MEDICINAL NATURE

OF

HEMLOCK:

In which its extraordinary virtue and efficacy, as well internally as externally ufed, in the cure of CANCERS, SCHIRROUS and OEDEMATOUS TUMOURS, MALIGNANT and FISTULOUS UL-CERS, and CATARACTS, are demonstrated, and explained : the whole being founded on obfervations made in a variety of the respective cafes, where this remedy was administered by Dr. Storck, the Baron Van Swieten, Dr. Kollman, and others of the most eminent physicians and furgeons at Vienna.

Translated from the LATIN ORIGINAL,

Written by Dr. STORCK, Phyfician in ordinary to the Pazmarian city hofpital at Vienna.

LONDON, Printed for J. NOURSE at the Lamb opposite Katherine-Street in the Strand.

MDCCLX.

TO HER SACRED CESAREAN, ROYAL, APOSTOLIC, MAJESTY, MARIA THERESIA, MOST AUGUST EMPRESS OF THE ROMANS; QUEEN OF HUNGARY, BOHEMIA, DALMATIA, CROATIA, SCLAVONIA, &c.; ARCHDUCHESS OF AUSTRIA; &c. &c.

ANTHONY STORCK.

every means of instructing their pupils in all the principles of medicine; and rendering them perfect in that Hypo-CRATIC practice, which is alone the true: but the practitioners themselves, bred up in this school, following the example of their masters, take the greatest pains, by the most intense study, and assistance of bealing.

Not to be wanting, therefore, with relation to my own share in this important concern, I compiled last year, an account of facts observed in my hospital; and published them.

From whence I received the high fatisfaction of feeing, that they were approved, and praifed, though, perhaps, beyond their merits, by the most considerable persons of the profession.

Incited more strongly by this success, I have, the present year, also, exerted my my utmost endeavours in making another collection.

But it was my opinion, that, above all others, the new experiments, I had made on the use of HEMLOCK, were of most importance to be communicated.

Of these I, therefore, wrote a most faithful account; and formed a little essay.

This new work, as I conceived it might prove of great utility to mankind, I have humbly prefumed to lay at the feet of YOUR MOST SACRED MAJESTY; and to dedicate it to you.

Since, it is evident from a multiplicity of inflances, that you always receive, most graciously, those literary performances, which tend to promote happines and health : that you afford them your protection; and, from your conconsummate benevolence, render them more extensively beneficial.

ersi sterificitation and in the first and

It cannot be doubted, moreover, but that this effay, having the fanction of your glorious name, will induce other physicians, to make further experiments, undertaken with due caution.

As to myfelf, whatever, for the future, it may be within the reach of my abilities to perform, for the alleviating or removing the sufferings of sick perfons, I will (if it please God) endeavour to accomplish with the greatest ardour and industry.

a mark the line of

PREFACE.

THERE are many difeafes, of the cure of which, even the most ski ful, both of the antient and modern physicians, have been ignorant: as no remedy has been hitherto found out of force sufficient to overcome them.

Reafon therefore fuggefts, and duty urges, that we should exert our utmost abilities to bring any such to light.

May it not be reafonably conjectured, that what we want of this kind lies concealed in plants, with whofe virtues we are unacquainted; or of which perhaps we entertain an ill opinion?

I, indeed, myfelf, as it feems to me, have, in the ufe of hemlock, made proof of a medicine, that may be highly ferviceable in refolving inveterate fchirruffes, and curing cancers. B I do

PREFACE.

I do not, nevertheles, intend to exaggerate here the specific power of this plant; or to plume myself with the honour of any invention respecting it. All I defire is, that the fruits of my endeavours may be applied to the fervice of my afflicted fellow creatures, and may become beneficial to them.

I should be forry, therefore, that any perfor should, through motives of envy or interest, prevent a fair trial.

. This effay is divided into three chapters.

The first contains the description of the plant, and the remedy.

The fecond recites the cafes in which this remedy has been administered.

The third prefents fome corollaries.

N shady places where the foil is rich; and near ditches, and the fences of fields and meadows; grows an umbelliferous plant, which flowers in the month of July. Its leaves, affixed to long thick hollow footstalks, are divided, by various fections in the manner of sweet cicely (myrrhis), into many flender wings, of a blackifh green colour. The stalk, which is tall, ferulaceous, fmooth, light, thick, hollow within, and of a diluted green colour, but variegated with red spots like a fnake, rifes frequently to the height B 2

2

height of three cubits. At the top are umbels; on which which grow *little* white *flowers*; that are fucceeded by *feeds* refembling those of anise, but fomewhat whiter. The *root*, which is about nine inches in length, and of the thickness of a finger, is hollow when it fends forth a ftalk, but till then folid. The soft of a fingereable and ftinking. See *Morison*, Vol. 3. p. 290.

Botanists have named this herb cicuta vulgaris; and, in the English language, it is called HEMLOCK.

Pliny writes, that the green stalks of hemlock were eaten by many without the least injury.

Ray affirms, that a perfon of the name of Boulle gave the root of hemlock, to the quantity of a fcruple, in malignant and quartan fevers; and preferred it to all diaphoretics.

Renealmus, in observation 3 and 4, administered a scruple, or half a dram, of hemlock in substance, for the resolving the schirrus of the liver, spleen,

3

spleen, and pancreas; or gave an infusion made with a dram or two of the root of it.

Many officinal plasters, and unguents, receive the juice of hemlock into their composition.

Excepting this, it is, however, marked with black by almost all authors; reckoned among the poisons; condemned; and of courfe wholly banished out of medicinal practice.

It is found plentifully every where : yet has neither any use or place in gardens; nor is at prefent applied to the healing cattle, much less to the curing men.

Hence is it always produced in vain; and withers again without having answered any purpose.

We all know, nevertheless, that nothing has been created by God, which was not defigned for fome good, and use.

I was determined, by these circumstances, to examine the virtues of this

this herb preferably to all others; and, perfuantly to fuch intention, I confulted many of the antient and modern writers on the fubject.

I found, however, in the courfe of my reading, that this herb had, in antient times, been much ufed, by external application, for the difperfing cold tumours, refolving fchirruffes, and mitigating the pains in cancers; and with great effect.

But that, internally given, all agreed in exclaiming against it as a most deleterious poison.

The first attempt was, therefore, to be made in the external use.

Accordingly I fewed up this herb dried, and cut, in a mattrafs, betwixt two pieces of linnen, in the manner of quilting. This mattrafs I let remain in boiling water for fome minutes : and then, having prefied out the fuperfluous fluid, I applied it warm to the parts affected.

By

By this method, I fometimes ftopt the progrefs of the worft gangrenes; and procured a feparation of the mortified part from the found.

To those, who could not bear, on account of the disagreeable stink, and the itching produced by them, the mattrasses that were boiled in water, I applied others boiled in milk.

These they bore with ease; and did not perceive any inconvenience from them: but all, on the contrary, found then relief.

In the cafe of a man, fixty years of age, for many years afflicted with the gout, I not only in a fhort time quieted the pains; but intirely foftened and disperfed the gout ftones.

The further confequence was, that when the fits returned, they were neither fo violent, nor lasted so long.

In rheumatifms of long standing, and in the gout, I gave great ease to some patients, and wholly freed others,

by

by the pills below defcribed, and the hemlock fomentation.

I failed, neverthelefs, of doing fervice to fome, even by a long continued courfe: but I did not, that I know of, do the leaft harm to any.

In fchirrous ftrumas, indurations of the glands, and breafts, and very bad cancers, I faw and experienced very confiderable effects.

But where tumours, that are inflammatory, or arife from hot humours, occur, with them fuch hemlock fomentation is lefs proper.

It may, notwithstanding, be of avail even in these cases, provided due evacuations be previously made.

Plasters, into the composition of which hemlock enters, have also great utility in medicine; and they often refolve and disperse what refists all others.

I began from thence to doubt, whether that refolving, penetrating, difcutient power, might not refide in the juice of the hemlock.

The last

I, there-

I, therefore, prefied out the juice from this herb; and evaporated it with a very gentle heat, in an earthen veffel, to the confiftence of an extract.

As it would, however, have been criminal to have made the first trial of this extract on men, I gave a fcruple of it, with a piece of flesh, three times a day, to a little dog that was hungry.

I then watched carefully, what changes might be produced in him.

He remained, neverthelefs, well, lively, and waiting with eagernefs for the piece of flefh.

The fecond day, the fame quantity being given, I found no difference in the refult.

Nor even on the third did I perceive any bad fymptom in him.

Encouraged by this, I made the experiment on myself.

I took morning and evening one grain of this extract; and drank a cup-ful of tea after it.

19115

8

I attended then carefully to my regimen, that I might difcover from thence, if any unufual effect was produced in my body.

I continued this dofe for eight days, without perceiving the leaft inconvenience from it. I was active and ftrong; had my memory perfect; enjoyed a good ftomach; and flept foundly.

The next week I increased the dose; and swallowed then, morning and evening, two grains: nor did any thing ill or unusual happen in my body from thence.

I was, therefore, now justified, in reason and conscience, to try this on others.

The fresh root, when it is cut in pieces, emits a milk; which is acrid and bitter to the taste.

I rubbed a small drop or two of this milk on the end of my tongue. It prefently became stiff; swelled; and was very painful; and soon after

after I loft the power of fpeaking. This untoward event frightened me; and gave me great apprehensions of the confequence.

I recollected, however, from what I had met with in reading, that acids refift the powers of fuch fimples; and deprive them of their virulence.

I therefore washed my tongue all over with the juice of a lemon; and rubbed the end with it: after which I immediately felt great ease; the pains and tension went off; and I was able to stammer.

I repeated the fame a quarter of an hour after, and then began to fpeak more freely.

The juice being thus applied feveral times more; at the expiration of two hours, my tongue regained its liberty; and all my fears vanished.

May it not be reafonably queftioned from hence, whether the ftrongest poifon does not refide in the milk of the root?

9

When, however, the root is dried, and reduced to powder, it becomes lefs noxious.

For I have taken a grain, or fometimes even two, of fuch powder, without any ill confequence.

As foon as I was certain of this, I prepared the following pills.

Take of the fresh hemlock, as much as may be sufficient.

Prefs out the juice; and let it be boiled, while fresh, with a gentle heat, in an earthen vessel (often stirring it, lest it burn) to the consistence of a thick extract. Let this extract be formed, with as much of the powder of the leaves as may be necessary, into a mass for pills: from which, let pills be made of two grains each.

If the juice be expressed from hemlock, previously boiled for some time in a sufficient quantity of water, it will then make an extract less efficacious; but yet of some virtue.

The pills may be covered with filver or gold; or fprinkled with various powders; that the difagreeable fmell may be avoided.

The fame extract may otherwife be administered in boluffes, mixtures, or any other convenient form; left the patients may be difgusted with the continual use of the pills; and nauseate them.

In the early time of my practifing this method, I always began with the leaft dofe : and only administered, at first, one pill morning and evening. On the third or fourth day, I gave the fame pill three times.

After eight days, I began to give two pills thrice every day; and, by increasing in this proportion, I gradually rose (if occasion required it) till I came to a dram, or a dram and a half, in the space of twenty four hours.

Though I have given these pills in a continued course, for a year or two, or more, even to persons in health, I never observed any bad effects to result from it. Since

Since then, I have conftantly entered on the cure with a greater dofe of the pills: and, where there was an appearance of a good habit and ftrength, I have given at first two, three, or four pills, twice or thrice in the day.

It is, notwithstanding, always best, to begin with a small dose: for there are *idiofyncrasies*, in which medicines otherwise greatly innocent are hurtful. Hence, that we may incur no danger from these; and that we may gradually attain to the knowledge of the peculiar habit of such patients; it is best to proceed in the safe road.

At each time that the pills are taken, a bason of tea, or of mutton broth, should be also given after them.

If the powder of the root of hemlock be made into pills, with a fufficient quantity of the mucilage of gum tragacanth, a medicine is produced of great efficacy; but which requires greater circumfpection in the ufe of it. CHAP-

12

[13]

CHAPTER II.

CASE I.

A Very beautiful girl had for three years the left parotid intirely fchirrous; of a purple colour; and fometimes acutely painful, though at other times free from all uneafinefs. The tumour exceeded a man's fift in fize.

Various remedies, as well internal as external, were administered by different physicians and surgeons: but they all proved ineffectual.

At length the patient applied to Mr. Leber, furgeon of the city hofpital; and he called me into confultation with him.

The cafe, and former prefcriptions being duly examined, we perceived that remedies, highly refolvent and difcutient, had been used, as well internally as externally.

We

We concluded, therefore, that nothing of this kind remained to be tried, except malt fpirit, and mercury fublimate.

Accordingly, a plafter of labdanum being externally applied, we gave the malt fpirit, &c.; and ordered the patient befides to drink plentifully of the decoction of the roots of grafs, garden fuccory, dandelion, &c.

After taking these, with the greatest regularity, for three weeks, we did not perceive the least benefit, not even the least change.

We determined, therefore, to try the pills prepared from hemlock.

I began with only one grain morning and evening; and each time I gave a cup-ful, or two, of the infufion of the flowers of elder.

At the end of eight days, the patient returned to us: and with great fatisfaction declared, that the tumour was lefs, fofter, and more moveable.

Sur-

Surprized with the effect, we readily agreed, that the patient, who was extremely follicitous to recover her beauty, fhould continue the remedy.

Eight days more being passed, she came again to us; but the diforder was nearly in the same state.

On this account, I increased the dose; and gave two pills, morning and evening.

In confequence of this, within three days after, the indurated part was more than half diminished.

The fame dofe of this remedy being ftill continued, all the hardnefs went off in fix weeks.

There remained, nevertheless, a flaccid pafty bag.

I gave therefore a purge; and ordered the flaccid bag to be rubbed very often with a piece of linnen, impregnated with aromatic fumes of maftic, olibanum, myrrh, &c. : which was fo efficacious, that in about fix days the bag quite difappeared; by C which

which means, the girl intirely regained her former beauty.

I carried the girl, thus cured, to the illustrious prefident Van Swieten; and she herfelf related to him the whole history.

CASE II.

A Woman (about thirty years of age) had then, for feveral years, been fubject to this diforder; that fometimes in the arm-pits, fometimes in the groin, and fometimes in the neck, there came fwellings in the glands.

At first, on the application of a plaster, and taking a purge, these swellings always disappeared; but, in a greater length of time, they became more obstinate; and sometimes, on the use of plasters, turned into ulcers: which, a copious discharge of ichorous matter being made, after some weeks healed again of themselves.

The strength of the patient gradually diminished; the feet, and the axillary

17

axillary glands fwelled: and, at length, the left breast inlarged also, and became intirely fchirrous.

A plaster being then applied, an acute pain sometimes seized the breast: the indurated part turned into lumps; a purple colour came on, and afterward changed to livid; and, at last, the fkin, breaking in two places with the greatest pain, formed two cancerous ulcers, discharging a most fætid, and acrid ichor.

The pain was daily much increafed towards the evening.

The affected perfon went to feveral phyficians and furgeons; and took many medicines; but did not ever find any relief.

At last, on the fourteenth of September 1757, she came to me: and, having examined well the cafe, I thought it a very favourable opportunity for trying the pills : and I administered, accordingly, every morning and evening, two pills, each of which were of C 2

of the weight of one grain: giving her also an infusion of the leaves of the male speedwell to be drunk after them.

The twenty-fecond of September, I faw, with pleafure, that the livid was almost every where changed into red; and thence into the natural colour: the pains were much mitigated; and a thin pus-like matter appeared in the place of the ichor.

On the fecond of October, the colour of nearly the whole of the breaft was natural; the bulk, and hardnefs were lefs; the pains flight; and the matter good.

The fourteenth of October, the breaft again began to fwell; becoming red, hard, and greatly painful: while, inftead of pus, an ichor was difcharged.

I was mortified at this ill fuccefs of my experiment; but did not yet give up all hopes: for, on close inquiry, I understood, that the time of the

19

the menftrual flux was then; and concluded the caufe of the mifchief might be deduced from thence: for which reafon, I advifed the patient to go on with the pills without intermiflion.

The next day the menfes came down; the fwelling of the breaft went off; the natural colour returned; and the pains were diminisched: on which account the patient perfevered willingly in the course.

On the twenty-fourth day of October, I found the breaft much lefs, as well as fofter; with the matter good : and I directed, that now fhe fhould take three pills, every morning and evening.

On the third of November, there was a copious difcharge of good pus from the ulcer; the breaft was lefs; the patient felt frequent tinglings in it; and the tumours in the left arm-pit began also to be dispersed. The nineteenth of November, the C_3 patient

patient informed me, that fhe had had the menfes at the regular period; and that then her breaft fwelled again, and greater pains came on; but that, not difcouraged by this, fhe had always continued the pills.

When I faw the breaft, I found the part above the nipple almost of the natural foftness, and magnitude; but the part below the nipple, hard as a stone. I therefore gave then four pills morning and evening.

The fecond of December, the patient returned to me difpirited; and complaining, that fhe could not fleep on account of very acute pains in the night; that her appetite was wholly gone; her mouth bitter and clammy; and that fhe had frequent fœtid belchings.

But, at the fame time, fhe confeffed what was the caufe of thefe fymptoms. For fhe acknowledged, that a few days before fhe had eaten bacon, made hard by curing with fmoke, and cabbage

bage badly boiled; and that thence the weight in the ftomach and the nausea had been produced; and the pains increafed.

I prescribed, for this reason, a purge composed of two scruples of pickt rhubarb, and one scruple of cream of tartar: which gave five stools; soon reftored the appetite; and mitigated the other fymptoms.

After this, I administered every morning and evening five pills, each of two grains weight : so that she now took a much larger quantity than before.

On the eighteenth of December, the patient told me, that, in the time of the menses, she had scarcely felt any pain; and that the breaft had remained of its natural colour.

In examining the state of the tumour in the arm-pit, I felt, that it was much lefs, and very moveable. The ulcers were clean, and appeared disposed to heal; the pus they difcharged C 4 12233702

charged was small in quantity, and perfectly good in colour and confiftence. The half of the breaft above the nipple was intirely of its natural colour, fize, and foftnefs; but the half below the nipple, refifting all means, remained of a stony hardnefs. From whence arose a just ground of doubt of the practicability of discussing it. The patient, however, having feen fo great a progrefs towards a cure, promised to continue the use of the pills, in the most regular manner, without intermission; and, indeed, begged, that I would not refuse to let her have them.

I now administered fix pills every morning and evening.

The twenty-fourth of December, the patient felt extreme pain in the breaft; which again began to be affected with rednefs, and tenfion.

But she declared, that these bad fymptoms had come on during three preceding days, that the ulcers of the breast,

breaft, covered with thick crufts, had been clofed; and the free difcharge of the matter obftructed.

In order, therefore, to soften these crusts, I put on a plaster of sperma ceti.

The next day the crufts fell off; and an acrid ferous humour flowed from the ulcers, fucceeded by pus: and foon after the fwelling of the breaft diminifhed; the rednefs difappeared; and all the pain went off.

The twenty-fifth of January, the hardnefs below the nipple, which till this time had remained unchanged, began now to be difcuffed; the patient had no pain; and the menfes returned at the regular period, without bringing on any bad fymptom.

The third of February, the patient complained of continual belchings, and nausea; uneasiness at her heart; and stronger pains in her breast: and said she always felt the same when she eat garden-stuff. I found, nevertheless, with

with respect to magnitude, colour, and foftness, the breast was the same as on the fifteenth of January.

As I believed the flomach to be loaden with what fhe had eaten, I adminiftered a purge; which operated with great efficacy: and afterwards the courfe of pills was continued.

On the twenty-fourth of February, the patient was in good health; the fchirrus in the arm-pit, was much lefs; and the hard part, which ftuck below the nipple of the breaft, was found to be much fofter, and divided into fix fmall lumps. It afforded me great fatisfaction, to perceive, that this fchirrus, which had been hitherto moft obdurate, fuffered at laft a change.

The thirteenth of March, I found every thing in the fame ftate, without the leaft alteration. I advifed, therefore, that fhe fhould then take fix pills thrice every day.

The tenth of April, things were nearly in the fame condition: and the

24

the patient defired, that I would order her a purge ; because she felt some weight and nausea.

I gave her, therefore, one dram of rhubarb ; which brought away a great quantity of bilious matter; and fhe found herfelf well afterwards.

The twenty-fourth of May, the breaft regained nearly its natural foftnefs and fize; the ulcers began to clofe; and only a little pus, of a perfectly good colour and confiftence, was difcharged. The tumour in the armpit was very fmall.

On the third of July, the whole breaft was in its natural ftate; the ulcers were clofed; and the tumour in the arm-pit fcarcely exceeded the fize of a pea.

I now directed, that fhe fhould leave off taking the pills at prefent; and refume them again after fome weeks: that, by this method, I might perceive, whether, on the ceffation, the breaft would remain found, or grow worfe again, The

The twenty-fixth of August, I found every thing right; and the woman in perfect health.

At the time I first undertook the cure, afterwards at the expiration of five months, and again when she was perfectly recovered, I took this woman with me to the most illustrious Baron Van Swieten; that he might see the whole progress of the experiment. He always received great pleafure from it; and, from his natural generofity, made the patient each time a prefent of money.

CASE III.

A Woman, twenty-four years of age, in all other refpects healthful, found about a year before, in her right breaft, a fmall lump, that was hard, and moveable. It gradually increafed however in fuch manner, that, on the twelfth of October 1758, at which time fhe came to me, it had cquired the fize of a goofe's egg. I per-

I perceived, on examination, that it was really fchirrous.

I administered, therefore, every morning and evening, three pills, of two grains weight each : and I directed, that she should drink after them, in the place of the insustant, whatever she liked most,

On the twenty-fifth of October, fhe came again to me : and I found the tumour fofter, and a little lefs. She afked me, if it was not proper to apply a plafter : but I would not confent, as I was defirous to try what the pills alone could effect : and advifed, therefore, that fhe might now, morning and evening, take four pills.

The fixteenth of November, I obferved, that the fchirrus was divided into many fmall lumps: and the woman rejoiced at this good fuccefs. She had the menfes regularly, and did not, during the time of their being upon her, ceafe taking the pills; as fhe did not perceive the leaft inconvenience from it. I pre-

I prefcribed a purge; which operated well: and the fwelling of the breaft confiderably decreafed.

I afterwards ordered her to go on with the pills.

On the twenty-fifth of December, fhe returned to me: and the breaft was almost in its natural state; only a small pasty lump remained.

The third of January, the breaft had intirely regained its natural condition.

I then again prefcribed a purge : and, from that time, I have never feen the woman.

CASE IV.

I N the month of August 1758, a virgin, eighteen years old, recovered in the hospital from an acute difease; and afterwards began to regain her strength. But she felt excessive pains in her left breast: which had now, for the space of seven years, been as hard as a stone.

I gave

I gave her then pills of gum Ammoniac, Venice fope, fal polychreft, rhubarb, &c.: and the furgeon *Haffner* applied externally a cataplafm of Venice fope, diffolved in milk.

At first things changed for the better. The breast began to grow fost; and the pains to abate.

But after this, the pains again increafed; and the breaft became again harder, and purple. At length it grew livid; and after fome days, the fkin broke; and there was formed a foul ulcer, difcharging a very great quantity of a very ftinking ichor.

On this account, I applied externally the fomentation of the leaves of hemlock; and internally I gave, every morning and evening, three pills, of the weight of two grains each.

The pains were much leffened, even the fame day, by these remedies.

On the third day, the lividness began to vanish; and thin pus appeared

peared in the place of the stinking ichor.

The feventh day, the whole breaft was of a bright red; the ulcer was clean; the pains, which, in the daytime were flight, grew a little worfe towards the evening. The matter in the ulcer appeared now good, and the breaft foft.

The fifteenth day, the ulcer feemed difpofed to heal; the breaft was much fofter; and almost of its natural colour; and the pains were flight, or none.

The twentieth day, the breaft was lefs in bulk, and fofter; and the ulcer clofed.

The twenty-fourth day, exceflive pains came on : which, at that time, began in the place where the ulcer was clofed.

The use of opium became necesfary to allay the pains.

The twenty-fifth day, the breaft was extremely foft about the nipple; and

and fome fluctuation was fenfible, though obfcurely. At night, it was requifite to administer opium again, on account of the excruciating pains.

I began, befides, to give, from this day, four pills, every morning and evening; and the hemlock fomentation was alfo diligently applied.

The twenty-eighth day, the fluctuation was manifest; and the pains extremely acute. The patient herself intreated, that the breast should be opened; which I also advising, Mr. *Haffner*, a most industrious surgeon of my hospital, performed it.

A copious quantity of matter flowed out, the pains then abated; and the breaft collapfed; except that in one part only fome portions of the fchirrus remained. The colour of the breaft was natural.

After this, we used nothing but the pills and the hemlock fomentation: that we might try what these alone could do. A sufficiently great quantity of pus D was

was every day difcharged; and the fchirrous remains were fo quickly difperfed, that on the fortieth day fcarcely any part was left; and the ulcer, being clean, began now to heal.

The fiftieth day, the breaft was healed intirely; and the ulcer covered with a cicatrix.

This patient was, therefore, intirely cured by the pills and hemlock fomentation alone; and never perceived the leaft harm refult from the use of them. She had daily well concocted stools, except on those days when the opium was used.

At the close, I gave this patient a purge; which moved her very efficacioufly four times.

At the end of three days afterwards, the menfes came down for the first time; so that, being now perfectly well, she took leave of the hospital. CASEV.

A Woman, twenty-eight years of age, fix weeks after her last delivery, per-

perceived a pain in her right breaft; and her child refused to fuck it.

At first she applied nothing but a linnen cloth, impregnated with aromatics.

When, however, fhe perceived a hardnefs to come on, and the pain to grow worfe, fhe put a plafter on the breaft: but it turned red by that treatment; and the pains became fo acute, that the poor woman could take no reft, either by night or day.

At length (in the eighth month) fhe was feized with a fever, attended with great thirst, and a difficulty in breathing. On which account, the mother and the child were both brought into my hospital.

I then determined to feparate the child from the mother: but it would neither eat nor drink; and loft its ftrength by continual.crying; though, when it was brought again to the breaft, it became quiet; and afterwards flept foundly.

D 2

It

34

It was neceffary, on that account, to let the child fuck the mother.

As her fever was great, and her pulfe high and hard, I ordered the mother to lofe fome blood. I applied an emollient cataplasm to the diseafed breast : and I gave a resolving nitrous decoction, as well for her common drink, as by way of medicine.

Within two days, the pain in the breaft became much gentler; and the fever went off intirely.

I continued the remedies for three days longer; and then almost all the pains were removed: but the induration remained the fame. As the fever did not however return any more, I changed the medicines.

Externally I now put on a cataplafm of Venice fope, diffolved in milk; and I gave, as an internal medicine, the following mixture:

Take of Venice fope, half an ounce; and diffolve it in one pound of elderflower water. Then add of fal polychreft,

chreft, one dram; and of fyrup of fuccory with rhubarb, two ounces and a half. Mix them: and let the patient take one ounce every two hours.

I afterwards administered this mixture for ten days, without intermiffion: but did not, nevertheles, find any change in the breaft; and the patient gradually took a difgust to the medicine. Moreover, the glands of the child's neck, though it was otherwise in health, began to swell, and grow hard.

For this reafon, I gave to the mother, three pills, to be taken thrice every day : and I ordered, that fhe fhould drink an infufion of elder flowers plentifully after them.

Within three days, I felt the breaft fofter on the furface; and the patient faid, that fhe breathed more freely; and made more urine than was ufual.

The infant, rejecting the mother's breaft, did not fuffer any way.

After eight days, I found the schir-D 3 rhus

36

rus in the breast divided into many fmall parts. The child fell into a gentle loosenes; and the mother ceased to make so great a quantity of urine.

The twenty-fourth day, the whole breaft was pafty: and the patient had a good ftomach; and went to ftool as fhe was naturally accuftomed, before her illnefs. The child ftill continued to have a gentle loofenefs; but was not weakened by it: and the glands of its neck gradually returned to their natural ftate.

The twenty-fourth day, the breaft was almost well: and the child was not any longer afflicted with the looseness.

The thirtieth day, I gave the mother one dram of pickt rhubarb; by which fhe was well purged : and, after fome days, fhe went with the child from the hofpital; both perfectly well,

I did not, in this cafe, increase the dose of the pills: nine every day proved to be sufficient.

CASE

CASE VI.

A Man, fixty-four years of age, had a most stinking cancer; which eat away every thing from the corner of his mouth quite to his ear. All the remedies he tried, availed nothing against this difease. The Peruvian bark itself had no effect on it.

I gave, therefore, every morning and evening, fix pills, with the infufion of elder flowers: and, externally, I applied a diachylon plaster.

The first day, the patient found no relief from it.

The fecond day, the pains abated : the patient flept at night : and the ulcer was lefs foetid.

The third day, an acrid ferum flowed copioufly from the ulcer; and the lips, which were before very much fwelled, grew lefs.

The fourth day, the quantity of ichor discharged was less : and the stinking smell of the ulcer but slight. D 4 The

The fifth day, a thin pus appeared, inftead of the ichor; and the ulcer feemed to be pretty clean.

The fixth, feventh, eighth, and ninth days, things were observed to be the fame. The pains were flight; and the patient's appetite good.

The tenth day, the pains increafed again; and the lips of the ulcer were in a flate of tenfion, fwelled, and very red.

The twelfth day, the ferum again ran plentifully from the ulcer : by which the pains were mitigated ; and the fwelling of the lips diminisched.

The thirteenth day, the ulcer was again foul; diffused a stinking smell; and excited great pain.

The fourteenth day, I augmented the dofe of the pills; and gave eight, every morning and evening.

The fifteenth day, the ulcer difcharged ferum copioufly; and the pains decreafed much.

The fixteenth day, good pus was pro-

produced : and the patient was free from any pain.

The feventeenth day, the ulcer feemed clean; the pus perfectly good; and the pain was gone off.

The eighteenth day, things were found in the fame state.

The nineteenth day, great pains returned again; and the lips of the ulcer fwelled. On which account, the patient, having loft all patience, went into the country; and put himfelf under the care of a perfon, who kept a bagnio. The fuccefs of his plafters and decoctions was fuch, that the cancer fpread itfelf over nearly the whole face of the poor man; and in about three weeks time occafioned his death.

The pills, during their ufe, checked the progrefs of the cancer : for it neither gained ground in extent nor depth : but, on difcontinuing them, the patient foon grew much worfe.

CASE

CASE VII.

A Lady of a noble family thrust her breast too violently in hunting against the pummel of the faddle.

She did not fuffer great pain from it: but after a week or two, fhe perceived, in the fame breaft, a fmall lump, of about the bignefs of a pea. This lump, without giving any pain, increafed gradually fo much, that it exceeded greatly the fize of a wall-nut.

In this ftate, the lady fent to me: and I then, on examining the cafe, gave her three pills, every morning and evening.

On the eighth day, fhe came again to me : but on infpecting the breaft, I found no change.

The fixteenth day, the lump appeared foft on the furface. This lady never felt any pain in her breaft : but while fhe took these pills, fhe had every day two or three loose ftools more than usual. Her ftrength was not

not however impaired by it; nor her stomach weakened.

At the end of a month, the lump appeared lefs in fize, fofter, and much more moveable.

The fecond month being over, the lump was lefs by almost one half; and fost; for which reason, I advised her to continue the pills regularly: but, from that time, I never faw her again.

She was always well, during the time fhe took the pills; had the menfes regularly; and did not, during the time they were upon her, omit taking the medicine : as fhe never perceived any harm to refult from it.

CASE VIII.

A Woman, forty-five years of age, came to me March 23, 1759, having her left breaft very large; hard as a ftone; immoveable; first purple, and afterwards livid; and most acutely painful. She could not, moreover, move the arm of the fame fide, on account

account of the pain of the breaft, and the fwelling of the axillary glands: and her refpiration, on walking, was fhort, difficult, and fubject to coughing.

There were indeed all the figns of a latent cancer.

She afcribed the caufe and origin of this diforder to her hufband : who, fix years before, had preft too forcibly on this breaft, in bed. From whence this lump, which had increafed to fo great a bulk, and turned into a cancer, arofe foon after.

Before I administered any medicine to this woman, I took her to the Baron Van Swieten: who, things being duly weighed, acknowledged the cafe to be difficult, and worthy to become the fubject of an experiment: and advifed, that I fhould give her, morning and evening, three pills; and fend her to him once every fortnight, that, by this means, he might be certain of the refult.

The

The thirtieth of March, the woman came again to me, and faid, that her pains were lefs; but that, in other respects, the breast remained in its former state.

I ordered then, that fhe fhould uncover it : and I faw immediately, the colour of the whole was changed in fuch manner indeed, that the part, which before was purple, was now of a bright red; and the part, which was livid and blackifh, now purple. I alfo perceived, that, towards the arm-pit, the breaft was fofter : and I, therefore, advifed, fhe fhould continue the pills regularly.

On the fixth of April, I took her to the Baron Van Swieten : and he was greatly pleafed with the good effects of the remedy. For he faw, evidently, the colour, which before was cancerous, was now changed in fome places into the natural; in others into a bright red; and was no where, at prefent, livid. The woman declared, alfo,

44

alfo, that the pains were lefs; but that her refpiration was attended with the fame difficulty, and coughing, as before. The Baron, on feeling the breaft, found it every where fofter near its infertion, and lefs. On which account, he gave the woman money, to encourage her to perfift more willingly in the courfe.

The thirteenth of April, the breaft was again fofter, and a little lefs: but, above the nipple, there was a fpace, three inches long and two broad, which feemed no way changed; and was very red, and immoveable.

I ordered then, that the patient should, from this time, take five pills, morning and evening.

The twentieth of April, at which time the patient went to the Baron Van Swieten, fhe complained, that the pains, returning by fits, were acutely pungent, rolling, and burning. Her cough was fomewhat more frequent; and fhe faid, that fhe perceived, in coughing, a greater pain in her breaft; and that her lungs

lungs adhered, as it were, to it in fuch manner, as to draw it then inwards.

With refpect to other matters, a part of the breaft, towards the fhoulder, of fix inches breadth, was intirely in its natural ftate, as to foftnefs, colour, and magnitude. From whence the Baron Van Swieten faid, that the hardnefs of the breaft had melted like ice.

The fwelling above the nipple remained, nevertheless, yet unchanged.

In order to loofen the dry cough, I prefcribed, befides the pills, a decoction of the roots and flowers of marshmallows; with the syrup of the same.

The twenty-feventh of April, the patient complained of the fame cough and pains; but fhe obferved, that fhe could contract the thorax much clofer, than a fortnight before; and concluded thence, that the breaft was lefs.

We perfevered, therefore, in the dole of the pills, and the use of the decoction.

The fourth of May, we again went to the Baron Van Swieten. The breaft was lefs, and fofter, except the indurated part, which cohered firmly with the ribs above the nipple.

The twenty-eighth of May, the patient was better; the cough was lefs troublefome, the pains moderate, and the breaft fofter. The indurated part above the nipple continued in the fame ftate; but the cough began to difcharge a vifcid phlegm.

On the first of June, the Baron Van Swieten had great satisfaction, in seeing the breast was grown less by two thirds.

But the patient complained of pains, and a troublefome cough in the night. On which account the Baron advifed, that a dofe of the mafs for pills, prepared of hounds tongue, might be given her at night.

The twenty-fifth of June, the patient returned, rejoicing, that she had slept well, and seldom coughed; that almost

almost all her pains were gone; and that her respiration was free. What she spit was purulent.

The indurated part above the breaft began also to grow fofter.

The twenty-ninth of June, the patient found her refpiration become still freer, and she discharged with ease the purulent spittle: but the induration above the nipple was nearly in the fame state. For which reason, I applied externally the somentation of the leaves of hemlock.

The thirteenth of July, fhe came again; complaining, that the indurated part above the breaft began to be ulcerated, by the use of the fomentation.

In examining the breaft, I perceived, that the epidermis had feparated for a fmall fpace; that the fkin was broken; and that an acrid ichor ran from that part.

But on inquiring more particularly into the caufe, the patient confeffed, that, feeling a difagreeable itching and E ting-

tingling in the breaft, fhe had fcratched the indurated part of it with her nails, and rubbed it hard with her fhift; and, from that time, had felt a violent burning; and been fubject to the difcharge of the ichor.

I ordered the fomentation to be continued : and gave her the pills morning and evening.

The twentieth of July, a pretty deep ulcer was formed: of which the lips were livid; and the ichor extremely ftinking. The patient had also greater pains; and spit pus.

The twenty-feventh of July, the ulcer was ftill deeper; but the pains were abated. The ichor, which was difcharged, ftunk; and no pus was produced: but a broad hard fortid core, like leather, grew out of the ulcer: from whence it feemed, that the hard part above the nipple, which till this time refifted every thing, diminifhed now by exfoliation.

The purulent spittle was discharged in

in a large quantity : but the cough excited tension, and great pain in the ulcer.

The lips of the ulcer recovered again gradually their natural colour.

I received the patient in this condition into my hospital.

Mr. Haffner, the furgeon, dreffed her twice every day; and filled the ulcer with lint moiftned in the infufton of hemlock : feveral cores like leather were daily thrown off : and the fwelling much diminished. The patient had no pain; she slept without opium; but coughed frequently in the night; and spit purulent matter.

The fifth of August, pus began to appear in the ulcer : almost all the bad smell went off : and the hard part diminished by supportation. The lips of the ulcer were clean, and of a good colour. The strength of the patient was not defective : she spit freely, and breathed much more easily.

The fixteenth of August, I took her again with me to the Baron Van Swieten,

49

50

he was furprifed, that the fchirrus, before fo obftinate, diminifhed now by a kindly fuppuration; and afforded the greateft hopes, that the remaining fmall hard part, being confumed, the ulcer would clofe of itfelf.

Every thing fucceeded extremely well: and accordingly the ulcer gave many figns that it would foon be healed.

The twenty-fourth of August, the patient complained again of a frequent cough; and great pains occasioned by it in the breast, which she faid was, as it were, bound with a cord, that in coughing drew it to the hollow of her cheft, with the most acute pain. From thence her nights were again disturbed; and it was, therefore, requisite to have recourse to opium.

On the use of the opium, the patient was well; had a good stomach; increased in her strength; was less troubled with the cough; and spit the purulent matter easily.

The

The fecond of September, about eight in the morning, I faw her in a good way, got out of bed, and walking about; and fhe neither complained of any pain or cough.

On the fame morning a quantity of wine was privately brought to her by fome friends: and, when they were gone, fhe drank freely of it, with her ftomach yet empty. From whence fhe was feized with a giddinefs, and vomiting; fell down; and, within a few minutes after, died apoplectic.

We found many varicofe veins in the dura and pia mater: and the cerebellum was compress with a large quantity of grumous blood.

The whole middle lobe of the lungs on the left fide was fchirrous and heavy: but the upper lobe partly fchirrous, and partly fuppurated.

These two lobes were strongly conjoined with the fore part of the pleura; and would not admit of being separated without tearing.

E 3

The

The ulcer was clean, the mufcles of the breaft intirely found, and the lips of the ulcer were perfectly well coloured; and had begun again to unite with the contiguous parts, and almost to join with each other. From all which, no body could doubt of the intire cure of this ulcer.

CASE IX.

A Young woman, aged twentythree, had had for two years the glands fwelled, and fchirrous, round her whole neck; from whence it was grown almost as thick as her head.

Many of these glands were exeded by cancerous ulcers.

The patient had not found the leaft relief from the innumerable remedies, administered by different physicians and furgeons, which she had tried ; and at last came into our hospital.

Mr. Haffner, who is a very eminent furgeon, applied, and used every thing externally, which his art could dictate. I ad-

I administered befides, copious decoctions; and pills from the ferulaceous gums, the refin of guaiacum, Venice fope, terra foliata tartari, the mass of pills from the cathartic extract; &c.

For fix weeks, these remedies were regularly continued; but yet I did not perceive any amendment in the diforder.

The ulcers continually wept a fætid and malignant ichor : and the ichorous matter corroded the cellular membrane; and produced finuffes, and fiftulas.

These things being duly weighed, I gave her the malt spirit with mercury sublimate.

But this, though fhe drank a large quantity of decoction with it, occafioned pains in her breaft : and fhe began to cough, and complained of a heat in the fternum.

I continued, neverthelefs, the ufe of the malt fpirit for a month : as the difagreeable fymptoms, brought on by E 4 the

54

the use of it, were afterward rendered much more gentle: but a flight falivation attended then this abatement of them.

On this account, I left off the ufe of that remedy; and, applying externally the hemlock fomentation, gave thrice a day four of the pills; and with them an infusion of ground-ivy, male speedwell, agrimony, &c.

The fixth day, the pains were abated: the lividness of the ulcerated glands was turned into a bright red, the ichor disappeared; and a diluted pus succeeded it.

The tenth day, the fwelling of the neck and glands was much lefs; the ulcer pretty clean; and the matter good. The patient, moreover, flept well; had a good ftomach; and was free from pain.

On the twenty-first day, a cicatrix was spread over some of the ulcers; the swelling of the neck was much less; most of the glands had regained their

55

their natural state; and the finusses were less deep.

I ordered then, that the patient should take fix pills, thrice every day.

The thirty-fecond day, every thing feemed to be better: moft of the finuffes were clofed; except that two large callous fiftulas remained on the left fide. Thefe, however, being cut, according to the practice of furgeons, were cured by the fame fomentation, and the pills, within a fortnight: by which time nearly all the glands were reftored to their natural ftate; and the fchirrous hardnefs could not any longer be felt; as nothing but a few pafty lumps were to be found.

I gave the patient then a purge, composed of half a dram of rhubarb, eight grains of scammony, and fifteen grains of fal polychrest: which worked fix times without weakning her.

After this, fhe took for a month, fix pills, thrice in a day: but nothing was now applied externally.

At the expiration of this month, fhe got perfectly well. This patient had the menfes, during the whole time, at the regular periods : and the pills did not produce any diforder.

I kept her, after fhe was cured, for three weeks longer in the hofpital; that I might know, whether the fwellings of the glands would return: or whether any of the finuffes, if prematurely clofed, would again break open.

But fhe remained perfectly well: and I, therefore, difmiffed her from the hofpital; after defiring her to come back to me, if any the leaft fwelling fhould appear.

It is, however, now feven months fince; and I have feen nothing of her.

GASE X.

I N the cafe of a virgin, eighteen years of age, the fubmaxillary glands were become wholly fchirrous; and fome of them were almost equal in bulk to a hen's egg. I gave

I gave her, in those circumstances, fix pills morning and evening: which she took for a whole month without almost any effect.

The fixth week, the tumours first began to fosten, and grow less.

Afterwards, a pafty foftnefs was obfervable throughout the whole compafs.

The feventh week, I began to give her fix pills, thrice every twenty-four hours; and I joined to them, every eight days, a purge of rhubarb.

By this method, the patient was perfectly cured in the fpace of three months.

CASE XI.

A Woman, fixty feven years old, had a moft fætid running cancer in her left breaft: which was of fo great an extent, that the fuperior extremity reached almost to the lower jaw; and the inferior went down quite to her belly.

The Baron Van Swieten, Dr. Dietman

man the Dean, Dr. Glaffer professor of anatomy, Dr. Jaus professor of furgery, and others, who were examiners in the furgery-chamber of the university, first faw this woman, and sent her to me, on the twentieth day of June, 1759.

The whole breaft was of a brownish black colour, and full of lumps. The ichor flunk most abominably, even at a great distance; and the patient could neither eat nor sleep for the pain.

I ordered, that fhe fhould take four pills, morning and evening; and I applied externally, during the day, the fomentation of the leaves of hemlock; and, at night, a diachylon plafter.

The twenty eighth of June, fhe came again, and told me, with great joy; that fhe did not at prefent feel fo much pain; that fhe flept foundly at night; and did not perceive the bad fmell fo great as before.

On examining her breaft, I obferved

ferved a thin pus, inftead of the ichor. The fixth of July, the colour of the breaft was reddifh, the pus difcharged by it good; its bulk lefs; and the fœtor weak. The patient faid, alfo, that, in the mean time, a great many cores, which feparated from the breaft, had fallen off: and that every other, or every third day, a large quantity of ferum was difcharged from the breaft; which was vifibly reduced in fize.

The twenty-fecond of July, all things were still more amended: and the patient complained of no inconvenience.

After this, I took her again to the chamber of the univerfity, while the phyficians were examining there.

The Baron Van Swieten, the Dean, and all the professions of physic, who had before feen this poor woman, were greatly surprifed at the extraordinary effect; and sudden change.

For the breaft was quite of its right colour;

colour; the stink scarcely any; the pus good; and the bulk of the cancer less by one half.

The Baron Van Swieten then gave the patient money; and advifed her, in the most perfuasive terms, to perfevere regularly in the course.

The third of August, the breast feemed to be grown still less. But the patient was disturbed, at night, with pains, that came on towards the evening. This rendered a paregoric necessary: which removed all complaints.

The fomentation, and the pills, were continued conftantly in the fame dofe.

The twenty-fifth of August, the cancerous breast was not much bigger than a man's fist: the pus was good: the fmell gone off: and the strength of the patient, considering her age, as it ought to be.

The twenty-fixth of August, we again went to the Baron Van Swieten: he

he faw that every thing was extremely well; and was much fatisfied with it. There was, indeed, the greatest ground of hope, that in a few weeks, if things continued to go on fo, the cancer would be wholly discussed.

The fecond of September, the patient was well in all respects : and the cancer was not now fo big as a man's fift.

The fixth of September, she fent to me, to inform me, that fitting early the fame morning in the ftreet to fell fruit, she felt, in consequence of a ftrong blaft of wind, a very great cold, in every part of her body : that foon after, she was feized with excruciating pains in her belly: which were followed by a violent and painful purging, which had much weakened her.

I ordered then, that fhe fhould leave off the pills; and I prefcribed other medicines fuitable to fuch a diforder. The next morning, the took care to

to let me know, that the loofenefs and pains were the fame; that fhe voided blood with her ftools; that her thirft was great; and that fhe had frequent faintings.

On this account, I and Mr. Laber the furgeon, went to her the fame morning : and I administered, both internally and externally, with the greatest attention, whatever I believed could be of any fervice : but all was in vain.

The third day, her face appeared like that of a corpfe: and the fourth fhe died.

Mr. Laber cut off her breaft after the was dead; and carried it to the chamber of the univerfity, during the medicinal examination.

The Baron Van Swieten, and all the professors of medicine, faw the quick, and extraordinary good effect of the remedy, in this desperate case: and were, confequently, mortified, that the successful progress of the experiment

periment had been fruftrated by the accidental death of the patient.

CASE XII.

ON the fourth day of April 1759, profeffor *Haen* fent a woman to me: whose neck was full of innumerable schirruss; of which many were turned into malignant ulcers.

Her whole left breaft was alfo fchirrous: and the part near the armpit was grown of a livid and purple colour: from whence, through a fmall orifice, a great quantity of burning, and corrofive ichor, iffued out.

Besides these, she had also many schirrusses, both in the arm-pits, and the groin.

At first, I gave this woman four pills, thrice every day; with an infusion of the male speedwell, to be drunk after it.

The fame day fortnight, the patient came again to me; and faid, that, by the use of the pills, the ulcerated F fchir-

fchirruffes difcharged a much greater quantity of ichor: but that in iffuing out, it did not excite fo great a heat.

The colour of the fchirruffes, before livid, were now natural, or of a bright red. Their magnitude was alfo lefs; and both her neck, and the glands, were more moveable.

The patient also felt herself easier in the arm-pits: for she could move her arms more freely; and bring them close to her body without pain: which was before impossible.

The livid colour almost wholly difappeared in the breast; which was foster, and less in bulk: and good pus ran from the small orifice in it.

I thought it proper, to continue ftill the fame dofe of the pills: and I delivered to her fuch a quantity, as might be fufficient for three weeks: that, as fhe lived at a great diftance, fhe might not have occasion to come fo often.

When she had taken these pills, she came to me again. Many of the schir-

65

schirrusses were now intirely gone away; feveral of the ulcers were fpread over with a good cicatrix; the lumps in the arm-pits, and the groin, were become very fmall, and were all moveable, and free from pain; the breaft was almost in its natural state, both as to fize and hardness; and very little pus could be preffed out of the orifice.

I gave her then, the quantity of pills that would ferve a whole month: but I did not order any increase of the dofe.

At the end of the month, she came back to me; and afked me, whether fhe ought to continue the pills any longer or not; fince she did not perceive in the neck, arm-pits, groin, or breaft, any pain, or other diforder; as the ulcers were all healed; and the fchirruffes grown fo little, that she could bear them now without the leaft trouble.

When I examined the breaft, I found it intirely in its natural state: the orifice

fice was well closed; and the lump, towards the arm-pit, felt scarcely diftinguishable, on account of its smallness.

The ulcers of the neck had firm cicatrices: and the fchirruffes were either gone away; or were grown fo fmall, that not a feventh part remained at prefent.

In the arm-pits, indeed, one or two fmall lumps, of about the bignefs of a pea, were found; but every thing elfe was foft, and in its natural ftate.

The patient faid, that all the fwellings had difappeared in her groin: and that, now, fhe could walk as freely as ever.

I gave her again the quantity of pills for a month : and I bid her return to me when fhe had taken them.

But, indeed, I have hitherto expected her in vain.

CASE XIII.

A Girl, eighteen years of age, had had, for many years, the parotids,

tids, fubmaxillary glands, and whole neck fchirrous; and fo much fwelled; that her neck was grown much thicker than her head.

The remedies prefcribed by the most fkilful physicians, and furgeons, afforded her not the least relief.

On the contrary, feveral parts began to grow livid; to be exceffively painful; and at laft to turn into ftinking ulcers. Nocturnal fweats, depression of the ftrength, and wasting of the flesh, also came on.

Notwithstanding the girl was much beloved by those, in whose fervice she lived, yet it was necessary, on account of the shocking ulcerations, the great and malignant stink, and the danger of contagion, to remove her into our hospital.

Mr. Haffner the furgeon, and I, found, among the ulcers and fchirruffes, innumerable finuffes, and fiftulas; and the patient was, moreover, very weak; and complained, that fhe F_3 could

could not get any fleep on account of pains in the night.

It was requisite, on this account, to use opium in the evening.

I then gave her twice every day three of the pills, with an infufion of ground ivy, fcabious, male speedwell, and a large quantity of milk. Externally we applied the hemlock fomentation.

The third day, the pains were much gentler, and the ichor ran plentifully. It was acrid, indeed, but not fo ftinking. The patient's neck also feemed fomewhat less fwelled.

The eighth day, there appeared to be good pus; feveral of the glands were become moveable; and the patient began to fleep without opium. The night fweats were alfo lefs profufe.

On the fourteenth day, the pus was good in almost every part; and the schirrous tumours less.

I increased, then, the dose of the pills; and gave four, morning and evening. The hemlock fomentation was also diligently applied. The

69

The thirtieth day, the nocturnal fweats were wholly gone off: many of the finuffes were clofed : the ulcers were of a perfectly good colour: and fome even were difpofed to heal. There remained, neverthelefs, three callous fiftulas, which required to be cut according to the practice of furgeons.

On the forty-fourth day, fome of the ulcers were healed : and the reft yielded good pus. The fwelling of the neck was much lefs : and the patient had recovered both her appetite, and her ftrength.

The fixtieth day, nearly all the ulcers were clofed : the fwelling of the neck was gone down : the fkin had regained its natural colour : and all the glands were lefs, and moveable. But, above the left clavicle, there fluck a fchirrus, bigger than a goofe's egg, which founded like a cartilage, on being flruck. This tumour had not fuffered the leaft change, during the F_4 whole

70

whole time the remedies had been used.

The feventy-fourth day, many of the fchirruffes were found divided into feveral fmall portions. One gland, in the left part of the neck, turned again into an ulcer; and ran purulent matter for three days. After which the whole bag collapfed; and within a few days a cicatrix was formed.

The ninetieth day, the neck had its natural colour and magnitude; not a tenth part of the fwelling remaining now. The fchirrus, above the clavicle, continued, neverthelefs, in the fame ftate: and, as it was immoveable, and refifted all the powers of medicines, we thought it advifeable to cut it out. But the patient would not confent: and, as fhe had now recovered her ftrength, and could move her neck eafily, fhe went from the hofpital home.

For two months, fhe omitted taking any medicines: during all which time, the

the schirrusses neither became bigger, nor less.

At length she came to me again, to ask whether she might not take the pills, in the house where she was a servant.

I advifed her to it; and I gave her fome, to be taken, three every morning and evening.

After three weeks, having used her quantity of pills, she came back to me; and the schirrusses were become less and moveable.

At the end of the fifth week, fhe returned again to me; and fhewed me, with great joy, that the fchirrus above the clavicle, which had been most obftinate, and which we before believed to be cartilaginous, was now lefs, and divided into fix fmall lumps.

I was furprized to fee the effect, I had fo long time withed for : and I advifed, that the thould now take four pills, morning and evening.

After a month, I faw her again: and every thing was grown better.

She

She has now used these pills five months: and, at present, takes fix thrice every day. She is strong, sleeps well, breathes freely, which before she could not, enjoys a good appetite, and has every day a natural and well concocted stool. All things promise a slow, indeed, but yet a perfect recovery.

CASE XIV.

O N the twelfth day of September, a woman came to me, about forty years of age, whofe right breaft had been fwelled for fix weeks before ; and was now become fchirrous.

The most learned Doctor *Collin* a physician, who did me the honour to be then with me, faw this woman at the fame time.

I gave her at first three pills, thrice every twenty-four hours; and I ordered that she should come again to me at the end of eight days.

She returned then greatly encouraged; because the schirrus was softer, and moveable. I ad-

72

The World

I advifed her, therefore, to perfevere strictly in the course.

Three days after, I took measures, that Dr. Collin should be again present when she came to me: and he admired greatly at the quick effect the remedy had on this woman: for more than half of the schirrus was gone away.

I delivered to her, then, a fufficient quantity of the pills to ferve for a whole month; that, as fhe lived at a great diftance, fhe might not be obliged to come to me fo frequently.

When she had taken these pills, the schirrus was scarcely bigger than an egg.

I ordered her at that time a purge; and fupplied her with pills for another month.

At the end of that month, I expected, and was very defirous to fee her: but she never came to me again.

CASE XV.

A Man, fifty-three years of age, by lying with an infected woman, con-

contracted the venereal difeafe: which partly from fhame, and partly from want of money, he neglected.

At length the left tefficle grew exceffively painful; and became wholly fchirrous: and the penis increafed fo much in bulk, as to far exceed that of a horfe.

At laft, fungous excreicences arole in three places on the penis : and, in a fhort time, turned into cancers, which flunk extremely.

The fcrotum itfelf was, likewife, exeded by a cancerous ulcer : and the left tefticle, being wholly laid bare, hung out of the fcrotum in an ulcerated cancerous ftate.

Hence the poor man could neither lie down, nor fleep, on account of the pain: much lefs was he able to walk.

On this account he entered into our hospital, under these most deplorable circumstances.

Mr. Haffner, the furgeon, and I, were intolerably annoyed with the ftink,

ftink, while we examined the parts. The left tefticle, hanging out of the fcrotum, was wholly cancerous; and more than twice, as big as a man's fift.

Neither the penis, fcrotum, nor tefticle, could bear to be touched with the leaft force; for it occafioned a great quantity of blood to iffue out.

The patient frequently fainted from weaknefs: and the flink was fo great, that we could not let him flay with the other patients; but were obliged to put him in a feparate room.

At first, I gave him, every day, one ounce and a half of the Peruvian bark: that, by this means, I might correct the acrimony; and procure a separation of the corrupted part from the sound.

But the fourth day, he refufed abfolutely to take the bark any longer, in whatever form it was adminiftered : nor did we, indeed, perceive any relief or change from it : but, on the contrary, he declined in his ftrength; and intirely loft his appetite. In

In this defperate cafe, I determined to try the pills, and hemlock fomentation.

At first, I gave him fix pills thrice every day: and I made him use the fomentation diligently on the parts affected.

The pains abated the very fame evening: and the poor man began to fleep naturally.

The next day, many putrid cores feparated; the penis was lefs fwelled; and the bad fmell was not now fo ftrong.

The third day, every thing appeared to be still better.

The fourth day, the pus was good in all the cancerous ulcers : the penis was lefs by one half : the tefficle was alfo diminished in fize, and fofter : the ulcers had a kindly colour : and the patient flept without opiates ; and began to have fome appetite.

The eighth day, the penis was almost reduced to its natural fize : the cancerous

cerous parts were much mended : the pus continued every where to be good : great cores feparated themfelves from the fcrotum : and the tefficle was foft ; and fcarcely bigger than an egg.

The twelfth day, every thing appeared to be still mending.

The eighteenth day, no remains of the cancer could be feen : the tefficle recovered its natural fize, and colour : and what had been eaten away by the cancerous ulcer appeared to be growing again.

The lips of the fcrotum, which were now of a perfectly good colour, began to unite : there appeared on the penis, in the place of the cancerous excrefcences, flat ulcers that were very clean : and the patient was better in all refpects; and had more ftrength. I went on, therefore, to the thirtieth day with the fame dofe of thefe pills, and the hemlock fomentation : and then the fcrotum was intirely healed : and the ulcers

78

ulcers on the penis much lefs and clean.

But the patient complained of being continually troubled with a difagreeable itching all over his body: on which account, left any thing venereal, lurking in the blood, fhould produce other deplorable fcenes, I performed the reft of the cure by antivenereal remedies.

In this cafe the pills, and fomentation, had been of greater avail than could ever have been hoped.

Dr. Kollman, phyfician to the army; Mr. Laber, furgeon of the city hofpital; brother Abdon, furgeon among the brethren of the mercy in Leopoldina: and others of my friends of this profeffion, whom I took to fee this patient, were greatly furprized at the quick, and fcarcely to be hoped for effects of the remedy.

CASE XVI.

A Woman, thirty-fix years of age, had, from fome unknown caufe, two

CHAPTER H.

two fiftulous ulcers in the left part of her neck; which produced fo many, and fuch extraordinary finuffes, that Mr. Haffner could penetrate, with his probe, to the tongue; the fternum; and, between the œſophagus and the aſperia arteria, to the opposite part of the neck : and what was more a subject of wonder, these finuffes had spread themselves through the whole thorax.

For when injections were made, according to the practice of furgeons, into the fiftulas, the patient felt them penetrate, in the fore part, to the bed of the heart : and in the hinder part even to the loins.

This was readily believed by the furgeon: for, in order to fill the finufies, fix ounces of the injected matter were, for the most part, necessary.

We tried every thing that appeared plaufible to us, or that the best authors had recommended in fimilar cases, to cure this disease.

But the whole intirely failed to pro-G duce duce any effect: for, after haraffing the poor patient in vain, for fix whole months, with various decoctions, injections, fomentations, and other remedies, exceffive pains came on ; and her body began to be in a wafting condition.

For this reason, Mr. Haffner, and I, refolved to try the hemlock on this fubject.

We, therefore, applied the fomentation to the whole neck and back.

Mr. Haffner injected, also, the fiftulas and finuffes with a weak infusion of the hemlock, twice every day.

The patient took, moreover, morning and evening, fix of the pills.

From the very first, the pains were allayed : and the patient flept without opium; which before fhe had not been able to do.

The third day, the furgeon found, that the fiftulas took a less quantity of the injection.

The tenth day, the patient found her-

herfelf well: and every thing feemed to be healing.

The fourteenth day, fcarcely two ounces of the injection could be thrown in.

The patient complained of tenfion in the back, heat in the sternum, and dryness in the throat.

On this account, I advifed, that the furgeon fhould leave off injecting the infufion of hemlock : and only ufe, in its place, the decoction of barley, thrown in by the gentleft motion.

This being done, within three days after, every thing was healed; and the fiftulas had got firm ciatrices.

This woman was detained in the hospital fix weeks afterwards; and we never found the least return of her diforder.

CASE XVII.

A Man, to whom an inducation in the anterior part of the abdomen, of the length of a span; and the breadth G_2 of of half a fpan, happened from the fudden fuppression of a quartan, was cured intirely in my hospital, within the space of four months, by only using these pills, with purges at proper intervals.

I had, likewife, two other fimilar cafes in my hospital at the fame time; of which the cure succeeded perfectly well by the pills.

The fame even diffolved a fchirrus of the liver; and cured the jaundice caufed by it: but a large quantity of whey was drunk along with them.

But, when, after intermittent fevers, the fpleen is inlarged, and its fubftance becomes fpongy, the pills conduce little to the cure : nor indeed do any other medicines at all avail under fuch circumftances.

CASE XVIII.

I N the cafe of a man, fifty years of age, blind with cataracts in both his eyes, and recovering from an acute difeafe in my hospital, the pills had so great an effect, that, in two months, he

CHAPTER H.

he could not only walk without being lead; but could diftinguish objects, and colours.

CASE XIX.

IN a girl, of the age of twentytwo years, the fight was rendered fo weak by recent cataracts in both eyes; that, without the greateft care, fhe could fcarcely walk alone.

By the use of the pills, however, in ten weeks, the cataracts were intirely dispersed; and her sight was so well recovered, that she could thread the smallest needle; and spin in the greatest perfection.

Mr. Laber took this girl to the Baron Van Swieten; and he heard a relation of the cafe; and faw the effect of the remedy.

CASE XX.

A Woman, twenty-five years old, had a fchirrous ftruma; which not only covered the fore part of her G_3 neck, 84

CHAPTER II.

neck, but extended itself into the cavity of the breast, and occasioned a difficulty of breathing.

By the ufe of the pills, in the fpace of four months, the ftruma was confumed, partly by fuppuration, and partly by a gentle difcuffion; and the refpiration rendered intirely free.

At the fame time, fhe was cured of a deep and malignant ulcer in the left thigh; which had refifted the power of every medicament; and baffled, for more than half a year, all the art of the affiduous Mr. Haffner, the furgeon of my hofpital.

These are trials, which I have made with complete success. I could mention others, indeed; but as they are not yet brought to a period, I chuse rather to pass them over in filence.

That my experiments may not, however, ftand alone; and that I may not feem to reft the whole of a matter, that concerns myfelf, on my own authority; it is proper to give an account

ot

of others, that were made by men of the greatest character in the profession.

There were three fifters; two of whom were fuffocated by fwelled and fchirrous glands in the neck. The third, the Baron Van Swieten faved, and cured by these pills.

In a fimilar cafe, where art had been in vain almost exhausted of refources, and where even the force of electricity had been applied without success, the *Archiater Kestler* produced most extraordinary effects by the use of these pills. He did not, moreover, observe any bad symptom to result; though, for a long time, he gave the patient every day thirty pills, each of two grains weight.

In the military hospital, at Leopoldina in Vienna, there was a soldier, in whom a schirrous of the right parotid increased to such a degree, that it covered all the side of his face quite to his eye.

This fchirrus, accompanied with the greatest pain, a livid and blackish co-G 4 lour,

lour, and others the worft fymptoms, threatned to become a very bad cancer: which, it was to be apprehended, would terminate in a confumption.

Dr. John Kollman, physician to the army, who prefided in this hospital, had recourse then to my pills; and applied externally the hemlock fermentation.

By which means, he not only, in a fhort time, took away all danger of a cancer; but difperfed, in a few weeks, nearly the whole fchirrous fwelling.

The honeft foldier, not regarding, as of any confequence, the fmall remains of the fchirrus, would not continue any longer in the hofpital; but went from thence to the army intirely well in all other refpects.

A lady of great quality concealed a latent cancer in both her breafts, for three years.

At length the pains became intolerably acute; and from thence livid lumps were produced in the breafts, which

86

which prefaged a cancerous ulceration of the worfe kind.

Being greatly affected with this, fhe fent for Dr. Joseph Pock, a phyfician who practifes in this city; and difcovered her diforder to him. He, on knowing thefe particulars, immediately concluded to give her my pills: which proved fo efficacious, that, within three weeks, not only all her pains ceafed; but both the blackifh and livid colour difappeared; and the natural returned.

After some days, the lumps diminished.

In the space of fix months, the hardness on the surface of the breast began to soften.

After two other months, the large indurated part, divided into feveral fmall lumps; which, on taking a purge, went away; and the whole bulk of the breaft grew lefs.

This lady, feeing fuch evident good effects from them, took the pills with the greatest regularity, and confidence; and and attefted, that fhe not only found fo great relief with respect to her breast, from the use of them; but that she was also freed by them from vomitings and the heart-burn, with which she was before troubled several times every day; and also from rheumatic pains, to which she was frequently subject.

In this most fuccessful progress of the experiment, an acute inflammatory difcase came on; which proved fatal.

The blood, taken from the veins feveral times, in this acute difeafe, was always rich; and very thick. Whence it appears, there is no reafon, why any fhould fear, that these pills cause a putrid colliquation of the blood.

This lady took thirty pills every day, for many weeks; and never complained of any inconvenience from it.

Mr. Ferdinand Laber, furgeon to the city hospital, who merits the greatest regard, not only for his eminent abilities in his profession, but from his readiness to exert them, as well in favour

vour of the poor, as rich, made many experiments, likewife, with these pills.

He discussed the most obdurate schirrusses, in various parts of the body.

He palliated many cancers, not only in the breafts; but also in the face, eyes, nose, &c.; and some he intirely cured.

He shewed all his patients, while under cure by this method, to the Baron *Van Swieten*, that he might be certain of the effect.

Mr. Laber gave these pills, with fuccess, in various diforders also of the eyes: but where the difease was of long standing, it was, for the most part, in vain. There is no harm, however, in trying.

It is an obfervation, however, made by Mr. *Laber*, as well as myfelf, that none of those who used the pills for cataracts, or any other thickning of the humours of the eyes, grew worse; tho' they were not cured.

Hence it refults, that the pills at least check the further progress of these kinds

90

kinds of diforders: and experience has taught, that in fuch cafes, two, taken every morning and evening, are fufficient.

But the effect is fometimes extremely flow; and does not become fenfible before the third or fourth month. Whence fuccefs is not to be defpaired of, though no change be found in a few weeks.

While I am writing this, a woman of about thirty years of age is come to me, who was first fent by Mr. Rechtherger, surgeon of Saint Mark's hospital, about three months ago.

This woman had had a schirrus in her breast for some years; which, by the use of various medicaments, began to pain her violently; and to threaten a cancer.

After confidering well the affair, I gave her at that time three pills thrice every day.

Within a few days, the pains abated: but the fchirrus remained unchanged. I increased gradually the dose of the pills,

pills, till the patient took every day eight: and I continued this proportion for eleven weeks: when I still found, that no change was brought about in the fchirrus.

From hence I doubted much of fuccefs: but the patient, fatisfied with having her pains removed, took the pills with great regularity.

The thirteenth week, the fchirrus began to foften; to divide into feparate parts; and to be difcuffed fo fuddenly, that, in the fpace of ten days, fcarce more than a twelfth part remained; and the remains, on being felt, appeared foft and pafte-like.

CHAPTER III.

COROLLARIES.

Corollary 1) FROM the above premifes, it may be inferred, that a remedy highly innocent may be prepared from the juice of hemlock, infpiffated by a flow fire; and, which

which in every habit of body, fex, age, &c. may be given in confiderably large dofes.

2) That this remedy does not hinder any of the natural functions of the body, the fecretions, nor the excretions.

3) That it acts in an infenfible manner: neither exciting ftool, vomit, urine, nor fweat.

4) That it discusses indurations, and fchirrusses; even in those cases, where other medicaments, the most penetrating, are not of the least avail.

It is, therefore, a medicament greatly discutient.

5) That what indurations, and fchirruffes, it does not difcufs, it brings, for the most part, to a kindly suppuration.

6) That it ftops the further progress of cancers.

7) That it corrects cancerous acrimony; and removes the bad fmell.

8) That it converts the cancerous ichor into good pus.

9) That it quiets pains.

10) That it cures cancers.

11)

11) That it heals ulcers, incurable by other means.

12) That it closes, and confolidates, fuch fiftulas, and finusses, as result all other remedies.

13) That it disperses ædematous tumours, even by external application.

14) That it reftores the fight when taken away by cataracts, that are not of long standing.

15) That it removes, or, at least, stops the further progress of recent cataracts.

ADMONITIONS.

1ft) THAT women who are afflicted with cancers or fchirruffes avoid great exercife, and all brifk motions of the body.

2d) That country air, and gentle exercise promote the cure.

3d) That anger, forrow, and fudden fright, do harm.

4th) That acid, vinous, and auftere, fubstances, are injurious; as are also farinaceous, crude, and unfermented.

5th) -

5th) That attrition, friction, and pressure, are hurtful in schirruffes of long standing; and in cancers.

Hence hard and strait stays, and rough shifts, must be avoided.

6th) That violent coughing is injurious. For it irritates the cancers, and makes them worfe; caufes hæmorrhages; and impairs the ftrength: by which means it retards the cure; and renders it almost impossible.

Women, who have a difficulty of respiration, and shortness of breath, and who, in coughing feel, very acute pains in a schirrous, or cancerous breast, attended with a violent constriction of the breaft, as it were, by a cord, and a dragging of it feemingly into the cheft by the action of coughing, have, for the most part, the lungs fchirrous, and cohering in that part ftrongly with the pleura.

Hence a more difficult, if not impossible, cure.

I have learnt from experience, that these pills are not in the least injurious 232

in

94

in cafes of the phthific: nor do they hinder spitting; but rather promote it.

QUERIES.

I HAVE, in a great variety of cafes, tried the juice of hemlock, reduced to pills, alone; that, by this means, I might accurately inform myfelf what it could fimply and folely perform.

But fometimes, I have found a quick effect; and, at other times, a very flow one. From whence it may be queftioned : whether, in cafes where its action is flow, the effect may not be accelerated by external remedies applied in various manners.

Query 1st) Whether it may not be proper to apply, feveral times in the day, the hot vapours of the decoction of hemlock to the part affected?

Query 2d) Whether, perhaps, it may not be more effectual to keep a cataplasm prepared from hemlock continually on the diseased parts?

H

Many

Many trials demonstrate, that fuch a fomentation is highly efficacious, in these circumstances.

There are, nevertheles, patients, who cannot bear this when laid on the naked skin. Whence,

Query 3d) Whether it is not better to cover the fkin of fuch patients with a diachylon plafter; and to foment the part, with the cataplafm, while fo covered?

Query 4th) Whether, while it is allowable to irritate the fchirrus, it would not be of advantage, to put on a plafter of hemlock and labdanum, or galbanum?

Query 5th) Whether, it is not requifite, that purges should be given to patients under the regimen of these pills, where their strength appears to admit of it; as the discussed matter is not discharged by any sensible evacuation?

Trials, respecting this query, made on several patients, seem to render it advis-

97

advisable to do what is proposed. But necessity does not exact it.

Query 6th) If cafes occur, in which acrid cancers fend forth very deep roots, corrupt all the humours, and debilitate the folids, in fuch manner, that the pills alone cannot fuffice; whether then would it not be proper to join the Peruvian bark to them? As, by this means, a medicine, indued with the virtue of each, and which would fully anfwer all intentions, might be prepared.

It is neceffary, therefore, that every phyfician fhould vary the method, according to the attendant fymptoms, by his own proper obfervation and judgment.

On the merits of what has been premifed, I beg of all phyficians whatever, that they will try and administer this extract on every occasion that shall prefent itself. But I intreat, that, at the fame time, they will lay asside every kind of prejudice and jealousy; H 2 from

from the confideration, how much the health of their neighbours is concerned in these matters.

If any bad confequence may be found to refult, let them inquire carefully, whether it arifes from the irrefiftible violence of the difeafe; from any miftake made by the patients, or those about them; or from the medicament itself : and let them not, from thence, condemn the remedy as hurtful, or inefficacious, without the ftrictest examination of the facts, and the maturest judgment on them. But if, after all, they know any better remedies, I do not defire they should neglect them in favour of this.

ADVER-

ADVERTISEMENT

OFTHE

TRANSLATOR.

A S the due trial of the virtues of the juice of HEMLOCK feems to be a matter of the greateft importance to the public, I thought it neceffary to infert here a caution, that experience has already fhewn to be neceffary, with respect to the preparation of it as an internal remedy, in the form recommended in this work.

Dr. Storck has not explicitly directed, that the juice of the *bemlock*, ufed in making what he calls the extract, fhould undergo any depuration, before it be infpiffated, in order to bring it to the confiftence proper for forming pills.

In confequence of this, some apothecaries, who have attempted to prepare

100 ADVERTISEMENT.

pare the pills, have fuffered the juice to fettle; and ufed the depurated fluid freed from the fedimentary part: imagining, inadvertently, that in fo doing, conformably to what is generally practifed in fimilar cafes, they were proceeding rightly.

But, by this treatment, the extract lofes all the fpecific and peculiar flavour and finell of the plant; and, doubtlefs, in a great degree, its medicinal virtue.

The direction given by Dr. Storck himfelf is, to boil the juice while fresh (RECENS): which implies, that it should not undergo any previous change. Though this is not so clearly expressed in words; but that it leaves room for the mistake I have mentioned to have been already made by some; and for the prevention of which in others, this intimation is intended.

BOOKS printed for J. NOURSE at the Lamb opposite Katherine-Street in the Strand.

INSTITUTES OF EXPERIMENTAL CHEMISTRY: I Being an effay towards reducing that branch of natural philosophy to a regular system, by investigating, first, in an introductory discourse, its object, end, and means; together with those principles of natural philosophy, which are fubferviently neceffary; including directions for the conftruction of a compleat apparatus, and for the conduct of the feveral general operations, as peculiarly accommodated to experimental purpofes; and afterwards by exhibiting all the curious and leading proceffes, with particular obfervations on each, explaining the rationalia of the proceedings, and pointing out the application of them to practice in medicine, metallurgy, and other arts, and to the improvement of natural knowledge in general; the whole being illustrated by observations on the generical nature of each fubject, in which the proper fpecific marks of diffinction are laid down on new principles. By the Author of the Elaboratory laid open. In two volumes, octavo.

THE NEW DISPENSATORY: Containing, I. The theory and practice of pharmacy. II. A diftribution of medicinal fimples, according to their virtues and fenfible qualities; the defcription, ufe, and dofe of each article. III. A full translation of the London and Edinburgh Pharmacopœias; with the ufe, dofe, &c. of the feveral medicines. IV. Directions for extemporaneous prefcription; with a felect number of elegant forms. V. A collection of cheap remedies for the ufe of the poor. The whole interfperfed with practical cautions and obfervations. Intended as a correction and improvement of Quincy. 8vo.
