Management of CHILDREN,

From their BIRTH to Three Years of Age.

By W. CADOGAN, M. D. Late PHYSICIAN to the Foundling-Hospital.

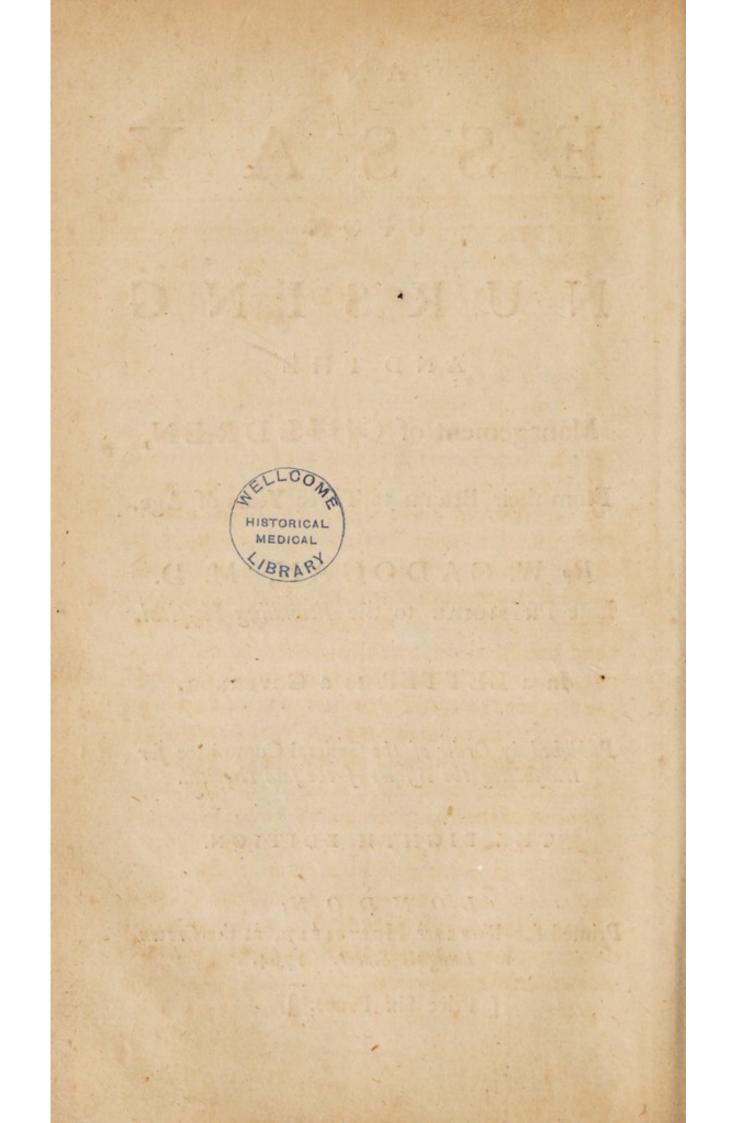

In a LETTER to a GOVERNOR.

Published by Order of the General Committee for transacting the Affairs of the said Hospital.

THE EIGHTH EDITION.

LONDON: Printed for ROBERT HORSFIELD, at the Crown in Ludgate-Street. 1764.

[Price Six Pence.]

SIR,

T is with great pleafure I fee at last the prefervation of Children become the care of Men of Senfe: it is certainly a matter that well deferves their attention, and, I doubt not, the Publick will foon find the good and great effects of it. The Foundling-Hospital may be of more use to the world, than was perhaps at first imagined by the promoters of it; it will be a means not only of preventing the murder of many, but of faving more, by introducing a more reafonable and more natural method of nurfing. In my opinion, this bufinefs has been too long fatally left to the management of Women, who cannot be fuppofed to have proper knowledge to fit them for fuch a tafk, notwithstanding they look upon it to be their own province. What I mean, is a philosophic knowledge of ·Nature, to be acquired only by learned obfervation and experience, and which therefore the the unlearned must be incapable of. They may prefume upon the examples and tranfmitted cuftoms of their Great-Grandmothers, who were taught by the Phyficians of their unenlighten'd days; when Phyficians, as appears by late discoveries, were mistaken in many things, being led away by hypothetical reafonings to entertain very wild conceits in which they were greatly bewilder'd themfelves, and mifled others to believe, I know not what strange unaccountable powers in certain herbs, roots, and drugs; and alfo in fome fuperstitious practices and ceremonies; for all which notions, there being no real foundation in Nature, they ought to be looked upon as the effects of ignorance, or the artifices of defigning Quacks; who found their account, by pretending to great knowledge in these occult qualities, and imposing upon the credulous. The art of Phyfick has been much improv'd within this laft century; by obferving and following Nature more clofely, many useful difcoveries have been made, which help us to account for things in a natural way, that before feemed mysterious and magical; and which have confequently made the practice of it more conformable to reafon and good fenfe. This being the cafe, there is great room to fear, that those Nurses who yet retain many of these traditional prejudices, are capitally mistaken in their management of Children in general, and fancying that Nature has

has left a great deal to their fkill and contrivance, often do much harm where they intend to do good. Of this I fhall endeavour to convince them, by fhewing how I think Children may be cloathed, fed, and managed, with much lefs trrouble to their Nurfes, and infinitely greater eafe, comfort, and fafety, to the little ones.

THE Foundlings under the care of the Hofpital, I prefume, will be bred in a very plain, fimple manner : they will therefore infallibly have more health, beauty, ftrength, and fpirits; I might add understanding too, as all the faculties of the mind are well known to depend upon the organs of the body; fo that when these are in good order, the thinking part is most alert and active ; the contrary, when they are difturbed or difeafed. When these advantages appear in favour of Children fo brought up, as I am confident in time they will, it may ferve to convince most Nurses, Aunts, Grandmothers, &c. how much they have hitherto been in the wrong, what mischief is done to Children, and what multitudes are deftroyed or fpoiled, as well by cramming them with cakes, fweetmeats, Ec. till they foul their blood, choak their veffels, pall the appetite, and ruin every faculty of their bodies; as by cockering and indulging them, to the utter perversion of their naturally good temper, 'till they become quite froward and indocile.

WHEN

WHEN a man takes upon him to contradict seceived opinions and prejudices fanctified by time, it is expected he fhould bring valid ' proof of what he advances. The truth of what I fay, that the treatment of Children in general is wrong, unreafonable, and unnatural, will in great measure appear, if we but confider what a puny valetudinary race most of our people of condition are; chiefly owing to bad nurfing, and bad habits contracted early. But let any one, who would be fully convinced of this matter, look over the Bills of Mortality; there he may observe, that almost half the number of those, who fill up that black lift, die under five years of age: fo that half the people that come into the world, go out of it again before they become of the least use to it, or themselves. To me this feems to deferve ferious confideration; and yet I cannot find, that any one man of fense and publick spirit has ever attended to it at all; notwithftanding the maxim in every one's mouth, that a multitude of inhabitants is the greatest strength and best support of a Commonwealth. The mifconduct, to which I must impute a great part of the calamity, is too common and obvious to engage the idle and fpeculative, who are to be caught only by very refined refearches; and the bufy part of mankind, where their immediate intereft is not concerned, will always overlook what they fee daily : it may be thought a natural

[6]

tural evil, and fo is fubmitted to without examination. But this is by no means the cafe; and where it is entirely owing to mifmanagement, and poffibly may admit of a remedy, it is ridiculous to charge it upon Nature, and suppose that infants are more subject to difease and death than grown perfons; on the contrary, they bear pain and difeafe much better, fevers especially (as is plain in the case of the fmall-pox, generally most favourable to Chidren) and for the fame reason that a twig is lefs hurt by a ftorm than an oak. In all the other productions of Nature, we fee the greateft vigour and luxuriancy of health, the nearer they are to the egg or the bud; they are indeed then most fensible of injury, and it is injury only that deftroys them. When was there a lamb, a bird, or a tree, that died because it was young? These are under the immediate nurfing of unerring Nature, and they thrive accordingly. Ought it not therefore to be the care of every Nurfe and every Parent, not only to protect their Nurfelings from injury, but to be well affured that their own officious fervices be not the greatest the helples creatures can fuffer?

In the lower class of Mankind, especially in the country, difease and mortality are not fo frequent, either among the adult or their children. Health and posterity are the portion of the poor, I mean the laborious. The want of superfluity confines them more within the

the limits of Nature : hence they enjoy bleffings they feel not, and are ignorant of their caufe. The Mother who has only a few rags to cover her Child loofely, and little more than her own breaft to feed it, fees it healthy and ftrong, and very foon able to fhift for itfelf; while the puny infect, the heir and hope of a rich family, lies languishing under a load of finery, that overpowers his limbs, abhorring and rejecting the dainties he is crammed with, till he dies a victim to the miftaken care and tenderness of his fond Mo-In the course of my practice, I have ther. had frequent occasion to be fully fatisfied of this, and have often heard a Mother anxioufly fay, The Child has not been well ever fince it has done puking and crying. These complaints, though not attended to, point very plainly to their caufe. Is it not very evident, that when a Child rids it's ftomach feveral times in a day, that it has been over-loaded? when it cries, from the incumbrance and confinement of it's cloaths, that it is hurt by them? While the natural ftrength lafts (as every Child is born with more health and ftrength than is generally imagined), it cries at or rejects the fuperfluous load, and thrives apace: that is, grows very fat, bloted, and diftended beyond meafure, like a houfe-lamb. But in time, the fame oppreffive caufe continuing, the natural powers are overcome, being no longer able to throw off the unequal weight; the Child, now

now not able to cry any more, languishes and is quiet. The misfortune is, these complaints are not understood; it is swaddled and crammed on, 'till after gripes, purging, &c. it finks under both burdens into a convulsionfit, and escapes any further torture. This would be the case with the lamb, was it not killed when it is full fat.

THAT the prefent method of nurfing is wrong, one would think needed no other proof than the frequent mifcarriages attending it, the death of many, and ill health of those that furvive. But the perfuading you of it may be a needless task; if you have ever thought about it, I doubt not but you are already convinced it is fo. However, fince you defire my fentiments upon the subject, taking it for granted you think with me, that most of our Nurses are got into a wrong method, I will endeavour, in as few words as possible, to tell you what I think a right one.

You perceive, Sir, by the hints I have already dropped, what I am going to complain of is, that Children in general are overcloathed and over-fed, and fed and cloathed improperly. To thefe caufes I impute almost all their difeases. But to be a little more explicit. The first great mistake is, that they think a new-born infant cannot be kept too warm; from this prejudice they load and bind it with flannels, wrappers, fwathes, ftays, &c. which all together are almost equal to B it's it's own Weight; by which means a healthy child in a month's time is made fo tender and chilly, it cannot bear the external air; and if, by any accident of a door or window left carelefly open too long, a refreshing breeze be admitted into the fuffocating atmosphere of the lying-in bed-chamber, the Child and mother fometimes catch irrecoverable colds. But, what is worfe than this, at the end of the month, if things go on apparently well, this hot-bed plant is fent out into the country to be reared in a leaky house, that lets in wind and rain from every quarter. Is it any wonder the Child never thrives afterwards? The truth is, a new born Child cannot well be too cool and loofe in its drefs; it wants lefs cloathing than a grown perfon in proportion, becaufe it is naturally warmer, as appears by the thermometer, and would therefore bear the cold of a winter's night much better than any adult perfon whatever. There are many inftances, both antient and modern, of infants exposed and deferted, that have lived feveral days. As it was the practice of antient times, in many parts of the world, to expose all those whom the parents did not care to be incumbered with; that were deformed, or born under evil flars; not to mention the many Foundlings picked up in London Streets. These instances may ferve to shew, that Nature has made Children able to bear even great hardships, before they are

are made weak and fickly by their miftaken Nurfes. But, befides the mifchief arifing from the weight and heat of these swaddlingcloaths, they are put on fo tight, and the Child is fo cramped by them, that it's bowels have not room nor the limbs any liberty, to act and exert themfelves in the free eafy manner they ought. This is a very hurtful circumstance; for limbs that are not used will never be ftrong, and fuch tender bodies cannot bear much preffure : the circulation restrained by the compression of any one part, must produce unnatural fwellings in fome other; efpecially as the fibres of infants are fo eafily diftended. To which doubtlefs are owing the many diffortions and deformities we meet with every where; chiefly among Women, who fuffer more in this particular than the Men.

IF Nurfes were capable of making juft obfervations, they might fee and take notice of that particular happinefs, which a Child fhews by all it's powers of expression, when it is newly undressed. How pleased! how delighted! it is with this new liberty, when indulged for a few minutes with the free use of it's legand arms. But this is not to last long; it is fwaddled up as before, notwithstanding all its cries and complaints.

I WOULD recommend the following drefs: A little flannel waiftcoat, without fleeves, made to fit the body, and tie loofely behind;

to

to which there should be a petticoat fewed, and over this a kind of gown of the fame material, or any other, that is light, thin, and flimfy. The petticoat fhould not be quite fo long as the Child, the gown a few inches longer; with one cap only on the head, which may be made double, if it be thought not warm enough. What I mean is, that the whole coiffure should be fo contrived, that it might be put on at once, and neither bind nor prefs the head at all: the linnen as ufual. This I think would be abundantly fufficient for the day; laying afide all those fwathes, bandages, stays, and contrivances, that are most ridiculously used to close and keep the head in it's place, and support the body. As if Nature, exact Nature, had produced her chief work, a human creature, fo carelefly unfinished as to wants those idle aids to make it perfect. Shoes and ftockings are very needlefs incumbrances, befides that they keep the legs wet and nafty, if they are not changed every hour, and often cramp and hurt the feet: a Child would stand firmer, and learn to walk much fooner without them. I think they cannot be neceffary 'till it runs out in the dirt. There should be a thin flannel shirt for the night, which ought to be every way quite loofe. Children in this fimple, pleafant drefs, which may be readily put on and off without teazing them, would find themfelves perfectly eafy and happy, enjoying the

the free use of their limbs and faculties, which they would very foon begin to employ when they are thus left at liberty. I would have them put into it as foon as they are born, and continued in it 'till they are three years old; when it may be changed for any other more genteel and fashionable : though I could wish it was not the cuftom to wear flays at all; not becaufe I fee no beauty in the fugar loaf shape, but that I am apprehensive it is often procured at the expence of the health and ftrength of the body. There is an odd notion enough entertained about change, and the keeping of Children clean. Some imagine, that clean linnen and fresh cloaths draw and rob them of their nourishing juices. I cannot fee that they do any thing more than imbibe a little of that moisture which their bodies exhale. Were it, as is fuppofed, it would be of fervice to them; fince they are always too abundantly fupplied, and therefore I think they cannot be changed too often, and would have them clean every day; as it would free them from ftinks and fourneffes, which are not only offenfive, but very prejudicial to the tender state of Infancy.

THE feeding of Children properly is of much greater importance to them than their cloathing. We ought to take great care to be right in this material article, and that nothing be given them but what is wholfome and good for them, and in fuch quantity as the

the body calls for towards it's fupport and growth; not a grain more. Let us confider what Nature directs in the cafe : if we follow Nature, instead of leading or driving it, we cannot err. In the bufiness of Nurfing, as well as Phyfick, Art is ever deftructive, if it does not exactly copy this original. When a Child is first born, there feems to be no provision at all made for it; for the Mother's milk, as it is now managed, feldom comes 'till the third day; fo that, according to this appearance of Nature, a Child would be left a day and a half, or two days, without any food. Were this really the cafe, it would be a fufficient proof that it wanted none; as indeed it does not immediately; for it is born full of blood, full of excrement, it's appetites not awake, nor it's fenfes opened; and requires fome intermediate time of abstinence and reft to compose and recover the ftruggle of the birth and the change of circulation (the blood running into new channels), which always put it into a little fever. However extraordinary this might appear, I am fure it would be better that the Child was not fed even all that time, than as it generally is fed; for it would fleep the greatest part of the time, and, when the milk was ready for it, would be very hungry, and fuck with more eagerness; which is often necessary, for it feldom comes freely at first. But let me endeavour to reconcile this difficulty, that a Child

[14]

Child should be born thus apparently unprovided for. I fay apparently, for in reality it is not fo. Nature neither intended that a Child should be kept fo long fasting, nor that we should feed it for her. Her defign is broke in upon, and a difficulty raifed that is wholly owing to miftaken management. The Child, as foon as it is born, is taken from the Mother, and not fuffered to fuck 'till the Milk comes of itfelf; but is either fed with ftrange and improper things, or put to fuck fome other Woman, whole milk flowing in a full stream, overpowers the new-born infant, that has not yet learned to fwallow, and fets it a coughing, or gives it a hiccup: the Mother is left to ftruggle with the load of her milk, unaffisted by the fucking of the Child. Thus two great evils are produced, the one a prejudice to the Child's health, the other, the danger of the Mother's life, at least the retarding her recovery, by caufing what is called a milk-fever; which has been thought to be natural, but fo far from it, that it is entirely owing to this mifconduct. I am confident, from experience, that there would be no fever at all, were things managed rightly : were the child kept without food of any kind, 'till it was hungry, which it is impoffible it should be just after the birth, and then applied to the Mother's breafts; it would fuck with ftrength enough, after a few repeated trials, to make the milk flow gradually, in due proportion to the

the Child's unexercifed faculty of fwallowing, and the Call of it's Stomarch. Thus the Child would not only provide for itfelf the best of nourishment, but, by opening a free paffage for it, would take off the Mother's load, as it increased, before it could oppres or hurt her; and therefore effectually prevent the fever; which is caufed only by the painful diftention of the lacteal veffels of the breafts, when the milk is injudicioufly fuffered to accumulate. Here let me describe a case of pure Nature, in order to illustrate this material point yet further. When a healthy young Woman lies-in of her first Child, before the operations of Nature have been perverted by any abfurd practices, her labour would be ftrong, and, as I have chofe to inftance in the cafe of a first Child, perhaps difficult; but in a few minutes after her delivery, fhe and her Child, if it be not injured, would fall into a fweet fleep of fix or feven hours: the Mother would awake refreshed, the Child hungry. A little thin broth with bread, or fome fuch light food, should be then given her; and foon after the Child be put to fuck. In one hour or two the milk would infallibly flow; and, if nothing elfe be given it, the Child would grow ftrong, and fhe recover perfectly in a few days. This is the conftant courfe of Nature, which is very little attended to, and never followed. The general practice is, as foon as a Child is born, to

to cram a dab of butter and fugar down it's throat, a little oil, panada, caudle, or fome fuch unwholfome mefs. So that they fet out wrong, and the Child stands a fair chance of being made fick from the first hour. It is the cuftom of fome to give a little roaft pig to an infant, which, it feems, is to cure it of all the Mother's longings. I with thefe matters were a little more enquired into, for the honour of the fex, to which many imperfections of this kind are imputed, which I am fure it does not lie under.

[17]

HERE I may be asked what is to be done with a Child born fick, that, inftead of fleeping, cries inceffantly from the birth and is hardly to be quieted by any means. Let good care be taken that it is not hurt by the dreffing, or rather let it not be dreffed at all, but wrapped up in a loofe flannel. If notwithftanding this precaution, it ftill continues crying; inftead of feeding it, for it is certainly a prepofterous thing to think of feeding a Child becaufe it is fick, though poffibly this may ftop it's mouth for a little while; let it be applied to the Mother's breaft, perhaps it may bring the milk immediately; which would be the best medicine for it in fuch a case; or the nipple in it's mouth may quiet it, though it does not bring it. And it is certainly better it should be quieted without food than with it, which must necessarily make it worfe. Sometimes indeed the Child may be fo very ill,

fuch a cafe, which I think can happen but rarely, let the phyfick I shall recommend a little further on, where Children are unavoidably to be dry-nurfed, be given, a little every hour, 'till it takes effect; ftill attempting to bring it to fuck the Mother's milk, which is the best Physick or Food it can take.

WHEN a Child fuck's it's own Mother, which, with a very few exceptions, would be beft for every Child and every Mother, Nature has provided it with fuch wholfome and fuitable nourifhment; fuppofing her a temperate Woman, that makes fome use of her limbs, it can hardly do amifs. The mother would likewife, in most hysterical nervous cafes, eftablish her own health by it, though the were weak and fickly before, as well as that of her offspring. For thefe reafons I could wifh, that every Woman that is able, whofe fountains are not greatly diffurbed or tainted, would give fuck to her Child. I am very fure, that forcing back the milk, which most young Woman must have in great abundance, may be of fatal confequence: fometimes it endangers life, and often lays the foundation of many incurable difeafes. The reasons that are given for this practice are very frivolous, and drawn from falle premifes; that fome Women are too weak to bear fuch a drain, which would rob them of their own nourishment. This is a very mistaken

miftaken notion; for the first general caufe of most peoples difeases is, not want of nourishment, as is here imagined, but too great a fulnefs and redundancy of humours; good at first, but, being more than the body can employ or confume, they stagnate, degenerate, and the whole mass becomes corrupt, and produces many difeafes. This is confirmed by the general practice of Phylicians, who make holes in the fkin, perpetual blisters, iffues, &c. to let out the fuperfluity. I would therefore leave it to be confidered, whether the throwing back fuch a load of humour, as a Woman's first milk, be most likely to mend her constitution, or make her complaints irremediable. The mother's first milk is purgative, and cleanfes the child of it's long hoarded excrement; no Child, therefore, can be deprived of it without manifest injury. By degrees it changes it's property, becomes lefs purgative, and more nourifhing; and is the beft and only food the Child likes, or ought to have for fome time. If I could prevail, no Child should ever be crammed with any unnatural mixture, 'till the Provifion of Nature was ready for it; nor afterwards fed with any ungenial alien diet what ever, at least for the first three months : for it is not well able to digeft and affimilate other aliments fooner. I have feen very healthy fine Children, that never eat or drank any think whatever but the Mother's milk for the C 2

the first ten or twelve months. Nature feems to direct this, by giving them no teeth 'till about that time. There is ufually milk enough with the first Child; fometimes more than it can take: it is poured forth from an exuberant, overflowing, urn, by a bountiful hand, that never provides fparingly. The call of Nature should be waited for to feed it with any thing more fubftantial, and the appetite ever precede the food; not only with regard to the daily meals, but those changes of diet, which opening, increasing life requires. But this is never done in either cafe, which is one of the greatest mistakes of all Nurses. Thus far Nature, if she be not interrupted, will do the whole bufinefs perfectly well; and there feems to be nothing left for a Nurfe to do, but to keep the Child clean and fweet, and to tumble and tofs it about a good deal, play with it, and keep it in good humour.

WHEN the Child requires more folid fuftenance, we are to enquire what, and how much, is most proper to give it. We may be well affured, there is a great mistake either in the quantity or quality of childrens food, or both, as it is ufually given them; becaufe they are made fick by it; for to this mistake I cannot help imputing nine in ten of all their difeases. As to quantity, there is a most ridiculous error in the common practice; for it is generally supposed, that whenever a Child cries, it wants victuals; and it is accordingly fed,

fed, ten, twelve, or more times in a day and night. This is fo obvious a misapprehension, that I am furprized it should ever prevail. If a Child's wants and motions be diligently and judiciously attended to, it will be found that it never cries but from pain : now the first fenfations of hunger are not attended with pain; accordingly a Child (I mean this of a very young one) that is hungry, will make a hundred other figns of it's want, before it will cry for food. If it be healthy and quite eafy in it's drefs, it will hardly ever cry at all. Indeed these figns and motions I speak of are but rarely to be observed; because it feldom. happens that Children are ever fuffered to be hungry. In a few, very few, whom I have had the pleafure to fee reafonably nurfed. that were not fed above two or three times in four and twenty hours, and yet were perfectly healthy, active, and happy; I have feen thefe fignals, which were as intelligible as if they had fpoke.

THERE are many faults in the quality of their food: it is not fimple enough. Their paps, panada's, gruels, $\Im c$. are generally enriched with fugar, fpice, and fometimes a drop of wine; neither of which they ought ever to tafte. Our bodies never want them: they are what luxury only has introduced, to the deftruction of the health of mankind. It is not enough that their food be fimple, it fhould be alfo light. Several people, I find, are miftaken in

in their notions of what is light; and fancy that most kinds of pastry, puddings, custards, Ec. are light, that is, light of digestion. But there is nothing heavier in this fenfe than unfermented flour and eggs boiled hard, which are the chief ingredients of those preparations. What I mean by light, to give the best idea I can of it, is any fubftance that is eafily feparated, and foluble in warm water. Good bread is the lighteft thing I know; the power of due fermentation, in which confifts the whole art of making it, breaks and attenuates the tenacious particles of the flour, fo as to give it these qualities I mention, and make it the fittest food for young Children. Cows milk is also fimple and light, and very good for them; but it is injudiciously prepared : it should not be boiled, for boiling alters the tafte and property of it, deftroys it's fweetnefs, and makes it thicker, heavier, and lefs fit to mix and affimilate with the blood. But the chief objection is, that their food is wholly vegetable, the bad confequence of which is, that it will turn four in their ftomachs. The first and general cause of all the difeases of infants, is manifeftly this acefcent quality of all their food. If any of these vegetable preparations I have named, be kept in a degree of heat equal to that of a Child's ftomach, it will become four as vinegar in a few hours time. These things are therefore very improper to feed a Child wholly with. Some

part

part of it's diet should be contrived to have a contrary tendency; fuch as we find only in flesh, which is the direct opposite to acid, and tends to putrefaction. In a due mixture of these two extremes, correcting each other, confifts that falubrity of aliment our nature feems to require. As we are partly carnivorous animals, a child ought not to be fed wholly upon vegetables. The Mother's milk, when it is perfectly good, feems to be this true mixture of the animal and vegetable properties, that agrees beft with the conftitution of a Child; readily paffes into good blood, requiring but a gentle exertion of the powers of circulation to break and fubdue it's particles and make them fmooth and round, and eafily divifible. I would advife therefore, that one half of infants diet be thin light broths, with a little bread or rice boiled in them; which last is not fo acefcent as any other kind of meal or flour. These broths should be made with the flesh of full grown animals, because their juices are more elaborate; especially if they have never been confined to be fatted. The juices of a young ox, taken from the plough, make the finest flavoured and most wholfome foup. I believe it is for the fame reafon, the flesh of all wild animals has a higher tafte than that of tame, faginated ones: and is therefore most agreeable to the palate of the luxurious; but this is to be understood of those creatures that feed on corn

or

or herbage. The other part of Childrens diet may be a little toafted bread and water boiled almost dry, and then mixed with fresh milk, not boiled *. This, without fugar, fpice, or any other pretended amendment whatever, would be perfectly light and wholfome, of fufficient nourishment, something like milk from the cow, with the additional ftrength and spirit of bread in it. Twice a day, and not oftener, a fucking Child fhould be fed at first; once with the broth, and once with the milk thus prepared. As to the quantity at each time, it's appetite must be the measure of that; it's hunger should be fatisfied, but no more; for Children will always eat with fome eagerness full as much as they ought: therefore it must be very wrong to go beyond that, and ftuff them 'till they fpue, as the common method is. They should not be laid on their backs to be fed, but held in a fitting posture, that fwallowing may be eafier to them, and that they may the more readily difcover when they have had enough. When they come to be about ten or twelve months old, and their appetite and digeftion grows ftrong, they may be fed three times a day; which, I think, they ought

[24]

* The London Bakers are fuspected of putting alum in their bread, which would be very pernicious to infants; therefore rufks, or the bifcuits called tops-and-bottoms, may be used instead of it. These will not turn four so foon as common bread.

never

never to exceed their whole lives after. By night I would not have them fed or fuckled at all, that they might at leaft be hungry in a morning. It is this night-feeding that makes them fo over fat and bloated. If they be not used to it at first, and, perhaps, awaked on purpofe, they will never feek it; and if they are not diffurbed from the birth, in a week's time they will get into a habit of fleeping all or most part of the night very quietly; awaking poffibly once or twice for a few minutes when they are wet, and ought to be changed. If it be thought neceffary to give them any thing between meals, a little milk and water is beft. Their meals, and, in my opinion, their fucking too, ought to be at stated times, and the fame every day; that the ftomach may have intervals to digeft, and the appetite The Child would foon be quite eafy return. and fatisfied in the habit; much more fo, than when taught to expect food at all times, and at every little fit of crying or uneafinefs. Let this method be observed about a twelvemonth, when, and not before, they may be weaned; not all at once, but by infenfible degrees; that they may neither feel, nor fret at the want of the breaft. This might be very eafily managed, if they were fuffered to fuck only at certain times. Were this plan of nurfing literally purfued, the Children kept clean and fweet, tumbled and toffed about a good deal, and carried out every day

m

in all weathers; I am confident, that in fix or eight months time most Children would become healthy and strong, would be able to fit up on the ground without support, to divert themselves an hour at a time, to the great relief of their Nurses, would readily find the use of their legs, and very soon shift for themselves.

IF it be asked whether I mean this of Children in general, and that weakly ones, born of unhealthy parents, should be treated in the fame manner; I anfwer, that it is not fo common for Children to inherit the difeafes of their parents, as is generally imagined; there is much vulgar error in this opinion; for people that are very unhealthy feldom have Children, especially if the bad health be of the female fide; and it is generally late in life when chronick difeafes take place in most Men, when the bufinefs of love is pretty well over : certainly Children can have no title to those imfirmities, which their Parents have acquired by indolence and intemperance long after their birth. It is not common for people to complain of ails they think hereditary, 'till they are grown up; that is, 'till they have contributed to them by their own irregularities and exceffes, and then are glad to throw their own faults back upon their Parents, and lament a bad conftitution, when they have fpoiled a very good one. It is very feldom that young Children are troubled with family

family diftempers : indeed, when we find them affected with scrophulous, venereal, or high fcorbutick complaints, we may reafonably conclude the taint to have been transmitted to them; but these cases are very rare in comparison of the many others, that are falfly, and without the least foundation, imputed to Parents, when the real caufe is either in the complainants themfelves, or bad nurfing, that has fixed them early in wrong habits. In one fense many difeases may be faid to be hereditary, perhaps all those of male formation; by which I mean not only deformity and diffortion, but all those cases where the fibres and veffels of one part are weaker in proportion than the reft; fo that upon any ftrain of the body, whether of debauch or too violent exercife, the weak part fails first, and diforders the whole. Thus complaints may be produced fimilar to those of the Parent, owing in some measure to the similitude of parts, which possibly is inherited, like the features of the face; but yet these diseases might never have appeared, but for the immediate acting caufe, the violence done to the body. Most distempers have two causes; the one, a particular state of the folids and fluids of the body, which dispose it to receive certain infections and impulses; the other, the infection or impulse itself. Now what I contend for is, that though this predifponent, state or habit of the body be heritable, yet D 2 the

the difeases incident to these wretched heirs may be avoided, by preventing the active caufe; which may be done in many cafes by a due attention to the non-naturals, as they are called; in plainer words, by a temperate, active life: in Children, by good nurfing. Therefore I conclude, that inftead of indulging and enfeebling yet more, by the common methods, Children fo unhappily born; that which I am recommending, together with the wholfome milk of a healthy Nurfe is the beft, the only means to remedy the evil, and by which alone they may by degrees be made healthy and ftrong. And thus, in a generation or two of reafonable temperate perfons, every taint and infirmity whatever, the king's-evil and madnefs not excepted, would be totally worn out.

THE plain natural plan I have laid down is never followed, becaufe moft Mothers, of any condition, either cannot, or will not undertake the troublefome tafk of fuckling their own Children; which is troublefome only for want of proper method; were it rightly managed, there would be much pleafure in it, to every Woman that can prevail upon herfelf to give up a little of the beauty of her breaft to feed her offspring; though this is a miftaken notion, for the breafts are not fpoiled by giving fuck but by growing fat. There would be no fear of offending the hufband's ears with the noife of the fqualling brat. The Child,

Child, was it nurfed in this way, would be always quiet, in good humour, ever playing, laughing, or fleeping. In my opinion, a Man of sense cannot have a prettier rattle (for rattles he must have of one kind or other) than fuch a young Child. I am quite at a lofs to account for the general practice of fending infants out of doors, to be fuckled or dry-nurfed by another Woman, who has not fo much understanding, nor can have fo much affection for it, as the Parents; and how it comes to pais, that people of good fense and easy circumstances will not give themfelves the pains to watch over the health and welfare of their Children; but are fo careless as to give them up to the common methods, without confidering how near it is to an equal chance, that they are deftroyed by them. The antient cuftom of exposing them to wild beafts, or drowning them, would certainly be a much quicker and more humane way of difpatching them. There are fome, however, who wish to have Children, and to preferve them, but are miftaken in their cares about them. To fuch only I would addrefs myfelf, and earneftly recommend it to every Father to have his Child nurfed under his own eye, to make use of his own reafon and fenfe in fuperintending and directing the management of it; nor fuffer it to be made one of the mysteries of the Bona Dea, from which the Men are to be excluded. I would

I would advise every Mother that can, for her own fake, as well as her Child's, to fuckle it. If she be a healthy Woman, it will confirm her health; if weakly, in most cases it will restore her. It need be no confinement to her, or abridgment of her time : four times in four and twenty hours will be often enough to give it fuck; letting it have as much as it will take out of both breafts at each time. It may be fed and dreffed by fome handy reafonable fervant, that will fubmit to be directed; whom likewife it may fleep with. No other Woman's milk can be fo good for her Child; and dry-nurfing I look upon to be the most unnatural and dangerous method of all; and, according to my observation, not one in three furvives it. To breed a Child in this artificial manner, requires more knowledge of Nature, and the animal œconomy, than the best Nurse was ever mistress of, as well as more care and attention than is generally bestowed on Children: the skill of a good Phyfician would be neceffary to manage it rightly. I am very glad this is not the method of the Hofpital : I believe there is not the least colour of objection to any part of the management of that most useful and excellent charity, as far as it depends upon the directors of it. Sending the Children out to country Nurses, under the care of inspectors, is undoubtedly the beft method they could take; but how far these Nurses and their Infpectors

fpectors (who, I fuppofe, are to be fome good Gentlewoman in the neighbourhood) may be perfwaded out of their old forms, to treat their Nurfelings a little more reafonably, is matter of much doubt. I fear they will be too tenacious of their prejudices, as well as opiniated of their skill, to be easily convinced they are in the wrong; and who shall undertake the tafk? However, I defpair not of feeing a reformation one day or other; and to contribute to it as much as lies in my power, I will give you my opinion as to the precautions neceffary to be taken in the choice of these Nurses; and likewise a few reasons why the Children, entrusted to their care, should be treated fomewhat differently from those who are nurfed in a more natural way, and fuck their own Mothers. I make no doubt, but great care is taken, that the Nurfes recommended to the Hofpital be clean and healthy Women. But this is not enough, the preference should be given to the middleaged; because they will have more milk than the very young, and more and better than the old. This is a material confideration, as I suppose they have each her own Child to fuckle befides. Those between twenty and thirty are certainly of the beft age. But what I think of the utmost confequence is, that great regard should be had to the time of their lying-in, and those procured, if poffible, who have not been brought to bed above two

that Nature intending a Child fhould fuck about a twelvemonth, the milk feldom continues good much longer. About that time, Women in general, though they give fuck, are apt to breed again; fome indeed, that are very fanguine, will breed fooner; thefe, notwithstanding their milk, are apt to be troubled with the catamenia, which difturb it greatly; and therefore are not fo proper to be made Nurses of. But, whether they breed or not, it is my opinion, that after a year's time, or thereabouts, however it may agree with a Child that has fucked it from the first, their milk will become stale and vapid, at least very unfit for a new-born infant; that if it be deprived of it's own Mother's milk, ought undoubtedly to have what is most like it: the newer it is, the more fuitable in all respects to it's tender nature. Yet it is a common thing for a Woman to fuckle two or three Children fucceffively with the fame milk.

A NURSE ought to have great regard to her diet: it is not enough that fhe be fober and temperate, her food fhould confift of a proper mixture of flefh and vegetables: fhe fhould eat one hearty meal of unfalted flefhmeat every day, with a good deal of gardenftuff and a little bread. Thin broth or milk would be beft for her breakfaft and fupper. Her drink fhould be fmall beer, or milk and water; water; but upon no account fhould fhe ever touch a drop of wine or ftrong drink, much lefs any kind of fpirituous liquors: giving ale or brandy to a Nurfe, is, in effect, giving it the Child; and it is eafy to conclude what would be the confequence.

THE Children, likewife, thus fent out, require a particular treatment. The plan I would lay down, could I prevail, should be that of Nature, excluding Art and foreign aid entirely. But when this is broke in upon, a little adventitious skill becomes indispensibly neceffary; that if we are not perfectly right in following clofely the defign of Nature, we may co-operate a little, and not be totally wrong in counter-acting it, as is too often the cafe. What I mean is, that every Child, not allowed the Mother's first milk, whether it be dry-nurfed, or fuckled by another Woman, should be purged in a day or two after the birth; and this purging continued for fome time; not by regular dofes of phyfick, that may operate all at once; but fome lenient laxative should be contrived, and given two or three times a day, fo as to keep the Child's body open for the first nine days, or fortnight; leffening the quantity infenfibly, 'till it be left off. It should be fo managed, that the operation of the artificial phyfick may refemble that of the natural. This is fo material, that, for want of it, most Children within the first month break out in pimples all E

all over; the Nurfes call it the red-gum, and look upon it to be a natural thing, and that the Children will be unhealthy that have it not. So indeed they will be in all likelihood ; and it is better that these foulness, which become acrid and hot by remaining too long in the body, should be discharged through the fkin, than not at all; or that they fhould be lodged in the blood, or fall upon the vitals, to lay the foundation of numberless future evils; but it is chiefly owing to the neglect of this method at first. A Child that fucks it's own Mother, unlefs it be greatly over-fed, or keep too hot, will never be troubled with this humour at all. If the Children that are brought to the Hofpital be not above a month old, and if it be found, upon enquiry, that they have not fucked their own Mothers, fomething of this kind prefcribed them would not be too late, nor improper. The following form may be used: Take manna, pulp of caffia, of each have an ounce; diffolve them in about three ounces of thin broth. Let the Child take two fpoonfuls three times a day, varying the quantity according to the effect; which, at first, ought to be three or four flools in four and twenty hours.

[34]

ORDERS should be given these Nurses to keep the Children awake by day, as long as they are disposed to be so, and to amuse and keep them in good humour all they can; not

I

to

to lull and rock them to fleep, or to continue their fleep too long; which is only done to fave their own time and trouble, to the great detriment of the Childrens health, spirits, and understanding. With regard to feeding them, as it is not likely they should have milk enough to fupport two, their own, and the Hofpital Child; it is best they should begin immediately according to the method I have recommended, if they or their infpectors can be perfwaded to think it right; which, however, I would not have underftood fo ftrictly, but it might sometimes be a little varied, preferving only the intention. I would advife, however, if it be thought proper, now and then to give them, as they grow up, a little bread and butter; that the butter be perfectly fweet and fresh, and allowed but in very fmall quantity; otherwife it will be apt to turn bitter and rancid in the ftomach, and foul all the juices of the body. A Child may be allowed any kind of mellow fruit, either raw, flewed, or baked; roots of all forts, and all the produce of the kitchen-garden. I am fure all these things are wholsome and good for them, and every one elfe, notwithftanding the idle notion of their being windy, which they are only to very debauched ftomachs; and fo is milk; but no Man's blood wants the cleanfing refreshing power of milk more than his, whole stomach, used to inflammatory things of high relifh, will not E-2 bear

bear the first chill of it. To Children, all this kind of food, taken in moderation, is perfectly grateful and falutary. Some may think that they carry into the ftomach the eggs of future worms; but of this I am not very apprehenfive: for I believe there are few things we eat or drink, that do not convey But then they can never be hatched them. in a healthy infide, where all the juices are fweet and good, and every gland performs it's office: the gall, in particular, would deftroy them: bullocks gall has been found to be a good and fafe vermifuge. It is my opinion, we fwallow the eggs of many little animals, that are never brought into life within us, except where they find a fit neft or lodgment in the acid phlegm or vitiated humours of the ftomach and bowels. Were these totally discharged every day, and the food of yesterday employed in nourishment, and the superfluity thrown off to the laft grain, no worms could ever breed or harbour in our vitals. As foon as the Children have any teeth, at fix or eight months they may by degrees be used to a little flefh-meat; which they are always very fond of, much more fo at first, than of any confectionary or pastry wares, with which they should never debauch their tafte.

BREEDING teeth has been thought to be, and is, fatal to many Children; but I am confident this'is not from Nature: for it is no difeafe, or we could not be well in health 'till 'till one or two and twenty, or later. Teeth are breeding the greatest part of that time; and it is my opinion, the last teeth give more pain than the first, as the bones and gums they are to pierce, are grown more firm and hard. But, whatever fever, fits, or other dangerous fymptoms, feem to attend this operation of Nature, healthy Children have fometimes bred their teeth without any fuch bad attendants; which ought to incline us to fufpect the evil not to be natural, but rather the effects of too great a fulnefs, or the corrupt humours of the body put into agitation by the stimulating pain the tooth causes in breaking it's way out. This, I believe, never happens without fome pain, and poffibly a little fever; but if the blood and juices be perfectly fweet and good, and there be not too great a redundancy of them, both will be but flight, and pafs off imperceptibly, without any bad confequence whatever. The chief intention of the method I am recommending is, to preferve the humours of the body in this state; and therefore if it fucceeds, Children fo managed will breed their teeth with lefs pain and danger than are commonly observed to attend this work of Nature.

As I have faid that the first and general cause of most of the diseases infants are liable to, is the acid corruption of their food; it may not be amis just to mention an easy and certain

certain remedy, or rather preventive, if given timely, at the first appearance of predominating acid; which is very obvious from the crude, white, or green ftools, gripes and purgings occasioned by it. The common method, when these fymptoms appear, is to give the pearl-julep, crab's-eye, and the testaceous powders; which, though they do abforb the acidities, have this inconvenience in their effect, that they are apt to lodge in the body, and bring on a coftiveness, very detrimental to infants, and therefore require a little manna, or fome gentle purge, to be given frequently to carry them off. Inftead of these, I would recommend a certain fine infipid powder, called magnefia alba, which, at the fame time that it corrects and fweetens all fourneffes, rather more effectually than the testaceous powders, is likewise a lenitent purgative, and keeps the body gently open. This is the only alkaline purge I know of, and which our difpenfatories have long wanted. I could with it was more univerfally received among us, and think it well deferves the rank in our books of Pharmacy, which it already has in fome foreign ones. I have taken it myself, and given it to others for the heart-burn, and find it to be the beft and most effectual remedy for that complaint. It may be given to Children from one to two drams a day, a little at a time, in all their food, 'till the acidities be quite overcome, and

[38]

[39]

and the concomitant fymptoms difappear entirely. I have often given it with good and great effect, even when the Children have been far gone in difeafes first brought on by prevailing acid.

IT is always eafier to prevent difeafes than to cure them; and as neither Children, nor indeed grown perfons, are ever feized with chronick difeafes fuddenly, the progrefs of decaying health being perceptibly gradual, it is no difficult matter for a Phyfician of common skill to observe the first step towards illnefs, and to foretel the confequence, in all those whose habit of life is well known to him. But to Parents and Nurfes in general, thefe obfervations may not occur; I will therefore point out a few certain figns and fymptoms, by which they may be affured that a Child's health is decaying, even before it appears to be fick. If these are neglected, the evil increases, grows from bad to worfe, and more violent and apparent complaints will follow, and perhaps end in incurable difeafes, which a timely remedy, or a flight change in the diet and manner of life, had infallibly prevented. The first tendency to difease may be observed in a Child's breath. It is not enough the breath be not offenfive ; it should be fweet and fragrant like a nofegay of fresh flowers, or a pail of new milk from a young cow that feeds upon the fweetest grafs of the fpring; and this as well at first waking in the

the morning, as all day long. It is always fo with Children that are in perfect delicate health. As foon, therefore, as a Child's Breath is found to be either hot, or ftrong, or four, we may be affured that indigeftion and furfeit have fouled and diffurbed the blood, and now is the time to apply a proper remedy, and prevent a train of impending evils. Let the Child be reftrained in it's food; eat lefs, live upon milk or thin broth for a day or two; be carried, or walk if it is able, a little more than usual in the open air. Let a little of this powder, or any other mild proper phyfick to be given; not that I would advise physick to be made familiar, but one dose administered now would prevent the necessity of a great many, that might afterwards be prefcribed with much lefs good effect.

[40]

IF this firft fymptom of approaching illnefs be overlooked, the Child, who, if it was healthy, would lie quiet as a log all night, will have difturbed fleep, reftleffnefs, terrifying dreams; will be talking, ftarting, kicking and tumbling about; or fmiling and laughing, as is common with very young Children when they are griped, and the Nurfes fay they fee and converfe with Angels. After this will follow lofs of appetite and complexion, check of growth, decay of ftrength, cough, confumption; or elfe colicks, gripes, worms, fits, &c. Difeafes that require all the fkill of a good Phyfician; and happy happy for them, if the utmost he can employ will reftore them to any degree of lasting health.

THERE is one thing more which I forgot to mention in it's proper place, and therefore I must take notice of it here; that is, the degree of exercife proper for Children. This is of more confequence than all the reft; for without it, all our care in feeding and cloathing will not fucceed to our withes : but when by due degrees a Child is brought to bear a good deal of exercise without fatigue, it is inconceivable how much impropriety and abfurdity in both those articles it will endure unhurt. A Child, therefore, should be pushed forwards, and taught to walk as foon as poffible. A healthy Child a year old will be able to walk alone. This we may call the æra of their deliverance; for this great difficulty furmounted they generally do well, by getting out of the Nurfe's hands to shift for themfelves. And here I must endeavour to correct a great miftake, which is, that most people think it wrong to put weakly Children upon their legs, especially if they are the least bent or crooked ; but whoever will venture the experiment, will furely find that crooked legs will grow in time ftrong and ftrait by frequent walking, while difufe will make them worfe and worfe every day. As they grow daily more and more able, let their walks be gradually increafed, 'till they can walk two miles on

on a ftretch without wearinefs; which they will be very well able to do before they are three years old, if they are accustomed to it every day. To lead them fuch a walk should be imposed as an indispensible task upon their maids, for to them it will be the highest pleafure; fo far from a burden to them, that if they perform the daily duty, they will from the impulse of their own active vigour, be found running, leaping, and playing, all day long. Thus, a dull heavy Child may be made playful and fprightly, a weakly one healthy and ftrong, and confirmed in good habits and perpetual health.

THERE are fome other little niceties, that, were they observed in the nursing of Children, would be of fome use to them; fuch as making them lie strait in bed. I do not mean extended like a corpfe, but that their limbs may be free and eafy. They should be taught to use both hands alike; for employing one more than the other, will not only make the hand and arm fo used, but also that fide of the body, bigger than the other. This is fometimes the caufe of crookednefs. It would likewife not be amifs to forward their fpeaking plain, by speaking plain distinct words to them, inftead of the namby-pamby file, and giving them back their own broken inarticulate attempts; by which means, I believe, fome Children fcarcely fpeak intelligibly at feven

feven years of age. I think they cannot be made reafonable creatures too foon.

THESE few loofe thoughts on the fubject of nurfing Children, I fend you for your private fatisfoction, if they be lucky enough to give you any. I have neither time nor patience to think of form and order or fupporting them by affected demonstrations taken from mechanical principles and powers All I have endeavoured is to be intelligible and useful; and therefore I have avoided, as much as poffible, all terms of art; together with learned quotations, as often produced out of vanity, and to fhew deep reading, as for the fake of proof. If you think it may be of any use to publish this Letter, I am not unwilling it should appear; if not, do with it what you pleafe. I deliver it up as a Foundling to be disposed of as you think proper. I shall only add, by way of perfwafive to those who may be inclined to make trial of the method I recommend, that I am a Father, and have already practifed it with the most defirable fuccels.

FINIS.
