ENQUIRY

AN

INTO THE

NATURE and PRINCIPLES

OF THE

SPAW WATERS.

WITH A

MECHANICAL EXPLANATION of their VIRTUES and USES in many DISEASES.

To which is fubjoined,

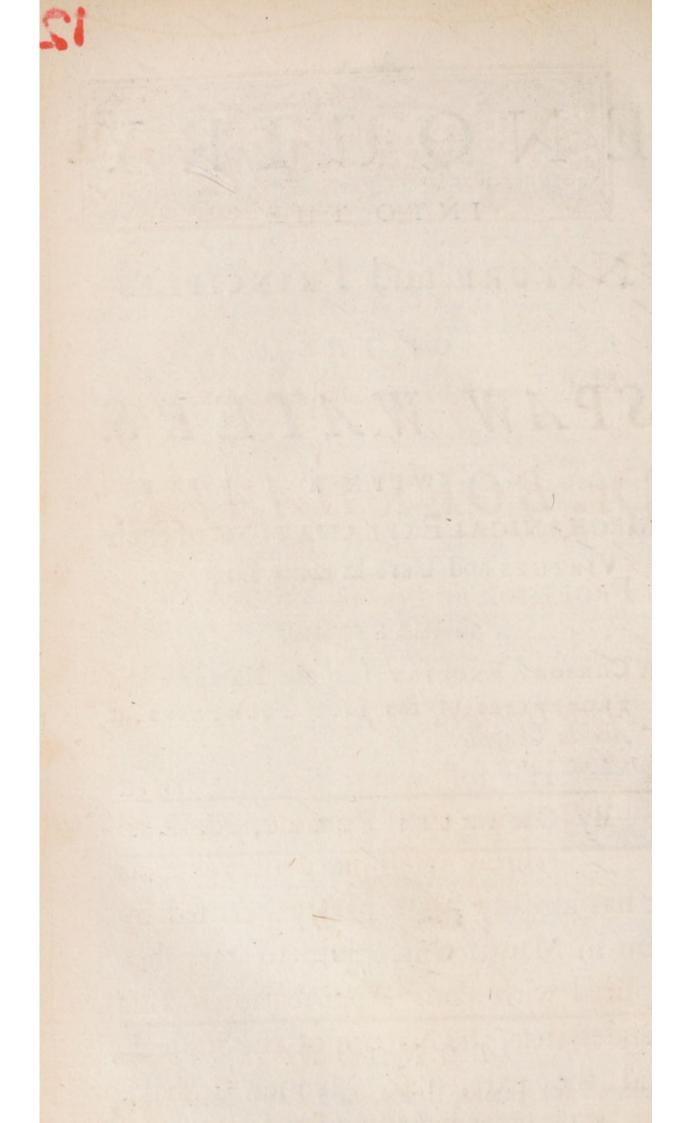

A CURSORY ENQUIRY into the NATURE and PROPERTIES of the HOT FOUNTAINS at Aix la Chapelle.

By CHARLES PERRY, M. D.

L O N D O N:

Printed for JAMES, JOHN, and PAUL KNAPTON, at the Crown in Ludgate-Street. 1734.

TO THE

Moft LEARNED and RENOWNED

Dr. BOERHAAVE,

PROFESSOR at Leyden, &c. &c. &c.

Much Honoured SIR,

HE following Treatife has a more than common Call to

throw itfelf at your Feet; as it has already been partly perufed by you in Manufcript, and, fo far, honoured with your Approbation: But befides that, the Nature of the Subject, and the particular Manner I have A 2 treated treated it in, give it a very natural and just Appeal to you.

Mineral Waters in general, and those of Spaw in particular, (though strictly fpeaking complex Bodies) conftitute an illustrious Branch of the Medicina simplex. This beautiful and excellent Part of Medicine, (viz. the Medicina simplex & genuina,) is what you have always been a firm Votary to: And your Endeavours to promote, cultivate, and reftore it to its ancient Purity, (after it has for fo many Ages been oppressed and darkned by a Succeffion of enthusiastical System Writers and Methodifts,) have been more happy and fuccefsful, perhaps, than those of any other Perfon whatever.

The Utile Dulci of Horace, is in nothing more fully exemplified than in the Spaw Waters; for every one's Experience teffifies that they are not lefs grateful

(iv)

grateful to the Palate, than they are beneficial to the Conftitution. A very fingular Happinefs to Mankind This! That a Medicine indued with fo many and fo great Virtues, fhould (contrary to almost every Thing elfe in the Medicinal Sphere) be even coveted, on account of its Delightfulnefs to the Palate and Stomach, as well as other inftantaneous happy Effects it produces in the human Fabrick.

It was the high Opinion I had of thefe Waters, founded partly on Experience, and partly on Tradition, that first inspired me to this Undertaking; and I embraced it with the greater Zeal and Ardor, as I flattered myself, that by visiting them at their Source, and analyzing them by all the Ways that Reason and Information could suggest to me, I should be able to refcue them A 3 from

from the Confusion and Obscurity in which they have been immerged by the chymical metaphysical Definitions of their own Country Men: And, indeed, it were a great Pity, but fo excellent and usefull a Part of Medicine, as mineral Waters in general, and those of Spaw in particular are, should be fet in the justest and clearest Light they are capable of. Such is the real End and Defign of this Treatife; in which I have endeavoured to strip them of their Masks and Difguifes, whether Chymical or Empirical; to reduce their Forces and Operations to a fort of Calculus, and to explain their Effects à Priore; that is, from their inherent mineral, and other Impregnations: And this Method of determining on the Effects of Medicines, à Priore, is certainly in great Measure practicable, notwith(vii) notwithstanding the great Difficulties

fome Persons make about it.

Treating the Subject in the Manner I have done, neceffarily led me into fuch Reflections and Definitions as retain to the Chymic Sphere; and efpecially whilft I was employed about the firft Part, or Bafis of the Work: *viz*. The Analyzation of complex Bodies, and the Separation, Inveftigation, and Definition of their Minerals, or other Principles: But after that, in accounting for the Virtues, Properties, Operations, and Effects of them, I have ftrictly confined myfelf to the moft abftracted mechanical Reafoning.

I fhall not in this Addrefs (conformable to the Example of Dedicators in general) attempt to bribe your Favour, *Uc.* by reciting a long Catalogue of your great Merit and Abilities. A 4 No!

(viii)

No! There is no Occasion; neither, indeed, is there Room for it. You need no Affertors; your great Merit and Abilities, and your confummate Skill in every Branch of the Medicinal Science, are avowed and acknowledged throughout the whole World, at least, all its disciplined Kingdoms and Estates. However, though I had no fuch mean temporary Views and Motives, in feeking for your Adoption to this fmall Performance; yet I confess am not a little pleased, that I have the Liberty to prefix your Name to it: For that alone (the Merit of the Work apart) will guard it against the Poison of Detraction, Calumny, and Slander: And moreover, as it will greatly contribute to draw the Eyes of the World upon it; so will it increase the Number as well as the Attention of its Readers,

(ix)

Readers, and by that Means render the Benefits it's defigned to recommend more diffusive.

It may, perhaps, seem strange to the World, that I don't publish this Piece in Latin, or fome other Language, with which it may be judged you are better acquainted: But all Surprize upon that Account will vanish, when People come to be informed, that you are a very good Judge of the English Tongue; a Thing well known to an infinite Number of Persons, who yearly go to Leyden for your Advice, upon the various Difeases for which they could find no Cure at Home. But moreover, this Treatife is particularly written for the Benefit and Instruction of the People of Britain and its Dependencies; therefore publishing it in a Tongue not familiar to that Community, munity, would have been going from the main End and Defign of it.

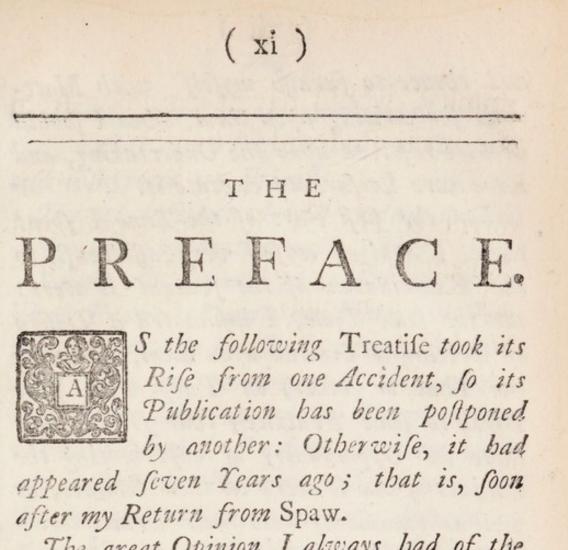

That you may long live in uninterrupted Health, for the Honour and Advancement of the Science of Phyfick in particular, and the Good of Mankind in general, is the fincere Wifh of,

SIR,

Your Most Obedient, and

Most Devoted Servant,

CHARLES PERRY.

The great Opinion I always had of the Spaw Waters, ever fince I have been converfant with them, and capable to judge of them, determined me in the Purpofe of visiting them at their Source, and inspired me with the Design of publishing my Sentiments upon them one Time or other: But, I confess, I had no Thoughts of writing upon them during my Stay there, 'till the very Day I set about it. I must acknowledge (however,) that I made a Journey to Spaw, chiefly with Design to examine into the several mineral Springs there; and

(xii)

and thence to furnish myself with Materials for writing upon them, when I should be more resolved upon the Undertaking, and have more Leisure to execute it.

For, the first Part of the Time I spent there, I applyed myself very assiduously to the Examination of the several Waters: At the same Time, I instructed a Design of writing a Treatise upon them, (meaning one Time or other) on Purpose to give Birth to some 'Practice; that so I might have an Opportunity of experiencing the Virtues of the Waters at their Sources, as well as examining into their Principles.

Several Gentlemen of my Acquaintance, mislook my Meaning, as to the Time of writing upon them, judging I proposed to do it there, whilst upon the Spot; and they reported my Designs under this mistaken Sense. Hence, by the Time I had compleated my Examinations and Experiments upon the Waters, I gathered from some Hints, that my Insinuations of a Design to write a Treatife upon them, were misapprehended as to the Time of doing it; and that it was expected I would do it then. Hearing this, I resolved to fulfill my

(xiii)

my Words, even in this mistaken Construction, rather than subject them to Censure, and disappoint my Friends.

The whole Piece (I will venture to fay) is wrought up mechanically. There is not a Sinew, nor fo much as a Thread, in the whole Frame, of any other Nature or Temper, except only the Basis or main Springs: And these are certain, real, and evident Principles inherent in the Waters; from the Consideration of which, in their various respective Natures, Mixtures, and Proportions, I have rationally deduced all their Virtues, and have directed them to their respective Diseases and Uses.

This Subject (I confess) has for a long While been my particular Favourite: And, as I have advanced some Thoughts and Reflections upon it, which are altogether new, and which Writers who have gone before me seem not so much as to have thought of; so I hope they will be no less singular for their Use and Benefit. As I have always been a great Admirer of these Waters, and a great Votary to them; so I have been of Opinion, could we once adjust and ascertain their Virtues and Uses upon the

(xiv)

the Principles of true mechanical Reafoning, we might by that Means render to the World, a more agreeable and safe, as well as a more effectual Remedy for an Infinity of Diseases, than either the Galenical or Chymical Systems are capable of affording us.

If what I have advanced in the following short Treatife, has the good Fortune to place these Waters in a stronger and more distinguishable Point of Light, than they at present enjoy; to raise the Opinion of the World in their Favour, and to encourage, as well as instruct Mankind, when and how to use them; I shall think the small Pains I have taken amply recompenced, as I may then assure myself I have advanced something which will promote the publick Good.

I have touched but very briefly on the Aix Waters, by Reafon my Enquirys were confined to fome of their abstracted Principles; having no Opportunity of examining into those Waters at their Source, except only by the Sight and Taste.

The following Piece is but small in the whole; but then it contains scarce any Thing more than what is really estential to the

(xv)

the Subject: And I only wish the Publick may accept it with as much Sincerity and Candour as I offer it. It is meerly defigned to place not only the Waters, but their Virtues and Vses likewife, in such a Point of Light as may render them visible to every Body; and to instruct the Publick when and where to apply to them: that is, upon what Diforders, and what particular Water to make Choice of under the different Kinds of Diseases. I have proved their Principles by Analyzation, and their Virtues from their respective Principles; con-Sidered first simply and separately, and afterwards in a compounded State; from the Relations they have with, and the Proportions they bear to one another. My Design is to serve the Publick; by recommending to those who are, or may be diseased, the Vse of such Remedies as, when rightly applied, will be innocent, agreeable, and effectual; instead of those that are too often not only nauseous and ineffectual, but de-Aructive too.

I wish every Thing I have said in the following Treatise, in Behalf of the Spaw Waters, may be justified by Proof and Experience :

(xvi)

perience : To which End it is necessary to admonifs the Publick in a Point or two. And, First, That in all Cafes of Importance, Perfons rather go to Spaw, than content themselves with taking its Waters transported to England, or elsewhere. For, whereas in and about Spaw, there are feveral mineral Springs (as I fall fbew hereafter) which have their distinct Virtues and Uses; of all these, the Water of only One will fand the transporting : And even that, which is called the Pouhon, must undoubtedly lose both in its Force and Vigour, by Time and Transportation. Secondly, There are great Quantities of Spurious Waters carried to England and other Places, under the Colour and Name of Spaw: As for Example; the Water of Cheveron, (commonly called Bru Water) which is much inferior to the true transportable Spaw Water : And besides, the faid Bru Water having been faithfully and accurately examined by the Faculty of Physick at Liege, appeared to be impregnated with a noxious Mineral, on Account of which it ought rather to be condemned than recommended for any medicinal Use.

But

(xvii)

But here methinks! at a Time when I am about to enumerate the many excellent and useful mineral Springs, which Providence had endowed a foreign Dominion with; I should be wanting in Gratitude to that Providence, did I not acknowledge the like Benefits which our own native Isle, Great-Britain (justly deemed the Rival of the Universe, on many Accounts) is blessed with.

Our mineral Waters, I allow indeed, are, in Nature and Excellency, inferior to those of Spaw and Aix: But these excepted, and those of Piermont, are seconded to none yet discovered for medicinal Qualities. We have a great Number of Springs, conspicuous for their Virtues of this Kind; but the most remarkable and renowned, are those of Bath, Briftol, Scarborough, and Tunbridge. There is likewife (befides feveral other mineral Springs of lefs Note in the fame Kingdom) one very famous Well at Waxford, in Ireland, called St. Peter's Well. This has been reported to me, to afford a Water highly impregnated with Minerals of excellent Virtues and Qualities. Thus much is certain, that it brings a great Concour Se 2

(xviii)

Concourse of People there every Season, and very great Cures are ascribed to it.

Each of these Waters has been thought worthy to employ the Pens, as well as the Practice of Jome one, or more eminent Physicians. I have read Pieces on the Bath, the Briftol, and the Scarborough Waters: And tho? I acknowledge these Pieces are not ill wrote, yet I cannot omit to offer as my Opinion, that they may be treated in a different Light, to much greater Advantage: That is, in fuch a Manner as will more effectually obviate, ascertain, and illustrate their respective Virtues and Uses: In Consequence of which, the several Waters will obtain their due Weight in the publick Estimation, and People will be naturally led to have more frequent Recourse to them.

The Method I would recommend, and which I would take myfelf in examining the faid Waters (could I fpare the Time, &c. necessary to go through fuch an Affair,) should be, First, To make exact and complete Analysis of each Water; Secondly, When I had duely discovered what Minerals, or other Principles they were impregnated with; I would

(xix)

would mechanically explain the Virtues and Properties of their respective Principles; considering them first in their simple and genuine, and afterwards in their compounded State: And lastly, determine and direct each particular Water to its proper Diseases and Uses.

This is the Method I have strictly observed in the following Treatise on the Waters of Spaw and Aix. Itake this to be a plain and fair Way of dealing; and 'tis what, perhaps, may be more persuasive with Mankind, as well as more Instructive to it, than the Methods generally used by Physical Authors, of enforcing the Virtues and 'Uses of this or that Water, or other Medicament, by reporting a long Catalogue of its Cures; which, notwithstanding the Veracity and Merit of the Author, the World will perhaps give but little Credit to.

The ingenious Doctor Cocquillet, senior, of Spaw, (who, besides some actual Helps, gave me many Directions and Instructions in analyzing the Waters of Spaw,) is intirely of my Opinion in this Particular. He asfured me that be declined writing a History of

(xx)

of the Cures effected by the Spaw Waters; (though much importuned to it as well by Physicians as others) because he imagined a great many real Traths would appear to the World mere Romance. And yet, I believe, there is no Man better qualified to give a practical Treatise on them, and History of their Cures than him; He having been intimately conversant with them, and constantly in the Experience of them, for above thirty five Years past, computing to the Time I was there.

(1)AN ENQUIRY INTO THE Nature and Properties OFTHE SPAW WATERS, SC. SECT. I.

Contains a brief Description of the Town of Spaw, and its adjacent Country; an Ac= count of the principal Mineral Springs in and about it; and an Enquiry into the great Volatility of their Waters.

rocky.

HE whole Country, for a confiderable Extent, about the Town of Spaw, is very mountainous and The Town it felf is fituate in a Bot-B toma tom, at the Foot of a Mountain, whose Declivity is very fteep, and defcribes a Semicircle about it; extending from the Weft-North-Weft to the Southward of the Eaft: Whence it is no Wonder the Place is healthy; being fo entirely covered from the Winds of the North-Weft and North-Eaft: Quarters, which conftant Experience teaches us, are extreamly hurtful and pernicious to our Constitutions. The Mountain, which thus half encompasses the Town, is exceeding rocky; and, upon a clear and ferene Day, affords an agreeable, though romantick Profpect. The Town is fmall, but pleafant and commodious enough. The Spot, on which it flands, is unequal, and somewhat rocky. It has a Fountain of foft Water in the Midst of it. which is not brought thither by Art, but rifes

out of the Earth naturally: It is excellent in its Kind; is perpetually running; and fupplies all the Inhabitants of the Town.

I decline giving a more particular Defcription of the Town, or any Detail of its Cuftoms and Regulations, (which may be found to Exactness in abundance of Writers,) those being foreign to my Defign; but shall hasten to my Purpose.

There

There are in and about the Town of Spaw feveral Springs of Mineral Waters; of which only five are remarkable. These are the *Poubon*, Geronster, Sauveniere, Tonnelet, and the Wartroz; of which, only the three first are now in Reputation and Use: To them, therefore, I shall chiefly confine my Reflections. And,

First: The Fountain called the *Poubon*, (from whence all the Water, which is transported to *Britain*, and other foreign Parts, is or ought to be taken) is in the Midst of the Town, about thirty Paces below the abovementioned Fountain of fost Water. It derives itself from that Part of the Mountain which lies to the Northward of it; and springs up out of the Earth into a Bason made on Purpose to receive and contain it; which is so plentifully supplied, that it feems almost inexhaustible.

The Geronster is fituate on a Hill, about two English Miles from Spaw, to the Southweftward of the Town; and fprings up into the Hollow of a Rock, shaped like the Bason of the Poubon. This Water (which is much to be lamented) will not stand transporting to foreign Parts; for upon several Trials it has always turned seculent and putrified; B 2 whence whence it becomes naufeous to the Sight, as well as to the Tafte; and all its Virtues are very much enervated, if not entirely loft.

The Sauveniere lies on the Side of an Eminence, about half a League from the Town, to the South-East of it; and springs up out of the Cleft of a Rock, which naturally forms a convenient Bason to receive and contain it. But this Bason, as well as the Spring that rifes into it, are much less than either of the former, infomuch, that fometimes it has been infufficient to fupply the Concourfe of People, who come to drink of it : In which Cafe every one is limited to a certain Quantity. This Water (like that of the Geronster) is unfit for Transportation; but from a very different Caufe: For the Strength and Volatility of its mineral Impregnations are fo great, that they would certainly burft the Bottles; except they were left uncorked for a confiderable Time, that the more active, elastic, and volatil Particles might fly off; by which Means it would loofe much of its Virtue, as well of its Force and Vigour.

Within about fix Paces from the Sauveniere is another finall Source, called Groesbeeck; which derives its Title from a Baron of that Name Name; who meeting with an extraordinary Cure by that Water, after all the other Springs had failed him, caufed a Stone handfomely carved to be placed over it, (fupported by two others, one on each Side,) which are a very pretty Ornament to it. The carved Stone that is placed at Top, bears the following Infeription, as a Teftimony of the Water's Excellency. Paulus Johannes Baro a Groesbeeck. Archi. Cond. Serenissima such Celsissima Cancellarius, Vitiantem a vera seperabat. This Water, though almost out of Use now, is exceeding volatil, and has a delightful Flavour.

The Tonnelet and the Wartroz are likewife very ftrongly impregnated with Minerals; though perhaps they may be different in Kind, Mixtures, and Proportions, to the reft. But, as thefe latter are now almost out of Date, and quite out of Use, I shall be very brief in my Reflections upon them.

The three Springs first described, as they are impregnated with the same general Principles, or nearly so, though different in their Degrees, Mixture, and Proportions; so their Virtues correspond and agree in the general; notwithstanding that in many particular Dif-

eafes

cafes, they fometimes produce different Effects, and feem repugnant to each other in their Operations. But these Things, which are the Dictates of Experience, are no less obvious in reasoning mechanically on the various Appearances that present in analyzing these Waters; as I promise myself, I shall be able to demonstrate.

Upon examining the Waters of the three first-mentioned Fountains, I confess I was much furprized to find fo fmall a Quantity of Feces produced from them; and those fo taftelefs and infipid in their Nature: But, when I had tried them by Fire, and by that Means difcovered the true Nature and Effence of their respective constituent Principles, and the Proportions they bare to each other; I concluded them to be of very little Account in themfelves; and no more than the Expreffions and Testimonies of fuch Principles exifting in the Waters in a much greater Degree, and in a more spirituous, volatil, and excellent Nature. This Conjecture is not only very rational, but is likewife manifefted by Experiment: For, did all the mineral Particles and Principles, as well the fubtil and volatil, as the gross and fixed, virtually

(7)

ally remain in the Feces after Evaporation, they would, when reincorporated with the fame Quantity of Water, which had been exhaled from them, contain the fame Virtues, and exhibit the fame Tafte and other Appearances as before; none of which do in the leaft appear. This is a Proof drawn from Experiment; which is beyond all Arguments. But, becaufe it is agreeable, as well in Phyficks as Mathematicks, to bring Matters of Fact, and Things evident to our outward Senfes, to quadrate with our Reafoning; fo I shall endeavour to difcufs it in that Light too.

It is univerfally maintained, That Nature is, in general, the best and most perfect Operator; and I prefume it will be allowed me that fhe is, in particular, the best Chymist. Hence (without making the leaft Digreffion, to explain how and wherefore Things are fo ordered and difpofed) it will appear, that the fundry Minerals, and other Principles, with which these Waters are impregnated, must be constituted in the justest Proportions, to obtain the Ends they are defigned for. It will thence no lefs appear, that their individual Particles must be more perfectly elaborated, more infinitely divided, more intimately B 4 mixed,

mixed, more highly fublimed, and, confequently, their Virtues and Properties more perfectly unchained, rarefied, and difplayed, than they could be by any human Art or Power.

It is this perfect Elaboration, this infinite Division, and intimate Mixture of the Particles of different Species of Matter, that unchains the hidden Properties of Matter, and calls forth its most latent Virtues to Senfe and Action. In a Word, it is in the Perfection of these various Operations, that the Spirituofity, Volatility, and Elafticity of Bodies con, fift. Thus we fee, that by the Mixture of two Bodies, (each of which shall seem fixed and abfolutely void of Volatility,) the Mixture becomes volatil; and the Volatility, which refults from the Mixture, will always be in Proportion, as the Elaboration, the Division, and intimate Mixture of their Particles, are more or less perfect. Now, it is to be fupposed that these volatil Particles or Effences did exift in the feveral Individuals before their Mixture; but were fo fettered and imprisoned, as to be undifcoverable by any of the human Senses: For, Nibil dat quod non babet, is an Axiom which I believe no one will go about to controvert. One

One Advantage of the volatil Effences, which fo greatly abound in the Spaw Water, is, That they render and preferve the more grofs, terrene Particles in a State of Comminution, Rarefaction, and Fluxion; and fo prevent them from aggregating together, and precipitating. And this is fo true, that if you expose any of these Waters to Heat, or let them stand fome Time open to the Air, (that their fpirituous, volatil Effences may diffipate,) their more großs, terrene Particles fhall aggregate, and combine together: The more ponderous of which will fublide and fall to the Bottom, at the fame Time that the lighter, and more tenacious or greafy, rife to the Surface, and appear in the Form of a Star. This Afcent of tenacious, greafy Matter to the Surface, in the Circumstances just now mentioned, is more confpicuous in the Poubon Water, than in the others: But fet any of them over a Fire, and the first Accefs of Heat will immediately put them into a ftrong Ebullition, even whilft to our Senfation they are perfectly cold. Indeed, this Ebullition is greater, and manifests itfelf sooner in some of them, than in others: But in all of them, the Instant they grow hot, their

(9)

their großs, terrene Particles fall into Confusion, and fo aggregate and combine together, as to render the Water troubled and muddy: Which demonstrates, what I have already observed, That the Existence of the spirituous, volatil Effences in the Waters, is the neceffary Condition of their Perfection, and their fole Barrier against Corruption or Depravation: But when, by the Heat of Fire, Accefs of Air, or Length of Time, those spirituous, volatil Effences, and elastic Powers are diffipated, That Water, which before was pleafing to the Sight, as well as delightful to the Tafte, becomes extreamly naufeous and offenfive, both to the one and to the other. The Poubon Water, however, is not fo fubject to Decay by Length of Time, as the others; though equally fo from the Accefs of Air or Heat. As a Proof of this, Doctor Cocquillet affured me, that he and Doctor Chrouet, being confulted together for a Patient in a wet Season, (at which Times the Springs must be, and actually are very much diluted and weakened,) they compared together, approved, and accordingly ordered the Use of Waters, which had been bottled from this Fountain fix and twenty Years before, preferable

(10)

((11))

preferable to those, which then flowed from the fame Source.

I flatter myfelf, the Arguments I have already urged, prove beyond Contradiction the great Volatility of thefe Waters: And I will now endeavour to make appear, in what Qualities and Degrees the fubtil, volatil Effences, with which they are manifeftly endued, must transferred the fame Specific, through fixed and terrene Principles, from which they were themfelves derived.

It is very obvious to Reafon, as well as evident from Experience, that two or more mineral, or other Principles, being mixed together and volatilized, their individual respective Parts are not only more infinitely divided, but are likewife more intimately mixed; and thence not only their own refpective Virtues and Properties are greatly heightened in themfelves, but new and neutral Virtues may possibly refult from that intimate Mixture and Union of their feveral Principles, which before were not proper or peculiar to either Individual. And this proves (what I have observed above,) that the Volatilization of different Principles or Species of Matter (being first mixed together,) unchains their

their refpective Particles, and calls forth their moft latent Virtues, as well as utmoft Vigour to Senfe and Action. For, notwithftanding what I have juft now faid of new and neutral Virtues, which were not proper and peculiar to either Individual; yet they muft be underftood to have pre-exifted in the Matter, though fo fettered and intricated, as to be undifcernable to the niceft Scrutiny, 'till Volatilization had given them Birth.

But, befides the fupposed Superinduction of new Virtues, those that manifested themfelves before in each individual Part of the Compound, are infinitely multiplied in Force, as well as Activity, by Volatilization. Hence it is, that whilft the gross, dull, terrene Particles require a formal and long Digeftion in the Stomach, demand to tafte the Bile in the Duodenum; and after that, require many auxilliary Forces to thrust them through the Lacteals; and yet a longer Time to concoct them in the Blood Veffels, and to mix and incorporate them with the Blood: After all which long Apparatus, (by Reason of their flow Progreffion and Inactivity,) they act perhaps by Piecemeal; without any Harmony or Concert: I fay, hence it is, that whilft the naufeous nauseous Lump of gross, terrene Matter (no lefs offenfive to the Palate, then oppreflive to the Stomach) is going its tedious Courfe, the volatil Particles or Effences (on the contrary) have a Transition, as fwift as Lightning. They no fooner falute the Palate, than they enliven the whole Frame of the Body; which I, myfelf, as well as many others, have experienced. I have more than once fafted four and twenty Hours, on Purpose to prove the Effects of a large Draught of the Poulson Water : When my Stomach was empty, and all the Blood-Veffels and Glands cleanfed, and relieved from their undue Diftentions; and all the grofs, fpiritlefs, and excrementitious Humours thrown off by Perspiration, and the other Secretions; and, in this Situation of Things, I must confess to have found admirable Effects from it : That is, I have immediate. ly perceived my whole Machine greatly enlivened, and my Spirits much invigorated by it.

The Virtues and Properties of thefe Impregnations being, naturally and fimply confidered, very excellent; how extensive must their Force and Power be, when we confider the infinite Subtilty, Elasticity, and Activity they acquire by Volatilization; especially cially when mixed and complicated together? What Coagulations may they not be fuppofed able to diffolve? what Combinations and Concretions of Matter not deftroy? what Humours, whether acid, acrid, or corrofive, not correct? what Obftructions not remove? what Relaxations not reftore? and, finally, what Secretions not regulate? Experience confirms (what Reafon in this Cafe plainly dictates) that all thefe great Ends are evidently and imminently effected by fome one or other of them, when directed by the Advice of a good Phyfician, and with fuch Preparatives, and other Affiftances from Medicine, as are convenient.

SECT. II.

Treats of the various Ways of analyzing the Waters; of the feveral Principles, or Minerals with which they are impregnated; and their respective Virtues and Properties confidered, both in a simple and a compounded State.

I will begin with the *Poubon* Water; as well for its being the most eminent, and generally used, as because it is the only *Space* Water

(15)

Water which is, or at leaft, ought to be tranfported to Britain, and other foreign Parts.

The first Trials I made upon this Water, were by adding and mixing different Bodies with it; amongft which I first used the known Experiment of a Gaul. By fcraping fome Gaul into it, the Water immediately turned of a deep purple Colour: But upon the Addition either of a little Quick Lime, Oil of Vitriol, or Spirit of Sal Armoniack, the borrowed Colour foon fubfided, and the Water became clear as before. This purple Colour, produced by the Scrapings of a Gaul, proves a predominant Vitriol in the Water. I could make no further Difcoveries, by any Experiments actually made upon the Waters, except the above mentioned, of a Gaul, and the Precipitation of its purple Tincture.

It is univerfally maintained (and indeed Experiments confirm it beyond all Doubt) that mineral Waters turning of a purple Colour, by projecting Scrapings of Gaul into them, always denotes a Vitriolic Impregnation. But what then (chymically fpeaking) can be the Caufe of the purple Colour's fubfiding upon the Admixture of the various Things above named; and efpecially the Oil

Oil of Vitriol? I don't remember to have met with a proper Explanation of this *Phæ*nomenon any where, nor any Attempt to explain it; therefore fhall endeavour to folve it here. And first of its Precipitation by Quick Lime. *Calx viva*, or Quick Lime, is a very powerful Alcaly: Whence it is no Wonder, that upon its being mixed with the Water, it solution in close Commerce with itself, and carry not only them, but likewise the Particles of the Gaul they had before affociated with, to the Bottom, and fo leave the Water clear.

Spirit of Sal Armoniac is likewife an Alcaly of the volatil Kind; and being inftilled into the purple Water, affociates itfelf with the acid, vitriolic Salts, fo as to brake their Force: And thence the Particles of the Gaul, which were before held fufpended in the Water, and uniformly diffufed through it, being freed and releafed from their Vinculum, aggregate and combine together, and fall to the Bottom. As to the like Effect produced from the Inftillation of Oil of Vitriol, (though in *prima Facie* it would feem a Paradox,) yet if we examine it clofely, the Myftery may perhaps be cleared up. I fhall firft

first premise, by way of Parallel, that many Difeafes are cured by Salts, fome of the acid, and fome of the alcalic Kind; when (if we credit many illustrious Writers of past Ages, as well as fome of the prefent) the Difeafes were owing to the fame specific Salts, by which they were cured : So that in Fact, (allowing these illustrious Authors to be in the Right,) fuch Difeafes were cured by increafing the Quantity of Morbific Matter. The Cafe here is pretty much the fame : For, though the Water was capable of retaining a certain neceffary Quantity of Vitriol; of

(17)

keeping it fulpended in it, and uniformly diffuled through it; yet upon the Addition of Oil of Vitriol, the Water might be over charged with that particular Ingredient. And, as the Vitriolic Particles would neceffarily come into a nearer Contract with each other; fo they might aggregate, clufter, and combine together, and fall to the Bottom; carrying the Particles of Gaul along with them. Or otherwife, the Oil of Vitriol, by its Tenacity, might first engage the Particles of Gaul affociated with the Vitriolic Principles of the Water; and afterwards by its Ponderofity fink them to the Bottom.

I had

C

I had next Recourse to Evaporation: By which Process fifty Pounds of Water afforded fix Drams of Feces, like a dry Powder, of a bright Cinnamon Colour, and not ponderous. I strewed some of this Powder upon a polished Iron Plate, made red-hot, and fet over a Fire proper to keep it in the fame Degree of Heat; but that Experiment produced nothing remarkable. It is a received Opinion, (and maintained by all the Writers upon this Water,) that it has a Sulphur in it: But if so, it must be a mere Essence of Sulphur; and that, in a very fmall Proportion, which diffipates imperceptibly. Every one that has gone through a Courfe of Experiments upon this Water, will, I believe, agree with me, That as it is not at all perceptible by the Taste; so neither is it discoverable by any other Trials. Was there a Sulphur refiding in the Feces, after Exhalation, it would liquify upon the hot Iron Plate; caft a blue Flame, and a sulphurous Smell; neither of which appeared in the leaft, upon my Examination of it. In the above-mentioned Experiment, the Powder loft a fourth Part in Weight: Nitre discovered itself in a confiderable Degree, by a great Quantity of bouncing

bouncing Sparkles. The Iron became very diffinguishable in the Feces, after this Experiment; as alfo fome Vitriol, and a fubacrid Salt. Some Writers take a great deal of Pains to prove that there is Allom in it; of which, I own, I could difcover no Marks. The Principles, however, with which it is evidently impregnated, are by no means inconfiderable: And thefe, when juftly proportioned to each other, duly mixed, and perfectly fublimed, may be fuppofed capable of producing very many and great Effects, without our being at the Pains to fearch for the Difcovery of Allom, or any Thing elfe to affift them.

It appears, as above, that the Principles, with which this Water is impregnated, are, Mars, Nitre, and Vitriol, with a finall Quantity of fubacrid Salts; of all which, the Mars is the greateft in Proportion. I will firft enquire into their Virtues and Properties, as fimple and feparate; and afterwards confider them in their compounded and medicated State.

Mars or Steel, which, from its excellent Virtues and Qualities, claims fo great a Share in the Materia Medica, is modelled and C 2 difpofed difpofed by Chymifts into a vaft Variety of Shapes; and by thofe different Modifications, is rendered applicable to, and ufeful in very many and oppofite Maladies. This is demonstrable, beyond all Contest; and yet, if I may credit the Authority of Writers, as well as common Report, and the Testimony of my own Reason; that great Chymist, Nature, has, by one fingle Preparation, fitted and qualify'd it to obtain all those various and opposite Ends, in a far more eminent Degree of Perfection. For,

Mars or Steel, in its native Drefs, difplays its first Effects on the Stomach. It creates Appetite, by increasing the Stomach's Attrition ; and, when Appetite is the Effect of fuch an increased Attrition, a good Digestion will certainly follow. But befides these Benefits, (which it eminently procures to the Stomach,) it fcowers and cleanfes it of Slime, and other Impurities; and, laftly, greatly inspirits it. Hence our Aliments pass into the Blood better elaborated, and less disposed to feed it with gross, feculent, flimy, or other noxious Humours. This Mineral increases the attractil Force of every Moles of the Blood, and of all the Solids; at the fame Time that

(21)

that it breaks to Pieces, and deftroys all grofs, tenacious Concretions, and other Combinations; which may be either forming, or already formed in the Blood Veffels, or elsewhere; and fo, of neceffary Confequence, must open Obstructions. It feems to communicate a Spirit to the Blood ; and, in Reality, it does fo ; or elfe greatly actuates and invigorates those already exifting in it. And yet (which may feem ftrange) it atchieves all those great Ends and Purposes without any extraordinary Virtues and Properties visibly inherent in it : But, it is fupposed to act chiefly by Means of its specific Gravity, and the Figure of its conftituent Parts. That is, First, by Means of its fpecific Gravity, it attenuates the Fluids, and increases their Momentum Motis; and, of neceffary Confequence, tends to break down and deftroy (as observed above) all gross vifcous Concretions or Combinations of Humours, which form and conftitute Obstructions in the Veffels. And, laftly, by the Figure of its Parts, it increases the Nifus of all the Blood Veffels, and the attractil Force of all the other Solids: Therefore we ought not to wonder that very great and various Ends are obtained by the Complication and Joint-Action C 3

Action of two fuch Powers, as appear to be impressed, one on the folids, and the other on the Fluids.

It is not my Defign to write a Treatife upon Steel in this P ace ; but I cannot difmifs fo great and important a Branch of the Materia Medica, without taking a nearerView of it, by examining curforily into its confiftent Parts, or first Principles; and the Manner of its Generation and Formation in the Bowels of the Earth. And, first, as to its Generation and Formation: It is, doubtlefs, like all other Minerals and Foffills, produced by a regular and proper, though a fubterranean Vegetation. This Doctor Chrouet (a Physician of that Country) afferts; but unluckily destroys his Thesis in the very Attempt to explain and prove it. After various Analyzations of this Mineral, he does not hefitate to affert, That the conftituent Principles of Mars, is an Earth refembling Potter's Clay, a very fixed Sulphur, and a double Salt; that is, a Salt partly acid, and partly alcaline. I will not pretend to deny that Mars is conftituted of these Principles : Becaufe, as I have not been at the Pains of analyzing that Mineral; fo I cannot judge what Phanomena might be present to favour

favour fuch an Opinion. But further, Doctor Chrouet is of Opinion, and peremptorily afferts, That the whole Bulk of the fuppofed conftituent Principles affemble at once together, and fo mix, and incorporate one with another, as not to be eafily feparable; except only the acid, of which the Salt partakes, and which (for that Reason) he looks upon to be the grand Operator in the Formation of this, Mineral. Things being thus fituated and disposed, he supposes the Air to descend upon the Mafs, and to inoculate or impregnate it: And there, by its intimate Commerce with the fixed Salts; to ferment, fwell, and dilate the Mass, like, as Leaven does Dough. By this Fermentation the various conflituent Principles (fays he) are more intimately mixed and interwoven with one another; and, confequently, their Parts difposed to come to a closer contact, and a stronger Union: And, laftly, (if I have comprehended the Doctor's Meaning, for he does not express it,) by the fupposed Fermentation, its Fibres are rendered fo ftrong and elastic, as that the whole Mass contracts itself together into a close, compact Body, to the Expulsion of the interposing C 4 Air

Tavotr.

(24)

Air; and so the true Marcasite of Steel remains.

This, indeed, is a very fpecious, or rather vociferous Definition, (though in my Tranflation I have much abridged and curtailed it ;) and it is supported by a good deal of the Chymical Bombaft and Jargon. I declare it is no fmall Mortification to me, that I must again differ from Doctor Chrouet, and diffent from him, in this his fo learned and laboured Definition. But, as I cannot facrifice my Reason to a Ceremony, nor prostitute it to Flattery; fo I can by no Means dispense myfelf from it. Whether, or not, the Doctor, in his feveral Analyzations of Mars, did really discover such Phanomena, as would lead a reasonable Man to think it composed of the Materials, and in the Manner he affigns, I will not venture to fay : But I rather incline to believe he was led into this chymical Way of defining it, from the Prejudices and Attachment he might have to the obfcure and mysterious Part of that Art, (which is no where fo much espoused and cultivated as in Germany;) and perhaps, to shew himself an Adept in it befides. But, be that as it will, I shall proceed to deliver my own Sentiments upon

upon it; which are intelligible, plain, and (I hope) natural.

My Sentiment upon the Matter is this. Allowing those Principles to conftitute Mars, which Doctor Chrouet lays down as Fact, I would fuppofe it to be brought to pafs by the following Mechanism, viz. That when, or wherefoever those Principles meet together in a proper Matrix, and ftrike each other at proper Angles, they inofculate, unite, and are intimately interwoven together, and fo affume a new Form and Denomination. And thus may be formed the first Seeds or Rudiments of a Mine, or mineral Bed; which may enjoy Virtues and Properties, as well as a Form and Substance, that did not visibly pre-exift in either of the Individuals; and thefe Seeds, or Rudiments, being thus formed and difpofed, might daily vegetate, and increase in Bulk. They would not vegetate, indeed, like as Plants and Trees do, which receive their Nutriment through the fine Tubes of their Roots and Seeds, but by a Kind of Vegetation, which is peculiar and proper to themfelves; in common with other Minerals, perhaps. But, though I don't abfolutely deny and reject Doctor Chrouet's Hypothesis, yet

(25)

(26)

yet, I confeis, I am more inclined to favour another. That is, I am of Opinion, that Mars or Steel is not a Body compounded of various Principles; but that all its conftituent Parts are fimple, genuine, and of original Exiftence; and that these Parts, or Particles, (conformable to the eternal and immutable Laws of Attraction,) as they approach nearer together, do incline more violently to each other, till at last they unite and combine together in one Mass; which Mass continuing to act in like Manner (in Obedience to the fame attractil Property) upon all fuch homogeneous, or fimilar Particles as pass over, or approach near it, does daily vegetate or increase in Quantity; 'till in Process of Time, large Mines, or mineral Beds, are formed : And this I hope will be judged more confiftent with the true Nature and Doctrine of mineral Vegetation, than Doctor Chrouet's Hypothefis. Moreover, that great Operator [Nature] is not more excellent and admirable in the Formation of this Mineral, which fhe renders fo folid and compact, as in a Manner to conceal its Virtues from our external Senfes; than she is in separating again, in diffolving, mixing, and fo rendering it applicable to

to a Multitude of medicinal Uses; in which it difplays furprizing and almost infinite Virtues.

But here I proceed to the Confideration of Vitriol.

Vitriol is commonly counted a Semi-Mettal, it being a Salt, which has poluted itfelf by engendering with fome Mettal or other. But however unchast and polute it may be in its Commerce with different Species, it is nevertheless excellent in its Nature and Uses. And, first, it greatly corroborates the Stomach and Guts; it reduceth their relaxed Fibres; and by contracting and reftoring the Orifices of fuch Glands, as were too lax and open, it represses a redundant Phlegm and Slime in the Stomach and Bowels; and fo becomes an Acceffory to the Promotion of Appetite and Digeftion. It opens Obstructions, by heating and attenuating the Fluids; and ftops Fluxes, by aftringing the Solids. Its Virtues and Ufes, fhould I enumerate every particular, are very many; but these are much increased, as well in Number as Degree, when it is complicated with Mars.

Nitre is a great Cleanfer of the Conduits and Veffels of the Body, and tends to purifying the the Blood: It incides and attenuates all greafy, flimy, tenaceous Humours; and by that Means removes Obftructions: It divides, and deftroys their Cohefion and Union, by penetrating them with its fharp Points: And, laftly, precipitates the Matter by Urine; and in that Operation, it likewife fcowers and cleanfes the Reins and Ureters.

The fubacrid Salt, which is produced upon the Analyzation of this Water, is in a fmall Quantity, that it fcarce deferves Notice. However, in Proportion to its Quantity, it must be very aperient, deterfive and cleansing.

It appears from what has been faid of thefe individual Principles, that they are all and each of them fhaped to the fame general Ends and Purpofes, though they affectuate them by different Ways and Means. And thus far Nature is juitified, who is faid to be right and uniform in all her Operations; as fhe has not complicated and blended together Things which are oppofite and repugnant to one another in their Natures and Effects.

When these various Principles are (by her) brought into a perfect Union, and are not only intimately mixed and united, but wrought up (by the fame Hand) to the utmost Degree of Sublimity and Volatility; what new Virtues tues and Properties must they not acquire? and to what Degree may they not increase those that pre-existed? Here it is, methinks, in this Situation of Things, that I can palpably trace and discover all those great, various, and even opposite Effects, which are produced by the Waters of the *Poubon*; and which (notwithstanding they are obvious from daily Experience) seem to have staggered the

Reafon of fuch Perfons as have hitherto wrote upon them.

Doctor Neffel, (another Physician of that Country,) when he is fpeaking of the great Virtues and Effects of thefe Waters, (though proved by him experimentally in numerous Instances,) anticipates to himfelf the Railery of the World. He supposes every one will account what he is about to relate apocriphal, if not paradoxical. Again, he supposes that the Almighty had impreffed an intelligent Spirit on them; by Virtue of which, the Waters knew precifely, upon what Parts, or Humours they ought to act, exclusive of, and abstracted from all the rest. He fears the World will think him very romantic, when he fays they are both hot and cold, moift and dry. And, indeed, well it may : For

For they are not actually fo, (as he feems to imagine,) but only virtually. He expects to find but a few Believers, where he fays they heat what is two cold; and that they cool what is too hot; that they dry up a redundant Moifture; and moiften what is too dry; that they open what is too conftipated ; retract and reftore what is too much relaxed, Sc. But why all this Aftonishment? Why must we suppose all these Effects, and Operations to arife and proceed immediately from the Direction and Influence of a fupernatural Agent? Certainly this Gentleman never made any Appeal to his Reafon; or elfe, furely, he would have been able (in fome Measure at leaft) to have difcerned the Caufes of all thefe Operations and Effects in a rational Light. For my own Part, I ingenuoufly and folemnly declare, that though my Senfes were not convinced in all these Particulars; yet my Reafon (informed by their Analyzation) would readily have fuggested them to me in Favour of these Waters.

To fum up all in few Words: I have difcerned fuch Virtues and Qualities in the PouhonWater, as lead me to believe, that by a juft, regular, and due Ufe of it, it is capable of curing ring very many and great Diforders; and, finally, of reftoring the just Ballance of Nature, of bringing all the particular Faculties and Functions of the human Constitution to a just Equilibrium; which, as it is the most certain Cure for many Difeases, fo it is the best Barrier of Health. Here I take leave of the Poubon, and proceed to the Geronster.

In examining the Geronster Water, I went through all the fame Experiments, as upon the Poubon: And afterwards I put it to the Wreck in divers other Manners. But, before I relate my Experiments, it will be proper to observe, that this Water is highly impregnated with a fulphureous Vapour or Effence; as is manifest to the Taste and Smell; besides, other Circumstances, which arife immediately upon drinking of it, plainly speak the same Thing. This Vapour or Effence must neceffarily be extreamly volatil, fince it instantly diffipates upon the least Access of Heat. People, ont heir first taking this Water, are ufually affected with fulphureous Belch. ings ; after they have drank a few Glasses of it. This is what I my felf have frequently experienced; and as oft as I have belched after drinking them, it has been attended with

with a very odd Perception; like as if a Flash of Gunpowder isfued from my Stomach.

I first tried it with a Gaul; which being fcraped very fine, and put into it, tinged it of a purple Colour; but upon mixing a few Drops of Oil of Vitriol with it, this borrowed Colour foon fubfided. I had next Recourfe to Evaporation : By which Process I extracted three Drams and one Scruple of a deep Cinnamoncoloured Oker, from five and twenty Pounds of the Water. This Powder likewife, affordeth but very little Tafte, and differed from that of the Poubon in nothing, so much as in the Colour and Quantity; though, indeed, but very little in the latter. When this Powder was taken out of the Evaporating Veffel, I perceived all around and about the Bottom of it a white faline Matter, which we could not fcrape off without Difficulty. This I judged to be an alumenous or vitriolic Salt, which (being not fo intimately mixed and incorporated with the Mars and other Principles) separated in boiling, and by its Weight precipitated, and fell down fooner than the other Feces. Indeed, it is evident that the Mars is not to perfectly blended and incorporated with its Fellow-Principles

ples in this Water, as in the others; and confequently, it is more genuine, diffinct, and feparable; which will plainly appear from the following Experiment. I gathered fome of the Ruddle, or reddifh earthy Matter, which gradually adhers to the Stones in the Fountain; but more especially to those it passes over, as it runs from it. This I judged more proper for any Experiment of this Nature, than the Feces remaining after Evaporation; because the former is a pure and natural Concretion, or rather gradual Gathering of the more groß, terrene Particles, free from the Alteration and Deftruction that Fire must undoubtedly produce upon the lat. ter. This earthy Matter, which to Sight appears a fort of Iron Ruft, and would incline one to think the Water impregnated with little elfe, were it not for its Lightnefs in Weight, as well as Greafinefs, and the faltish Tafte that it imparts : This earthy Matter (I fay) being calcined gently on a polifhed iron Plate, or in a Crucible, all its ironish Parts eafily detach themfelves upon the Approach of a Loadstone, and adhered to it. Which did not appear in the like Experiments made on the Feces of the other Waters. Hence we are instructed

(33)

instructed that the Mars, contained in this Water, is not fo much fettered and entangled with its Fellow-Principles, as in the others. The Feces remaining, after the ironish Particles were thus extracted by the Magnet; being boiled in rain Water, and then filtered and exhaled; there remained a fmall Quantity of a bitter, piquant Salt, of the neutral Kind. This Water, then, manifeftly contains a redundant fulphureous Spirit or Vapour, as appears both from the Smell and Tafte, as well as from other Circumstances already mentioned; a good Quantity of well elaborated Mars, not intricated and confused with the other Principles; fome Vitriol, as is apparent from the Tincture it receives by the Gaul; and an alcalic, fixed Salt. I call the Salt alcalic, though in Reality it is neutral; because the alcalic Quality greatly predominates over the acid. How many, and what great Virtues and Properties must neceffarilybe contained here? And what Effects may we not expect from these Principles, juftly proportioned, intimately mixed, infinitely divided, and, laftly, fublimed to the highest Degree of Volatility ?

1.1.10 31.1 70 2000

(35)

Mars and Vitriol I have already explained upon; and it would be unneceffary to fpeak of Sulphur in this Place, were its Virtues as well underftood, as they are univerfally allowed. To speak then of Sulphur: It is a most powerful Purifier, and a confiderable Rarefier of the animal Juices : It attenuates, diffolves, and deftroys all grofs, tenacious, and viscous Combinations : It refolves all morbid Concretions, by diffolving, or otherwife deftroying their Cement; and is equally good in many acute, as well as chronical Difeafes: It cures all cutaneous Diftempers, whether recent or inveterate: It levels (in general) all ill Humours, whether acid, acrid, or corrofive: And if there be any Humours fo stubborn as to refist a compleat Diffolution, Correction, or Expulsion, it will so work upon them by Digeftion, as greatly to enervate and unarm them. And this it effects by filing off, and blunting their Points; and fo rendering their acute Angles obtufe and offenceless. But should only the first Character or Quality, I have afcribed to Sulphur, be granted me, viz. That it is a great Rarefier of the Blood; it would be easy to prove the Neceffity of all the reft, from the ingenious Doctor D 2

Doctor Morgan's Explanation of the Laws of the Motion and Secretion of the animal Fluids. * Befides thefe, it foftens the too-rigid Veffels and Fibres, and promotes Perfpiration. And, finally, (to end where I should have began,) it warms and comforts a cold, weak Stomach, and reftores its decayed Ferment.

(36)

The fixed Salt, difcoverable in these Feces, is what now demands to be spoke to. This Salt feems calculated to make the Compolition truely perfect and harmonious : This is wonderfully adapted to precipitate and carry off by Urine, those Humours which were wrought upon and prepared by the Sulphur, Mars, &c. Besides this, it may have, and undoubtedly has many inherent Virtues, which are peculiar to itfelf; and it may be qualified to act on some Species of Humours, which none of the other Principles could touch. For, though their Virtues are really very great and numerous, yet I don't pronounce them Panaceas. When fpeaking of Sulphur, e.g. I faid it levelled in general all ill Humours, whether acid, Sc. That is to be taken in a comparative Senfe. This Salt 13

* Philosophical Principles of Medicine

(37)

is a powerful Bitter, and confequently a Promoter of Digeftion: It refolves and attenuates the Fluids by its Subtility, and Piquancy of its Points; and for the fame Reafon, muft deterge and cleanfe the Glands and Blood-Veffels; efpecially the latter, and the fmaller. Now, when by the Joint-Force and Action of thefe Principles and Powers, all the ill Humours, whether acid, acrid, or corrofive, are corrected; and all the grofs, flimy, vifcous, and tenacious, are refolved, and the whole deftroyed, or difcharged; it is not improbable, but all thofe happy Effects, I fhall hereafter mention, may enfue.

In examining the Sanveniere Water, my first Essay was by Exhalation; by which Process fifty Pounds of the Water yielded me five Drams and a half of Powder, of a brighter Colour, though in Weight and Tasse nearly refembling those of the Waters already mentioned; but this Powder, being calcined upon an iron Plate, the greatest Part difsipated in bouncing Sparkles, like Nitre. There remained, after the Experiment, an acrid, picquant Salt; which, upon a close Examination, we found had corroded the Plate.

Doctor

Doctor Chrouet relates an Experiment which I had not Time to make myfelf; and therefore, for the present, must take it upon Truft. He reports to have put twelve Drams of that red earthy Substance (which adheres to the Stones over which the Water passes) upon an iron Plate made very hot, and that it immediately sparkled violently, (I fuppose like Nitre, tho' I have not the Doctor's Word for that,) and fpread a truly fulphureous Smell for the Space of two or three Minutes. But, when these Appearances were over, and the Smell of Iron began to take Place, he remov'd it from the Fire, and found it diminish'd three Drams in Weight; which affur'd him that it contain'd one fourth Part Sulphur. After this (adds he) the Magnet attracted it very readily, and it turn'd a Tincture, given by a Gaul, blackish; which it has been observ'd not to do, when kept a longer Time upon the Fire; because the Texture of its Mars being very loofe, the Fire would eafily confume its metallic Sulphur, and fo entirely destroy the Metal: Whereas, being (on the other Hand) but a little while expos'd to the Fire, it only confum'd its exterior, großs Sulphur,

(38)

Sulphur, which before hinder'd the Force and Action of the Loadstone upon the Mars.

Hence it is evident, that the chief, if not the fole Impregnations of the Sanveniere, are Mars, Sulphur, and Nitre, with a fmall Quantity of an acrid, vitriolic Salt: But, how well Doctor Chrouet's Experiment quadrates with his own Reflections upon it, I leave the World to judge. He fays, That putting the Matter upon a red-hot iron Plate, it immediately sparkled very much, and caft a fulphureous Smell for the Space of two or three Minutes; and after that, weighing the Matter again, and finding it one fourth Part diminish'd, he does not hesitate to charge the whole Confumption upon the Sulphur, and makes no Account of the nitrous Particles that first detach'd themselves from the Mass in the Way of bouncing Sparkles.

It would be needlefs in this Place, to fay any Thing of the Virtues and Properties of Mars and Sulphur, as being the principal Minerals with which this Water is impregnated; (having already been pretty copious on each.) However, I cannot omit to add in Fayour of Sulphur, That its balfamic, D 4 foftenz foftening Quality, coacting with the penetrating, diuretic Nature of the Nitre, and the deterging, cleanfing Property of the Mars, muft neceffarily qualify it to effect thofe great Ends and Purpofes, for which I fhall hereafter recommend it. This Water, being reputed very cold, I tried it with a Thermometer ; which (being firft filled with rectified Spirit of Wine) I plunged in the Water, and held it there about five Minutes ; after which, taking it out again, I found the Spirit condenfed about a fiftieth Part.

The three other Fountains, viz. the little Sanveniere or Groesbeeck, the Tannelet, and the Wartroz, are truly Sources of very delightful Waters, and have fome perceptible Differences from each other; but they are now almost out of Date, and quite out of Use. The Wartroz has a purgative Quality: There is yet one Thing (as I have been well affured by credible Persons) common to all the mineral Fountains about Spaw: It is this; Take an Eel, or any other Reptil, and plunge into it; it gives a Spring, and dies immediately.

耳

(41)

I will now enter upon my third, and laft Section: Wherein I shall endeavour to appropriate and direct the great Virtues and Properties, I have ascribed to these Waters, to their proper and respective Diseases.

SECT. III.

regomenent in This Water.

A A BAR AND A CONTRACT

HE Waters of those three admirable Fountains, the Poubon, the Geronfler, and the Sanveniere, though they have fome Virtues and Properties in common with each other; yet have they others which are distinct and peculiar; and in some Cases, they even produce Effects directly opposite and repugnant to each other: But this is no less obvious to Reason, than it is evident from Experience; as I shall make appear, when I come to explain mechanically upon the Virtues and Properties of each Water; deducing them from the Confideration of their respective, individual, constituent Principles, with which they appeared (upon Analyzation) to be impregnated.

The Poubon Water appears evidently to be greatly impregnated with Mars, Vitriol, and

(42)

and Nitre. Some Phyficians and Authors contend very obstinately, that there is both Sulphur and Alom in it. But, as I could difcern no Marks of either in its Analyzation; fo I shall confider them no further, than only to obferve, That should there be some Sulphur, its Proportion is fo fmall, (compared with the other Principles,) as to be almost out of the Question. Besides, the Use and Experience of this Water, in many Cafes, (as I am credibly and well informed,) are equally tacit concerning a Sulphur, as the Examinations I passed upon it; and; as I have already hinted, those three cardinal Principles being granted, in that Justness of Proportion, fo intimately mixed and incorporated, and fo highly fublimed, as they evidently appear to be; I need not rack the Water, or my own Brains, to find out new Ones.

I have already fpoke of the Virtues and Properties of these three Principles taken separately: I shall now proceed to confider them in their compound State. And,

FIRST, The Mars and Vitriol are wrought by Nature into a perfect Vitriol Martis of the most fublime and excellent Kind. This Com-

Compound befpeaks many, and very great Wirtues and Uses: But then, being intimately mixed and incorporated with Nitre, its pre-exifting Virtues must necessarily be increafed, as well in Number as Degree. This happy Confederacy of Principles, by their Joint-Force and Action, are capable either of raifing or reducing the animal Oeconomy to, or fupporting it under a just Regulation. They are capable either of fearching or guarding it, from their first Entrance at the Mouth, through its most intricate Meanders and Labyrinths, to its most remote Outlets They are calculated, and qualified to distribute impartial Justice every where. They can raife and infpirit what is weak and languid ; curb and fupprefs what is too luxuriant. They can force open and cleanse those Ducts and Canals, which are choaked up with Filth, or otherwife obstructed; contract and restore those that are relaxed, and too much dilated.

But to proceed regularly.

I shall, (for Method's sake,) First, set forth how, and by what various Ways and Means this Water acts upon our Constitutions. Secondly, How, and by what Mechanism, it it produces the various Effects afcribed to it. *Thirdly*, In what Difeafes it is particularly proper and ufeful; and in what improper and pernicious.

Its first Action is upon the Prima Via, or what we call the alimentary Duct, as far as to the Stomach; though, indeed, if drank in large Draughts, and at fhort Intervals, its Action will reach the Guts likewife; where, by its Coldness and Weight it strikes forcibly on all the interior Glands and Fibres, fo as to contract them very vigoroufly; its fubtil, volatil, elastic Spirit acting at the fame Time with a Stimulus, not only cooperates to the fame End, but it likewife penetrates their Orifices, and gets immediate Paffage into the Blood, by piercing through, or breaking down any flimy, vifcous Humours; which, flicking in and clogging the recipient Tubes, might obstruct its Enterance. The above fuppofed Action, which is thus communicated to the interior Glands and Fibres of the alimentary Duct, by the Coldnefs and Weight of the Water, and the Stimulus of its volatil Particles, (not to mention the increased Attrition of the Stomach, which will contribute a good deal to the famq

apuborg H

fame Ends,) is continued with a proportional Diminution to the very Superficies of the Body; when at the fame Time the fubtil, volatil, elastic Particles, which e're now have penetrated the recipient Tubes, and got Access to the Blood, are co-affisting to the fame End, by invigorating the Blood and Spirits, and teaching the exterior Solids, as well as the whole artereal Syftem, to re-act proportionally to the increased Force they receive from within. We are here to confider, that by this Time (for this complicate Scene is not long in Acting) a great deal of the more gross, as well as volatil Elements have infinuated themfelves into the Blood; and that their Virtues and Forces are joined together, and disposed in Action. Here, may we discern a triple Power in Alliance and Joint-Action together. All the Solids are ftirr'd up to Action by the Weight and Coldness of the Water striking upon them; whilft the Blood and animal Spirits are actuated and rarefied by the volatil, elaftic Principles contained in it, which get immediate Accefs to them; and by this Time, all the Parts and Principles of the Water, as well the gross and terrene, as the fubtil and volatil.

volatil, are uniting and levelling their utmost Force, to correct or alter, attenuate or diffolve, break down and deftroy, all ill Humours, whether acid or acrid, grofs or flimy, vifcous or glutinous, which may happen to lie in their Way, and obstruct or interrupt their rapid Motion. The whole Frame of the human Fabric, thus co-operating with the medicinal Virtues of the Water; those great Ends and Purpofes will very probably be obtained, (as Experience teffifies they often have been,) which neither the fame, nor any other Principles, in any other Form or Difpolition, could accomplish. But further; whether the Ends defired are perfectly obtained, or not, the Conftitution certainly fares the better for it (to the Exception of a very few particular Circumstances.) For it is the peculiar happy Property of these Waters to act in Confervation of the human Frame, and not to its Deftruction ; which is the ill Faculty of but too many Medicines given in other Forms.

(46)

It may by this Time, perhaps, fufficiently appear from the Natures and Properties I have affigned to these Waters, as well as from their Operations, that they do, and indeed

(47)

indeed necessarily must act in Prefervation of the human Frame, with all its particular Faculties and Functions, and not to their Destruction or Depravation : And was it not that I should degrade what I am intimately concerned about, and interested in, (that is, the Practice of Phyfick,) I might with equal Eafe and Certainty shew, that other Forms of Medicines (fome of them at leaft) act to very different Effect, that is, to their Destruction, and not to their Prefervation; except only, when they are directed by a Phyfician truly judicious in Medicine, as well as penetrating into Nature; which, I may venture to fay, are not the Portions of every one amongft us. I shall readily be understood to mean here, all Medicines of the Galenical or Chymical Tribes, directed or applied by fuch Perfons, who, for want of a due Knowledge, either natural or acquired, or both, are incapable to form any just Judgment, either of the Nature of a Disease, or of the Intentions of Cure; or, lastly, with what Instruments to execute fuch Intentions. And if these Medicines, which have a strong and violent Operation, should (as it's odds but they will) mifs of their Aim, and produce

no

no good Effect on the Matter or Humours conftituting the Difeafe: Thefe will evidently remain the fame, or perhaps be aggravated, whilft the poor Conftitution is the Sufferer; and which being thereby greatly debilitated and extenuated, falls a Victim to the Enemy.

The late learned and accurate Doctor Freind, in his History of Physick, very justly censures some of our systematick Physicians of the prefent Time: Thefe Men (he tells you) purfue their own Notions and Chimeras in Phyfick, in Contempt and Neglect of all the ancient and modern Writers in that Science. Strange Arrogance! That this or that Man should implicitely believe and prefer his own Whimfies and Conceits, fo far as to difdain fearching for farther Information, or drawing any Succours from past Ages. But Doctor Freind has treated this Subject in fo mafterly and convincing a Manner, and has so shortened every Man's Labour of this Kind, by culling out, and fevering from the voluminous Chaos, fuch Books only as are peculiarly proper and ufeful to be read in the feveral Branches of Phyfick, that I hope, in Time, we may have

have the Satisfaction, and the World the Benefit of feeing these Gentlemen become his Proselytes.

(49)

The very learned and juftly-renowned Doctor Boerhaave, Professor at Leyden, has laboured more happily and effectually towards reftoring the Practice of Phylick to its primitive Purity, than any other Perfon, (that I know of at least,) either in the prefent or feveral Ages paft. He, indeed, is a Mirror of Perfection in every particular Branch of it; and the Merit of his Labours is rewarded with the universal Testimony and Approbation of all the learned World. His Labours, Discoveries, and Improvements in Chymistry, have of late appeared in Putlick, and are very justly acknowledged to be flupendious, and to excel every Thing extant upon that Subject. The fame Harmony, Purity, Truth, and Chaftity, are alike confpicuous in his Practice and Theory. Expertus loquor : For I have the Honour of some Acquaintance with both. The Lectures he utters to the Pupils in his Colleges, excel (perhaps) any Thing to be met with of that Nature: They are fo clear, perspicuous, orthodox, and instructive, that

L

I will venture to fay, if amongft the great Number of young Phyficians that lift under him yearly, any go away unduly qualified, it can only be owing to their own Inattention, or Incapacity to digeft and turn them into falutary Nourifhment.

Doctor Morgan, in his Preface to the excellent Book above quoted, ftrenuoufly urges another Branch of Learning, which to fome perhaps may feem a little foreign to Phyfick, as indifpenfably neceffary towards the forming a good Phyfician: And, indeed, He finely illuftrates the Ufe of it in the Text of his Book. This is the Science of Mathematicks; and therein particularly Arithmetick, Geometry, and Algebra; upon whofe Bafis and Principles he requires that a competent Knowledge of the animal Oeconomy, with its Laws of Motion, Sc. fhould be founded.

An accurate Acquaintance with Matheticks, is indeed abfolutely neceffary to the perfect Attainment of many Arts and Sciences: But, I apprehend Doctor Morgan lays too great a Strefs upon it, with Regard to Phyfick. It is certainly, however, a good Bafis, as well as an Ornament to Phyfick,

fick, when it does not interfere with Things of greater Use and Importance. But then, furely, our chief Endeavours (after having attained to a due Knowledge of what we call the Leges Scripta Medicina) ought to be employed about cultivating and improving the natural Genius; or in acquiring an Aptitude and Facility to folve all the Phanomena of Nature, especially all those incident to the human Body : That is, its various Difeafes and Diftemperatures.

I would not, however, be thought to contemn or difregard the Science of Mathematicks; but rather admire and recommend it : As it's not only useful, but ornamental to that of Phyfick; and as it ftrengthens and enobles the human Mind. But then, I would obviate its Subordination to what is really more effential: That it fhould be fought, indeed; but in that Order of Time and Degree of Measure, which are proportional to the Weight and Ufe it carries in Phyfick. What I particularly contend for, and would give the Precedence to, is mechanical Knowledge: And I prefume it will be allowed me, that mechanical Knowledge did precede the mathematical in Point of

of Time, as it now does in Excellency and Extent. For, mathematical Knowledge ferves only to explain and demonstrate the mechanical or rational : And fhould the mechanical or rational want that Demonstration; it may nevertheless be true, substantial, and useful. But (vice versa) a Man of the most confummate mathematical Knowledge, may be incapable of folving, in a mechanical Light, the fimpleft Phanomenon, which lies without the Sphere of his paft Experience, or what he had never heard debated. And this leads me to applaud the Poet, - where he fays - Falix qui potuit rerum cognoscere causas. Furthermore, it will appear, that mathematical Knowledge is (in a comparative Senfe) narrow and bounded; but the mechanical is liberal and univerfal : It takes every Thing into its View. And the Phyfician, who does not (though I hope and believe many do, indeed) confider every Difeafe in a mechanical Light; with Regard to its Nature, Effence and Intentions of Cure, is, de Facto, no more than an Emperick. On the other Hand; I prefume the greatest Advocates for Mathe_ maticks, or Adepts in it, feldom appeal to

it

it in their Reflections on Difeafes, or make it in any wife the Rule and Standard of their Practice. And hence I infer, that mathematical Learning, without a natural Aptitude and Capacity to reafon mechanically about Things, will be of but little Service in Medicine; whereas the latter, without Mathematicks, may be of a great deal.

I am not (however) about to derogate from Doctor Morgan's Performance. No! But far otherwife. I profess to admire it; and account it very excellent. The Book bespeaks, not only the accurate Mathematician, and One well acquainted with the animal Occonomy, but the Man of a fruitful and fine Invention likewife; and is fuch as must fecure the Approbation and Esteem of all Men of useful Learning and found Judgment, both to it self and its Author. But, to wave this Argument; Would all Phyficians, or rather Students in Phyfick, be directed by Doctor Freind, in so important a Point as he urges to them; we might in Time, not only arrive to fome Degree of Perfection, but to a Uniformity in Practice likewife: Whereas at prefent we are the most variable, as well as inconsistent Set of Men E 3 (repaid))

(54)

Men living. We are not only one Day, but in one Place or Country, Peripateticks; in others Epicureans: Here Galenifts; there Chymifts: Every Age, or Country, new modelling the Art, and adapting it to its own Scheme and Caprice. Hence, it's no Wonder that the Profession is fcarce advanced fince its Infancy; and that Theories and Practice should so vary amongst the Learned. But here I finish a long Digression, and resume my Story.

The mineral Waters, in and about Spaw, but more especially the Poubon, enable Nature's Self to work, at the fame Time that they put Tools into her Hand to work with: And to suppose the worst of these Waters; Though this or that Difease in Queftion should not be compleatly cured by their Use; (which will very rarely happen, where the Patient exactly conforms to the Dictates of a judicious Physician,) it is a great Chance, but some other latent Disease is prevented: For, it is their peculiar Prerogative to preferve the whole human Frame under its due Regulations: To reftore its loft or decayed Ballance of Power, and to bring every Thing into a just Equilibrium.

(55)

librium. And it is by these Means, chiefly, that they cure fo many, so great, and so opposite Difeases.

I shall in this Place, endeavour to reconcile all those mysterious *Phænomena*, which have appeared so stupendious and unconceivable to some Physicians and Writers upon these Waters, and render them familiar and intelligible to the meanest Capacity: And, instead of being staggered at their real and obvious Effects, prove from their constituent Principles, and the Laws of Mechanism, that the like must necessarily come to pass.

The Science of Phyfick, in general, is dark and intricate enough; but fuch *Phænomena* as thefe, are particularly abftrufe and unintelligible; and I don't at all wonder they fhould appear Myfteries and Riddles to fome amongft Us. For, though there are many who practice Medicine, that either by Accident, Intereft, or Stratagem, acquire and eftablifh Characters in the World; yet, I will be bold to fay, not all of thefe are equal to fo important and perplexed a Task. It has been often remarked, (and indeed it's what muft recur to the Memory of every E_{4} curious,

curious Observator,) that some Gentlemen of the Faculty have bribed the publick Vogue, and stepped into high Repute, by Means of a huge Heap of learned Lumber, which they have acquired at immense Pains, on Purpose (perhaps) to cover and conceal their Defects of natural Genius. This, indeed, is what always captivates the Opinion of the Vulgar; who obstinately refuse to fee any Imperfection under this Veil: But nevertheless, fuch Men have often been found the most egregious Ideots in reasoning upon the various Phanomena of Nature. This reminds me of what Doctor Baynard fays, in Sir John Floyer's Hiftory of Cold-Baths, viz. - That " Learning in " fome Men only ferves to worfen them." Such Men (as I have been speaking of) may very justly and aptly be compared to an industrious Husbandman, or expert Gardener : For, as the former bestows the best Manure on the barrenest Soils, and the latter lends preternatural Aids to raife the colder Seeds and Plants; fo those Gentlemen take more than ordinary Care to dung their cold, infertil Brains with a great deal of Learning. I remember a Paffage in an

epta

(57)

epigramatical Poem (wrote by a young Phyfician, and one of the finest Genius's of the Age) which supposes to a Tittle what I here affert. It is this - " Great Phyficians " we have heard of, meer Quacks in Difpu-" ting, Sc." It must be confessed, however, that (generally speaking at least) an accurate Acquaintance with the dead Languages and Logick, with the School Philosophy and Mathematicks, must cultivate and improve every Genius: And every one who is an Adept in these Things, will (cæteris paribus) excel another who is lefs verfed in them. But, if the Genius fo equiped had not, in its rude and natural State, a peculiar Turn and Aptitude to folve and difcuss whatsoever Phanomena may present in a mechanical Light; the Man (indeed) may make a Figure in the World, but will never have much real Merit in his Profeffion: For it may be faid (in a comparative Sense) of a Physician, as of a Poet, Nascitur non fit : That is, in a Degree of Eminence or Perfection. But to my Purpose.

We fee several Diseases, diametrically opposite in their Natures and Symptoms, cured by the same specifick Space Water. One Man

Man has an utter Dejection of Appetite; another a violent, but depraved one. In one the Fibres of the Stomach are too lax; in another too tenfe. In this Man the Ferment of the Stomach is exorbitant; in that weak and languid. One Perfon's Bowels shall be of a hot Temperament; another's of a cold one. The Bile shall be redundant in one; and deficient in another. The Guts of one Perfon, shall be too rigid and conftipated; those of another too lax and open. Some perspire too little; others (though but few fuch) too much. We obferve the Blood to be too hot and rapid in fome; too cold and lazy in others. We fee Tumours and Defluxions of different Natures, and proceeding from different Caufes; as fome from Heat, and too violent a Motion; others from Cold and too flow a Motion of Humours. We see some Women labouring under violent menstruous Fluxes; and others under fevere Obstructions; and all thefe, in common, cured by the fame fpecifick Space Water. Finally, We fee fome Women rendered fertil by the Use of these Waters, who had been barren for many Years, against the Force of all other Medicines:

(59)

cines: But here, indeed, they do not produce the contrary Effect; for no Woman was ever rendered steril by them.

Now ; To obviate and folve the Nature and Reafon of fo many extraordinary and different Operations or Effects: I fuppose first, That all these Diseases which have their particular Shapes and Appearances, and feem to have different and diffinct Effences, do primarily arife from Errors, either in our Accretions, or our Secretions. These are (in my Opinion at least) the Caufa prima, or original Caufes of most Difeases; subordinate to, and dependent on thefe, are other Caufes, which are properly ftiled the mediate Caufes. These are Humours that offend either in Quantity or Quality; or perhaps in both. Such Humours as offend in the first Sense, cause a Plethora, or Redundancy. This generally yields to Fafting. or proper Evacuations: But if it fubfifts long, may produce very many and great Diforders; as Headaches, Giddinefs, Vertigoes, Apoplexies, Shortness of Breathing, Oppression at the Stomach, Loss of Appetite, Bloody Fluxes, and Hemorrhages of the various Kinds, Tumours, Defluxions, &c. The

The Reafons why, or how all these Diforders may arise from a Plethora or Redundancy, are too obvious to any Physician (I would hope) to need explaining.

The Difeases, which will necessarily refult from Humours offending in Quality, are very numerous; and (I apprehend) may reasonably be supposed to constitute nine Tenths of all the Difeafes which infeft Humankind. They are even capable of producing all the Difeafes above mentioned, (and afcribed to an Offence in Quantity,) though by different Ways and Means. Hence arife all Sorts of Fevers, except the contagious and pestilential. These (viz. Humours offending in Quality) are the Parents of almost all chronical Difeases; such as the Hypocondriac, Scorbutick, Scrophulous, Strumous, Leprous, Nephritick, and Gouty : As also, the Rheumatism, Jaundice, Dropfy, and even Madness itself. Indeed, fome of these may possibly be produced from Errors in Quantity; but that will very rarely happen. Now, That I may not appear to the Undifcerning and Incredulous, to impose a meer Ipse dixit upon the World, I shall proceed to explain this long Train of

of Diforders (which appear fo opposite to one another in Nature and Effence) upon the aforefaid Hypothefis; and demonstrate that they fpring from one and the fame mediate Caufe, only differently disposed; That is, from Humours offending in Quality. And, First, a Loss of Appetite may proceed (as indeed it generally fpeaking does) from ill Humours deposited in the Stomach, or otherwife critically thrown upon it from the Blood; which will neceffarily weaken or vitiate its Ferment. On the other Hand, grofs, flimy, or vifcous Humours, clogging and obstructing the Glands and Capillaries of the Stomach, may deny Access to the animal Spirits, and those Juices, by whofe Joint-Force and Irritation the Perception of Hunger is excited. Or furthermore, flimy, fizey Humours, gathering within the Cavity of the Stomach, and flicking to its inward Rugee, or Plies, may either weaken their Force, or render them fo flippery, as to fubvert their Faculty of retaining the Aliment received into the Stomach, 'till the Office of Digeftion is duly performed. A ravenous, depraved Appetite, or Fames canina, must be caused by acrid,

(62)

aerid, corrofive Humours, whole precife Figure I will not pretend to determine; or by a vitiated and too-exalted Ferment; which may immediately proceed from them. A Relaxation of the Stomach's Glands and Fibres, may come from their Immerfion, or foaking in flimy, viscous Humours; or from the fame Humours obstructing, and immoderately diftending the capillary Veffels; by which Means the Nerves may be fo compreffed, as to deny a due Access to the influent Spirits. On the contrary: Too great a Tension of the Stomach's Fibres, &c. must refult from an impetuous Influx of animal Spirits; or from hot, acrid Humours, which too violently irritate and contract them. An Excels or Defect of the Stomach's Ferment, fall under the immediately preceding Definitions; or otherwife may fpring from an ill proportioned Mixture of its natural Juices, Sc. A hot Temperament of the Bowels must neceffarily flow from too rapid an Influx of Blood and Spirits; or from a Redundancy of irritating Humours; or poffibly (indeed) from a Defect of Mucofity. A cold Temperament (on the other Hand) from a Defect of animal Spirits, and a Surcharge of phlegmatick

(63)

matick, flimy Humours. A too rigid and conffipated, or too lax and open State of the Guts, generally arise from the opposite Temperaments just mentioned; and confequently, are only remoter Effects of their Caufes. A Defect of Perspiration most commonly proceeds from an Obstruction of the excretory Pores; but it may poffibly refult from some excessive and opposite Evacuation; as by Urine, Stool, or Spitting. On the contrary: An Excess of Perspiration must proceed from a Suppression of some one or more of those; or elfe from violent Exercife, or too great a Relaxation of the excretory Pores : Though, indeed, the Confequence of the latter would rather shew itself in gross Sweats, than what we (in a strict Sense) understand by Perspiration.

Here I can't omit to relate one Inftance of what I have just now advanced. The Story was told me at Spaw (even whilst I was writing this) by my worthy Friend Doctor Cocquillet, Sen. He relates, That he had a Gentleman for his Patient, who had not the least Discharge by Urine for the Space of a Year and half; but that the Sweat fell from him in large Drops; which the Doctor supposed,

posed might Counterballance the Surcharge of Fluids, which must necessarily refult from a total Suppression of Urine. But, fuppose we that; most certainly it could not be so heathful, because 'twas not so natural. This Gentleman went to Spaw on Purpofe to feek a Cure from the Waters, (commiting himfelf to the Care and Directions of the faid Doctor Cocquillet ;) which he very happily and foon obtained. The Doctor obferved further, that the Patient drank very hard of spirituous Liquors, even whilft he had this Diftemper upon him. Doctor Cocquillet faid, . He found but few Believers amongst the many Perfons, and even Physicians whom he told it to. The Cafe was (indeed) very uncommon : But I am neverthelefs furprized, that Phyficians (efpecially) fhould account it fo great a Prodigy.

(64)

A too rapid Motion of the Blood, may refult from external Heat, and violent Exercife ; but doubtlefs does more commonly proceed from hot, irritating Humours intimately mixed and incorporated with the Mafs; which, by their Stimulus excite the Blood to violent Motion, increase the Nifus of the artereal Veffels, and precipitate the

the Separation of animal Spirits. On the contrary; a too flow; lazy Motion of the Blood, must derive from cold, fizey, viscid Humours; which flowing with the Blood, will sheath and depress its native Heat, weaken the Elasticity of the arterial Veffels, and obstruct the due Secretion of animal Spirits. Tumours of the various Sorts (whether by Fluxion or Congestion formed) are produced from Humours fome Way or other offending in Quality. As for Example: A Tumour by Fluxion, comes from hot, irritating Particles; determined, or critically thrown off from the Blood upon fome one Part or other; where, their Paffage being hindered by Reafon of their Figure or Size, they ftagnate; and a Tumour immediately enfues; or, otherwise, the like might be produced by fharp Humours determined on a Part; whofe Spiculæ or Points, ftriking into, and wounding the Sides of the Veffels; the fuppofed Veffels would thereupon contract themfelves violently; drive the pointed Wedges yet deeper into their Sides; and the confequent Hurry and Confusion of Humours would necessarily bring on a Tumour. Tumours by Congestion (on the other Hand) are caused by F the

(65)

(66)

the Groffnefs, Sizynefs, and Viscidity of Humours; which settling gradually, in this or that Part, form a Tumour by flow Degrees, and frequently without Pain. Defluctions, indeed, generally proceed from Redundancy, and sometimes from the Weakness of Parts.

Inordinate menstruous Fluxes, most commonly take Rife from Redundancy; but fometimes from too great a Heat and Rapidity of the Blood : Or, otherwife, from sharp, corrofive Humours; which falling upon those Parts, tear the Glands and capillary Veffels. Suppressions of the Menses, are most commonly caused by gross, viscous, tenacious Humours; which, choking up the Glands and capillary Veffels of the Parts, deny Paffage to the Fluid deftined to be discharged by that Way. Indeed, the like Effect may (and doubtlefs fometimes does) proceed from immoderate and oppofite Evacuations : Or, from hot, irritating Humours; which, being thrown off upon those Parts, contract and fhut up the Vents.

I flatter myfelf, it will by this Time evidently appear that the *Poubon* Water, if it really has the Virtues and Qualities I have afcribed to it, (which I, myfelf, am perfect-

14

ly well convinced and affured of, as well from Reason as Experience,) may be capable of giving Relief in all the Diforders above mentioned. However, I will attempt to give a general, though a fhort Reafon to confirm it. And first: This Water, by its forcible Action on the Stomach, greatly increafes its Attrition; and by strengthening the contractil Force of all its Glands, enables them duly to eject their Contents, and then fcowers them off; which, otherwife, by refiding long in them, might choke up, and diftend them : The Glands of the Stomach, being thus choked, and preternaturally diftended, would deny Access to the animal Spirits and influent Juices ; and confequently, either pervert or impair the Functions of the Stomach. This Water provokes Appetite, and confirms a good Digeftion and Concoction. Thus the prime Vie are fecured, and all their Functions eftablished. And hence, all our Aliments pais into the Blood (through those common Recipients, the Lacteals) perfectly elaborated, and free from Crudity, Acidity, Viscidity, or other Depravities. Hence again, the Water gets a fwift Transition into the Blood-Veffels

and

and mixes with the Fluid; where, at the fame Time that it augments its Velocity, it prepares and fits its Humours for Motion ; by correcting the acid or acrid, and by attenuating the vifcous or glutinous. And, laftly, by increasing the Action both of the Solids and Fluids, it forces the Obstructions of the Skin, (if any there be,) and reftores and confirms a due State of Perspiration. Moreover, all these great Ends are effectuated at one and the fame Time, without the least Violence or Offence to the Constitution; which will neceffarily and equally tend to repair all Weaknesses, repress Fluxes, and other irregular and exceflive Evacuations, as to open Obstructions. It opens Obstructions, by promoting the Attenuation, and increasing the Motion of the Fluids: As on the contrary, it redreffes Fluxes, and other inordinate Evacuations, by affifting and increasing the opposite Discharges, by which Means the Tendency and Preffure of the Humours upon that Region are diverted; and by deterging and cleanfing the Veffels of the Parts affected, and by restringing their lax Solids. This Water is a Specific in Barrennefs, from what Caufe foever

foever it may proceed, except it has a Foundation in Nature; and even then, (which may feem a Paradox,) may possibly supplant it. But this is so effential a Part of their Utility, that I cannot omit to make some Reflections upon it.

The Caufes of this unhappy Circumstance are various. In the first Place, Barrenness may proceed from a Weakness of the Parts in general, or a Relaxation of the Womb in particular; which, in Confequence of either, will be incapable duly to perform its Office: That is, of retaining the Treafure committed to it. The Whites, if in a great Degree, are absolute Bars to Fecundity; and they may produce that fatal Ef. fect two Ways. First, By deriving and exhaufting a great Deal of that Substance, which is required for the Nourishment of the Foetus. Or, Secondly, Should a Woman conceive under this Diforder; the difeased Matter, for want of a free Outlet, difcharging itself into the Womb, might deftroy or prevent the first Rudiments of Generation, by mixing with, diluting and spoiling the Stamina, as well as the Pabulum or Nourishment appointed for it. F 3 Thirdly

(70)

Thirdly, A total Defect of the Menses are Bars to Pregnancy.

Now, Let us suppose Barrenness an Effect of the Caufe first affigned, viz. That it proceeds from a Weakness of those Parts in general, or a Relaxation of the Womb in particular. The Poubon Water is, in that Cafe, perhaps, preferable to any other known Remedy; and being duly and advifably used, will very probably obtain the defired End, by strengthning the weak Parts in general, and by invigorating, infpiriting, and reftoring the relaxed Womb, in particular. If Sterility refult from the Whites, this Water claims the Precedency of any other Medicine whatfoever; for it most powerfully penetrates and fearches, deterges and cleanfes the lymphatick Glands from all their Filth, Slime, and Mucus; and at the very fame Time, ftrengthens and reftores their contractil Force. But, whereas the Whites do fometimes arife from a Defect of Perspiration, or some other natural Evacuation; this Water will most eminently and effectually relieve in that Cafe, for Reafons already affigned.

But, moreover, the Male Sex are fometimes subject to Infirmities, which are comparatively the fame with those I have been mentioning in Women: For, we have heard fpeak of Imbecility and Impotency in Men, as well as Sterility in Women; in which Cafes, these Waters prudently and duly administered, must afford great Help. To make this Affertion appear feazible, I will, first, fet forth from what Caufes Imbecility in Men can reafonably proceed. These indeed are various: And, First, (to pass over the common, trite Caufe affigned by ignorant Perfons and Empericks, called Onanifm, or Self-Pollution,) 'Tis poffible that a Man's Blood may not be fufficiently replete with the neceffary Stamina. In fuch a Cafe the fecreted Semen will be very little in Quantity, or very poor and spiritless in its Nature and Quality. Secondly, Supposing the Blood to be duly furnished in this Particular; the Vasa afferentia may be naturally too narrow; or may be accidentally contracted or obstructed, so as to deny Passage to a suffi-

(71)

cient Quantity of Blood. Or, Thirdly, The preparatory Organs may be fo choked and obstructed with viscous, fizey Humours, as F 4 to to hinder their natural Functions. Fourthly, The Proftatæ may be fo immoderately diftended and weakened, that the Semen depolited in them may run off upon the least Exercise or Strain; fo that there will be but little or none left in those Repositories to antwer the proper Occasions.

I don't remember, indeed, to have been informed, either by Reading or Conversation, that thefe Waters have been administered, or even recommended upon these Occasions: But nevertheless they must certainly be of very great Account in them. For if we recur to what has been already faid of the Virtues and Properties of these Waters, viz. That they infpirit, invigorate, and ftrengthen the Blood; fo, First, They must, in Proportion, heighten and increase all its more noble Principles. Secondly, They must give a vigorous Action to the Fluids, and a ftrong Flexure to the Solids. Thirdly, They must tend to delate the over-contracted Vessels, and reftore a free Circulation of the Juices. And, Hourthly, That they promote the Attenuation and Refolution of all viscous, fizey, tenacious Humours, and reftore the weakened Glands and Veffels, has already been fuffently proved. 1 hus

Thus I have given a general, but concile View of the Virtues and Qualities of the Poubon Water; mechanically deduced from the Principles, with which (upon Analyzation) it appears to be impregnated. 10 ollors

I shall now abstract my Reflections upon it; and direct it to fuch Difeafes, as it feems particularly calculated to, and fpecifically good for. And these are, principally, all Obstructions of the lower Belly, viz. of the Liver, Spleen, Miffentary, Sc. inveterate Quartans, Tumours and Hardnefs of the Hypocondrias, Hypocondriac Melancholly, King's-Evil, and the Dropfy, if recent, and the Solids not corrupted. It reproves all billious Diforders, by regulating their Sourfe, that is, the Bile; which it either raifes to, or confines within its proper Limits. It reftrains and regulates inordinate menftruous Fluxes; and with equal Force and Certainty, removes their Obstructions. It breaks to Pieces, and expels all Concretions in the Reins, Ureters, or Bladder, whether they be Stone or Grayel: And, finally, it cures the Scurvy, by fupplanting its first Cause. But, be it understood; I am not fo bold as to fuppose it cures Stones, or Calculi

(74)

culi of all Magnitudes and different Textures: For we have feen fome, which have been taken out of dead Bodies, and others extracted from living ones, that are near as hard and compact as Flint; and which no Medicine in Nature could fo much as touch, or produce the leaft Effect on; let whimfical Chymifts, and other chimerical Perfons talk what they will. But for Stones of lighter Substances, and loofer Textures, they are certainly diffolvable in the Body; and to that End, this Water will work Wonders.

Thus far; Having defcribed the Virtues and Ufes of the *Poubon* Water; I come now to fay fomething in Abatement of it: Which, however, I cannot offer upon the Foot of Experience, but Tradition, and the common Teftimony of the People, as well as the Opinion and Report of Phyficians who refide at and about *Spaw*. I have been credibly informed, and well affured, that this Water has been found hurtful fometimes in the Gout; as alfo in flubborn afthmatick Diforders, and radicated Coughs. The Reafon of which may be this: When the Matter conflituting a Fit of the Gout, is fo com-

compact and folid, as to refuse Diffolution; Division, or Comminution; or when that productive of an Afthma, a Cough, or the like, is fo tough and vifcous, as not to admit of Attenuation or Refolution; either Cafe will be fo far from meeting with a Cure, that, on the contrary, it will be the more confirmed by the Use of this Water. But then, even in these Cases, I conceive that some previous, preparatory Methods might be directed by the skilful Physician, which would greatly facilitate and contribute to the Success of the Water : And fuch, as in moral Certainty would prevent any ill Effects from it; though the Ends proposed were not perfectly obtained. But, indeed, it is too much the Practice of Perfons who visit Spaw, to go giddy to work, and drink the Waters without confulting a Phylician concerning the particular Kind; the neceffary Preparations, and the Quantity or Manner of Drinking. And though many may do this, without drawing any palpable Inconveniency on themfelves; yet they very probably fruftrate thereby the Benefits and Advantages which might otherwife have been obtained. And thus, these Waters, the moft

(75)

most innocent, as well as most excellent Remedy in the World, may be fometimes brought into Difcredit.

When I reflect on the many excellent Virtues and Properties of this Water, and its admirable Effects, I apprehend a very just Parallel may be drawn betwixt them, and those which arise from Cold-Bathing; fo far as the latter extend : For the Ufes and Benefits of Cold-Bathing are, by much, more limited and confined than those of the Spaw Water. Cold-Baths are calculated and adapted rather to prevent, than cure ill Habits in general: Whereas the Poubon Water does both the one and the other. The Ufe of Cold-Bathing would be very pernicious, and even destructive in many Diseases arising from ill Habits of Body; but the like could not possibly happen from Spaw Water in equal Circumstances. However, Thus far their Uses and Benefits may be drawn in exact Parallel: The Space Water ftrengthens and reftores the impaired Action of the Fluids and Re-action of the Solids; fo does Cold-Bathing; but inverfly. The Space Water dephlegmates, thins, and refines the Blood in a duplicate Senfe: The Ufe of Cold

Cold-Baths, does the fame in a fingle Senfe. Spaw Water strengthens the nervous System, and promotes the Elaboration and Separation of animal Spirits: Cold-Bathing does the fame. The Spaw Water is eminently good to correct Errors in our Secretions, efpecially, that of Perspiration; so is Cold-Bathing. Spaw Water ftrengthens and reftores the decayed elastick, or conctractil Force of the excretory Pores, hardens the Skin, and renders it Proof against Cold, and the like external Injuries: And, that the Use of Cold-Bathing, answers all these Ends in the higheft Degree of Perfection, is univerfally allowed. On the other Hand; wherever the Spaw Water has appeared to be hurtful; as in stubborn Gouts, Asthmas, radicated Coughs, and the like; there too, Cold-Bathing would be extreamly pernicious. And the Reafon of these Things will appear plain, if we confider, First, That Cold-Bathing has only the fingle Property or Power of hardening a lax Skin, and of increasing the contractil Force and Action of the Solids, and Reaction of the Fluids: But it communicates no other Benefit to the latter, except fuch as will neceffarily refult from the fupposed increased Action

(77)

Action of them: And thefe are the Refolution and Comminution of all grumous, phlegmatick, and flimy Humours; by which Means, thofe already formed, and incumbent in the Blood, will be prepared and thrown off by the Excretories of the Body, and the Generation of new ones be at the fame Time prevented: Whereas, the *Poubon* Water does not only anfwer all thofe Ends, by the very fame Mechanifm inverfly; but at the fame Time, by its volatil, elaftic Spirit, and other inherent Qualities, greatly affifts to the Accomplifhment of the fame, and many other great Ends.

(78)

Furthermore, The *Poubon* Water and Cold-Bathing are alike qualified to render the Body defenceable (in a comparative Senfe at leaft) against all malignant and pestilential Diseases. For, As both the one and the other manifestly strengthen the elastic, contractil Force of the exterior Pores, increase the Motion of the Blood, and cause a strong and vigorous Perspiration; so they must necessarily strengthen the Barrier without. For, in Proportion to the Quantity of Matter thrown off by Perspiration, and the Force with which it is propelled, it will refift and repel all malignant and other noxious Effluviums.

That great Numbers of weak, valetudinary Perfons, have been rendered ftrong and robuft, by the Use of Spaw Water or Cold Bathing, is undeniable: And I apprehend it would be no difficult Matter to adjust the Quantity or Measure of such Effects by certain Experiments. As for Example, By holding finely polifhed and burnifhed Mettals, or Looking-Glasses before a Man's naked Stomach and Breaft: For, By fuch Experiments, the Quantity of Dew they received, and the Distance they took it at, would fufficiently determine the Degree of Perspiration, and the Extent of its Atmosphere. The Effects of this Sort, produced from the Use of Space Water and Cold Bathing, refemble those caused by voracious feeding on high feafoned Meats and ardent Spirits; only those flowing from the latter, are momentary, foon fubfide, and give Place to bad Confequences; whereas, those produced by the former, are conftant, equal, and permanent, and are affociated with many other great Benefits.

(79)

To make this appear, Let any one, by Means of the above-mentioned Experiments, measure the Extent and other Circumftances of the Atmosphere, encircling a Person under a Debauch of high feafoned Meats, and ardent Spirits: And let him obferve again, by the fame Experiments, when the Debauch is intirely over; he will affuredly find the Action of the atmospherical Effluviums to be much brisker, the Substance denfer, and the Extent greater in the first State, than in the latter. Now, under the Circumstance of fuch a Debauch, a Man would, perhaps, be as well fecured against the Access of infectious Diseases, as if he was interested with all the Benefits of Space Water, or Cold-Bathing. But, alas! When this temporary Guard is fled, leaving a weak Barrier without, and the Fortrefs within equally defenceless, he will then become a very eafy Victim to the Fury of the Enemy.

The learned and ingenious Doctor Cheyne, (I remember,) in his Essay on Health and long Life, censures Punch very severely, for the many Mischiefs it causes to Persons much accustomed to drink of it; and especially the West-Indians. But, for my Part, (though

(though I have all imaginable Respect and Deference for Doctor Cheney's Sentiments and Writings,) I am of Opinion, that the Mischiefs he charges it with, proceed rather from the Diforders it creates in our natural and regular Secretions, than from any noxious Qualities inherent in the Punch itself. And, the Diforders I would be understood to mean here, may be no other than an Inequality in our Secretions at different Times. For, Suppose a Man to debauch every, or every other Day with Punch, or any other ardent, spirituous Liquor: In that Cafe, all the Secretions, but especially Perspiration, would be in a State of reciprocal Ebbing and Flowing, which would be fufficient to fuperinduce very many and great Evils.

(81)

The Geronster Water, which is at this Day in great Repute upon the Spot, is, as it were, faturated with a fulphureous Vapour or Effence; which, as I have already proved, is exceeding volatil. It is this fulphureous Impregnation, which (by Reafon of its great Abundance and Volatility) renders it fo eminently ufeful in all afthmatick Diforders, and inveterate Coughs. Its Mars, as I have faid before, is better elaborated, and more G genuine

genuine than in any of the other Waters, as appears by its ready Approach to the Magnet; which it does without that Purgation by Fire, that is requisite to separate it in the Feces of the other Waters. This Water is of wonderful Efficacy in curing Barrenefs; that, indeed, is accounted its cardinal Virtue: It acts here, chiefly, by Means of its fulphureous Effence; which not only attenuates and diffolves the vifcous, ftagnant Humours, and fo fcoures and cleanfes the Glands and Veffels of the Womb, from whatfoever foul Humours they may be fluffed with ; but at the fame Time, invigorates and infpirits the whole. Seat of Generation. It is a grand Specific in the Scurvy ; which it cures fooner, and by a different Mechanism to that of the Poubon : It warms, comforts, and ftrengthens a cold, weak Stomach: It powerfully corrects all Acidities and Aufterities, and difcharges their Matter either by Urine, Vomit or Stool: It destroys all tenacious, viscous Humours in the Blood, and renders it fluxil, pure, and spirituous. Its Virtues extend even to the Gout (that Scandal to Phyfick and its Ministers;) which it generally relieves, and fometimes cures.

(82)

I cannot omit to remark, That this Water is attended with very odd Effects when People first begin drinking of it. It gives a Giddinefs, and to fome a Numbnefs of the Head; which greatly indifposes Persons for Reading, but more especially for Writing, during some Hours. These Effects plainly fpeak the volatil, fulphureous Effence ; which, by rarefying the Blood, fo diftends the arterial Vessels, that the Nerves are compressed by them, and the animal Spirits feem imprisoned for a Time: Or, the like Phanomenon might arife from an extraordinary Action impreffed on the animal Spirits themfelves; whence the Brain might be for a Time confused; and the Nerves and Membranes endeavouring at Extension, seem girt and confined. The Sauveniere, is what next demands to be spoke to.

(83)

The Virtues and Properties of this Water are not very numerous; but are, neverthelefs, extraordinary in their Kind. This Water is chiefly directed and determined to the urinary Paffages, being highly Nephritic and Diuretic; and, confequently, powerfully breaks to Pieces, and expels the Gravel and Stone; whether it be in the Kidnyes, G_2 Ureters, Ureters, or Bladder. It is a fovereign Remedy for Ulcers in the Reins, Ureters, or Bladder; which, it first deterges and cleanses, and afterwards disposes to heal. It is likewise a Specifick in the Hemorrhoides, and represses inordinate Fluxes of the Menses.

(84)

The three other Fountains, viz. The Groesbeeck, the Wartroz, and the Tonnelet, have likewife their respective Virtues and Properties: But, as I had not Time to examine them by Analyzation; so, am not duly qualified to judge, or speak of them.

I might enlarge, and embellish this little Treatife with numberless Cures, wrought by these Waters; which I could have gathered from the Phyficians, and other Inhabitants of the Country; and which would be fo many Testimonies of the Justice and Truth of my Reasonings upon them: But that would be foreign to my Intention and Purpose; which were only to give a fuccinct, mechanical Explanation of the refpective Natures, Properties and Uses; and to affign Reasons for the various and great Effects of thefe Waters; and all thefe founded upon, and deduced from the most folid Basis, viz. The Natures, Virtues, and Properties of the feveral

feveral individual Principles, with which they appear to be impregnated; and that, confidering them, first in their simple, and afterwards in their compounded State.

Postfeript. Although, in revising and trans scribing this Esfay, (after a Suspension of feven Years; during which Time, it has been out of my Hands,) I have strayed a little from the Promise I made in the Preface, of flicking close by my Text, and introducing Nothing that was not strictly pertinent to it : Yet, as I have only interspersed a Digression or too, (which duly considered, may appear not altogether foreign and impertinent to the main Scope,) and have, en passant, paid a flight Tribute to the Merit of some great Men of the Faculty: So, I hope the candid Reader will be indulgent, and pardon this Breach of my Covenant with him: For fuch I account the Preface of a Book to be.

(86)

OFTHE

Hot FOUNTAINS

AIX-LA-CHAPPLLE, Sc.

H AVING proposed in the Title to to the foregoing Piece, to subjoin a curfory Enquiry into the Natures and Properties of the hot Fountains at Aix-la-Chapelle; and having to that End, taken a View of the feveral Springs there, and tasted them on my Way to Spaw; yet I designed at my Return, to have passed a longer Time there, on Purpose to have gone through the whole Class of Examinations upon their Waters. But, just as I had finished the above Treatise on the Waters of Spaw, and was preparing to return to Aix; some Affairs of Moment required my immediate Departure for Holland. Hereupon I contented

tented myself with getting all the Materials I poffibly could, and brought them with me. What I here call Materials, are the Principles difcovered and produced from them by Analyzation, Ge. And thefe were only a Salt, and a very fine Flower of Brimftone; which last feems to me to be Nothing elfe than the meer groß and fubstanstial Part of a Vapour, which is perpetually steaming from the Waters, and gathers to the Sides and Roofs of the Pits and Bathing Rooms ; whilft the more fluid, watry Particles diffipate. However, Though I have not had an Opportunity of analyzing thefe Waters; yet, as I am well affured, by Phyficians and others, that the Salt and fine Sulphur aforementioned, together with the more grofs Sulphur that is produced by Exhalation, are the only Principles difcoverable in them: So I hope, upon a due Examination of those Individuals, to be able to judge and determine on the Virtues and Ufes of the Compound. But before I proceed, it may not be amifs, that I relate the Sentiments of fome Writers of that Country, concerning the Nature of their Waters,

(87)

G 4

And,

And, First, They all agree to allow they contain a Sulphur in great Plenty; and though they don't express it in the Manner I do; yet, were we to debate it fairly together, I believe they would fcarce difagree with me. Their great Dispute is about the Salt found in them; and concerning this important Point, there are very many and different Opinions.

Monfieur Heuesh maintains, that it is an alcalic Salt, inclining to the lixivious Kind. Meffieurs Blondel and Didiez affirm it to be a Confusion of Sea-Salt, Nitre, and Alom. Monsieur Franciscus de le Boë Silvius, as well as Monfieur Heuesh, denies that Sal Gem, or Nitre, bear any Proportion in this Salt : And the former urges, as a Proof, that the great Acidity of Sal Gem, or Nitre, cannot admit of fuch a Supposition. Abbeers agrees with these latter, in the Opinion that it contains no Nitre; and he gives for a Reafon, that Nitre is no where generated, but in the Superficies of the Earth, and not in its Entrails : Because the acid Air (which he takes for granted, is absolutely necessary to the Formation of Nitre) cannot penetrate f.nd.

into the Bowels of the Earth; where he supposes these, and indeed all other mineral Waters, receive their Impregnations. Monfieur Vicaire, is likewife of Opinion, that Nitre has no Share in this Salt: But he pretends to fupport his Notion by a dogmatical Polition, which I can by no Means allow to be just: For, he confidently affirms, that Nitre is a Part of, and peculiar to the animal Kingdom; and that it does not in the least appertain to the Mineral, Glauber feems to refute this Polition with great Colour of Reason. He afferts and maintains, that there is no Composition in the three Regions of the animal, vegetable, or mineral Kinds, without Nitre: And this feems very probable; because the alcalic Salt of Vegetables and Minerals, together with the Acid of the Earth, are, in Nature, no other than the Acid of the Air, and the alcalic Salt of Animals; from which Nitre is generally allowed to be produced.

The fame Thing may be faid of all mineral Waters; becaufe the moft alcaline amongst them contain fomething of an acid Spirit: And Vicaire affirms, that fomething which he he calls the univerfal, interior, acid Spirit of the Earth, is the efficient Caufe of all fuch Impregnations in Waters. He fuppofes this Spirit to exift in all Minerals; and that upon their Immerfion in Water, the Spirit extricates itfelf from its Imprifonment : And, that afterwards by its reciprocal Action on the Minerals, and the Water in which they are immerfed, it divides, fubtilizes, and finally, prepares and difpofes the Minerals in fuch a Manner, as to make them incorporate, and become effential with the Water.

Thus I have given a fhort Abstract of the Sentiments of feveral the most reputed Authors, who have mostly refided at, and about Aix-la-Chapelle, concerning the Nature and Effence of their Waters; believing it will not be unacceptable to the Reader. But, I am of Opinion, the World will agree with me, that these chymical Definitions are only a Gingle of Words, and prove very little, or nothing effential. Indeed, they feem to me, rather calculated to perplex and confound the Truth of Things, than to obviate and explain it. Doctor Brefmal.

mal, indeed, offers fome fair, and honeft Experiments upon them; but then they only ferve to prove what one may almost difcern with the naked Eye. As, Firft, Where he avers, that the hot Fountains of Aix-la-Chapelle contain a Sulphur; becaufe, that upon the Projection of powdered Gaul into them, they immediately turn as white as Milk. Secondly, Becaufe that Nitre and Sea-Salt being concentered with the fulphureous Acid of Vitriol, and inftilled into the faid Waters, they appear tinged with a purple Colour; which he fays could not be produced, except by the Mixture of two Sulphurs. But, to fum up, or rather to banish all further Regard to the many Difputes concerning the Nature of this Salt; I may venture to affirm it (though really neutral) to be much retaining to the alcalic Kind; as is manifested by the very notable Effervescence that arises upon its Projection into acid Spirits. But, though the alcaline (as abovefaid) is manifeftly their predominant Quality; yet some Experiments evince, that they are not without an Acid too. But, e're I finish my Report of these Authors;

(92)

Authors; I must do them the Justice to relate fome Accounts from them, which are not incurious. And, *First*, Doctor Brefmal afferts, that the Sulphur of the Aix Waters is produced by a Mixture, or Operation of the universal, acid Spirit, with certain fat, bituminous, and fubtil Particles: And these Principles (he fays) in Conjunction with the lixivious, alcaline Salt, must necessarily yield a Remedy to Men, for which they cannot fufficiently thank the Almighty.

This Notion is not difingenious; and the univerfal acid Spirit, he talks of, being granted; I can eafily conceive how the fupposed Spirit, acting upon greafy, bituminous Particles, may change them into the Form and Effence of a Sulphur: And was it convenient in this Place; I could offer fome Experiments, not unlike it in their Nature, which would be fo many collateral Testimonies of its Probability. But Monsieur Vicaire delivers Experiments, which are absolute Proofs of it. He affirms, that any inflammable Oil: For Example, Oil of Turpentine, Juniper, or Amber, mixed with a volatil acid Spirit, and distilled through Authors 3

(93)

a Retort; there will remain a perfect Sulphur.

This is his Text. R. Pingue aliquod inflammabile, v. g. Oleum Terebinthina, Juniperi, aut Succini, &c. distilla per Retortam, & acquires Sulphur vivum perfectum. (1.) Monfieur Bresmal further observes, That the Salt, which remains after Evaporation, being put into a Crucible, and placed in a melting Furnace, will melt prefently: That for the Time it is on the Fire, it gives a Flame refembling live, burning Sulphur; or like common Salt in a melting Furnace. After this Operation, he fays, the last assumes an ironish Colour, and becomes fixed : Neverthelefs, it diffolves in Water; and the Solution being filtered and evaporated, renders a Salt perfectly white : But that Salt, being again exposed to the Fire, loses its Fixidity, and diffipates entirely. But here I take Leave of those Authors; leave them to themfelves, and proceed to deliver my own Sentiments.

The fine Flower of Brimftone, which refults from the Steam of the Waters, in the Manner above mentioned, (and in whofe Formation,

(94)

mation, Nature's felf is the Artificer) is a very subtil, pure Effence : And either in its natural and fimple, or in a compounded State, does undoubtedly very far exceed that prepared by human Art or Skill. Its very Price gives fome Colour to this Supposition : For the Person, from whom I had it, told me it cost him five Shillings per Ounce: And I am affured on all Hands, that there is no Instance of its being fold for lefs than two Pistoles per Pound in Quantity. This, as above observed, is a presumptive Testimony of its Excellency; but its Tafte, its Subtilty, and Purity, are felf-evident Proofs of it. Besides this; the more gross, terrestrious Flower of Brimstone, (which the Waters yield in fuch great abundance by Exhalation,) deferves our Notice likewife. This, though infinitely fhort of that I have been speaking of, is yet vaftly preferable to the ordinary Flower of Brimftone.

The Salt extracted from these Waters (as has been already proved) is of the neutral Kind: That is, it is neither perfectly alkaline, nor perfectly acid. It imparts a very ftrong Relish; and being once communicated

ted to the Palate, is retained a good while. It is very picquant, and fomewhat acrimonious. I am not informed of the Method to extract this Salt from the Waters, separate from the Sulphur : But I apprehend it may be effected by boiling any Quantity of the Water over a Fire, 'till the spirituous, volatil Particles, being diffipated, (which, like as they do in the Space Waters, preferve the feveral Principles in a State of intimate Mixture, Disfolution, and Rarefaction,) the individual Principles, refuming their more großs and terrene Forms and Natures, begin to attract, aggregate, and combine together. The Water being brought to this State, may be paffed through a Paper by Fil-

tration; in which Operation all the Salts will efcape with the transparent Water, whilst the Sulphur remains behind in the Paper: And the filtered Water, being afterwards evaporated, would leave the Salt at bottom: And as to the Quantity of it, according to Doctor *Brefmal*, every Tun of Water yields a Pound of Salt.

This fine Sulphur and Salt, together with the more groß Sulphur produced by evaporating

(95)

rating the Waters, are, as abovefaid, the only Principles discoverable in them : Whence it appears a great Mystery how they acquire fuch a Heat in the Bowels of the Earth, as they are evidently poffeffed of when they are spewed out of it. Indeed, it is natural and reasonable to suppose, that the soft spongy, yielding Parts of fulphureous Matter, might sustain an eternal Mixture, Motion and Collifion with the Particle of any Salt whatever, (efpecially when they both flow in fo cool, and pacific an Element as Water,) and never excite Heat; like as the Particles of divers heterogeneous Bodies, which perhaps are all hard in their Natures, and diffimilar in their Figures, most reasonably and neceffarily must do, when in violent Agitation and Collifion together: And efpecially when they flow in fo pure and thin a Medium as Air; which will fcarce interrupt their Motions, sheath their Points, or stifle the Heat they may produce. The Fact however is evident; and it has been a long contested Point amongst Writers, what are the Causes of it. The ingenious Doctor Chrouet, in his Book intitled, Traité sur les Eaux d'Aix

(95)

(97)

d'Aix, Sc. recounts the Opinions of two Authors, who have been most confpicuous for their Labours to unriddle this great Myftery, which when brought to Light, won't avail the World a Halfpenny, and very juftly exposes them as unreasonable and ridiculous: But then, he fubstitutes Notions of his own, in the room of those he has dethroned; which I confess appear to me (though wrought up with more Art, and with a more mechanical and luxuriant Invention) to be equally chymerical and groundlefs. However, having given my Suffrage in its Favour, as preferable to the others, in Point of Invention and Neatnels, I will here give an Abstract of it.

Doctor Chrouet, first supposes a subterranean Cavern, of any given Dimensions: Let us call it (for Example) 200 Foot long, 60 Feet wide, and 30 deep. Secondly, A Bed of Sulphur, fituated at one End of the fupposed Cavern, to have taken Fire, and to burn continually, throwing its Flames all along the Cavern. In the third Place, He makes this Cavern, towards the farther End, to fend out a smaller Branch on one Side, H which

which, we are to imagine, terminates in a fubterranean Current of Water. And, laftly, that the fulphureous Flames, being projected through this Branch, with great Force and Rapidity, becaufe of its Narrownefs, are quenched in the Water; and by that Means, doth heat and impregnate it with its Sulphur.

The Objections brought against this Solution by the Physicians and Authors of the Country are twofold. *First*; It is affirmed, that Fire cannot fubfiss without Air. *Secondly*; That the supposed Bed of Sulphur would decay, and be entirely exhausted with Time. But these Objections are, in my Opinion, of but very little Weight. The first is built upon a false Supposition; (for Air pervades and posses all Parts of the Earth, even to its inmoss Recesses;) and the latter carries no great Weight with it, because the Earth may continually vegetate Sulphur to feed the Bed proportionably to what is spent in Flames.

But here perhaps it may be expected, I should offer my own Sentiments upon the Matter, which I will do with all possible brevity: In order to which, it may first be be neceffary to defcribe the Situation of Aix.

The City of Aix lies in a Bottom amidft a Circle of Hills, which are pretty high, very rocky; and of an almost perpendicular Afcent. Now, as it's utterly impoffible to come at an abfolute Certainty about these Things, we must content ourselves with the most probable Conjectures ; and my Conceptions about the Matter are as follows. I imagine feveral large Basons or Refervoirs in the Bowels of the Hills, which encircle the City, towards their Tops; formed by Nature to receive the Waters continually rifing from all around towards their Eminences. I imagine further, that, the Waters rifing continually upwards, and forcing themfelves inceffantly into the fupposed Basons or Refervoirs, Nature has opened other Conduits or Channels, by which they are derived, and conveyed from the Basons to the Places where they rife out of the Earth in hot-boiling Springs.

It will not be difputed, I believe, that the Caufes productive of Heat, in all Bodies whatever, are Matter and Motion: And the Degrees of Heat will always be in the H 2 compounded compounded Ratios of the Qualities of Matter, and the Quantities and various Directions of its Motion.

I suppose the Waters to have acquired the first constituent Cause, affigned to Heat, before they reached the faid Bafons; by running through fome fulphureous and faline Beds in their Courfe thither : But I prefume that the latter Caufe was impreffed on them, in their Paffage from the Basons to the Places where they are difcharged out of the Earth. I fuppose again, those Ducts or Channels, by which the Waters are conveyed from the fuppofed Basons to the Places where they iffue out of the Earth, have infinite Turnings and Windings; and that they grow gradually lefs and lefs. Allowing Things to be thus difposed, and the Waters to be forced forwards with a great and continual Preffure, together with their own Weight; and, befides, passing de vasibus majoribus in minora, from larger Ducts or Conduits into finaller, they must necessarily move with great Rapidity: And, as they will meet with many retrograde Courses in their Way, the Principles or Particles, with which they are imbued, will have

fo

(101)

fo great and various Commotions, and be in fuch different Angles and Directions, as cannot fail to excite great Heat. And further; befides the Benefit of Heat thence arifing, this violent Preffure of the Waters, and inteftine Motion of the heterogeneous, diffimilar Particles contained in them, must neceffarily digeft, divide, fubtilize and fublime them to the higheft Degree of Perfection.

I apprehend this Notion cannot be liable to any Objection, either in Nature or Reason; as all those I allude to (of which I have only quoted the most specious and ingenuous) are: For, if we confider the many Rivulets of common Water, which fpring from the Tops of high Mountains, it would be impoffible otherwife to account for the Way or Manner of their getting thither, than by fuppoling that Water does actually pervade the Soil, and afcends à Profundis in Altum: Though I shall not go about to explain in this Place, by what Mechanism Nature produces a Phænomenon fo contrary to the known Property of Fluids; which is always to defcend, except fuftained by fomething, or elfe impelled upwards by fome active Force. H 3 And

And thus I conceive the Aix Waters; the most admirable and stupendious for their Virtues and Uses, acquire their Heat and the Perfection of their Qualities. But e're I difmiss this Topic; to give my Conjecture all the Force and Weight it's capable of; let us examine it more minutely. I fuppose those Ducts or Channels, by which the Waters are conveyed from the Basons to the Light, are not only conical, but have infinite Turnings and Windings, in the most retrograde and opposite Directions to one another; otherwife they could not impress fo great a Heat on the Fluid passing through them: For though true it is, that conical Tubes or Canals, running in right Lines, might, by the Reliftance their Sides would give to the influent Waters, caufe fome intestine Motion in their inherent Particles; yet fuch a Motion would be far inferior to that caused by the different Turnings and Windings I fuppofe,

This Argument has a very natural and juft Appeal to a Thing every Day visible to our outward Senfes : Which, though not exactly parallel to it; yet I think gives great Colour of

of Truth to my Conjecture. This is Thunder and Lightning: I confider them as one, because they are most commonly inseperable, and are Effects of the fame Caufe; both which, I prefume, are caufed by a violent Compression of Air, abounding with heterogeneous Particles, in the midft of Clouds, which environ it on all Sides. Now, was that Preffure, I speak of, equal on all Sides, (a Thing not to be fupposed) the intestine Motion caufed in the Air would be nothing, or, at most, but very inconfiderable; and confequently, but little Heat, much less Fire, would be produced. But this Preffure being unequal on the different Parts of its Superficies; the inclosed Air must fuffer great intestine Motion: And thus moving, in Obedience to the unequal Preffure on its Superficies; transversely and obliquely in all manner of Angles and Directions; its heterogeneous Particles, striking variously and forcibly against each other, excite fo great a Heat, as to terminate in Fire. And fo the Air, which had been for fome Time pent up and confined in the Midst of Clouds, enlarges and relieves itself by Explosion, which fo

H 4

(103)

fenfibly.

(104)

fenfibly appears to us in the Shapes of Thunder and Lightning.

I am fo unhappy, indeed, as to differ from a great Man of our own Country, in Opinion about the Caufe of Heat in Mineral Waters; that accurate and ingenious Naturalift, Doctor Lyster. He fays, all hot Springs derive their Heat from the fulphureous Marchafites, which are formed, heated, and inflamed in the Bowels of the Earth: And from them likewife, fays he, all Earthquakes, Volcanos, and burning Mountains proceed.

I have weighed and confidered this Notion very maturely and impartially; and fo far as it regards Volcanos, burning Mountains, and the like, I agree with him: But, as it relates to hot Springs, I cannot help differing from him. For how unreafonable must it be, to imagine that those fulphureous Marchasites should continue burning for fo many Ages, and always with equal Force, or nearly fo. And furthermore; should the Fewel be exhausted, or the Fire be extinguished by Time or Accident; the Water would foon loofe its Heat. Besides this, another another Objection prefents against Doctor Lyster's Definition. For, did those Waters derive their Heat from the supposed Marchafites; they must not lie at any great Distance from the very Issues; otherwise, the Waters would grow cold again in their Passage through the Earth: Whereas, allowing

they acquire their Heat in the Manner I have laid down, it will be not only continual, but always the fame, or nearly fo. Having thus deferibed the Caufe of the Heat and Impregnations in the *Aix* Waters, I shall proceed to confider the Virtues and Properties of their inherent Principles.

The Virtues of Sulphur I have already fpoke to pretty largely, in treating of the Spaw Waters; as a Principle with which they are impregnated. However; as it exifts in the Waters of Aix, in a different Form, Mixture, and Proportion; fo it may not be amifs to confider it under this new Shape.

It would be unneceffary to repeat here, that Sulphur, however fhaped, mixed, or modelled, is perhaps one of the greateft Purifiers of the Blood in Nature. Befides that, it rarefies the Blood beyond any other Thing, yet

(105)

yet discovered; whether in the vegetable or mineral Worlds (Opium excepted.) It is by Means of this rarefactive Faculty, that it refolves, attenuates, and divides all grofs Concretions, and other viscous Combinations of Humours in the Blood, or elfewhere: And it not only fits and prepares fuch Humours to go off by Perspiration, but generally expells them by that Secretion; and fometimes (though more rarely) by Stool and Urine. It greatly promotes the Digeftion and Concoction of ill Humours, and is equally good in many acute, as well as chronical Difeafes. In many of the latter Denominations, it entirely exterminates their very Seeds and first Principles; and in those of the former, it cures by bringing on a Crifis. It is too well known, to need mentioning here; how efficacious Sulphur (even in its most coarse and common Form and Nature) is in all fcorbutic, and other cutaneous Eruptions : And I am very much of Opinion (though I have no Authority for it, but my own Reafon and Conjecture) that so pure a fulphureous Essence, as is contained, and in fo great Plenty, in the Aix Waters, would, if judiciously di-

rected

(106)

(107)

rected and long used, exterminate the Leprofy itself.

It is notorious of what admirable Ufe this Foffil (efpecially as it exifts in the Aix Waters) is in Phthificks, Afthmas, and all other Difeafes of the Breaft. It is a Specific in all Difeafes of the Reins and Ureters; and forcibly diffolves and expels both Gravel and Stone: The laft of thefe it performs by deftroying (as I have obferved before in my Treatife on the Waters of Spaw) their Cement, and the Firft by increasing the Motion of the Fluids; and confequently the Expulsion of Humours, Sc. which it greatly facilitates; by fostening (at the fame Time) and relaxing the Passages, and for rendering them capable of greater Diffension.

The Salt which thefe Waters manifest upon their Analyzation, is, as above observed, of the neutral Kind; and of a sub-acrid, picquant Taste. One very confiderable Property or Use of this Salt is; that, by opening the Body of the suphureous Particles, these are more infinitely divided, and more intimately mixed, and united with the Waters, than so spongy and tenacious a Substance would

(108)

would otherwife be capable of. But as Nature is no where niggardly in beftowing Endowments on what fhe produces to Light: So this Salt, befides the Property already afcribed to it, has feveral innate, medicinal Virtues, proper and peculiar to itfelf. It is highly absterfive and cleanfing: By means of which Properties, it scours (in some Degree at least) all the Veffels of the Body in general; but more particularly the Stomach and Guts, from any fort of Filth, which may adhere to them, fo as to clog and depress their elastic Force, and obstruct their natural Functions. If it meets with any Filth in the Stomach, it ufually difcharges it by vomiting; and fometimes, though more rarely, by Stool: But if it encounters Filth, or any kind of noxious Humours in the Inteftines, it always discharges them by Stool; and, according to the Quantity and Quality of the Humours offending, it will fometimes create a very notable Conflict for a Time; 'till Victory inclining to the Remedy, the Enemy yields. But the chief and fovereign Virtue of this Salt is, that, when coacting with the Sulphur, whilft This rarefies, atattenuates

(109)

tenuates and refolves the noxious Humours; That, by irritating the Solids, increases their Nifus or Action; and, by that Means, enables them more effectually to throw off the Humours fo prepared by fome Secretion.

Thus far, I have only pointed out the Virtues and Properties of these two Principles, as they are simple and separate : It may now be expected I should confider them in their mixed or compounded State; determine on their conjunct Qualities, and direct them to fuch Diseases as they appear most singularly, and eminently good for.

The Aix Waters, being impregnated with fuch Principles, and in the Quantities and Qualities above named; muft neceffarily poffefs the following Virtues and Properties. And firft: They are peculiarly calculated to diveft and cleanfe the Stomach from all flimy, glutinous, or other noxious Humours: They warm, comfort and revive it, if cold, weak, and vapid: They ftrengthen its Ferment, and correct a redundant Acid: They cleanfe, warm, and comfort the Guts; and invigorate, as well as ftrengthen their periftaltic Motion. They deftroy Worms, and totally

totally exterminate their very Seeds and fifft Principles. Thefe Waters are a fovereign Remedy for Coughs, Phthificks, Afthmas, and almost all other Difeases of the Breast. They are of fingular Ufe and Benefit in the Taundice, whether the yellow or black; whether recent or inveterate. They are a Specific in pluretic and rheumatic Diforders; in which they not only palliate, and relieve the Effects; but oftentimes extirpate their Caufes. It is notorious, of what admirable Use and Efficacy these Waters are in all fcorbutic Diforders; nor can they fail to equal (perhaps) any other Medicine in the Reduction of the Scrophulous and Strumous: Indeed, I cannot suppose them void of Use, even in the Gout. They are a Specific of the first Rank, in the Gravel and Stone; and likewife for all Ulcers in the Bowels, whether the Guts, Reins, or Ureters. All Experience testifies (what Reason in this Cafe plainly speaks) that they are of ftupendious Use and Efficacy in all inflammatory Diseases; especially those of the Bowels and urinary Ducts; bleeding being premifed; and fuch other Helps joined with them, as the

(111)

the good Phyfician shall think convenient. I will not prefume to extend their Benefits to stubborn, radicated, venereal Cafes; but in recent Claps, they will happily and speedily do the Business, with only a very little Help drawn from the Galenical and Chymical Provinces: Indeed, it's to be wifhed their Utility in this Particular, was univerfally known; as it might hinder many a good Conftitution from being shattered and debilitated by Medicines (which are but too much in Ufe amongst Quacks and ignorant Pretenders to great Secrets in that Way; not to mention fome Men of Learning and a regular Education) that have a rugged and violent Operation.

To conclude; I flatter myfelf (and I hope Phyficians, and others, who are well acquainted with the Aix Waters, and intereffed in them, will agree with me) that I have given a pretty compleat (though brief) Account, of their most eminent and confpicuous Virtues and Uses: Though, I allow, they may be used indifferently, in many other Cafes, with some Prospect of Success from them.

Indeed ;

Indeed; a good deal might yet be faid in behalf of these Waters, as applicable externally: For it's well known, and univerfally acknowledged; that in radicated, fixed Tumours, proceeding from a cold, phlegmatic Caufe; as also in fixed Pains, arising from the like Caufes; very extraordinary Cures have been performed by bathing in the Waters, and pumping them upon the Parts affected : But what I have delivered concerning their internal Use, will be a sufficient Light and Guide, when and in what Circumstances to use them externally; Wherefore I chuse to fpare my felf the Trouble of writing; and and the Publick that of reading, what in Reality, would be a fort of Tautology.

I have delivered my Sentiments upon the Aix Waters, in fuch a Style, as may perhaps be thought fomewhat positive and peremptory: When, at the fame Time, I declare that I have neither the Authority of Experience or Tradition for what I fay: But have given an Account (meerly rational) of their Virtues and Properties; deduced from a mechanical Confideration of the Principles with which they appear to be impregnated.

If

(113)

If ever Inclination or Accident should lead me to visit Spaw, and Aix la Chapelle, again; I propose to make, yet a more minute Search and Enquiry into the Natures, Virtues, and Properties of their refpective Waters : For in my frequent Reflections upon them, fince my Return into Holland; I fuggested to myself feveral Ways of torturing them; which have not been thought of; or at least not described by any of the Authors I have met with: And, if this little Effay should appear acceptable to the World; I may probably acknowledge its Indulgence, by giving a larger, and more finished Treatife upon the same Subjects.

CHAUD

(114) CHAUD FOUNTAINE, SC.

N my Return from Spaw, my Curiofi-O ty led me to visit Chaud Fountaine, and Huy. The first of these is a Spring of lukewarm Water, which iffues out of the Earth in great Plenty; and is raifed by four Pumps into a large Ciftern, from whence its conveyed by Pipes into feveral commodious Baths. This Spring lies in a large Gut, or Valley, near the Side of a shallow River; which, by Reafon of its Cafcades, and the Mountains that run on each Side of it; and whofe Turnings and Windings feem exactly parallel with it; exceeds, for Beauty and Agreeablenefs of Profpect, any Thing that the Latin Poets have described, or that Fancy could fuggeft.

I confess I was highly ravished with my Passage down the River, from thence to Liege, in a Boat. That Place was certainly

(115)

ly calculated for, and defigned to be the leat of the Mufes, however they came to mifs of it: For nothing could more irradiate and infpirit a poetic Vein. I had not an Opportunity of making any other Inquiries into the Nature of this Water, than by the Tafte only; which does not fuppofe it to be impregnated, in any Degree, with Minerals, either as to Quality or Quantity. And hence; though I allow it to be an agreeable Bath; yet I cannot conceive it poffeffes any extraordinary Virtues or Qualities.

The HUY.

Huy, is a Town fituate on the River Meufe; the Midway betwixt Liege and Namur. It has only one Spring, which they account Mineral, about five hundred Paces without the Town: It rifes out of the Earth, in a Flat, near the Side of a River. I examined its Water by the Tafte only: And though the Inhabitants of the Town make great Account of it, I could not difcover the Marks of any great Virtues in it, nor I 2 any

(116)

any Characters of mineral Impregnations. I met with a Religious (as I remember, a Jefuit) coming back from it; who gave me a long Detail of its Virtues and Cures. But as his Report agreed very ill with that of my own Senfes; I had not Faith enough to believe him, nor Curiofity enough to commit what he told me to Memory.

The CHEVERON.

I think there is only one other mineral Fountain difcovered in those Parts: And that is the *Cheveron*, whose Waters are commonly called *Bru*: But as this Water deferves rather to be exploded than recommended to the World, on account of a noxious Mineral it contains (as I have mentioned in my Preface) fo I did not take the Trouble of going to examine it.

The Fountain LOUZANA:

If we take a Survey of Mineral Waters in general, we fhall find them, according to their different Impregnations, to be very ftupendious,

(117)

ftupendious, and no lefs variable from each other, in their Qualities and Effects. We fee fome which foften, and even diffolve a Stone; and others which endurate, and even petrify whatfoever is immerfed in them. But the most furprising Phanomena which prefent in any mineral Spring in Nature (perhaps) are those of the Fountain called Louzana, in the Kingdom of Galicia; fituate in a high Mountain called Cebret, near the Source of the River Lours. It is reported by Authors of Credit, that this Fountain flows and ebbs alternately and regularly, like the Sea: though in my Opinion, it cannot reasonably be supposed to communicate with it, or depend on it; being above twenty Leagues diftant from it. But what is yet more furprifing, is, that this Fountain is reported to be at fometimes as cold as Ice, and at others very hot.

One of the German Authors above mentioned, has undertaken to affign the Caufes of those extraordinary *Phænomena* : But, in my

(118)

my humble Opinion, with no better Succefs, nor greater Probability of Truth on his Side, than he has attempted the Explanation of many other Things, in the fame Sphere; though indeed, of different Natures. He has really explained them into yet greater Obfcurity; or at leaft, has explained nothing about them; as I believe it will appear to every judicious Reader.

As to the first mentioned Phanomenon; the Flux and Ebb of this Fountain; he fays, it depends on that of the Sea; and he offers as a Reafon for his Opinion, that this Fountain is horrizontally parallel with the Sea's Surface. A very violent Prefumption this; · to fay peremptorily, that a Thing fituate above twenty Leagues diftance from the Sea, is exactly upon a horrizontal Parallel with its Surface! A Man should be accurately skilled in the Art of Surveying, or rather in Calculations of that Sort, to make this appear. And after all (allowing that) it will require a great many Arguments to prove, that the Fountain

(119)

Fountain in Question, has fuch a Connection with, or Dependance on the Sea, as thus to fympathize with it in its ebbing and flowing. But, to fay no more; the very Situation he gives to this Fountain, is a plain Contradiction to the Caufes he affigns to the Phanomenon. As to the latter Phanomenon; he fays, that the Coldness of the Water is its natural Temperament; but that its Heat is preternatural and adventitious: But, the Caufes he ascribes to this Phanomenon, are so uncooth, intricate, and trifling, and depend on fo unreasonable Postulata, that I forbear to recite them. For my own Part, though it would be very eafy to find out Caufes, equally at least, if not more plausible than those I hint at: Nevertheless, I confess my Weakness, and Infufficiency for fuch a Task; and that I am not a little staggered when I think of Indeed, these Phanomena seem to me to it. be amongst the Infolubilia; or those Things which are too deep for a human and finite Capacity to fathom.

In

In a Word, I defy all the Adepts in Chymistry (in which Commodity Germany is very fertil; and 'tis from that Source that the Definitions of these Problems must be drawn) to produce a Solution that will stand the Test of Examination.

FINIS.
