is abfurd to range fuch Remedies, which prefently work off, among those called specifick. Nor is there any elective Power in fuch evacuating Medicines, to fingle out and fasten upon any one Juice more than another; fince they can do nothing, but by ftimulating the Stomach and Inteffines, oblige them to difcharge promifcuoufly their Contents: And therefore I difregard the numerous operofe Forms of purging Medicines relating to this Difeafe, that fill the Pages of many laborious Systematical Writers of Physick, and shall only mention two Recipes.

Take of Leaves of Senna three Drachms, of Tamarinds an Ounce; boil them in Spring-water to three Ounces, strain it, and add of Manna half an Ounce, Syrup of Buckthorn an Ounce, of Compound Piony or Hysterick Water three Drachms; make a Draught, to be taken early in the Morning; and at Night after its Operation, take two Scruples
174 Of MELANCHOLY.

Scruples of Venice-Treacle going to Bed. When this is repeated, as now and then it ought to be, let the Dofe be increafed or leffened according to the degree of its Operation, fo that it may move the Patient about eight or nine times.

Or, Take of Pilul. Coch. Maj. twentyfive Grains, of Calomel fifteen Grains, of Refin of Jalap feven or eight Grains, with Gum Ammoniac diffolved; make four Pills, to be given in the Morning with due Government; and at Night going to-Bed take the fame Proportion of Venice-Treacle before mentioned, and when the Pills are repeated, augment the Dofe, if the former fould be defective in its Duty.

Copious eating of good Apples has been to fome very ferviceable; and the Benefit of agreeable Diverfions, efpecially riding on Horfeback, new Company, Change of Place, and Variety of Objects, that recreate the Spirits, and give them another Turn, is known fo well to all, that I have only named them.

As to Opiate Medicines, they are here at best infignificant and unavailing; while, though given in a proper quantity, they rather exasperate and provoke, than compose

OF MELANCHOLY. 175

pose the Spirits, and introduce Reft. It is true, that this quieting Medicine takes place in Hypocondriack and Hyfterick Inquietude, and fcorbutick Pains of the Limbs, and the Torments of the Gout, Stone and Cholick; in which Cafes it has great Effect, and delivers the Patient from the Rack: But it must be confidered that in fuch cafes the Spirits are too much agitated and expanded, and by being clogged or contracted into a narrow Compass, they become lefs volatile and active, and therefore not fo liable to receive fuch painful Imprefiions from the Inftigation of noxious Humours; while this friendly Confinement and pleafing Stupefaction that the Opiate lays the Spirits under, blunts their perceptive Faculty to that degree, that they not only grow lefs fenfible of Pain, but are likewife foothed and lulled into refreshing Sleep. But now the Cafe of melancholy Perfons is much otherwife, for in those the animal Spirits are fo far from being too volatile and diffused to an exceffive Compass, that they are heavy and dull; and fo far from being refined and exalted to an immoderate Height, fo as to be capable of irradiating the Nerves with too much Light and Vigour, and communicating convulfive Force to the Parts at the greatest Distance, that they rather DEA

176 OF MELANCHOLY.

rather appear benumbed and fenfelefs; and though, like the Spirits diffilled from acid Minerals, they are reftlefs, yet their Motions are always in a Round of a short Compass, and are not subject to the Dominion of the Mind. Now, fhould they be reduced by the Charms of Opium, they would still be confined to a narrower Sphere, which was too ftrait before, and fo become yet more unfit Inftruments for their natural Functions: But, as faid before, when an Opiate is prefcribed after the Operation of purgative and vomiting Medicines, it should be given under the Protection of generous and cordial Remedies.

Since a low, depauperated Constitution of Blood is the principal Caufe of this Diftemper, not only Medicines that impart Vigor and Activity, by elevating and reftoring the nobler Principles, in this case over-balanced and depressed, but likewife Meats and Drinks, that enrich and comfort the Blood, and fupply it with Plenty of wholesome Juices, should be likewife prefcribed: and therefore a moderate degree of generous Wine, as it exhilarates the Spirits, promotes the Bufinefs of Digestion, and conveys Heat to the Veins, and facilitates the Circulation of their Contents, should always be indulged to melancholy Perfons.

OF MELANCHULY. 177

And fince it is likewife highly probable that in fuch Cafes acid or auftere Fluids are feparated from the Blood, and abound in the various Bowels, it muft be allowed that fixed and volatile Salts are very ufeful; fuch as Salt of Wormwood, Tartar, volatile Salt of Amber, Hartfhorn, &c. and all forts of abforbing, teftaceous Powders, fuch as red Coral, Crab's Claws, Pearl, and for the fame Reafon Chalk finely powdered, are beneficial.

Of the PALSY.

TO a healthful State of Body is re-quired a just Temperament of all the fluid Parts, as well as a regular Order, Connexion and Tone of the folid; by which means the various Organs of the living Fabrick, by performing all their Offices with due Subordination and Harmony, are effectually fubservient to Nature's Oeconomy : and therefore every Error or Deviation from the fundamental Conftitution of the animal Government being a Breach of the Symmetry and Order of the vital Administration; and by that means the Caufe of seditious, intestine Tumults, is justly called a Distemper or Difeafe. And as this is true in general, fo it is very confpicuous in the Palfy, which is an Aberration from the native Temper and Disposition of the animal Spirits, and the System of the Nerves, in a manner peculiar to this Malady; the Idea of which confifts in a Deprivation or Diminution of the Spirits, and the Relaxation or Obstruction of the nervous Fibres;

Fibres; whence the ready Flux and Irradiation of the Spirits is intercepted, and in fome measure eclipsed; by which means the voluntary Motion of the Limbs is leffened, or totally suspended, and the fenfitive Faculty much abated or quite benumbed. For if the Brain, grown poor and indigent, is not furnished with a fufficient Plenty of pure and refined Spirits; which, at the Command of the Mind or Imagination, may alternately dart from the Head, and rebound thither through the nervous Passages, upon all the Errands and Negotiations of Life; or if they are fo stopped and arrested in their Flights, that they cannot advance farther, nor perfectly execute the Meffages they were fent about, the effential Properties of the Palfy will appear in the Defect of mulcular Motion and Senfation.

First in defect of Motion; which comes to pass, if the muscular Fibres have lost their native Tension, and are become fo flaccid and feeble, that they are disabled from performing their Duty; that is, they cannot, like the Strings of musical Inftruments, when not extended beyond Nature's Staple, return of themselves; and by their own Spring and Motion of Restitution, recover their regular Disposition. And if this Power is lost, a Palfy N 2 must

must immediately follow; as it is plain to all, who contemplate the Nature of mulcular Motion, that requires a due Mixture of Firmnels and Flexibility in the nervous Threads, and a Readiness by turns to swell and vibrate by the Influx of the Spirits; and fuch a Stretch of the Mufcles as does not exceed Nature's Standard, but is capable of springing back, and of being accommodated to the reciprocal Duty of Extension and Contraction necessary to Nature's Service. And fince the Aid of the animal Spirits is abfolutely required, as the first Movers in this cafe, if we fuppofe that their Flights and Excursions from their Fountain to the diftant Organs of the Body, should be interrupted or prevented by the Relaxation of the Fibres, or the obstructed Pores or ruined Road of the Nerves, the Parts to which they were directed being defrauded of their Influence, their Motion must, according to the degree of fuch Hindrances, be weakened or wholly abolished; while however the vital and involuntary Emanations of the Spirits into the Breaft and Bowels may be preferved without Interruption or Diminution.

It is owing to the depraved and degenerate State of the Spirits, that is, their Weaknefs and Penury, or the Oppreffion of

of inordinate and noxious Particles adhering to them, that thus become unable to perform their Duty of Sensation, as well as to the Dulnefs and Flaccidity of the Nerves, that in paralytick Cafes the want of Motion is accompanied with Numbnefs and Defect of Feeling; for while the Spirits, the Inftruments of Senfe, are interrupted and detained by a torpid Impotence in the weak or obstructed Muscles, they are unable to reflect to their Fountains, and carry with them the Impreffions they received from outward Objects to the Brain, where all Perception is transacted, that being the Seat of the first Principle of Sensation, and the Residence of the Judge and Arbiter; to which, by the Mediation of the Spirits, all the external Pulses made upon the Organs of Feeling, as well as of the other Senfes, are communicated. So that if the Spirits, the Inftruments and Meffengers employed in the animal Regimen, to convey to the Senforium in the Head the Characters imprinted upon them by the touch of outward Objects, are hindered from performing this Duty, all Perception, as to that Part, is cut off. To illustrate this, let it be observed, if one leans a-while his Elbow on a hard place, by that Preffure the Paths of the Spirits

in

in the Nerves are fo clofed and fhut up, that their further Influx is for a Seafon stopped; whence the Arm becomes ftupified and infenfible, till the Spirits by degrees with an uneafy tingling Effort open their Paffages, and again irradiate the Arm and Hand. In like manner, when from internal Caufes the Muscles of any Part are deprived of their Communication of the Spirits, that Limb feems a lifeless, unanimated heavy Lump; while the Spirits, that used to watch in the Frontier of the Body, are difabled from carrying any Intelligence to the Brain, or giving any notice of what Impreflions are made on the Organs by outward Objects.

Notwithstanding it is evident, whatever fome Philosophers have imagined, that Perception or fensitive Judgment is the Prerogative of the Head, where the animal Spirits are convened, yet in what Part of it the Sensorium, in which the animal Soul presides, is situated, is a Secret not yet unfolded: But it is an evident Deduction from its Operations, that this fensitive Principle is incorporeal; for Body, as such, is not fensible, fince Matter may be conceived without Sensation, which does by no means contain in its effential abstract Idea, such a perceptive tive Property. And if Matter, as fuch, has no fuch difcerning Principle, then should it be reduced to the minutest Atoms, and by any Force be impreffed, agitated, and put into the most rapid Motion, either direct, oblique, or circular; or fhould the various Parts be compelled by their impulsive Force to act upon one another by various Rencounters and Collifions, or should they be ranged in any determinate Order or Method, or enter into any Mixtures or Combinations that can be imagined, or relide in any organical Parts whatfoever, all this will be utterly ineffectual to give to Matter a fenfitive Principle, which it has not in it felf; for Rarefaction or Expansion, Celerity or Variety of Motion, mutual Collifions, Order and Disposition, cannot impart to Matter what they have not themfelves to give; that is, a fensitive Power, which is a fimple Principle, and not a confused Aggregate of Modifications.

To return from this Digreffion, the full Discussion of which would take up a whole Treatife. By what has been alledged, it is evident that a Palfy, which is a Lofs or Sufpension of muscular Motion, with an Abatement of fensitive Perception, proceeds from the Relaxation of the Nerves, and the Poverty and Weak-N 4 nels

nefs of the Spirits themfelves, or from the Obstruction of the nervous Threads, by fome irregular and hurtful Matter admitted into them, or by fome diforderly Parts intimately combined with the Spirits, whence arife various Distinctions of this Distemper.

Of the different forts of PALSIES, and their different CAUSES.

Palfies are either univerfal or partial; and the partial are fub-divided into those that affect the greatest Part of the Limbs, and that affect only one or but few. They are likewise external or internal; the first disable the Limbs, or outward Parts of the Body; the last affect some particular internal Organ: for example, the Gullet, Stomach, Intestines, $\mathfrak{O}c$, and these shall be spoken to at the laster end of this Discourse. Palfies are likewise divided into simple and uncompounded, or mixed and complicated with other chronical or acute Distempers, as shall be shewn afterwards.

This Diflemper, that, as I have faid above, is a Relaxation of the Tendons or Muscles employed in Motion, is fometimes introduced by Hysterick and Hypocondriack Affections, by a scorbutick Habit,

bit, or Epilepuck Fits. For what is commonly called a Hemiplegia, or a Paraplegia, or a dead Palfy, that follows an apoplectick Fit, seems rather a Species of an Apoplexy, than a distinct Disease. It is evident, that in the highest Degree of an Apoplexy the animal Spirits inhabiting the Brain, are the primary Subject of that Disease; which being oppressed, imprifoned, and confined to the Head by the fudden Irruption and Affault of a ftupifying Matter, can no longer take their Flights from the Brain, nor keep up their Commerce or Correspondence with the distant Organs of Motion. But if, as it often happens, the noxious Humour that benumbs, involves, and muffles the Spirits, is not of a fufficiently malignant Quality, or in fo great a Proportion, as to overwhelm and fink the Spirits, and fo make a Settlement in the Brain; then, like a Gafs, or poifonous Steam, it paffes fwiftly through the Paths and Traces there; and entering into the Orifices of the Nerves, stifles with its narcotick Influence the Spirits refiding in them; whofe Motion being thus intercepted, a Palfy fucceeds in all the Muscles to which those Nerves use to fend, by their various Branches, their active Meffengers. Sometimes this narcotick Shade paffing through only

only one Lobe of the Brain, occasions a particular Eclipfe, and takes off the motive Faculty of one fide only; and then the Eye of that fide is weakened, and fuffers by the Relaxation of the Glandula Lacrymalis, the Muscles of the Cheek are in a State of Laxnefs or Refolution, unable to perform their Duty by drawing with equal Force, and fo balancing the Muscles of the opposite Cheek; whence the Mouth is difforted or drawn aside; at this time, the Tongue, being in part benumbed and torpid, is unable to form diftin& Expressions; and fometimes when the Mind directs and intends one Word, the Patient, by an involuntary Error, shall chufe another, while he himself is confcious that he fpeaks another thing from that which he defigned; which feems to arife from this, that the Traces of the Nerves in the Tongue being defaced and clofed up, the Spirits that do Duty in that Organ, though directed to one Part, finding those Avenues shut up, are compelled to go into those that are not obstructed, but left open to them. Palfies of this fort that follow an apoplectick Fit, differ in degree; fometimes they difable only one Part, fometimes one whole Side, and with it fometimes half of the other; and fometimes they affect

affect the whole Fabrick, by relaxing all the Muscles that are instrumental in voluntary Motion; whence the Patient is fometimes unable to speak with perfect and diffinct Accent, and fometimes remains entirely speechles: But at other times a flight and transient apoplectick Stroke spreads a paralytick Disposition upon the Spirits, when the mufcular Motion is weakened only, but not oppressed; in fuch a Case the Spirits seem to be injured by a noxious Afflatus, and by that Impression are so enfeebled and difordered, that they imperfectly ferve the Mind and Imagination in forming Ideas, and in going abroad on their Meffages; and from this Debility and Tendernefs of the Spirits, beat down and much difabled by the apoplectick Force, it comes to pass that the Patient is subject to weak and unmanly Paffions, expressed by various Ways of Complaint, but especially by Tears; and fuch is their Facility and Readinefs to weep, that upon all Emotions and Impreffions of outward Objects the ferous Flood gushes through the Strainers or Sluices of the Eyes, called Glandulæ Lacrymales, which chiefly and eminently in these Perfons are relaxed or dilated; and this Evacuation is fo involuntary, that when the Patient would be pleafant.

pleafant, and intends to laugh or express Satisfaction and Joy, he, against his Defign, will break out into a Fit of Crying; and though the unhappy Perfon moves, eats, drinks, and fleeps, and has a healthful Afpect; yet his Understanding, Memory, and Imagination, are fuch great Sufferers, that he is no longer uleful in his Generation, but often a great Object of Compassion; while fine and elevated Parts are effaced, and the Animal (uncomfortable State!) furvives the Man; which is a Condition of Life more fad and calamitous than Death it felf. This is the mildest fort of Palfy that follows an apoplectick Stroke, which after various Turns, generally terminates in that fatal Difeafe : and this ought to have been fpoken to before those Degrees mentioned above.

The fecond Sort, which perhaps is the only true Palfy, depends not upon a Refolution of the mulcular and tendonous Fibres, by any incongruous and peccant Matter exploded or transmitted from the Brain, as in the fudden Paroxysms abovementioned, but arises from internal or external Causes, that chiefly affect the mulcular Fibres of any of the organical Parts employed in Motion; while the fensitive Faculty is not much injured. The flaccid State, or Loss of due Tension

in

In the nervous Threads, rifes frequently from Hypocondriacal and Hyfterick Paroxyfms, that by degrees fo far enfeeble and relax them, that they are unable to execute their native Office, having loft the fpringy Power of Restitution, whence a paralytick Incapacity enfues in that Member; and therefore this partial Palfy is rather a Symptom of those Distempers, than a diftinct Difease. In like manner this Inability of Motion in fome Parts will accompany a scorbutick Habit of Body in a high degree, and is introduced by the Poverty of Spirits, or Debility of the Mufcles and Tendons, occafioned by the hurtful Materials of that complicated Diftemper; which produce Aches, Pains, and at length a Torpor and Trembling in the Parts affected ; neither do these Sufferings discover a distinct Disease, but are properly a Part of the numerous Train of Symptoms that attend that various Difease, if indeed it merits a different Denomination, and is not only a Complication of other Distempers not yet ripe enough to be called by their genuine Name, as I have above fuggefted.

These Palsies that proceed not from an apoplectick Gass or Afflatus passing from the Head into the System of the Nerves, are either partial, yet in different degrees, or

or total; those in a lower degree affect fometimes one Hand or Arm, or one Leg or Thigh, and which are fometimes however attended with a general Debility or Coldnefs in that fide, and at other times affect the Muscles of the Hands; sometimes only those of the Neck, whence the Hands and Head shall tremble and shake for many Years, without any confiderable Suffering or Decay. This proceeds not from any noxious Matter transmitted through the Brain, as in paraplectick or hemiplectick Cafes, but generally from fome incongruous Matter deposited and fixed upon the Muscles and Tendons of those Parts; by which they are enfeebled and incapacitated for regular and ready Motion; but often there happens a general Refolution of the Muscles, accompanied with a great Atrophy or Defect of Nourishment; and though these Patients are not deprived of all Motion, yet they are fo feeble and emaciated, that without the Support of Crutches they are unable to ftir, and then too but very poorly.

Though Palfies chiefly proceed from internal, yet they fometimes arife from external Caufes: for inftance, a Wound, a Bruife, a Fall, or great Blow, that efface and deftroy the nervous Tracts, by which the Roads and Avenues to the mulcu-

muscular and membraneous Fibres are ftopped, and the Communication and Intercourse of the animal Spirits are diminisched or cut off; which being thus defrauded of their Influence and Emanations, that are absolutely necessary to animal Motion, they become empty, unbraced and flaccid, that is, paralytick.

As fometimes Bruifes by Falls, or projected ponderous Matter, which injure and weaken the Tendons and Muscles, as Weapons by cutting them afunder, quite destroy their organical Use, and occasion this Distemper; so sometimes the breaking, or Diflocation of a Bone, will produce it; as particularly, the displacing of the lower Vertebræ of the Back in Children, whether from an external or internal Caufe, when from the Diffortion of the Toint the Bone bears upon the Medulla Spinalis, or the Orifice of the Nerves isluing thence, by which the Irradiation or Influx of the Spirits is cut off; and the inferior Limbs being defrauded of their animal Supplies, grow feeble and unactive, and apparently wither and fhrink away; by which it likewife appears, that the refined Juices conveyed by the Nerves are greatly interested in the Businels of Nutrition.

Sometimes this Diftemper is occafioned by taking Cold, either when a Perfon too thinly cloathed is exposed to fharp and fevere Blafts of Air, or the Rigor and Inclemency of hard Winters; for the mufcular and membranaceous Threads, unable to refift the violent Assaults of fuch Invaders, lofe their Firmnefs, and grow fo flack and loofe, that they can no longer exert their motive Power. Frequent Instances occur of Perfons that have felt their Limbs grow not only unactive and benumbed with fevere Cold, but the fleshy Parts have been eaten in and corroded to fuch a degree, that fometimes a cutaneous, and fometimes a deeper Mortification has followed, while the pungent and biting Particles of Air act the Part of a Cautery, and burn the Flesh like Fire: And this, as I am informed, often happens to those that travel with their Faces unguarded through the Snows of Ruffia.

Sometimes a Palfy proceeds from long, continued Labour, which fpends and wears by degrees the connected Materials of the animal Machine. And it is no wonder that active Husbandmen and Mechanicks fhould by repeated Toil weaken and relax the mufcular Fibres, till in a great meafure they lofe their Tenfion and reactive Spring, and fo contract an Incapacity

pacity of Motion: for we fee that the human Structure will fink and decay in fome Perfons meerly by Time and advanced Years; while by the long ufe of the Limbs in performing only their natural Offices, together with the Aches, Pains, and Infirmities of old Age, the muscular and tendonous Fibres are much impaired, if not wholly worn away. Such is the delicate Mechanism and Conformation of the various Parts, that if the living Fabrick be not attacked and ruined by outward Violence, yet will its feveral Organs, by constant Use and Employment, by degrees grow feeble, and be difposed to paralytick Symptoms; much more then will this be effected, if great Pains and immoderate Toil have long exercifed the Mufcles and exhaufted the Spirits, which is often followed by a Refolution or Flaccidity of the Parts.

Violent Motion of the Limbs will likewife difable the Muscle or Ligament it employs. Thus fometimes an active Tumbler, by exerting extraordinary Force, has inapped in two the Tendon of a Muscle in his Leg, or many of its Threads; or at least has fo strained and stretched it beyond Nature's Staple, that its elaftick Power being destroyed, and the Part being unable to reftore its felf, and recover its

its former Polition, the motive Faculty has been wholly loft.

CERCEPTICE CONSTRUCTION OF THE CONSTRUCT OF THE CONS

Of the METHOD of CURE.

ND first, of the Disease vulgarly called the Dead Palfy, I mean an Hemiplexia or Hemiplegia. If the specifick Matter of an Apoplexy continues fixed in the Brain, and by stupifying, stifling, or blafting the animal Spirits refiding there, fuppresses the exercise of the Organs of Senfe and Motion, that Difease is then wholly confined to its proper Limits, and diffinguished from other Diftempers that affect the Spirits and the Nerves. But sometimes a great Part of the noxious Humour, after its Invalion of the Head, makes its way to the Mouths of the Nerves implanted there; and infinuates it felf into their various Branches dispersed over the Body, and by their opposite destructive Quality, suspend or destroy the motive Energy of the Spirits, that have their Abode in them, and then the Difease is divided; and while a great Part of the hurtful Matter is detained and

and confined in the Brain, and a great Part is communicated to the Members of the Body, it is partly apoplectick, and partly paralytick: And while the Patient is in this State, he remains in great Danger, by reason of the feveral important Symptoms that affect the Head, while the peccant Humour still possesses it in a confiderable degree. But when this ftupifying Humour entirely leaves the Head, and is discharged upon the Nerves, and distributed to the Organs of Motion and Senfation, it is denominated a Hemi-plegia, if it feizes only one Side; or a total Palfy, if it affects both; though fometimes it must be acknowledged, it difables only fome Parts of one Side, and fometimes the whole, and half of the other.

In these Cases letting Blood from the Arm to ten or twelve Ounces, as the Patient's Pulse will bear, is very adviseable : for this fort of Palfy arising from the apoplectick Humour propagated and transferred from the Region of the Brain to the Muscles and Tendons of the Limbs affected, the Veins being emptied in some measure by copious Bleeding, will, to replenish themselves, suck up and take into their Cavities the Matter of the Disease, if the Evacuation is quickly performed, O 2 before

before it is settled and fixed in the Parts on which it is caft and deposited. And this Effect we fee produced in flighter apoplectick Fits; for when a Vein is speedily opened e'er yet the Diftemper has by delay taken deep Root, and entered far into the Cells and Pores of the Brain, the Difeafe is usually removed; and the Benefit of letting Blood in particular Cafes I have often experienced. It is therefore a great Mistake, when Physicians forbid Bleeding in this Distemper, because of the Weaknefs of the Patient; for what if the Limbs are weak, the Pulfe is not fo, but will bear the Evacuation, and that to great Advantage, as I have found by repeated Trials.

Veficatories, or bliftering Plaifters applied to the Neck, and Arms and Legs of the paralytick Side, are likewife beneficial; while by their active Particles they flimulate and provoke the mufcular Fibres, and roufe and animate the flupified Spirits, and fo enable them to fhake off the adhering Matter that benumbs them: And in this Senfe they are chiefly ferviceable, and not by the fmall Difcharge they make by the Vefications or Bladders, caufed by their Force in the Surface of the Limbs; and as the Blifters become dry, and begin to heal, others fhould be raifed in frefh places,

197

places, that the Nerves may be continually vellicated, and the Spirits difturbed and provoked to awaken, and put themfelves into Motion, till the Symptoms begin to abate, and the Patient is in profpect of Recovery.

But no Evacuation is more eminently uleful than Purging in paralytick Cafes; and the following I like as well as any.

- Take of Tinchura Sacra two Ounces, Syrup of Buckthorn one Ounce, compound Spirit of Lavender twenty Drops; make it a Draught, to be taken at Night going to Bed, and let it be repeated, interposing three Days, for three times. If the Patient bas fufficient quantity of Strength to undergo stronger Medicines, he may take the following Pills.
- Take of Pil. Coch. Maj. a Scruple, and eight or ten Grains of Pil. ex duobus, made into four Pills for one Dofe.
- Or, Take of Pil. Fatid. min. twenty Grains, of Extractum Rudij ten Grains; make it into the fame number of Pills: and the Strength of the Medicine the fecond time may be either increased or diminisched, according to the degrees of their Operation.

In

198

Of the PALSY.

In these Cases it often happens that after the Patient has lain fome Days fluggifh and fleepy, his Spirits will on the other hand become too active and volatile; whence he is thrown on the other Extreme, and grows reftlefs and obftinately wakeful: and in this State of Inquietude opiate Remedies are not only allowable, but neceffary. I am apprized, that many are deterred from prefcribing quieting Medicines in a Palfy, left they should fink and depress the Strength of the Patient, too low and feeble before. But this is their Error, and their Fear is groundless: for first, the Vigor of the Sufferer will be much more wasted and abated by long Wakefulnefs and reftlefs Turnings and Agitations, than it can be by the Operation of Opiates, if any fuch Effect should follow. But it is not true, that those Remedies are attended with any fuch Confequence; on the contrary, by restraining, calming, and fixing the animal Spirits, too much inflamed and expanded, and by this means introducing comfortable Sleep, they at once give Tranquillity and Strength to the Patient. For who does not know that Quiet is the Cure of Inquietude, and that Sleep, after it has been long wanting, is the great Reftorer of Strength and Serenity of Temper?

Temper? When Opiate, given judicioully in respect of the Season of giving it, that is, when violent Pain and invincible Wakefulness require it; and the quantity of the Medicine, no Inconvenience can attend it that over-balances the Benefit it affords. And in this cafe, when either contumacious Indifpofition to Sleep, or a stubborn Hickcough prevails, as well as in many other Instances, I have for many Years prefcribed it with good Succefs, and repeated it often, till the Symptoms yielded to its Force. And it is therefore furprizing, that any Gentlemen of the Faculty should lye under fuch an invincible Prejudice to the use of this Remedy, and that upon the account of fuch odd, dark, and unintelligible Reafons as thefe, That Opiates tye up the Humours in the Blood, fix the noxious Matter in the Nerves, distract and confound the Brain, and make the Head dull and muddy: But if this last Complaint be an Effect of it; one would be tempted to think that the Objectors had taken more of it themfelves than they are willing to acknowledge. But I have difcourfed of this Subject largely before, where I fpake of the Cure of Hypocondriacal Affections, and I have there answered the Objections made by many against this not only inno-

cent,

199

cent, but useful Medicine; though I allow it is accompanied with Inconveniencies, and that it is an Edge-tool, not to be trufted in an unskilful Hand.

As to alterative Medicines, they are internal or external; the internal may be given in the Form of Pills or Electuaries.

Take of Myrrb, Galbanum, Extract of Gentian, each a Drachm; of Salt of Amber two Scruples, Saffron a Scruple, of Salt of Steel, or Steel prepared with Tartar, a Drachm and half, of Gum Ammoniac diffolved a quantity fufficient; make all into Pills of a moderate fize, and take four every Morning and Afternoon, drinking after it a Glass of Penyroyal Tea.

Or thus, Take of Conferve of Orange, or Citron Peel, an Ounce, and of Rofemary Flowers an Ounce, of Trochisks of Myrrh two Drachms, of candied Nutmegs and Ginger each a Drachm and half, of Powder of Vipers, of volatile Salt, of Hartfborn, each a Drachm, and of compound Syrup of Piony as much as is fufficient, and make an Electuary; take the quantity of a large Nutmeg every Morning and Afternoon, and drink after it a Cup of Penyroyal or Sage-Tea.

Or,

Or, Take of Conferve of Roman Wormwood two Ounces, of Virginian Snakeroot a Drachm, Trochisks of Myrrh, Steel prepared with Tartar, each two Drachms, Syrup of candied Nutmegs a quantity sufficient; make it an Ele-Euary, to be taken as that before.

A quarter of a Pint of Viper Wine in the Morning and Afternoon daily by it felf, or after the first Electuary fet down, or after the Pills, without Steel, is very proper for this purpole; rectified Spirit of Hartshorn, Tincture of Caftor, Tincture of Affafætida, Compound Spirit of Lavender, Spirit of Sal Ammoniac fuccinated, O.c. taken by themselves to thirty Drops a Day, in any convenient Liquor, or mixed with one another, are very proper; for it is certain, the most generous, active and penetrating Remedies, must be employed in these Cases, as well to open the obstructed nervous Passages, as to enliven and rouse by their Instigation the oppreffed Spirits; and so enable them to irradiate the Muscles, and make their reciprocal Flights in regular Order, and with due Celerity.

As to external Remedies, excepting Blifters, in paralytick Cafes that are derived

rived from an apoplectick Infult on the Brain, as before-mentioned, I never obferved they were of any confiderable ufe; though I acknowledge that in fome partial Palfies arifing from other Caufes, efpecially external Injuries, they are often beneficial; of the Cure of which I fhall afterwards difcourfe.

It is very common, as before mentioned, that Hypocondriacal and Hysterick Affections, by exhausting the Spirits and flackening the Nerves, introduce a paralytick Difpolition in fome of the Limbs, as fometimes, though rarely, they terminate in an Apoplexy or Hemiplegia : But in none of these Cafes are external Remedies of any value. And therefore the Phyfician will be obliged to have recourfe to those Methods and Medicines that are most prevalent in the Distempers named, of which the paralytick Complaints feem only the Symptoms. And thus by laying the Axe to the Root, the Branches will quickly fall, and the most efficacious Remedies in the original Distempers I have above fet down, at least fuch as I have found to be fo in the Courfe of my Practice : and those Palsies that are judged to arife from a scorbutick Habit, will likewife be most fuccessfully removed by anti-fcorbutick Medicines.

But

But as to those that proceed from external Violence, Bruifes, and crushing of Limbs, catching Cold, Falls, or Diflocation of the Bones, rigorous Seafons; in fuch cafes topical Remedies are often very useful, when skilfully applied; fuch as Queen of Hungary's Water, compound Spirit of Lavender, compound Piony Water, employed to embrocate and refresh the Part, Barbadoes Tar, Nerve-Ointment, mixed with Oil of Turpentine; bathing, of which afterwards, Veficatories and warm Plaisters, as that of Cummin, and various others.

HEREFERENCE (HEREFERENCE)

Of partial internal PALSIES.

Have hitherto discoursed of the Method of Cure in paralytick Diftempers, proceeding from internal Caufes, that however suppress or extinguish the motive Power, and abate the Senfation of the external Parts of the Body; but there are other Palfies that affect, as I have above afferted, particular internal Parts only; for instance, the Gullet, the Stomach, the Inteftines, the Kidneys, and the Sphincters of the Bladder; which require our Confideration. That of the Gullet difables the Patient from fwallow-

ing

ing Foods and Liquors, that, stopping in their Passage, threaten the Patient with Suffocation; till after a great Struggle they are thrown up, and return by the Mouth; for if either a schirrous Tumour or a Fungus obstruct the Passage, or a Relaxation of the Fibres of the Gula oppose the Descent of Meats ingested, they cannot reach the Stomach, or at least in so small a Proportion, as is infufficient for the Support of Life; while the Patient is obliged to add fome Supply by nourifhing Clysters, part of which infinuating it felf into the Veffels of the Guts, conveys fome Aliment to the Blood. And this was the Cafe of the celebrated Duke of Leeds, who laboured under this great Infirmity feveral Years. The Difficulty of fwallowing is fometimes fo great, that the Patient is obliged to use a Prevang, that is, a Whalebone with a Button at the end; which thrust down the Gullet where the Stop is made, pulhes down the Meat into the Stomach: And it often happens that fome Patients, affected with a Paralysis of the Throat, are able to take down Solids, but not Fluids; and on the other hand, fome can fwallow Fluids, but not Solids.

In fuch cafes, warm, fpicy and active Drugs, formed into large Pills, and chewed often by the Mouth, and fpit out again; and

and Gargarifms, formed of the pungent and aromatick Roots, by a confent of Parts, stimulate and enliven the Spirits in the fides of the Gullet, and awaken them to do their Duty: and Infusions of Snakeroot, Zedoary and Galangal, and Lignum Vitæ in White-wine; adding to them a fit Proportion of Tincture of Caftor and Spirit of Lavender, taken Spoonful by Spoonful, as the Patient can fwallow it, is beneficial; and fo are the Drops of Steel, or a Spoonful or two of Steel Wine, taken in a finall quantity of Whitewine; or the Preparation of it with Tartar, taken in a convenient Conferve or Confection, will do good Service, as they animate the Spirits in general; and therefore those in the Gula will have their Share in the Benefit.

A Paralyfis in the Fibres of the Stomach is often introduced by Hypocondriacal Sufferings in that Part, while the Tone of it is much enfeebled and depraved by frequent Pains, Strainings to vomit, and violent Eructations, and flatulent Diftenfions, from a Load of fowre and acrimonious Juices. And the Method of Cure fet down in Hypocondriacal Diftempers, will be very ferviceable to paralytick Stomachs, that will not bear, without great Oppreficen and Difficulty, their necef-

neceffary Meats, but reject them by the Mouth.

Intemperate drinking of Wine and strong cordial Waters, do likewise often destroy the Appetite; and by relaxing its native and regular Tone, introduce a Palfy in the Stomach; which becomes a weak, loofe and flabby Bag, unable to digeft, or fo much as to retain its Contents : And in this cafe, generous, bitter and aromatick Remedies, as well as fixed and neutral Salts, fuch as Salt of Wormwood and Tartar, vitriolated, have a good Effect; especially if affisted with the Bath Waters, that, with the greateft Succefs are drunk upon the Place; and in all other cafes, where the Stomach is not vitiated and ruined by excels of Wine and ftrong Liquors, those Waters are of admirable use, not only as they dilute the bilious Juices collected there, but as they evidently reftore the Appetite, and confirm and corroborate the nervous Fibres for the Work of Concoction. And this I know as well by my own Experience, as by the Cures that I have obferved have been wrought upon others.

Sometimes a Paralyfis affects the voluminous Syftem of the Guts, efpecially those that receive the Chyle descending from the Stomach, and those that carry off

off the recrementitious Parts per Anum. And this fometimes happens in fo high a degree, chiefly from the weak and tender Constitution of those Parts by Nature, that fometimes the Refuse, or fæculent Remains of the Foods not admitted by the lacteal Veins, fink through their Paffages, without the Affiftance of the protrufive peristaltick Motion; but falling down through the feeble and flaccid Inteftines, they exclude themfelves by the Sphincter: nor is the Patient by any Endeavours able to prevent it, especially if he stands upright. And in this Cafe likewife as other active and generous Medicines are very proper, fo I have known that the Bath Waters, drank in a regular Method, have been eminently useful : And fo likewife are Chalybeate Springs. And befides these Remedies, frequent Injections, not of purging, but warm and ftrengthening Clyfters, have had a good Effect.

A Palfy in the Bladder, accompanied with an involuntary Difcharge of Urine by Drops, and great Uneafinefs and Pain, is fometimes occafioned by an Ulcer in that Part, or in the Neck of it, and fometimes meerly by advanced Years; for when the Organs of the animal Engine are impaired and damaged by their long and conftant Exercife, their fhattered and feeble

feeble State is justly reckoned no more than the Ware and Tare of old Age. Though mortal Life declines and confumes it self by flow, but certain Steps, few Men however in their advanced Age are willing or capable to make this Reflection, and to attribute their Infirmities to their natural and genuine Caufe, that is, a protracted Courfe of Days; in which time the human Fabrick has been worn and shaken by external Injuries, or internal Diftempers, or at least is enfeebled by gradual and infenfible Decay: But they apply themfelves to the Phyfician, and request him, as well to explain their Symptoms, and tell them the Caufe of their Diftemper, as to prefcribe them a Method of Cure; as if, while they languish and stoop under the Burden of seventy Years or more (a Difease that eludes the Force of Phyfick) the Weaknefs and various Complaints that naturally attend grey Hairs, arole from the fame Caules as the Diseases of young Persons.

But to return from this Digreffion: The Palfy of the Bladder, that, as I faid, is very incident to antient Perfons, by which that Receiver is no longer able to retain the Urine derived into it through the Ureters, by reafon of the Weaknefs and Refolution of its Fibres, or those of its

its Sphincter, is feldom, if ever cured. But this does not hinder but that younger Perfons, afflicted with an involuntary rendering of their Urine, may be relieved by the Medicines proper in a partial Palfy, before mentioned; which by their ftrengthening and aftringent Operation, may reftore the loft Tone of the Fibres of the Bladder, or its Sphincter: And therefore Decoctions or Infufions of Herbs and Drugs, endowed with fuch Qualities, together with others in lefs Proportion, that are fmooth and foft to the Parts, that fuffer by the Acrimony of the Urine, fhould be often injected.

Sometimes a Palfy affects the Kidneys, whence the papillary Canals of that eminent Strainer lofe their Tone; and being grown feeble and flabby, lye fo flatted, while their Mouths or Inlets are fo clofed, that they cannot perform their natural Office, by feparating and carrying off the watery Parts of the Blood. This Event may fometimes happen from a too tender and delicate Conformation of that Bowel by Nature; which faulty Disposition is often increased by intemperate Drinking, especially of small Liquors; and it is often the Effect of previous Distempers; fometimes of venereal Impressions, as well from the fevere and painful Method ot
of Cure, as from the Difeafe it felf; and fometimes from the Translation of gouty Matter, removed from the Joints or external Mufcles, and determined to the Kidneys; where being deposited, it introduces a Refolution or flaccid Disposition of the fecretory Glands, whence their Tension is much disabled, and their Power of Percolation fuspended: The Confequence of which is a partial or total Suppression of Urine; partial, if the Paffages of fome Glands only are obstructed and shut up; and total, if the whole System is rendered impracticable and ufelefs.

As to the Cure of this Diftemper, while the Patient does not fuffer a total Suppression of Urine, diuretick Medicines mixed with those that corroborate the Parts, should be used. For example,

Take of the Conferve of Rosemary Flowers, of Orange Peels, each an Ounce; of Millepedes powdered two Drachms, Tartar vitriolated, and Myrrh, each a Drachm, of Salt of Steel two Drachms, of Syrup of Nutmeg candied enough to make it an Electuary; let the Patient take the quantity of a small Chestnut twice a Day, and drink after it a Glass of White-wine.

Take two or three Cloves of Garlick, infuse them in a Quart of White-wine, and let it stand near the Fire on warm Embers, till it has taken the Vertue of it fully, to be discerned by the Taste: drink a quarter of a Pint twice a Day.

The Syrup of Garlick, or Garlick preferved, are likewife very proper: fo are the Cloves boiled in Broth, or eaten unprepared with any convenient Food. Likewife

- Take of Millepedes alive fifty or fixty, bruife them in a Mortar, pouring on them a quarter of a Pint of Rhenifb Wine, and half an Ounce of compound Water of Horferadifb; and let the Expression he a Draught, to be takeu twice a Day: and five or fix Earthworms managed in the fame manner, are useful.
- Juniper Water, well made, especially that of Cologn or Holland, is very beneficial: so is small Punch, as likewise Oil of sweet Almonds or Linseed, mixed with Syrup of Lemons, or Syrup of Garlick and Oxymel Scilliticum, and made with Sugar into a Linstus, to be taken a Spoonful at a time frequently.

P 2

Re-

Repeated Purging with Elixir Salutis. Tinctura Sacra, Pil. Coch. Maj. is advife: able.

But if the Supprefion of Urine is to tal from a general Relaxation and Flaccidity of the percolating Glands of the Kidneys, which often happens, either from the natural or acquired Weaknefs or too great Tendernefs of their Fibres. or from the Translation of the Matter of other Difeafes, as that of inveterate Rheumatifms, or the Gout, deposited on this Strainer, the following Remedies are proper to be prefcribed.

Bleeding and purging Remedies are demanded to empty in fome measure the Blood-Veffels, diftended and oppreffed by the ferous Parts, that in this Cafe remain unfeparated by the Kidneys; and by this means to fupply as much as poffible the Defect of that natural Discharge, till other Remedies open the obstructed Inlets, and make a Way for the Paffage of the watery Parts of the Blood into the Bladder. And for the fame Reafons active Vomits ought to be given, that by the Concussion and Agitation of the Parts, may quicken and roufe the torpid Spirits to do their Duty, and help to move and diflodge the obstructive Matter, and free the papillary Glands from their Incumbrances.

cumbrances. Active Clyfters are likewife useful, for the fame Reasons that Purgatives are prescribed. Vesicatories, or bliftering Plaifters, are of great Service, not only, or fo much as they caufe fome Evacuation, but chiefly as they ftimulate and provoke the relaxed or paralytick Parts, and oblige them to perform their Office: And for this end, riding on a trotting Horfe, or driving in a Coach over paved Streets, or uneven and ftony Ground, are to be encouraged.

And as for internal Medicines, those above-mentioned, especially Garlick, are to be tried in their turn; and likewife Spirit of Turpentine and Tincture of Cantahrides, that is, Spanish Flies, taken to twenty Drops at a time, as well as going into a moderate warm Bath, are often found very beneficial in promoting the Passage of the Urine through the Kidneys.

And this leads me to the Confideration of the Bath Waters, which have long been a celebrated Remedy for removing paralytick Complaints, and reftoring Strength to weak and feeble Limbs; and I will fhew in what Kinds they are uleful, and in what they are either infignificant or hurtful. In those Palsies that are confequent upon an Apoplexy, or a transient Stroke Р

Stroke of a Paraplexy or Hemiplexy, partial, or more general, Bathing in the hot Spring-waters must be detrimental; for this only affects the Skin and exterior Mufcles, but cannot strengthen the Brain, exfuscitate and quicken the Spirits, and free the nervous Tracts from the noxious Matter that obstructs them; and no Benefit can arife from any Method or Medicine ineffectual to these Purposes. And according to my own Observation in this Difeafe, commonly called the Dead Palfy, the going into those warm Waters scarce ever relieved the Patients; though after they were almost recovered, they have found fome Advantage by bathing in those hot Springs, but more by drinking their Waters.

Nor is Bathing beneficial in paralytick Diforders, that proceed from a Hypocondriacal, and especially an Hysterick Constitution, for the Reasons before given. But the Patients who reap the greatest, if not the only Advantage, by going into those warm or hot Springs at the Bath, are those who become lame and paralytick from external Caufes; fuch as are infirm in their Limbs from Bruises, Strains, catching Cold, or are difabled by hard Labour, or the fuffering of very sharp and rigorous Weather; fuch Cripples and paralytick

lytick Perfons as thefe often receive great Benefit: And I believe it is thefe chiefly that have, upon the Recovery of their Strength, left behind them their Crutches and other Supporters, and hung them up in the *Batb*, as Trophies and Monuments of their Conquefts over their feveral Infirmities.

APPENDIX:

AN

BEING AN

E S S A

UPON THE

Y

SPLEEN.

T was the Opinion of many among the Antients, who, from a curious and inquifitive Genius, contemplated and examined the Works of Nature, that the Spleen was a noxious and prejudicial, or at leaft a fuperfluous Part, as being in their Opinion of no ufe in the animal Oeconomy. Those who condemned it as hurtful, were induced to it from the Obfervation of its frequent Swelling, and invading the Territories of other principal Bowels; which Distension, they feemed

ed to think, was often natural, as well as often the Effect of a distemper'd State: They likewife looked on the Spleen as the Caufe of intemperate and diffolute Laughter, which (a) Pliny, (b) Serenus Sammonicus, (c) Calius Rhodiginus, and others atteft, (d). From the Spleen proceeds Laughter, from the Gall Anger, from the Heart Wildom, and from the Liver Love. And the Reafon affigned for this Opinion is, that this Bowel, by feparating from the Mass of Blood, its dark and dreggy Parts, make it fplendid, pure and active; whence, fay they, Alacrity, Gaiety of Humour, and a constant Disposition to laugh, naturally arife.

Befides, they accufed it as the Sink of heavy and melancholy Humours, and a great Enemy to Race-Horfes, by clogging their Sinews, and abating the Celerity of their Motion: (e) This Pliny affirms; and therefore fays, the Owners burnt the Spleen of their Courfers, to give them greater Speed; which * Hoffman fays, was a Pra-

thice among the Jews, as appears from what is fpoken in the Gemara, of the Horfes and Horfemen which Adonijab had prepared to run before him. These hurtful Qualities were also charged upon the Spleen in Men, as appears from (f)Pliny, whose Affertion is confirmed by (g) Plantus.

Hence it was that they used various Medicines to be taken inwardly, which they believed by degrees would wafte and confume this exuberant and detrimental Part; for fometimes they endeavoured to deftroy it by an actual Cautery, which was executed in this manner, as (b) Pauhis Agineta relates: they raifed up the Skin with a Hook, and then with a redhot Iron pierced it through, and with the fame Wound burnt the Spleen underneath; and fometimes they opened the Side, and cut it entirely from the Body : And this kind of Castration is mentioned by Pliny and Sammonicus; who, fpeaking of the Spleen, has this Paffage,

* Hence filly Laughter flows; But if cut out, that Paffion decent grows.

* ---- Tumidus nocet, & rifum addit ineptum, Dicitur exectus faciles auferre cachinnos.

Serenus Sammonicus, ubi fupra. This

This he does not affirm from his Knowledge; but fays it was the common Opinion.

Thus as the Stoick Philosophers reproached the Passions as the Blemisthes and Distempers of the Mind, that perverted its Faculties, and disturbed its Operations; so these Naturalists looked on the Spleen as a useless Production, or rather a hurtful Error of Nature; and as the first strove to suppress and eradicate the one, so the last labour'd to get rid of the other.

Those of the Antients who ascribed any Usefulness or final Caufe to this Part, from the Observation of its Colour and Magnitude, as well as its foft and loofe Contexture, concluded that it was defigned to attract and drink up, like a Spunge, the grofs and adust Impurities of the Blood; which being thus purged and refined, might be prepared for the Service of the Liver, and appear in that Receptacle pure, bright and fprightly : And this was the Opinion of Plato. Aristotle, who declares that he thought the Spleen only accidentally neceffary, affigns to it the low Province of drawing to it felf the dark and coarle Vapours that arife from the Bladder and Intestines, to give them a greater degree of Concoction; fo unskilful

ful was this Philosopher in Anatomy, and fo unacquainted with the Oeconomy of Nature.

The modern Phylicians and Anatomifts, reflecting that the Spleen is confantly found to be an integral Part in every Individual among Animals of the most perfect Species, Birds excepted, and that Nature makes nothing impertmeent and in vain; and confidering likewife that the minutest Gland, the least Vessel, and the fmallest Fibre of a Nerve or Muscle, are defigned for fome valuable Purpofe, could not think that the Spleen, a Bowel of fuch Amplitude, Contrivance, and Situation, which takes up fo much room, and makes fo confiderable a Figure in the Composition of the Body, was a wanton and ufelefs Production; but that on the contrary it must be destined to some Service.

Various are the Opinions of Philofophers and Phyficians about the Province affigned by Nature to this Bowel, fo remarkable for its Magnitude and Structure, as well as its Equipage of Veins, Arteries and Nerves, with which it is abundantly furnifhed; they compared it with the other large Bowels and bigger Glands; and while they obferved that all thefe were Strainers, formed for the beneficial Defign of purifying and refining the Blood

Blood from grofs and noxious Mixtures: for inftance, the Kidneys to separate and. discharge the superfluous watery Parts; the Liver the immoderate Choler, the Lungs the redundant Phlegm, and the large Glands their particular hurtful or exceffive Humours; they were induced to believe that a Province of the like nature must be appointed for fo eminent a Part of the Animal as the Spleen: And upon their Contemplation of its unlively and livid Afpect, while it is entire, and the blackish and heavy Liquor which appears in it upon Diffection, they were tempted to appropriate to it the Task of dividing from the Mass of Blood the recrementitious Juices. But fince no fecretory Veffels, nor common Receptacles for fuch Humours, nor any Channels to convey them away, could ever, by the strictest Enquiry, be discovered in the Spleen, as they are in all the eminent Strainers of the Body, and which could not have escaped Observation in so large a Part, this Hypothesis wants a sufficient Foundation to support it; for if there be no Outlet to carry off the Liquors suppofed to be constantly separated from this Bowel, it must by fwelling to an immense degree, become disproportioned and destructive of the animal Administration. Others

Others appoint to the Spleen no other vital Service, than to cherish the Stomach with the warm and comfortable Application of its Substance to that Side on which it is incumbent; by which means, fay they, the Stomach being conftantly refreshed and invigorated, its digestive Power is aflisted and preferved. But if this be its whole Bufinefs, in my Opinion it is no great Post of Honour, nor a Task worthy fo confpicuous and diffinguished a Bowel as the Spleen. And this Conjecture is eafily over-ruled, when we confider that after the Animal is caftrated of this Part, the Stomach not only retains its concoctive Faculty in as great Perfection as before, but grows more hungry and voracious, which by Experience evidently appears. *

The celebrated Dr. *Willis* has formed the following Hypothesis concerning the use of this Part. He supposes that the Blood, which is carried by the animal Ducts into the Spleen, deposits there by Percolation its thicker and more ponderous Parts; which thus difunited from the Mass, and lying for a while undifturbed out of the Road of Circulation, con-

* Malpighius de Liene. Dr. Purcell, in his Book of the Cholick.

tracts

tracts such an Acidity, or austere Nature, that it becomes a Leaven, like that of a Portion of Paste; which being preserved till it acquires a sowre Quality, is capable of fermenting a large Mafs of Dough. This Leaven thus prepared in the Spleen. as our ingenious Author fuppofes, being re-conveyed to the Blood by the Veins, and to the animal Spirits by the Nerves, agitates and purifies the one, and stimulates, refines, and exalts the other to fuch a degree, as the animal Faculties demand for their just and regular Operations; without which, he imagines, they would be languid and defective in their Functions; and from the Irregularity, that is, the too great Portion of Aufterity that often happens, as he fuppofes, to this Ferment in the Spleen, he derives the Rife of Hypocondriacal Affections, while he endeavours to account for all their various Symptoms in the various Parts of the Body, from the different Modifications of this Leaven, which in a different, but still an exceffive Measure, agitates, impels, and difturbs the Spirits in their Motions.

'This may be reckoned an ingenious Hypothefis, and finely imagined; but fince the Author has not fhewn any peculiar Veffels by which thefe heavy and melancholy Humours are feparated from the Blood,

Blood, nor any common Ciftern where they fhall be lodged after their Separation, nor any Canals by which they fhall be reconvey'd to the Blood and Nerves, but leaves them in the ftrait Vacuities and Interffices of the Subftance of the Spleen which muft be diffended to a vaft Size, if as a Strainer it receives a conftant and uninterrupted Affluence of Humours, and has no way to empty it felf and unload its Burden; his Pofition feems rather a Romantick Speculation without any Foundation in Nature, than the Production of an acute and reafoning Philofopher.

Other Anatomists assign another Use to the Spleen, who suppose it was form'd by Nature to arrest the Motion of the Blood and moderate its Velocity, that it may not rush into the Liver with too impetuous a Current, and suppose that this facilitates the separation of the Bile in the Liver.

In a Point of fuch abstrufe Nature, my own Conjecture is, that the Spleen is formed, tho' perhaps not only, yet principally, for fome remote yet confiderable Office, by which it promotes the Propagation of the Species. The Reason that induces me to entertain this Opinion is, that it plainly appears that this eminent Bowel is

is unneceffary for the Confervation of the Individual; for it is certain, by undeniable Experience, that it may be taken out from the Animal, without any visible Detriment; and is fo far from being abfolutely useful to the Existence of the Individual, that without it that Individual not only continues in Being, but in Health and Vigor; and as far as can be observed, does not feel the want of it. Now it cannot be imagined, that a Bowel of fuch Diftinction in the Body, of fuch a Magnitude, fuch an artful Compolition, and endowed with fuch numerous Veffels, should have no Concern in the Prefervation of the Animal, if it were defigned for that Purpofe. And therefore fince it must be allowed to be formed for fome Purpofe, what other End can be affigned, than that of the Continuation of the Species? We observe that the other Parts of the Animal, that are made for the Propagation of the Kind, may be removed entirely, without destroying the Being or Health of the Individual, as being deftined for another End, and therefore little interested in the Support of its Existence; whence it is reasonable to conclude, that when a confiderable integral Part of the Body, fuch as the Spleen is, may be entirely spared, the Animal receiving little or no Damage by the removal

moval of it, the Part must be intended for some other use; and what other can be suggested but multiplying of Individuals.

The Spleen therefore, by a Parity of Reafon, may be justly fupposed to be framed for the fame Purpole, as the other Parts defigned for the Continuance of the Species. How this Office is performed by the Spleen, is not eafy to explain, nor to answer the Difficulties that may be started on this Subject. Many Mysteries continue in Nature, that elude the Sagacity of curious Enquirers, to humble the Pride of learned Philosophers. Man is a vain Being, and would be too apt to triumph, to boaft of his Conquests, and neglect to admire the supreme Caufe of Things, should all the wonderful Scheme of Nature be laid open to his View, and no Secret escape his Enquiries. Besides, the Divine Author takes Delight to honour himfelf by different Perfons, and in different Times and Nations. He lets Mankind by degrees into the Knowledge of his Works, and future Ages may probably excel this in their intellectual Improvements and Difcoveries, as this furpaffes the antient Ages in the Infancy of Science and the first Dawning of Philosophy. And as new Acquisitions are referved for new

new Men, fo it is probable that fome fagacious Anatomists may arise in coming Ages, who may unfold this Difficulty. But from what I have urged, it must be concluded, that either this which I have afferted, is the proper Office of the Spleen, or that it can have none of any Confideration answerable to its Size and Stru-Ature: for fince it can be removed with little or no Damage, it is, as to particular Animals, almost useles and infignificant, like the Parts contrived for the Production of Individuals. But notwithstanding this Subject is fo intricate and abstrufe, I will attempt to ease our Conceptions, by opening the way by which the Spleen may perform the Office before named.

Since it appears by uncontefted Experience, that the Animal may furvive the Separation of the Spleen from his Body, without any fenfible Detriment, which is a plain Demonstration that it is infignificant to the Confervation, and unemployed in any confiderable Service of the Individual; what can be inferred with more Certainty than this, that it must be of fome important Use for the Continuation of the Species? For should it be affirmed, that it is neither beneficial to the one or the other, then it being impossible that it Q 2

should be useful any other way, this gross Abfurdity must follow, that it was formed for no Purpole, and fo is an idle and impertinent Production of Nature. I cannot fee how the Force of this Argument can be evaded; and therefore I conclude, that this Bowel was contrived for the fake of the Species, as before afferted. If it be asked, and nothing is more natural than to make that Enquiry, which way this Bowel contributes to the Confervation of the Kind? I answer, it is probable that it performs this Office by obftructing the Stream of Blood, and moderating the Rapidity of its Motion, which otherwife might rush into the Parts fubfervient to Procreation with too great Violence and Abundance; and by that means communicate to them, by proper Strainers, a greater Measure of prolifick Fluids, than the regular Oeconomy of Nature demands. Nor is this Hypothesis in the least shaken, by faying, that the Current of Blood iffuing from the Spleen, is at a great Distance from the Repositories of those Fluids; for if the Remora, that checks the immoderate Celerity of the Blood, is ever fo far off, the Effect is the fame as if it were fixed much nearer to those Receptacles; that is, it would equally abate the Velocity of its Motion before

it flowed into those Parts, in the same manner as a Dam at a Miles Distance will as much retard the Stream of a small Rivulet, and make it flow into a Meadow with the like quantity of Motion, as if it were fixed but twenty Foot before its Entrance.

Now that the Spleen is formed by Nature to bridle and reduce the Rapidity of the Blood, will appear evident, if we compare the fmall Cavity of the Artery, which conveys the Blood, with the Amplitude of the Bowel into which it is conveyed: the Dimension of the first is exceeded by that of the last about eighty times, notwithstanding an Allowance be made for the folid Parts of it, by as just a Calculation as can be fettled; for the Variety of the Diameter of the one and the other is fo great in different Individuals, that an exact Proportion is difficult to be fixed. If then the Diameter of the arterial Inlet is furpassed eighty times by that of the Spleen, then the Circulation of the Blood through this Bowel must be eighty times flower than it was at its Entrance, which is plain by the Laws of Hydrostaticks. It is true, that when it leaves the Spleen, it recovers much of its former Celerity; but still it enters the Liver eight times flower than when Q3

when it first flowed into the Spleen. These Observations were communicated to me by that eminent Anatomist and skilful Surgeon Mr. Chisleden. By this then it is clear, that the Duty of this Bowel is to diminish the quantity of Motion in the Blood, and reftrain its Velocity, which otherwife would be hurtful to the animal Government; and fince this cannot be in respect of the Individual, as above has been fully proved, it must relate to the Species; and then what can be more reafonable to fuppofe than this, that fhould not the Blood be thus controuled and retarded in its Current, it would rush in greater Abundance to the Parts deftined for Procreation, than the Intention of Nature requires. This Hypothesis is supported by the Observation of the learned Dr. Purcell, who affures his Reader, in his Treatife of the Cholick, that he found that Dogs, after the Exfection of the Spleen, were more falacious and prone to Venery than before. And if this be allowed, then this Caufe, among many others, may be affigned, why fome human Animals have a chafte Complexion, and others are defective in their Inftincts of this nature; for fuppoling that the Artery that distributes the Blood is much fmaller, or that the Spleen that receives it is much wider,

wider, than in the ordinary Formation of those Parts, it will follow, that the Progrefs of the Blood will be too much opposed and arrested; by which means the Parts deftined to Procreation will be defrauded of the ordinary Supplies required in a just and regular Constitution : and we shall be apt to favour this Opinion, when we reflect, that the Remedies administred in fuch Cafes, are of a generous, active, and stimulating Nature; which, by agitating and impelling the Blood, promote the Swiftness of its Motion. On the contrary, if we suppose that the fore-mentioned Inlet is much larger, and the Spleen of less Dimension than usual, which Variety may often happen; then the Blood, for want of a just Remora, will rush forwards with too impetuous a Current, and by that means deposit an immoderate prolifick Store in its proper Receptacles. And this Remark may furnish us with one Reason, why fome particular Perfons are incontinent and lascivious by their Constitution.

I have fuggested these probable Conjectures concerning the way how the Spleen may promote the End which I have assigned to it, and which it is not unlikely may be confirmed by future Experiments. But should these Notions be Q4 reject-

rejected, either as not reafonable or folid in Theory, or not fufficiently backed and ftrengthened by ocular Obfervations, this at leaft I may infift upon, that the Bowel, of which we are difcourfing, is either appointed for the Continuance of the Species, as above afferted, or that it was contrived for no purpofe at all, or at leaft for none of any Importance, in proportion to its Size and Structure.

Of HYPOCONDRIACAL and HYSTE-RICK AFFECTIONS, whether they arife from the Spleen?

T was the Opinion of the Antients, that Hypocondriacal Passions were owing to cloudy Fumes and melancholy Vapours, elevated from the Spleen to the Head, which they imagined infected the Brain, and diffurbed the Operations of the animal Spirits, interrupted their peaceable State, and impelled them into irregular and convulfive Motions: and in the fame manner they accounted for Hysterick Symptoms, which they ascribed to impetuous and diforderly Vapours that afcended from the Womb, and produced various Paffions, involuntary Agitation of the Limbs, Suffocations and Tremblings of Heart; of which more hereafter.

These learned Men believed that the Spleen, when distempered, causes Tumults and Infurrections in the animal Commonwealth, and with Uproar and Sedi-

Sedition, troubles and embroils all the vital Provinces of the Soul: Hence in *Plautus, Lienofum cor habeo*, I have a difturbed or diffracted Heart.

The learned Dr. Willis, before mentioned, derives likewife the Origin of Hypocondriacal Diftempers from the Spleen, but accounts for their Rife another way: He supposes, as faid before, that all the Symptoms of that Difeafe arife from an inordinate Sowrenels and Aufterity, contracted by a Leaven which he places in this Bowel for an important Service of Nature, that is, to ferment and ennoble the Blood, to ftimulate and exalt the Spirits, and augment their Purity, Brightness, and Velocity: 'for when, (fays he) it happens that the Ferment ' that inhabits the Spleen acquires an ex-" ceflive Acidity, as foon as the Particles * of it mingle with the Blood, and adhere ' to the animal Spirits, these too fowre ' Companions over-agitate the first, and ' urge the laft, together with the nervous ' Juices, with too great Violence and Im-' petuofity; and by the Conjunction of ' the Blood and nervous Liquors in this ' distempered State, he supposes that the ' Spirits are as it were fired, and, like " Trains of Gunpowder, rarified and dri-' ven into violent Explosions.

But

But upon a due Examination, I imagine the Spleen will be cleared as well from the Acculations of the Antients, as the injurious Imputation of the Moderns. It is my Opinion, that this Bowel cannot be charged with the Guilt before mentioned, for these Reasons. First, there is no Foundation in Nature to uphold their Supposition, that melancholy Steams and dark Fumes are still mounting, as if it were from a hot reeking Veffel, from the Spleen to the Brain. This is a coarfe and unphilosophical Conception; for by what Paffages and Canals shall these Fumes be elevated to the Head? Are any Conveyances appropriated to this Ufe? But if these Vapours return to the Veins and Nerves, it is evident they must mingle and incorporate with the Blood and nervous Juices; and then, while involved and complicated, they circulate together, how can we conceive any Reeks and Exhalations separated and arising from them? Now, because the Production of fuch Steams, and the Conveyance of them through proper Ducts to the Head, are impracticable and inconfistent with the Nature of things, I reject this Hypothefis, as ill imagined.

The main Reafon which they alledge for their Opinion is, that when a Hypocondriacal

condriacal Paroxyfm prevails, and, like a violent Tempest, agitates the Blood, and engages the Spirits in various Paffions and Diforders, which now most juftly are called Perturbations, the Spleen is much afflicted, fwells to a painful Dimenfion, and encroaches upon the Districts of the neighbouring Parts. But this can be no folid Foundation to fupport their Hypothesis; for other principal Parts are affected by Hypocondriacal Paroxyfms, as well as the Spleen, and much more: The Stomach, its Neighbour, extremely fuffers by this Diftemper, which causes there a redundant Portion of acid and auftere Juices, black adust Choler, Indigeftion, frequent Vomitings, and flatulent, sowre and bitter Eructations; whence it is frequently diftended with tormenting Winds, that, ftruggling for Vent, like Vapours confined in fubterraneous Caverns, fhake with Violence the whole Fabrick.

Nor does this Difeafe produce lefs Diflurbance in the Brain, than in the Stomach, where it often attacks with Fury the Refidence and chief Fortreffes of the Mind, draws the Spirits into great Diforder and Confusion, and turns the intellectual World upfide-down: The Mind is filled with dark Images and Scenes of Horror

Horror and Diftrefs, with Diffidence, Sufpicion, Inconftancy, Fluctuation, and fad and melancholy Reflections; which however have no Foundation, but in the perverted Temper of the animal Faculties; befides many other Symptoms which afterwards will be enumerated.

Nor is the Heart in a lefs confpicuous manner afflicted by this Difeafe, than the Stomach and Brain, where it caufes vehement Emotions, Tremblings, Palpitations, and irregular Pulfations, which are oft attended with fhort and difficult Breathing; while the difordered Mufcles of the Breaft are unable to perform their Duty, by dilating and contracting it in a fedate and regular Succession.

Hence it will appear that the Spleen, from its being much difturbed by Hypocondriacal Paffions, is not more accountable for the Production of that Diftemper, than the Heart, the Brain, the Stomach, or the Breaft; all which are as great Sufferers by its noxious Power as the Spleen; and in particular, the Stomach is afflicted by it in fo eminent a manner, that the ingenious Dr. *Highmore* was induced to believe, that this dark Diftemper derived its Origin from that Part of the Body.

Rejecting therefore these Opinions, I must declare, that in my Judgment, what we

we call the Spleen, is a Diffemper belonging to the whole Syftem of the animal Spirits, and has its Rife immediately from them; and upon this Hypothefis, it will not be hard to account for the various Appearances and furprizing Symptoms arifing from this myfterious Difeafe. And in order to this, I will lay open in fhort, the Nature, Conftitution, and the Duties of thefe Spirits, and then confider the various Symptoms of Hypocondriacal Affections; whence I imagine my Affertion will become evident and inconteftable.

The animal Spirits, which are the first Agents employed in the Formation of the Fatus, being awakened and fet in Motion through the Brain, by a due genial Heat, expand themfelves, and by their reciprocal Motions, excavate and extend the Arteries and Veins, unfold and amplify the entangled Limbs, diffuse the Membranes; and in fhort, difcharge all the Offices of their plastick Province, till the integral Parts are finished, and the Animal becomes compleat: And then they are the immediate Ministers of the Soul in all her various Operations; they are neceffary to her in this State of Existence, while she exercifes her fuperior intellectual Faculties, being her immediate Inftruments in Cogitation, Reafoning, Invention and Fan-

CYN

cy, as well as in fenfitive Perception and local Motion. By their Figurations, and the various Modifications of their Activity, they agitate and work the Heart in various ways; whence they impart to it pleafing or painful Paffions, and produce all the Diverfity of Motions which are found there. As a great Part of the animal Spirits inhabiting the Brain, make their Excursions through the fecret Roads of the Nerves, by the Impulse of the Will, to move a particular Member, or the whole Body; fo others, by a fpontaneous and involuntary Motion, from an Instinct of Nature, descend through other Paffages to all the nobler, as well as the lefs confiderable Parts of the Body, where they affift in the animal Oeconomy, by preferving the Motion of the Heart, the reciprocal Contraction and Dilatation of the Brain, the digeftive Faculty of the Stomach, and for other peculiar Offices in other Parts, upon which depend the Nourishment, Vigour and Duration of the Individual. Thus have I given a fhort View of the Nature and vital Offices of the animal Spirits, and will now enumerate the Symptoms which arife from the Diftemper vulgarly called the Spleen.

This Diftemper, which is likewife called Hypocondriacal, from the Hypocondrias,

drias, which are the Regions on each fide where the Spleen and Liver are fituated, and which are often painfully diftended, efpecially that in which the first is lodged, during a Fit or Paroxysm of this Difease, produces in the Stomach a great Variety of Complaints, depraved Appetite, and Inability of Digestion; whence proceeds frequent Nauseous frequent Nauseous field the Stomach Heart-burnings, and a frequent Disposition to Vomiting; and fometimes too great Eagerness to eat, and after eating Uneasinels and Oppression.

This Diftemper caufes a great Diverfity in the Disposition of the Minds of those who are afflicted with it; fometimes they express great Alacrity and Pleasantry of Temper, and by their agreeable Humour and fudden Starts of Imagination, are entertaining in Conversation; yet, weary of attending any thing long, by a fudden Abfence of Mind they forget themfelves, and feem to withdraw from the Company; to which however they foon return, and refume their Part of the Discourse, when the odd Fit is over. At other times they are dejected and cloudy, and now none but dark Images, desponding Thoughts; and melancholy Scenes employ their Brain; fometimes they are bolder than Men

and foon after more timerous than Women; this Day in a lively active Temper, they are firm, enterprizing to undertake fome great and worthy Defign, which they have newly formed; the next, when their Spirits are reduced, and their fine Flame is spent, they reverse their Opinions, delay their Attempt, and either continue suspended, or wholly lay aside the Execution of their Project. Their Minds are perpetually wavering and undetermined, by the different Appearances of their Ideas, from the different Difpofition of the Spirits, that never long reprefent them alike to their Imagination; whence they always vary and difagree with themfelves, and continually fpend their Hours in forming Schemes of Life; which however they feldom thorowly purfue, and are always exercifed in making and breaking Refolutions. From this capricious Levity and Ficklenefs of Mind, they express no Equality or uniform Appearance in their Demeanor or Pursuits, but are full of Starts and Incoherencies, and often repugnant and contradictory to themselves; and by this Mutability and Unsteadiness of Temper, where this Difease is much predominant, they deftroy the Regularity and beautiful Series observed in the Actions of wife and prudent R

prudent Men; whence arife many difhonourable Breaks and Blemiss in Life, which in more sedate Intervals they reflect upon with Shame and Regret.

The Symptoms of this Diftemper in the Head are, Dimness of Sight, black Spots and Nets dancing in the Air before the Eye, ringing in the Ears, Swimmings, Giddinefs, and vertiginous Eddies; besides fudden Eruptions and Flashes, like those of kindled Powder, as it were exploded and darting through the Brain. Sometimes the Imagination is over-heated by too great an Expansion of the Spirits; whence they become bright, of great Celerity, and almost rarified to a State of Lunacy; and fometimes by a fudden Change, they are diffipated and depressed, whence the Faculties of the Mind are ill ferved by their torpid and unactive Minifters.

Hypocondriacal Perfons are frequently reftlefs and unquiet, full of Anxiety, Diffidence and Sufpicion, and by turns obftinately wakeful, or liable to Drowfinefs and immoderate Sleep; and by the uneafy Viciflitude of their Temper and fwift Change of Taffe, they foon grow weary of the fame Satisfactions, are unfteady in Love and Friendship, and alwaysengaged in the Purfuit of new Objects. 2

Various Diforders in the Heart arife from this Diftemper; whence it fometimes fprings against the Breast with emicant Vigor and impetuous Vibrations; as if impatient of Confinement, it would break through the Fences that restrained it; and sometimes its Motions are so faint and languishing, that it seems cast down from its Seat, and depressed into an inferior Station.

In Persons thus affected, if any Phantafm strikes upon the Imagination with Vehemence, if an Incident of Importance, or any Meffenger of ill News furprize them, the Spirits in the Brain being of a volatile Nature, and eafily dispersed, are agitated with fuch Violence, that they rush from thence through the nervous Passages in Diforder and Precipitation; of which some by a convulsive Grasp, con3 tract the great Artery called Aorta, and by that diffurb and interrupt the Current of the Blood; and others entering the Heart in Confusion, cause Variety of Perturbations, Trembling, Palpitation, violent Leapings, and a fwift; intermitting Pulfation, by which it receives and projects the Blood with great Inequality.

In Paroxyfins of this Diftemper, the Perfon feels fuch a Hurry and Tumult of the Spirits, and fuch a Confusion of Ideas R_2 in

in the Head, fuch short, broken, and laborious Breathing, fuch Strife and Emotions in the Heart, and fuch an Inquietude and Sinking in the whole animal Nature, that he feems to himfelf to be entering upon the Agonies of Death; and though he has fuffered a hundred times the fame Diftrefs, yet still he thinks that the last will be fatal. Under this Apprehenfion of imminent Death, which returns with the Fits of the Difeafe, the unhappy Perfon dies daily, and perhaps fuffers more in the Expectation of the fatal Stroke in every fuch Agony, than those who died but once, and now lye buried in the Grave: And his Condition is the more deplorable, becaufe while he eats, drinks, and looks healthful, like other Men, he becomes rather the Object of Raillery and Reproach, than of Tendernels and Compassion.

In the Appendages to the Stomach, and the inferior Belly, this Diftemper often fhews it felf in cholical Pains, tumultuous and noify Agitations and Convolutions of the Entrails, in the Difturbance it gives to the periftaltick Motion, and often by the paralytick Relaxation of the Fibres of the Inteffines; whence their native Warmth, Power of Retention and protrufive Faculty, receive great Prejudice.

dice. In the Habit of the Body, it appears in the Shaking or Trepidation of the Limbs, and erratick Pains, in the Leaping of the Tendons, convulsive Twitches of the Muscles, a frequent unaccountable Lassitude, and a temporary Indisposition to move, not from the Extinction of the Spirits, but from the Suspension of their Activity. If the Nature of these Symptoms, at least of the greatest Part, is attentively confidered, it will be eafy to fee that they chiefly and immediately arife from the Irregularity and Confusion of the Spirits, whence the animal Oeconomy is interrupted and diffurbed.

And this will further appear from the general Observation, that Hypocondriacal Perfons, if their Spirits are not overheated and agitated to the higheft degree, are endowed with quicker Apprehenfion, acuter Senfe, and greater Vivacity of Imagination than other Men. The celebrated Dr. Willis, in accounting for this, fays, that in these Persons the Spirits are animated and fublimed to an eminent State of Purity, by the Ferments of the Spleen, exalted to a proper Measure of Acidity, and communicated to the Nerves inferted in that Bowel. This, though a precarious Affertion, and without Proof, fhews however, that the animal Spirits are the origi-R 3 nal
nal Subject of Hypocondriacal Spirits; nor is the Cafe otherwife in the Female Sex, who often derive their fuperior Wit, good Senfe, and fprightly Imagination, from the Activity and Finenefs of their Spirits, raifed and ftimulated by Hyfterick Ferments.

My Polition will be farther supported, if the Method of Cure, which has been found by the Experience of Phyficians to be most successful in this Distemper, is confidered. Those Remedies which are most efficacious in foothing the Fury, appeafing the immoderate Heat, and reducing the exceffive Velocity of the Spirits, by which they fuppress the Seditions, Tumults, and Infurrections that embroil the animal Government, and introduce a peaceful Calm and a State of Tranquillity, are either pacifick, which immediately compose the Conflicts of the Spirits, restrain their irregular Excursions, and moderate their Celerity; or fuch as impart fuch Stability, Firmnefs, and Confiftency to them, as may enable them to perform their reciprocal Motions and vital Functions in a steady Courfe, without being obnoxious to inordinate Impreffions from every furprizing Object, and vehement Hurries and explosive Diffipation。

Though

Though the greatest Part of these Sufferers are by Nature fo formed and difpofed, as to be liable to grievous Perturbations, yet sometimes Men acquire them by long indefatigable Idlenefs, and fometimes by indulged and obftinate Sorrow. uneafy Reflections, and deep Melancholy, arifing from the Misfortunes and Calamities of Life. Assiduous Dependents on Perfons in Power, long promifed, and still disappointed in their Expectations of Preferment, as well as Men of Bufinefs and Commerce, who have a great while supported their Credit, and made a handfome Figure in the World, but at last found themselves falling to decay, have funk into the Depths of Hypocondriacal Sadnefs. And fince these unhappy Perfons are thus overwhelmed with the Spleen from no other Caufe than what affects the animal Spirits, it is evident that those Spirits are the immediate Subjects of that Difeafe.

It is true, that this faulty Temper of the Spirits is in part owing to the Conftitution of the Blood, from whence, being the finer and purer Parts, they are ftrained through the narrow Messes of the Brain; and there yet more laboured and refined, are distilled into the Mouths of the Nerves, through which they shoot $\mathbf{R} \mathbf{4}$ with

with great Swiftnefs to difcharge their Offices of Senfation and Motion. And as the Qualities and Contexture of the Blood are fo vitiated, fo in Proportion the animal Spirits derived from it, muft be perverted from their regular Complexion: yet this is but to affign one of the remote Caufes of the Spleen, and not to give its effential Idea ; which from what I have faid, I believe, will be allowed to confift in the inordinate Difpolition of the Syftem of the Spirits.

Of HYSTERICAL AFFECTIONS.

I we contemplate the Nature of the various Symptoms of this Difeafe, we fhall foon conclude that there is no fpecifick or effential, but only a gradual Diflinction between them and the Effects of the Spleen, arifing from the Diverfity of their Modifications and Appearances; fince it is evident to the judicious Obferver, that Hyfterick, as well as Hypocondriacal Paffions, act all their tragical Parts in the Frame of the Nerves, by the irregular and feditious Motions of the Spirits.

The Antients, from a groß Conception, imagined that Hyfterick Paffions derived their Origin from the difordered Matrix, which they fuppofed fent up Clouds of Fumes and dark Vapours through the Veffels to the Brain; as they believed that Hypocondriacal Symptoms proceeded from melancholy Reeks, elevated from the dark and impure Sink of the Spleen to the Head: But as I have demonstrated with the cleareft Evidence, that those Sym-

Symptoms arife immediately and effentially from the diftempered State of the animal Spirits, by which they are perverted and difabled from performing their natural Functions in a fteady and regular manner; fo Hyfterick Affections will appear to have fo great an Affinity to them, that they must be accounted for in the fame manner.

The chief Symptoms of this Diftemper, which is appropriated to the Female Sex, are noify Convolutions and Workings of the Inteffines, ftruggling and striving upwards, Cholick Pains, Sickness in the Stomach, depraved Digeftion, lofs of Appetite, frequent Disposition to vomit, and noxious Ejections of green, fowre, bitter, and fometimes infipid Humours; Fits of short and difficult Breathing, Palpitation of the Heart, Faintings, Suffocation and Strangling in the Throat, Giddinefs, Swimmings and Dimnefs of Sight, violent aking of the Head, profuse Laughter, and on a fudden an immoderate Eruption of Tears, Inconstancy, Timidity, Irrefolution, frequent Change of Temper; and in fhort, all the Train and Symptoms before enumerated, as the Effects of the Spleen in Men; and in this only they feem to differ, that in the Female. Sex they are carried on to a higher degree :

gree : For in Hysterick Fits, which often approach near to Epileptick, the Sufferer is thrown into violent convulfive Motions; while the Eyes are difforted, the Face diffigured, the Limbs agitated with involuntary Concuffions, the Contraction and Diftension of the Cheft difturbed and interrupted, and the Exercise of Reason and Perception suspended; often the afflicted Perfon falls to the Ground, beats her Breaft, fets her Teeth, bites her Tongue, and ftruggles with fuch extraordinary Force, that fhe is fcarcely to be held and restrained by those about her. These violent involuntary Agitations in the whole Structure of the Body, which invade the animal Oeconomy, arife partly from the Conftitution of the Spirits themfelves, which in the Fair Sex are more volatile and fubtil, and of lefs Stability and Confiftence than they are in ours; and therefore more receptive of Impressions, more liable to Diffipation, Disturbance and Confusion; and partly from the Finenes, Delicacy, and Tenderness of the Nerves, which are not woven of fuch firm and robuft Threads, as they are in Men; and for that Reason being not able to resist the inordinate Motions and Perturbations of the Spirits which rush upon them, they are driven by the violent Impulse into convulsive Contractions.

Thefe

These unhappy Perfons, in the fame manner as Hypocondriacal Men, are fubject to be alarmed by frequent Apprehenfions of approaching Death; and while they feem well to others, receive from them little Commiseration, a Respect due to the Miserable and Unfortunate.

Hysterick Passions are often occasioned by the impetuous Emotions of the Mind, immoderate Anger, Fear, and even Excefs of Joy; the hearing of ill News, or fome furprizing Incident, the unexpected Arrival of a Friend, a fudden Outcry; and more, the hafty opening of a Door shall cause this extraordinary Diforder: and I fuppofe none will afcribe this to the rifing of Fumes and Vapours, I know not how, from their Seats to the Brain, nor to any fecret Ferments that harbour in any Part of the Body. Since therefore the Paffions of the Mind, as well as furprizing external Objects, will produce Hyfterick Fits; then no Steams or Reeks exhaling from Crudities and unconcocted Aliments in the Stomach, nor any Leaven lurking in any Parts whatfoever, can be affigned a fufficient general Caufe of thefe Symptoms. But if we recur to the System of the animal Spirits, we shall find an equal and uniform Caufe of all thefe Effects, and from their Perturbation and difor-

diforderly Influx into the Nerves and Muscles, may account, with Satisfaction. for all these various Phænomena. As this is plain in the Inftances last mentioned, which arife from the Emotions of the Soul, or the vehement Impulse of foreign Objects upon the Imagination; fo if all the other Hyfterick Paffions above defcribed, are contemplated with Attention, they will eafily admit the fame Solution : For, fuppole that any internal Caufe, any auftere, difagreeable, noxious Juices, that dwell in various Parts of the Individual, by their opposite Nature, instigate, excite and impel the Spirits in an exceffive manner, the fame hyfterick Paffions and convultive Motions will arife, as from the impetuous Agitation that outward Objects often produce; fo that still the animal Spirits are the immediate Subject of these Fits.

There is therefore but one effential Idea of Hypocondriacal and Hyfterick Affections, which is this of the diftemper'd Difpofition of the Spirits. by which they are inclined to be eafily difturbed and perverted in their reciprocal Motions; but the remote Caufes of their irregular Conftitution are various, as well from without as from within, and therefore it muft not be fuppofed that the Stomach, the Spleen,

Spleen, the Womb, the Brain, or the Heart, are either of them the total Caufe of these Diseases; for each of them, in their turn, may communicate to the Spirits those hurtful Ferments, or impure stimulating Mixtures, which may drive them into the utmost Diforder. To account for the Nature of convultive Contractions in Hysterick Perfons, is not fo eafy a Task. Muscular Motion is fo intricate and mysterious, that after all the Attempts of the greatest Writers upon this Subject, it is little underftood; and how fhall we know what is an Errror and Deviation from mulcular Motion, till we first understand what muscular Motion is?

The Learned Dr. Willis has explain'd it by the Effects of the nervous Juice nieeting with the fulphurous Particles of the Blood, which kindle, fays he, and go off by their Union, and by this means fwell and fhorten the Muscle. Thus by the conftant Explosion of this fine Matter compounded of vital Nitre and Sulphur, he plays the whole animated Engine, or a particular Part. Hence when a Masterhand runs Divisions on a Violin, it must be fuppos'd that this fpirituous complex Matter is rarify'd, and exploded as fwiftly, and in as regular a manner, as the Artift moves his Fingers and his Bow. By this

this Hypothefis, an Animal feems a living Cafe of Fireworks, a System of involved and complicated Tubes, ready to be difcharged for every Motion of every Muscle. This Supposition feems rather the Produation of Wit and fine Imagination, than of a folid and philosophical Judgment. But this Difcourfe fwells to a greater Bulk than I intended. Those who would fee this Subject treated more fully, and with more Accuracy and Method, I refer to Dr. Willis on Hysterick Affections, and to Dr. Purcell, a Learned Gentleman, not only well verfed in the Theory, but likewife skilful in the Practice of Phylick; in whole Treatife of this Diftemper, the Reader will find many ufeful Observations and Instructions, as well as curious Experiments.

RIUCH

SECT.

SECT. II.

Of the Power and Influence of the Spleen on human Understandings.

Hough I have in the preceding Difcourfe demonstrated, that the Diftemper denominated the Spleen, confists in the inordinate and perverted Constitution of the animal System of the Nerves and Spirits; yet I must admonish the Reader, that tho' in the following Pages I shall often make use of the word Spleen, it must shall be understood in the Sense before explain'd.

From the different Nature and Conftitution of the Spirits arife different Qualifications and Turns of Mind, which give to the Poffeffors of them various Appellations.

Those who believe that human Minds are in themselves equal, and that all the wonderful Distinction of intellectual Excellencies and Perfection, which appears in the Individuals of Mankind, arifes from the different Dispositions of the Humours,

mours, and various Formation of the Organs of the Body, which fupply the Mind with different Instruments for its Operations, will be ready to embrace a mechanical Explanation of the Inequality of human Understandings. According to this Way of thinking, a great and admirable Genius will be allow'd to refult from some curious Structure of the Brain, from regular and exalted Ferments, and more immediately from the Finenels, Vivacity, and abundance of the Spirits, which enrich the Imagination with clear Ideas, and enable the Soul to exert all her Powers to the utmost of her Activity; tho' I shall not contend with any who account for this furprizing Difparity of our fuperior Faculties, by afferting, that Minds without refpect to the Body, are often by Nature of very different Capacities.

This elevated Order of Men is divided into many fubordinate Degrees of Diflinction, according to the various Proportion of Genius and Judgment imparted to their Conflitution: It is not however by their Swiftnefs of Conception, Brightnefs of Imagination, and Redundancy of Spirits, that they are diferiminated from others; but Prudence and good Tafte, Solidity of Senfe, Reflection and confiftent Reafoning, are the effential S

Differences which conftitute this first Rank of Men, and vary and limit them from Multitudes, who have other intellectual Endowments in common with the wifest.

The finer Spirits here defcribed, are not only diffinguished from others by their different Measures of Wit and Understanding, but likewise by their different Temperament, resulting from the various Combinations of Humours and Ferments, which meet together and blend and qualify one another in their particular Compositions; and this Diversity of Character in the ingenious Natives of this Island, proceeds from nothing more than from a lighter or stronger Tincture of what we call the Spleen in their Mixture.

The Spleen, a Quality almost peculiar to this Nation, is of a different Nature from Madness and Distraction, which are frequently the Diseases of hot Countries, and, as I have before explain'd, is the particular Constitution of the animal Spirits, stimulated, enliven'd, and refin'd by certain active Principles, to a greater Degree than they are in others. 'Tis therefore a general and just Observation, that those who are endow'd with a moderate Portion of the Spleen in their Complexi-

011,

on, are Perfons of fuperior Senfe, and extraordinary Vivacity of Imagination; and while predominant Judgment holds the Reins, and keeps the Balance of Power equal and fteady in the Soul, governs its Operations, and prevents the Exceffes and Irregularities of the lighter Faculties, this happy Complication cannot but produce an excellent Genius.

It is for this Reafon, that as fome, to procure Reputation, perfonate the Characters of good or bad Men, and are Hypocrites in Virtue or Vice, as the one or the other grows in Fathion; fo many, to be thought Men of Parts and Ingenuity, lay claim, out of mere Oftentation, to the Power of the Spleen in their Complexion, to which they have no manner of Title; nor are there Inftances wanting in the fair Sex, who pretend to this reputable Diftemper of the Spirits, with the fame Vanity that others affect the Beauty of an unfanguine and fickly Countenance.

It is true, this Complexion has Advantages above others, yet the Poffeffors often pay dear for their Superiority; those especially of the beaut ful Sex, whose tender and delicate Fibres, and the lively Motions of their Spirits, make them obnoxious to violent Akings of the Head, S 2 and

and painful Hyfterick Paffions. The Springs of their Sufferings by vulgar Error are called Vapours, accounted Difeafes arifing from noxious Humours, while they are nothing elfe but the natural Effect of the Keenefs, Mobility and Richnefs of the animal Spirits; of which they cannot be cured, but at the Expence of their good Senfe, and the Prejudice of their fprightly Imagination.

It is true, if these active Principles implanted in their Conftitution, by getting ground of the reft, which should reftrain them, grow predominant and licentious, they produce a Distemper, which attended with numerous uneasy Symptoms, and accompany'd with Suspicion, Distidence, Irrefolution, Inconstancy, Timidity, and perpetual Apprehension of Death, often approaches to a State of Lunacy, tho' it rarely rifes to that Excess.

I cannot difmifs this Subject, till I have made the following Remarks. Tho' the Diftinction that appears in the Air and Afpect, the Mien, the Structure and Motion of Mens Bodies is remarkable, that of their Faces and Features is ftill more furprizing; and tho' this Difagreement of Countenance does not only diftinguish one Individual from another, but there is likewise a peculiar Cast of Face in the A

Natives of different Countries, especially if at a great Distance; yet there is not a greater Diversity in the Countenances of different People, than of Humour and Disposition of Mind. All Nations have fomething in their Complexion appropriated to themselves, arising from the Difference of Soil, and Degrees of Heat and Cold in the Air they breathe; the *French* and the *Spaniards*, the *Italians* and the *Britons*, are no lefs divided and diftinguished by their Inclinations, Habitudes and Manners, than by the Boundaries and Limits of their Countries.

But of all these different People, the Temper of the Natives of Britain is most various, which proceeds from the Spleen, an Ingredient of their Constitution, which is almost peculiar, at least in the Degree of it, to this Island. Hence arifes the Diversity of Genius and Disposition, of which this Soil is fo fertile. Our Neighbours have greater Poverty of Humour and Scarcity of Originals than we. The Spaniard farcaftically fays of the French, If you have seen one, you have seen all; tho' a Frenchman may as justly retort the Raillery on the grave Caffilian: And this may be as truly affirm'd of the Italian on each Side the Appenines, and of the High-Dutch and Low. But an Englishman needs sound and S 2 Borthulia trais non

not go abroad to learn the Humours of these different Neighbours; let him but travel from Temple-Bar to Ludgate, and he will meet, among his own Countrymen, the Frenchman, the Spaniard, the Italian, and the German; he'll find Perfons as much difagreeing, as all the Nations of Europe can flow; and more than this, he may difcern in fingle Perfons, as they are fober or inflam'd with Wine, dejected by a Disappointment, or elated by a lucky Accident, or as they have been crofs'd by their Wives, vex'd by disobedient Children, or put out of Temper by their Servants, in four and twenty Hours, the Difpositions and Humours of all the Nations of Europe.

When the Spleen, in too great a Proportion, affects Men who are curious to enquire into the fecret Operations of Nature, it introduces into the World a ftrange Variety of fantaftical Adepts, and whimfical Philofophers; and if it mingles in an exceflive Degree in Conftitutions difpos'd to Theological Contemplations, it fills the World with odd and irregular Productions of another Kind, numberlefs Vifionaries, and extravagant Sects of Religion, diftinguished by their feveral chimerical Singularities, fuperstitious Fears, and Hypocondriacal Enthusias And hence

hence it comes to pais, that fo many morofe, rigid and melancholy Perfons unhappily bring Difhonour on the Practice of Virtue, by tempting others to look on Religion, which in it felf is most amiable and delightful, as an unlovely and frightful Object. From this Obfervation, fome Men of Wit have reproached all Devotion, as the Effect of a diffemper'd Brain, and an Imagination over-agitated by the Spleen; but they might with as good Reafon infer from the numerous Difeases and monstrous Deformities which are found among Mankind, that there is no healthful Constitution, or beautiful Frame of Body in the whole Species.

By what has been faid, predominant Judgment and Difcretion are fettled as the Limits, which circumfcribe the Man of Senfe and the genuine Wit from others of a different Nature and Denomination : If you pass this Frontier, you enter into a wild uncultivated Region, an Intelledual Africa, that abounds with an endles Variety of monstrous and irregular Minds. These absurd Understandings are the Errors and Deviations of Nature in the Formation of the Head, of which thousands are incompleat to one that is brought to Perfection.

S 4

Infinite

Infinite is the Variety of these Tribes of Men, that are deftitute of good Senfe and Judgment, whofe general Heads are divided and fubdivided into numberlefs Branches, all diversified by their peculiar Oddneffes and fpecifick Caprices. It is extremely difficult to trace effential Differences among regular Beings, but it is much more fo to fettle the Boundaries that divide one Species from another among these anomalous Productions: their conffituent Whimfies are fo very delicate and abstrufe, that perhaps they often confift in the improper Length, Size or Situation of a Fibre, in a disproportioned Humour, or an immoderate Ferment in the Composition; but to gratify the Curious, I shall attempt to deduce the Pedigree of fome of the most eminent Clans.

When Stupidity and a great Degree of Splenitick Madnefs meet in the fame Complexion, while the former reduces and qualifies the latter, and the latter enlivens and refines the former, the Production is either a Coxcomb, a Buffoon, or a mere Wit, which are multiply'd into numerous Kinds, as their Ingredients meet in various Proportions, or are more flightly or more intimately blended and combin'd. From thefe different Complications arifes the diffinguifhing Difparity, that

that is found among the numerous fubordinate Claffes of thefe ambiguous Animals, to which the Rational and Irrational World equally pretend; fuch are the feveral Tribes of the Half-craz'd, the Impertinents, the Pedants, the perpetual Talkers, the Men of Form, the Mafters of infignificant Eloquence, and the Affected, which Clafs includes an under Species equally difagreeable, of thofe who with vifible Affectation labour to appear unaffected.

If Hypocondriacal Fury has the Superiority in the Mixture, a Progeny is produced of fhining Fops, Poetafters, petulant Laughers, or morofe falfe Criticks; but if the Fool prevails and keeps the Madman under, you have a furprizing Race of crafty Blockheads, who are fenfelefs in Converfation, yet cunning in their Actions, and cheat us daily under the Appearance of Stupidity. Hence alfo proceeds a Species of Men, who having only a Sprinkling of Genius in their Composition, always aim at fine Things, and difturb the Company with infipid Raillery.

As often as the Balance of Power between these two Qualities is broken, according to their different Degrees of Superiority on either Side, a new Set of these

thefe capricious Animals is brought into Being, whofe common Nature is more varied by their feveral whimfical Properties, than the Ape or Monkey-kind, which imitates this irregular Race of Men, as the others refemble Perfons who are endowed with Genius and good Senfe.

Thefe Reflections bring to my Thoughts a Story, which I have fomewhere read, of a young Gentleman in the Court of France during the Reign, as I remember, of Henry the Third: This Perfon being of a graceful Aspect, great Humanity and obliging Behaviour, was beloved by all, notwithstanding that his little Share of Senfe made his Conversation low and trifling: It happen'd, I cannot recollect by what Accident, that this Gentleman grew distracted; and then the Ferments of the Madman having agitated and exalted the flegmatick Fool, he became an ingenious and pleasant Companion, the Court was mightily pleas'd with him, and engaged the King's Phyfician to undertake his Cure; the Gentleman by the Doctor's Prescriptions soon recover'd, but the Fool recover'd with him, his fhining Parts were funk and effaced, and his Head reduced to its original Softnefs.

As

As in the Instances I have given of the various Compositions where Judgment and Difcretion are no Ingredients, Stupidity and Fury are fo thoroughly mixed, as to make a Composition, different in Kind from either of the combining Principles; fo it falls out, that the Union of them in fome Conftitutions is fo flight and loofe, that, like Wine and Oil but gently shook together, they are not perfectly blended and incorporated, but still preferve their diffinct Natures: and not being entirely united and confolidated, this Confusion, rather than Mixture, in which the Principles eafily separate, makes not a complex Being of a different Appellation. This defective Composition produces an inconfistent Race of Men, which may be denominated lunatick Wits; in whofe flack Contexture the Madman breaking loofe from the Fool, and the Fool difengaged from the Madman, often appear entire and uncompounded, or at least in a great meafure free from Allay. In this Complexion the two Competitors feem to have compromised their Differences; and being determined to act independently, share the Government of the Man between them: The first, as Sovereign, takes Poffeffion of the Brain, and rules the Imagination; whence arife the Acutenefs

nels of Thought, Quicknels of Apprehenfion, those furprizing Turns of Wit, and that entertaining Humour, which are always peculiar to this Species. The Provinces where the laft has Dominion, are the various Concerns and Affairs of Life, in which he acts as uncontrolled, and fhines as confpicuous as the Lunatick does among the intellectual Powers. Hence it comes to pafs, that the fpeculative Wildom, and the practical Folly of this Tribe, illustrating and improving each other, are both admirable; and that famous Expression may justly be applied to them, They never speak a filly Thing, and never do a wife one.

It is from the Contemplation of this. Species, that a known Obfervation has been made, That all great Wits have a Tincture of Madnefs. The Reafon of this Remark, I imagine, is, because that as in Proportion there are a greater Number of Wits of this Species than of any other; fo they are likewife the most eminent for fprightly Imagination, agreeable Strains of Raillery, and genteel Satyr. A Wit of the lunatick Kind has Spirits fo expanded and inflamed, that one Heat more had made him a George Fox, or a James Nailor; the Transition being very eafy from the Frontier of this Clafs to the College

College in *Moorfields*. While a Man of Wit of this Rank, has fo much of the flegmatick Principle in his Make, as bridles the Lunatick, no Genius is more admirable, either in Converfation or Writing; but fuch are his Inequalities, and fo many Excursions from good Senfe appear in the Conduct of his Life, that it is evident his Composition is inconfistent and extravagant: and this was the Cafe of a noble Peer, one of the most shining Wits of the last Age.

All thefe Ranks of abfurd Productions in the rational World, which I have mentioned, agree, as I have faid, in one general Notion, namely, Indifcretion and Privation, or Abfence of Judgment; but the particular Properties and curious Particularities, which, by a wonderful Fertility, produce fubaltern Orders, are innumerable; for Error or Deviation is infinite, and no Mind is endowed with fufficient Sagacity to trace the minuteft Receffes of Nature, unravel the odd Complications of difagreeing Principles, and tell where one Species ends, and another begins.

This is the Province of the Comick Poet, and perhaps no Nation on Earth furnishes him with a greater Variety of original Humourists, or more surprizing, ridicu-

ridiculous, whimfical Characters, to be exposed on the Stage, than our own Island; which I believe is the Reason that the British Theatre affords more Entertainment of this kind than any of our Neighbours, who, in comparison of us, are indigent of such Distinctions and Particularities.

I have reprefented in fhort predominant Madnefs, allayed with Folly; and now fhall confider prevailing Folly, fprinkled with Madnefs. Though in the Struggle of the contending Ferments, while the Individuals of this kind are in Embryo, the wild and furious Principles are at laft overpowered, and the crude and flegmatick get the Dominion; yet there ftill remains interfperfed in their Compositions fome glimmering Streaks of Mother-Wit, and Difcoveries of the elemental Madman.

As those Productions, in which the raging Particles are not half tamed, and but flightly hampered with the fluggish, may be denominated lunatick Wits; so where the Madman is shackled, by being thorowly worked and kneaded into the Fool, if the Balance is confiderable on the fide of the latter, fince the Denomination must always arise from the prevailing Quality, this kind may justly be called lunatick Fools.

As in general by the first fundamental Settlement in these Complexions, the greatest Share of Authority is lodged in the last; and the first, who is apt to be seditious, is manacled and kept under Hatches; fo the exuberant Fertility of these dull Animals is determined to various Species, limited by their peculiar Ideotifms and Characters of Stupidity. This Temperament of Dominion keeps the Fool from being absolute; for though the Government of the Man is entrusted with him, and the Paffions and Appetites commonly are obedient to his Di-Aates, yet the Madman will often break loofe; and though buried in a flegmatick Heap, like Enceladus under Aetna, he will now and then thake himfelf; and ftriving to get free, make terrible Commotions: and it is from the different Proportions of Strength, fecured to the one by the original Compact, and the various Limitations under which the other must act in different Perfons, that these effential Diftinctions proceed, which diferiminate the numerous Branches of this witlefs Kind.

A perfect Enumeration of them is impracticable; for what Imagination has Compals enough to conceive the infinite Variety of ridiculous and abfurd Animals,

mals, produced by the different Combinations of Fury and Folly, diversifyed by the Mixture of other Qualities? The principal Denominations are, the Blockheads, Sots, Blunderers, half Ideots, perpetual Laughers, and the Unreflecting, who are in a Surprize at every Event, and are known by the use of that filly and unavailing Sentence, Who would have thought it? Most of these enjoy a steady and immutable Dullnefs, while the Fool is always uniform and confiftent in his Actions; but many of them, according as the Moon, Wine, hot Seafons, or violent Provocations, roufe their Spirits, express a great Inequality of Weakness; and their Stupidity is interrupted by lunatick Intervals, as now and then they feel a Paroxyfm of the Madman.

I have before named an eminent Species of this Race, that are crafty Blockheads, where the lunatick Activity of the Spirits feems fo opprefied with fluggifh Humours, and the Madman fo perfectly difguifed, that at the firft Converfation you imagine the Fool is pure and entire; but if you come to drive a Bargain, and think to take an Advantage of his want of Senfe, you are undeceived, and find that he is more Knave than Fool.

As

As the Mundus Intelligibilis of lunatick Wits, and other Tribes of a whimfical and irregular Genius, lies in a Zone parched by too much intellectual Heat, whence their Brain is dry, and their Spirits are fired and rarified to Excess; fo on the contrary these Bœotian Territories, which are barren of Understanding, are extended in a frigid Climate, and are visited but with weak and languishing Rays, whence the Spirits are benumbed, and but half animated; and being incumbered and involved in crude and heavy Humours, the Mind is torpid, and unable to exert any. bright Operations: and as in the Cafe of lunatick Wits, the Madman has Dominion over the Head, and the Fool over the Actions; fo here the Reverse often happens, while the Fool reigns in the Head, and the Madman in the Life.

There is another Species in whom the Fool is mightily prevalent, who however, from a certain Participation of Lunacy, feel a violent Inclination to be reputed Men of Parts. Hence they are prompted by a reftlefs Inftinct, to court the Acquaintance of the fashionable Wits; they crowd among the Criticks of the first Rank, that lead the Taste of the Town, determine the Fate of Writers, and deal out Esteem and Praise at Discretion; they believe the T Reputa-

Reputation of having mingled in the Company, and heard the Difcourfe of fuch applauded Perfons, is fufficient to elevate them above the Vulgar, and to rank them at leaft in fome fubaltern Order of Wits. Though thefe Perfons have enough of the Madman in their Mixture, to make them afpire to this high Converfation, yet they have fuch a Redundancy of the Fool, that they cannot difcern that they are a flanding Jeft among those fuperior Men, whose Favour they follicit with fo much Importunity.

There is on the contrary another Clan of these Animals, who have a great overbalance of the Fool, and a flight Dash of the Madman, worked up with a fowre, melancholy Leaven; whence their Temper is always dull, morofe and cloudy. As a Perfon of this Constitution is uncapable of lively Imagination and pleafant Humour, fo he detefts nothing more than Wit and Raillery; his Brain is encompassed with a Fence of fuch impenetrable Thickness, and his Spirits fo clogged with Dregs, and muffled up with Flegm, that his Head is inacceffible to all the Powers of Senfe and Ingenuity : He looks upon a Man of Wit to be no more than a merry, trifling Creature, formed by Nature like the Monkey, for no other purpole *HiggsM

pole than to make People laugh. These Perfons are either great Managers in Bufinels, and flavish Projectors of Wealth, or haughty and infolent in the Enjoyment of an over-grown Fortune. If you name a Man of shining Parts in their Company, the first Question they ask is, what is he worth? It is pleafant to see with what fupercilious Arrogance they pretend to look down on Qualities which are above them, and with what an impertinent Satisfaction they defpife what they are not able to attain,

Of the Influence of the SPLEEN on the Manners of Men.

N the preceding Parts of this Difcourfe, I have observed that the Teniperament of the Body, which Phyficians call the Spleen, while its Power is limited to a moderate Superiority, is not a Difease, but in reality a generous Constitution, which gives that Acutenefs, Vivacity of Imagination, and Abundance of Spirits, that exalt the Poffeffor above the Level of Mankind. From this active Spring, as it is differently mixed and modified by Combinations of various Humours, arife in this Island, where it fo much prevails, that great Variety of Men of Senfe and Wit, as well as weak and irregular Heads, who have however fuch an original Diffimilitude to each other, as cannot but surprize the Observer. Nor is the Spleen lefs concerned in fettling the numerous Characters which are found in the moral World, where Vertue and Vice take a different Turn, and acquire difinct

ftinct Properties and Appearances, as this Leaven, that agitates and exalts the Spirits, has more or lefs the Balance in the Complexion.

The Philosophers and Divines who have composed Systems of Ethicks, defcribe Vertues in their greatest Height and Perfection, and delineate the Ideas, as existing in their own Imagination, pure and refined from all Stains of the oppofite Vices, like those Painters and Sculptors, who sometimes by the Strength of Fancy represent more beautiful Faces than any which are framed by Nature; such were always esteemed the Venus of Apelles, and that of Cleomenes.

But the epick and tragick Poets, as well as the profe Writers of Characters, exhibit Vertue and Vice mingled and blended, as they find them really exifting in Mankind, where they appear in different Shapes and Diftinctions, arifing from the different Proportions in their Mixture.

No Man is adorned with Vertue fo refined and fpotlefs, that it is not debafed and fullied by fome impure Allay; nor have any acquired that fupreme Degree of Vice, which excludes all good Inclinations, and entirely extinguishes the Senfe of moral Evil. Should we therefore ab-T 3 ftract

ftract from Men of the higheft Clafs, who approach the neareft to Perfection, all their Excellence and Vertue, and draw their Characters only by their Faults and Follies, they would appear odious and ridiculous; on the other hand, fhould we feparate all their evil Ingredients from the worft of Men, and reprefent them by their good Qualities only, they would feem regular and amiable, or at leaft not deformed.

Though various specifick Natures are required to diftinguish one Order of Animals from another, yet in Morality the different Degree of Vertue or Vice, as one or the other is fuperior in the Mind, is fufficient to constitute and denominate a good or bad Man. From this predominant Degree the Line is drawn that limits the two opposite Species, and divides the moral World in halves, where the People of each Hemisphere are diversified by the various good and bad Qualities which meet together in their Temperament. It is eafy to difcriminate, by the confpicuous heroick Vertues of the one, and the prodigious Wickedness of the other, the best and the worft of our Race : But the loweft Rank of good, and the highest of ill Men, as well as the numerous intermediate Species

cies of each Kind, have fo great a Refem-. blance and Affinity to each other, that it is very difficult to fettle their Diftinctions.

As the feveral Combinations of Splenetick Madnefs and Folly produce an infinite Variety of irregular Understandings, fo the amicable Accommodation and Alliance between feveral Virtues and Vices produce an equal Diversity in the Difpolition and Manners of Mankind; whence it comes to pass, that as many monstrous and abfurd Productions are found in the Moral, as in the Intellectual World. How furprizing is it to obferve among the leaft culpable Men, fome whofe Minds are attracted by Heaven and Earth with a feeming equal Force; some who are proud of Humility, others who are cenforious and uncharitable, yet self-denying and devout; fome who join Contempt of the World with fordid Avarice; and others who preferve a great Degree of Piety with ill Nature and ungovern'd Paffions. Nor are Instances of this inconfistent Mixture less frequent among bad Men, where we often with Admiration fee Perfons at once generous and unjuft, impious Lovers of their Country, and flagitious Heroes, good-natur'd Sharpers, immoral Men of Honour,

Honour, and Libertines, who will fooner dye than change their Religion : And tho' it is true, that repugnant Coalitions of fo high a Degree are found but in a Part of Mankind, yet none of the whole Mafs, either good or bad, are entirely exempted from fome abfurd Mixtures.

Virtue never makes a more bright and amiable Appearance, than when it is introduced into a Complexion, where the Humours of the Body are fo perfectly blended, the conflicting Ferments fo well balanced, and the Activity of the Spirits fo moderated, that the Poffeffor is by that Temperament dispos'd to Industry, Benevolence, and Serenity of Mind. By this fine Nature refulting from their original Constitution, Children become a Soil prepared to receive the Seeds of Virtue, which cultivated by good Education, come forward apace, bear early Bloffoms, and foon rife to great Perfection. Tho' thefe are ranged in the higheft Clafs of excellent Men, yet their Mixture is faulty and imperfect; that gentle, humane and complaifant Temper, which disposes them to Goodnefs, not being accompanied with, a fufficient Portion of Fortitude, not only makes them unapt for brave and hazardous Attempts, but exposes them to unwarran-

warrantable Compliances, by which they may gain the Favour of ill Men, whence their Virtue receives many Blemishes.

Others have a noble Fire that pushes them on to great Undertakings and heroick Actions, in defending their Country, and promoting the Happinels of Mankind; but it must be acknowledg'd, that the fame Warmth of Temper exposes them often to paffionate Refentments, rafh Expreflions, and indifcreet Actions. The World is highly indebted to this active Complexion, that proceeds from a due Coalition of the Splenetick Leaven and refin'd Choler, which is requir'd to form the Patriot and the Hero; and it is reafonable to forgive their Faults and Irregularities, fince they fpring from the fame generous Principle, that makes them the Benefactors of Mankind, and the Glory of their Country: Were it not for their extraordinary Merit, they would be liable to fewer Errors.

The Men of Virtue first described by the Sweetness of their Disposition, the Government of their Passions, and their fine Humanity, have an undisturb'd Posfession of themselves, and provide best for their own Peace and Felicity; but the brave and active Individuals of the last

laft Sort, who neglect their private Intereft for the Good of others, and engage in the moft dangerous Enterprizes, notwithftanding their Imperfections, are the moft beneficial to Mankind; and this is the mixed Character of the greateft Spirits in all Ages, not only of Pagan, but of Chriftian Heroes, whofe generous, and fometimes ungovernable Fire, has been the Caufe of their illuftrious Actions; the firft fave themfelves, but the laft cheir Country; one is freer from Defects, but the other has more Beauties.

Another inferior Class of vertuous Men is constituted, when a prevailing Degree of Piety is infused into a Complexion where Flegm and Hypocondriacal Melancholy are united: In these, though Piety is indeed predominant, yet it is fo rough, querulous, and ill-mannered, that it makes an unlovely and disagreeable, if not a forbidding Appearance. It is furprizing to find a Man of Vertue either always fad, and tormented with Scruples; or fupercilious, fullen, and cenforious; to fee Piety mixed with Malevolence and Singularity, rude Sanctity, or discontented and defponding Goodnefs. Though a prevalent

lent Degree of Vertue gives them the Denomination of good Men, yet they cannot be reckoned as Members of the first Rank by any but themselves.

The next fort is of those where the Spleen has an inordinate Dominion. who are always wavering and irrefolute, and always halting between Vice and Vertue. From the Fluctuation of their Temper they divide their Time by reciprocal Returns of Sinning and Repenting, and fpend all the Periods of Life in violating and renewing their Vows and good Purpofes. These approach fo near to the Frontier of bad Men, that it is difficult to determine to which moral Species they belong. It is certain, that if their Vertue in this doubtful State is fuperior, yet the Diffinction is fo nice and hard to be difcerned, that the Possession are not able to observe it; and therefore can reap no Satisfaction from the Consciousness of their Vertue here, or the Expectation of its Reward hereafter. It must be an eminent Degree of Goodnefs, that by the Review of it can fill the Mind with Joy and Satisfaction. Weak and unequal Piety must leave a Man in conftant Suspence about his Safety,

Safety, while he still continues balancing and undetermined, whether his good or bad Actions, his Vertues or his Vices, have the Ascendent: But of this I have discoursed at large in the Essay on False Vertue.
