TREATISE

ON THE

STONE.

CONTAINING

The Causes both remote and immediate. The Indications, Counter-Indications, and the Prognostick.

WITH

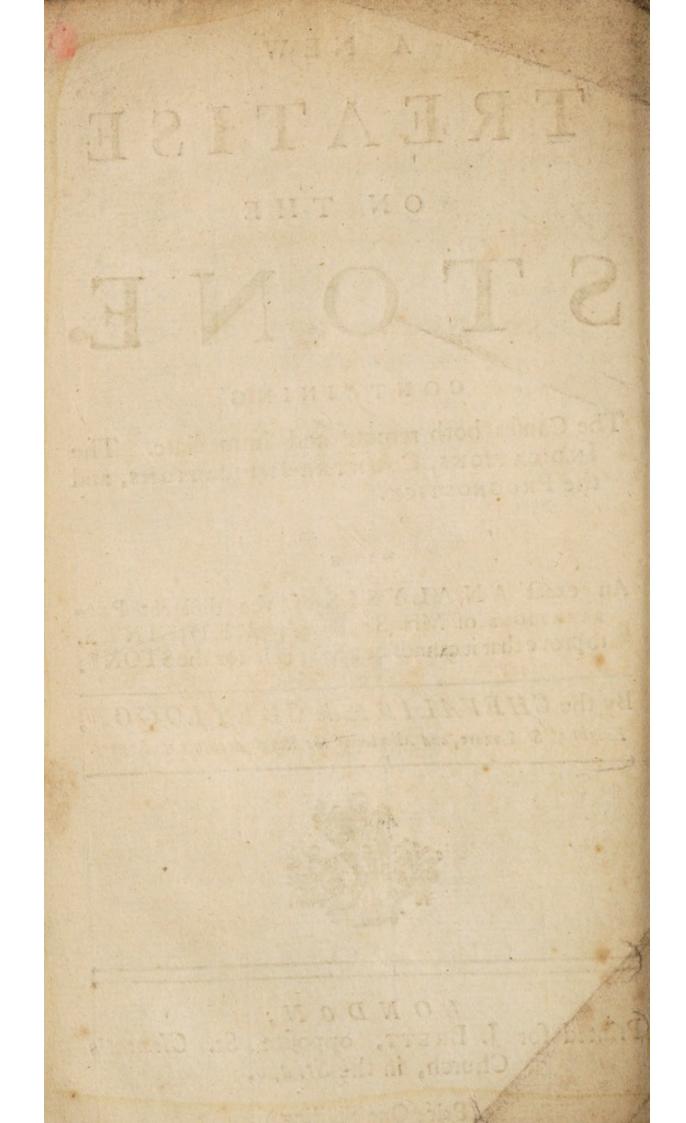

An exact ANALYSIS of the different PRE-PARATIONS of Mrs. STEPHEN'S MEDICINES, to prove that it cannot be a Specific for the STONE.

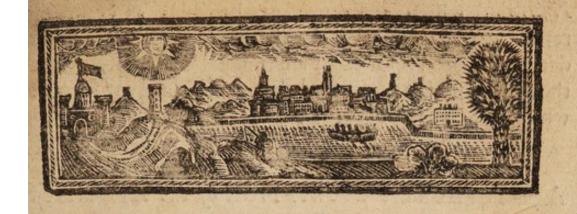

By the CHEVALIER de COETLOGON, Knight of St. Lazare, and Member of the Royal Academy of Angers.

Printed for J. BRETT, opposite St. Clement's Church, in the Strand,

(Price One Shilling.)

ANEW

TREATISE

ON THE

STONE.

EFORE I enter upon an exact Analysis, or Examen of the different Qualities, Virtues, Properties, Effects, &c. of all the Ingredients, whereof Mrs. Stephens's Medicine is composed; to prove it can't be a Specifick for the Stone (and to nder, at the same Time, my keaders capable, of them-lves, to judge pertinently of it, or hinder them from cusing me of Partiality) I think it not improper, to ve them a general Idea of the Causes, Indications, Conalidations, &c. of a Malady, attended with such cruciating Pains, that it is not surprizing, if the Patient

A New TREATISE on the STONE.

Nostrums, which are represented to him as capable of relieving him; and that I may proceed with some Order, I'll begin by a short anatomical Description of all the Parts chiefly afflicted by the Stone, or Gravel, which are the Kidneys, Vessels, and Bladder.

ANATOMICAL DESCRIPTION of the KIDNEYS.

HERE are two Kidneys in an human Body, both placed in the lower Belly, or Abdomen; the right Kidney is fituated under the Liver, the left between the Spleen and Musculus Lumbaris, and

both under the Duplicature of the Peritonæum.

They have each two Membranes, one common from the Peritonæum, and the other proper from the exterior Coat of the Blood-Vessels. By their external Membrane they adhere to the Loins; by the Blood-Vessels to the Cava and Aorta; and by the Ureters to the Substance of the Kidneys, which are a Texture, or rather Congeries of Blood-Veffels, Glands, and excretory Ducts. They receive their Blood-Vessels from the Cava and Aorta, by Means of the Emulgents. The emulgent Artery, by its numberless Ramifications throughout the whole Substance of the Kidneys, supplies it with Blood from the Aorta; and, after infinite Convulfions, terminate itself in Glands of a globular Figure, which compose the cortical Part of the Kidney of about half an Inch thick, and of a Liver Colour. From each of these Glands iffue out the Tubuli Belliniani, which extend themselves toward the Pelvis of the Kidneys, form the Papillæ, adjoining to which is the Fistula Membranacea, through which the Urine is emptied into the Pelvis, that it might be discharged by the Ureters into the Bladder.

The Blood remaining after the Secretion of the Urine, is carried back to the Heart, by the minute capillary Veins, which arise from the Extremities of the arterial interial Branches, being inclosed in the same Capillar with the Artery, going out where it enters, and

erminating at the Cava.

There are likewise a great Number of muscular Finers in the Mechanism of the Kidneys; which is a plain Demonstration, that they are not appointed by Nature or the Secretion of the Urine only; but also for the Expulsion, or Discharge of any concreted Matter that may odge in their Substance, even without the Help of Medicine; and which is an evident Proof that the Kidneys are as well active as passive Machines in an human Body; contrary to the erroneous Opinions of those who believe them placed there only for to give a Vent to the serous Part of the Blood; having no Power to open as Treasure, or extract its Principles, otherwise than y Filtration.

Description of the PELVIS, and of the URETERS.

ROM the Substance of the Kidneys, and without mentioning the other Parts, which have no Retion to our present Purposes, as the Glandula Renalis, c. I proceed to the Description of the Pelvis, which a Bason, or Cavity in the Middle of the Kidney,

hich arises from a Dissention of the Ureter.

There are two Ureters, or long, small, and memcanous Pipes, of the Bigness of a Goose-Quill, tho' an unequal Diameter in their Cavity, to convey the rine from the Pelvis; into which they pierce, on each de its Neck, with oblique Insertions. Their Obstrucon will cause a Suppression of Urine, and either being sected, will excite a Strangury.

The Description of the VESICA URINARIA, or BLADDER.

three Membranes, the uttermost Common, from the Peritonæum, and the two others Proper. The middle one is composed of carnous Fibres, both Long tudinal and Circular; by the Astion of the Longitud nal, the Fund of the Bladder is press'd forward toward the Os Pubis, from whose lower Part they arise, as we as from the fore Part of the Prostatæ; while the Circular ones, by lessening its Dimensions, procure the Dicharge of Urine.

The inward Membrane is nervous, and of an exquisitive Sense; and therefore it would be subject to many more Accidents, was it not senced on all Sides, with a variable of Glands, against the Acrimony of the Uring The Sphineter Vesica, is a Muscle placed at the Neck the Bladder, which by keeping it constantly closed, his

ders the unvoluntary Emission of Urine.

The Bladder is a Kind of Reservoir, which receive the Urine of the Kidneys, that it might not be evacuate against our Consent; for which Purpose, Nature his joined to it the main excretory Vessel, or Pipe, calle Urethra; which being as tender as the inward Membras of the Bladder, she has lined it in the same Manner wis small Glands, to avoid the frequent Dangers it other wise might be exposed to.

The Bladder and Urethra receive into their Comp fition Veins and Arteries from the Epigastricks and I liack Nerves and from the Pelvis of the Abdomen.

This short, though very necessary anatomical D scription of the urinary Organs, thus established, will not be improper, before we attempt to discover to Causes of the Maladies which affect those Parts, established of the Stone and Gravel, to give likewise an Id of the Nature of the Utine; its Properties, Quality and its constituent Principles; since from the Depravati

d ill Habit of that Fluid, after its Separation from e Blood in the Kidneys, proceed all Stones, Gravel, d fabulous Concretions.

DEFINITION of the URINE.

THE Urine is an elementary Water, separated from the Blood in the Kidneys, and impregnated with the acid and alkaline Salts. The Accurateness of this estimation is evidently demonstrated, by the daily Exeriments of our Chymists upon that Fluid, from hence is extrasted; 1st, a stegmatick and insipid ympha. 2d. A volatile Spirit. 3d. An acid Salt. h. Sulphur. 5th. Very little Oil, except in a Cacoimous Constitution. 6th. And some fixed Salt,

hich afford its earthly Sediments.

Reason alone, without the Assistance of Chymistry, ay convince us that Urine is Elementary; since its inciples are inclosed in those Mixtures, which serve for a Aliments, and which participate likewise of the ur Elements; and the more one of those Elements is edominant in the Aliments we like most, the more is a Urine impregnated with the Principles of that Element, viz. If we prefer Pickles, Roots, Fruits, &c. any other Food; or Cyder, Water, or any other egmatick Liquor, to spirituous ones, our Urine is en clear, limpid, and, if put to the Alembick, assords the little Spirits, or volatile Salt, a great Deal of allegm, and a considerable Quantity of fixed Salt, or ther what the Chymists call Caput Mortuum.

However, it would be a groß Error, to pretend, that ie different Qualities of the Urine, proceed entirely from e different Qualities of the Elements; since when the erment of the Stomach, is more or less capable to permits Functions, the different Qualities of the Paneatick Juice, and of the other Juices, employed by Nater to perfect the Chyle, the different Changes, or Mutions the Blood acquires in its Circulation; but,

above

above all, the Imbecillity, or the just Harmony sulfisting between the urinary Organs, alter the Urine.

Another Error no less to be condemned, is to believe that the Quantity of the Urine proceeds always from the Quantity of the Liquor we drink; since Experience convinces us of the contrary. The more is our Constitution weak or strong, hot or phlegmatick, the Urine is more or less abundant. In a weak Constitution the Pores of the Body being more open'd an relaxed, Part of the Lympha, which should have separated from the Blood in the Kidneys, is evacuated by Sweat, or insensible Perspiration, even in a hot Constitution, though perhaps very strong, Parts of the Lympha is consumed by the excessive Heat of the

Body.

I am not of the Opinion of some Physicians, wh pretend that the Evacuation of the Serum by excessiv Sweats, diminishes always the Quantity of the Urine fince I have feen, in some Subjects, a very large Evacua tion of Urine, after an exceffive Sweat; neither would their frivolous Reasons, that the Blood being impoverish' and spoiled of the Spirits which must facilitate its regu lar Circulation, and, consequently, say they, depriv it of the Strength necessary to force its Passage through the complicated arterial Branches of the Kidneys, wil ever make me alter my Sentiments, fince the Veffel of the urinary Organs admit of a Relaxation in their Parts, though not so sensible a one as the Cuta neous Glands; and that it is agreeable to the ftricted Rules of Anatomy, to think that, in such excessive Secre tions of the Serum from the Blood, it must flow in greater Quantity through its ordinary and natural Con duits, or Pipes, than otherwise, especially when th Serum is superabundant.

That the Serum, evacuated by Urine, or Sweats, if the same with that of the Blood, is apparent by the Serum which swims upon the Blood extracted by Phlebotomy of the same Consistence, Colour and Taste of Urine.

Th

Causes of the different Colours of the URINE.

HE different Colours of the Urine have different Causes; the Crudity, or Watery Colour of the ne, without either Sediment or Cloud on the Surproceeds from the Crudity and Imbecillity of the olvent of the Stomach, in the Coction of the Alits; which being imperfectly separated, a considera-Part of their most sulphurous and volatile Particles, est and carried off with the gross Excrements. The ne of a deep Orange Colour, with a brickish Seent, proceeds from an imperfect Separation of different Fluids wherewith the Substance of the od is composed; or a Dissolution of the nourishing es, which through the Relaxation of the urinary ins are evacuated together with the Serum through ordinary Paffage of the Urine; that Colour arifing the oleaginous Particles of those Juices, wherewith rarified Pores of the Urine are fill'd, which causes nperfect Separation, and changes the Refraction into olique Reflection.

different Qualities of the URINE, from the Difference of the Constitution of the Body.

HOSE are not entirely mistaken, who pretend to discover the Constitution of the Body, by the ction of the Urine; though I would not pretend to ove the ridiculous, knavish, and monstrous Conof those Quacks, who the better to impose on the lulity of the Vulgar, and cozen them of their Mopretend to judge pertinently of the Constitution Person, or to form a just Prognostick of a Malady the Inspection of Urine, poured into dissevered the Urine being an Excrement divested of those Spirits

Spirits which should keep its Motion, and the little vola tile Salt it contains, being wrapt in a predominar Quantity of Phlegm and terrestrial Particles, it must no ceffarily tend to Corruption, and acquire by those Tran valations and Motions, the same Qualities with that which has been kept for the Space of Four and twent Hours in a Glass f rom which no Body would attempt to form a Prognostick. Besides, this is rather work fince the Sediment, if there be any, is irregular, and th Texture of the Particles, without which no Indication can be expected, entirely broken; therefore nothing mor can be discerned than the most terrestrial Particles, an theother Bodies it might contain, which by their natur Gravity are carried to the Bottom of the Glass, suc as Sand, Gravel, &c.

The same cannot be said of the Urine, which h experienced no other Motion than from the Urethra in the Veffel; which fettles gradually by the gradual Ev poration of the Spirits, which kept the different Pri ciples it is composed with, in a Ferment; for then Physician, by the Inspection of such Urine, can easi judge of the Constitution of his Patient, and of t

Nature of his Distemper.

General Rules to discover the Constitution of Patient by his URINE.

HE general Rules to discover the Constitution a Person by his Urine, are these.

1. A thin, clear, and flameous Urine, overstock'd w Salts denote a bilious Constitution; fince the Bile, o of the Substances, which enter into the Composition the Blood, the most impregnated, with igneous Par cles, where it predominates, infallibly communicates the Blood a greater Volatility, without a Rarefact of the Phlegm, and an extraordinary Exaltation of faline Particle, disfused thro' the whole Mass of Blo Part of which can't avoid being carried away by Secretion of the Urine. 2. 1

2. Persons of a sanguine, healthy Constitution make, enerally an Urine of a deep amber Colour, with a redish Menstruum, and a sulphurous Sediment sull of

right fandy Gravel.

3. The Urine of a phlegmatick Constitution, is thick nd heavy, with a whitish, earthy Sediment, occasion'd y the Scarcity of the Spirits so absolutely necessary o give a regular Motion to the Fluids. Such Contitution is more subject to the Stone, or Gravel, than he two other; because the Coolness of the Stonach, leaves the Chile overloaded with earthy and helgmatick Particles, which should have been caried with the gross Excrements, in the first Separation, nd blunt the Activity of the Bile, and of the Pancreaic Juice The Fluids, render'd flow in their Motions, y being overburthen'd with that Phlegm, stop in the affage; and the Kidneys, render'd likewise Adust by he repeated Efforts they make for the Excretion of the erum, condense it to such a Degree, as to reduce it to fandy and gravellous Confiftence.

This brings me naturally into a strict Inquiry of ne efficient Cause of the Concretion, of the constituent rinciples of the Gravel and Stone, and of the maner of their Formation in both the Kidneys and

ladder.

The Causes of the Stone and GRAVEL, and their Formation in the Kidneys and Bladder.

PIVE R IUS admits for the two remote Causes of sandy and gravellous Substance in the Kidneys, the coldness of the Stomach and the Heat of the Reins, thich Opinion I have mentioned in the preceeding Artici; and in that he seems to agree with some modern hysicians, with this Difference, that they find that ause, which they call predisposing, in the Imbecillity, Relaxation of the Fibres of the urinary Organs, and sign for Reason thereof that it would be impossible

that

or Bladder, were not the Tone of those Organs impaired by their Fibres being depriv'd of their natural Elasticity which render them incapable of expelling that phlee matic and glutinous Matter which has lodged itself it their Cavity, and oppose their Concretion: For, sathey, while the whole Microcosm continues in its just Harmony, while the whole Machine preserves the sam regular Motion, all its Springs will be equally capable to resist or oppose, all that could disturb their OEconomy

Others reject that Opinion, and fearch the remot Causes of the Stone and Gravel in the Quality an Quantities of the Aliments, and believe that an Epicur who minded nothing else, but how to load his Stomacl with the most delicious Viands, is more commonly sut jest to the Stone and Gravel, than those that eat an drink with Discretion, and Frugality. To support the Sentiment, they alledge, that the more delicious our Al ments are, the more they are charged with earthy an faline Particles, which meeting in the Blood, with the igneous Arcanum the first Principle of its Activity, are cor densed together, and form a Kind of Coagulum, or tenaci ousPhlegm, which retards its Circulation, and which bein with much Difficulty separated by the Secretion, from its Substance, and wanting the Fluidity necessary for speedy Evacuation, stops in the Passage so long as to b concreted or obdurated, by the Heat of the Reins.] must not be supposed that this glutinous Matter, which fettles in the urinary Organsis very volunimous, for the in a very short Space of Time it would cause a total Ob struction, it increases only by Degrees, and even Part of it is carried off by the Fluidity of the Serum, especiall when it flows with some Impetuosity, thro' the natura Evacuation, often without the least Pain; for that fand Substance is some Time almost impalpable, or of so little Volume that it rolls with the Urine without the lear Tension of the Vessel, some of them larger, causes mome taneous Obstruction attended with some Pair by being forced thro' the Passage, by the Impetuosit of the Urine, which Sentiment destroys entirely the Sy stem of those, who place the immediate Cause of th

Gravel

faline

Gravel in the attractive Faculty of the saline Particles, or Corpuscles of our Aliments, therewith the Urine is impregnated: For if those Corputcles have that magnetick Virtue, it must be an occult one, which is the same as nothing, or by Effluviums. But how can it be by Effluvium, fince the Atmosphere absolutely necessary betwixt the two Bodies for the Concatenation of the Corpuscles flowing from each of them, to create the Attraction, must be unadvoidably broken, by the overflowing of the Urine; and if that Salt has that attractive Quality, why so often a sandy Subfance in the Kidneys, and evacuated by the Urine, without being ever conglomerated, into a Gravel or Stone? Is then that attractive Quality, ad Libitum, or naturally inherent in that Salt? If it benaturally inherent t must always produce the same Essect; if ad Libitum; suppose it often Dorment as well as its Affertors.

To demonstrate more evidently that supposed attracive Virtue in their Salt, they have Recourse to some Experiment to prove, 1. That there are saline Corpusles in the Texture of the Gravel, or Stone; which no Body has ever objected against, since there are no Mixe n the whole Creation without its Salt, both volatile nd fixed; but above all our Substance which abounds vith saline Corpuscles. 2. That it has really an attracive Faculty; which is evidently apparent in the Difolution of the Gravel or Stone reduced into an impalpable Powder, in warm Water, which Water is immediately mpregnated with faline Corpufcles, from whence they onclude, that every gravelly Corpuscle, has a saline Corpuscle for its Center; no doubt but it may have uch Center; but how will this Experiment prove he attractive Faculty of that Center? Must not that ery same saline Corpuscle, be diffused thro' the whole ubstance of the Urine, since they cannot be brought nto the Kidney, otherwise than by that Vehicle? It so, thy should not that attractive saline Corpuscle lest in the Treters or Kidnies, have the same Activity towards all the ther Corpuscles homogeneous to them? Why does the Urine main impregnated with such Quantity of the very same C 2

14 A New TREATISE on the STONE.

faline Corpuscles, after the Evacuation, as its evident by its brakish Taste, and its Analysis in the Alembick? O is it because that centrical Corpuscule, borrowsits Activity from its different Positions, and directed toward it Poles, like the Loadstone, before it might be able to ut that attractive Faculty; but if the Position is of n Signification towards it, which must be those refractationes which scornfully despise intimate Affinity; and whis not the whole saline Substance of the Urine petrified?

The real immediate Caule of the GRAVEL in the KIDNEYS.

The Gravel in the Kidneys proceed from a viscour and tenacious Phlegm, separated from the Substance of the Blood, and secreted with the Serum through the Vessels of the Kidneys, and carried from the Tubus Belliani and the Papillae into the Pelvis, where, by it Adhesion to the internal Membrane and by the Heat of the Reins, its obdurated and concreted sometimes into a almost impalpable Sandy Substance, easily carried away by Urine, and without the least Pain; and sometime into a Gravel or Sand of a bigger Volume, which Gravel being of a viscous Substance in their first Formation when in some Quantity, by their Collision occasion by the Fluidity of the Urine, are often conglomerated together, and form that voluminous one, call'd Stone.

If it be ask'd why that viscous and earthy Substance does not follow the Rapidity of the Urine, in its entire Evacuation through the Ureters, Bladder and Urethra, as well as its Secretion through the Vessels of the Kidneys? I answer, that they are forced in the Secretion by a strong Impulsion of the Arcanum, disfused through the whole Mass of the Blood, from which it is separated, and by the Compression of the secretary Vessels; that sinding a larger Capacity in the Pelvis and deprived of that Impulsion which could likewish

forc

orce it through the Ureters, it is carried by its natural Gravity, like any other heavy Body thrown into a Vefel full of Water, to the Bottom of the Pelvis, or raher like Limus Fluviatilis, adhere to the Side of that

art where it acquires its Concretion.

If it be ask'd likewise, why that Matter, being in he same Quantity, is not always concreted in the same Manner? I'll answer again, that though, in all Appearance, the same Substance, it has, however, very ften different Qualities; and that the less viscous, proluces always a less voluminous fandy Substance, which substance is often so friable, that by their Collision, in being continually roll'd by the Fluidity of the Urine, hey are resolved into almost impalpable Sand: But when, on the contrary they furabund with glutinous ind tenacious Corpuscles, they are, by that Collision, oined tagether, as I have already mentioned; and, in Process of Time, form a Stone of a considerable Bigness, hough seldom exceeding in its Volume a small Beans nd is often reduced to its former State of Sand or Grael by the same Means they had been accumulated or oncreted together; for when the cataneous Texture f the glutinous Corpufcles which had been the efficient Cause of the Concretion, is broken, which happens when those Corpuscles are in such opposite Positions. s to leave Intervals for any stronger Body to lodge itelf in those Intervals, and by its frequent Secouses, or hakings, cause at last a Dissolution; the Overpowering r Rapidity of the Urine giving often the finishing troke. In that Wreck of the Stone in the Kidneys, Part of it is always forced thro' the Ureters, which Parts being rough, fharp and acute, from the Inequality of heir Angles, cause sometimes an Excoriation with exquisite Pains, and which is apparent by the Urine eing dyed with Blood.

This Opinion upon the immediate Causes of the Gravel, or Stone in the Kidneys, does not feem to me therwise repugnant, to that of those who place the Cause in the Salts, than by depriving that Salt of its retended magnetick Virtue; for I'll agree with them,

if

if they please, that the saline Corpuscles are the chie Foundation of the Gravel or Stone; but I'll deny, no only their attractive Faculty, but likewise that the are capable of being so intimately united together, as t form so hard a Concretion as is the Gravel or Stone without the Help of viscous and earthly Corpuscle obdurated by some Heat. The Urine itself, by it continually flowing through the urinary Veffels, woul hinder that Concretion coming to any Solidity, as i appears in the Saline Marches in France, where th smallest Rain will destroy the best Concretion of Salt and by daily Experience, when a small Quantity of Water will destroy a greater Quantity of Salt withou the Corpuscles of that Salt separated by the conti nual Rotation of the globular Corpuscles of the Water being capable to attract each other for a Concretion without the Help of the Fire, by an Evaporation which reunite those Salts, in their Condensation, with fome Earth and Phlegm.

Neither can it be objected, that this Magnetick Salt which serves for the Formation of the Gravel or Stone is entirely different from our common Salt; for it is given pro Confesso, that it is almost the same as our common Salt Armoniack, and we know that it suffers the same Changes with our common Salt, and admit of

a Diffolution into Water.

The Generation of the STONE in the BLADDER.

COME of our modern Authors, especially the Gen-I tlemen of the Magnet, charmed to have so favourable an Occasion to let the World know they have studied des Cartes and Newton, are resolved to sollow no other Principles, right or wrong, or speak any other Dialect than that of those two famous Philosophers. I wish they could likewise forbear laming the Principles of those two illustrious Men, or depriving them of their natural Light by their prolix Discourses and tedious

Repetitions

epetitions; for what fignifies making three or four hapters of a Subject, which might be treated in two r three Pages? They know no other Cause of the eneration of the Stone in the Bladder, than the same nagnetick Salt, which causes it in the Kidneys; and hey employ halt a Book to endeavour to convince us f that ridiculous Opinion, which is entirely repugnant our Reason and our common Experience. That atractive Salt might have pass'd, perhaps, at least with nore Appearance of Truth, for the Center, or the Arcanum of the Gravel in the Kidneys, since those arts being a great deal narrower than the Bladder, a Corpulcle of that Salt being left in the Veffels of the Cidneys for a Center for the Gravel; might chance to ook in en passent some of its Kindred; but in the Bladder, which is of a far greater Capacity, and seldom r never without a tolerable Quantity of Urine, which est there without any Motion, till discharged through ne Urethra, how can that saline Corpuscle escape a Diffolution, in so large a Quantity of Fluid? But hose Gentlmen don't mind it; they will have that agnetick taline Carpuscle for the Center, or rather, ne immediate Cause of the Stone in the Bladder, as ell as in the Kidneys; but how can they be able to x that Corpuscule in a Place so that it might attract all ne other Corpuscles homogeneous to itself, to form of it Concret of the Figure of a Stone, since it is a comonly received Truth, confirm'd by Experience, as I ave already demonstrated, that those faline Corpuicles re not only diffused through the whole Substance of ne Water, but also are seen like a Cream upon its uperficies, especially if the Water be without Motion, ad continue so till it is agitated by the Wind, or some ther Accident, which it's impossible to be effected in ie Bladder.

They'll fay, perhaps, that it is done by the Evacuaon of the Urine, which, if not entirely evacuated, te small Quantity left afterwards is not capable to hiner the Concretion; but is the Interval between the vacuation through the Urethra and the Supply the

Bladder

Bladder receives from the Ureters, long enough to allo a sufficient Time to those saline Corpuscles for the Concretion, or rather Petrifaction? Or does not the fresh Supply of Urine distolve, or destroy the Textus of the first Concretion, which cannot be accomplish so soon in the Bladder, where especially it cannot be a fifted in that Concretion, where the Coolness of the Orga or by its natural Warmth, or by that of the vicir Parts? Those learned Authors provide, nevertheles against all those Inconveniences, by marshalling contrar to the Order of Nature, and the true Principles of a ra tional Philosophy, those homogeneous saline Corpu cles into many Battalions, making fome march to for the Body, and the others the different Coats of th Stone; as if it was possible for the Corpuscle, place by them for the Center, to have an attractive and re pulfive Faculty both, and at the fame Time, toward the fame homogeneous Corpufcle? In vain to confirm this Opinion do they alledge, that were not the Corpu cules of the Urine to observe such exact Discipline i their Separation, they could never form the different Coats of the Stone in fo exact a Manner; fince we fin every Day Stone and Pebbles, whose Coats far furpali in their Exactness and Cymetry, the Stones of th Kidneys or Bladder; though our Authors would no pretend to advance that fuch Stones or Pebbles are form ed otherwise than per Congeriem, or by the natural Gra vity or Propenfity of the Corpuscles to their Center.

Without the magnetick Virtue of the Center, and the exact Discipline which the Corpuscles, designed for the Formation of the Stone, must observe in their March, those Gentlemen would fain make us believe that it would be impossible to account for the different Phenomena of the Stone, viz. Why some of its Coat feem thinner than others, or not so closely attach'd to the Nucleus? For my Part, I think it might be an swer'd without the least Hesitation, and according to our Principles; that as it cannot be supposed that the Stone is formed all at once, or that our Urine is always impregnated with an equal Quantity of viscous, phleg

matick and earthy Corpuscles; therefore, as at each Evacuation of the Urine, a new Coat is added to the Nucleus, the less the Urine evacuated is loaded with those Corpuscles, the Coat or Strata must be consequently thinner; and when the glutinous Matter is dried and condensed by the Heat of the Kidneys, the less vehement is that Heat, the less are the Corpuscles condensed, and the less is the Texture of the Strata or Coat.

Besides, it cannot be imagined, that Nature would take so much Pains, or use so much Art, in the Formation of a strange Body, which ie a Burthen to the organick Parts, disturbs the Harmony which should subsist between them, obstructs their Functions, and threatens the whole Microscosm with its entire Dissolution.

It refults, from what I have faid already, that the Stone in the Bladder proceeds from two Principles, or Causes: 1st. From the Nucleus, or rather Gravel, formed in the Kidneys, and by the Impetuosity of the Urine, and the Impulsion of the Column of Air, forced through the Ureters into the Bladder. 2d. From the viscous and earthy Corpuscles which have escaped the Separation in the Kidneys, which, by staying longer in the Bladder than in other urinary Vessels, have Time to conglomerate themselves with the Nucleus, and to form out of it a far more voluminous Body.

It might be objected that if the Stones proceed from the Viscosity of the Urine, when once a Stone has been extracted, another would soon supply its Place; and consequently it would be needless for the Patient to extose himself to the dangerous Accidents, or undergo the excruciating Tortures of the Operation? To which answer, 1st. That the Extraction of the Stone seldom nisses being succeeded by the Generation of another; and when it happens otherwise, it proceeds from the extraordinary Dilatation of the urinary Vessels in the list Evacuation of the Stone; in which the Caruncule Papillares, are often broken, leaving thereby a more ree Passage to the viscous and tenacious Limph of the Urine, which, through the Imbecillity of the Organs,

D

admir

admit of no Separation. 2. 'Tis supposed the momen taneous Torture of the Operation is nevertheless pre ferable to the too frequent excruciating Pains of the Stone, and the subsequent Accidents not quite so dan gerous as those of an entire Obstruction of the Passage which must infallibly happen, if the Operation be neglected. Befides, the Interval between the Extraction of a Stone, and the Generation of another, fo as to grow equally dolorous, must be of great Ease to the Patient.

It cannot be reasonably expected that the Patien should always be entirely cured by the Extraction o the Stone, till proper Remedies are found to take of the remote Causes of the Distemper, by restoring the Tone of the Stomach, and cooling the vehement Hea of the Reins; unless, also, the Vessels have been so dilated, as to be render'd quite imbeciles for the Secre tion; for then, altho' the remotest Causes or Focus or the Stone remain, and the Urine continues to be impregnated with the same Quantity of viscous and earthy Corpufcles, being no more interrupted in their March. by the Narrowness of the Organs, they follow the Impetuofity of the Urine in the Evacuation: And if, by the Urine staying longer in the Bladder, than in any other of the urinary Organs, there happens a Concretion. it is but a fandy and almost impalpable one, easily evacuated without the least Pain; which Phenomenum destroys entirely the whole System of those who admit of a magnetick Vertue in the faline Corpufcles of the Urine for the Formation of the Stone in the Kidneys or Bladder; for if the Secretion is hinder'd in the Kidneys, by the extraordinary Diflocation of the Organs, and thereby the faline Corpufcles, which used to form the Nucleus, are left in the Urine, they are not however deprived of their Qualities, and have Time enough, while the Urine stays in the Bladder, before it can be evacuated through the Urethra, to direct themselves to their Poles, and work each other fo as to form a Nucleus, or Basis for another Stone; and therefore a Patient would never be free from it, till the Tone of the Stomach could be entirely repaired. Neither can it be objected,

nat the same might be said of my System; since, by my dmitting the viscous Flegm of the Urine for the imrediate Cause of the Stone, when once, for Want of ecretion, that Phlegm is left mixt with the Limph of ne Urine, and deprived of that extraordinary Heat adnitted by me as absolutely necessary for its Condensaon, not to be met with but in the Reins, it is imposble it should form a Nucleus in the Bladder, which is temperate Body, little susceptible of any extraordinary leat; and if those viscous and earthy Corpuscles are, y their Gravity, directed to any Part of the Bladder, ne continual Motion of the limphatick Corpufcles, ocafion'd by their globular Form, hinders them from onglomerating together, so as to form a Nucleus.

he Causes of the Differences of the Stone, as to their Volume, Density, Colour, Number, &c.

W E are convinced, by a continual Experience, that the Stones differ in their Denfity, Volume, Magnitude, in their Form, Colour and Number; nd all the Authors who have wrote on the Subject ave endeavour'd to affign a Reason, true or apparent or that Difference.

Those who have fixed the immediate Causes of the ones in the Attraction, Direction, and Repression of ne faline Corpuscles secreted from the Urine, affign'd or the different Denfity of the Stones, the different ofition of the Corpufcles thus attracted to their Center, r Nucleus, arifing from their different Gravity or Veocity with which they meet each other in their various ccurfions, pretending that their Contract or Cohefion less, where the Rapidity of their Motion is greater; nat there is a continual Repulsion, and therefore never an meet together fo as to form a Concert of any Denty, wherever their Motion, or that of the Aqueous lenftruum, wherein they are suspended, over-ballance neirPropensity to contract; and if their attractive over-

ballance

ballance their repulfive Principles, even then the Den fity acquired by their f w Contacts is so loose, as no to be properly call'd Density; fince by the Rapidity or overflowing of the Urine it might be dissolved.

The different Density of the Stones, is by others a tributed to the different Figures of their constituer Parts; in so much that the Parts which afford a greate Number of Contacts, as those of a Cubic Figure produce the harder Stone; fince where there are a great Number of Contacts there is a greater Closeness of the Corpuscles, and therefore a greater Firmness and Density in the Body they compose; which cannot be sai of the Corpuscles of a spherical Figure, which havin but very few Contacts, render the Texture of the Stones.

less compact and more brisly.

Those two Sentiments, tho' of a modern Inventior and so little different from each other, feem to me er tirely opposite to the received Rules of Gravitation Attraction, Direction, and Repulsion; for it must be supposed that those Corpuscles have their Gravity themselves, or borrow it from the Impulsion of the ac jacent P rts; if from themselves they must be carrie by a natural Propenfity to their Center; if from th adjacent Parts, it is by the Compression of the Colum of Air perpendicular to them, or by the Impulsion pro creeding from the Fluidity of the globulous Corpusch of the watery Menstruum, in which they should swin If by the Impulsion of the Column of the Air perpend cular to them, they must be precipitated to their Center with no less Velocity, than they should be by their n tural Gravity, fince it cannot be supposed that the Co lumn of Water opposite to it could refift the Compression ef ecially fo far as to keep the Corpufcles long enoug fulpended in the watery Menstruum, as to give the Time to direct themselves to their Poles, for their A traction and Repulsion. Since we see daily that the fmalled Body, indued with the least Gravity falling as confiderable a Body of Water, as can be supposed the Bladder, and with as little Motion, is immediate precipitated to the Bottom: But suppose even that the Corpuic

A New TREATISE on the STONE. 23

corpuscles could be kept long enough on the Surface to irect themselves to their Poles, as they cannot act but y the Effluviums, as well from the attracted, as from ne attracting Parts, which must form an Atmostphere etween both, how can that Atmostphere subsist in a ratery Menstruum, which, by its Fluidity, must break ne Continuity, without which it cannot be either attraction, Direction, or Repulsion; besides, the gloulous Corpuscles of the Water must fill the Pores of nose Bodies, and hinder the Emission of the Effluiums.

Real Causes of the different Density of the STONES.

HE Denfity of the Stones proceeds from the Equality of their compounding Parts, as well as from e Graduation of the heat in the Part they are form'd; or if the viscous and renacious Corpuscles which enter to the Composition of the Stone, exceed in Quantity ie faline and earthy ones, if the Heat is moderate, the one being indurated by Degrees, grows harder than at formed with Precipitation by the extraordinary ehem ney of the leat; therefore we have no Need to ok for any other Reason of the different Density of e Stone form'd in the Kidneys, from that form'd in e Bladder, fince the Vehemency of the Heat of the idneys evaporating with too much Precipitation the imph of the viscous Corpuscles, fill the Vacancy with neous Particles, which causes a great Inequality in e Tacts of the compounding Parts of the Stone, and ereby render it lighter and more brittle than that rm'd in the Bladder, whose Heat being always temrated by some Quantity of watery Menstruum, acts adually, and makes no other use of its igneous Cor-Iscles, than as of so many Hammers, which workg always at one equal Distance, draw likewile the mpounding Parts of the Stone to an Equality of Tacts,

and

24 A New TREATISE on the STONE.
and leaving no Intervales betwixt, the Stone grows harder, and more compact.

The WEIGHT of the STONES.

HE Weight of the Stones does not proceed from their Bigness, or the Largeness of their Volume. but from the Closeness of their compunding Parts, and the Exactness of their Tacts. There is as much Difference in their Weight as there is in their Volume: the bigger they are, the more difficult and dangerous is the Operation; and the more frequent and excruciating are the Paroxifms they occasion. The biggest I ever saw. is one kept at the Charity, an Hospital at Paris; it weighed, when extracted, one and fifty Ounces. It cannot be reasonably expected, that the Stones should be always of the same Size and Weight; their Difference, in that, proceeds often from the Capacity of the Parts wherein they are formed, or from the Abundance or Scarcity of the Matter they are form'd with. In Children, for Example, whose urinary Organs are of a narrower Compass, and whose Stomach is not so much imbecillitated as to load the Blood with a vast Quantity of viscous Phlegm, the Stones never exceed the Bigness of an Apricock Stone: In Men they often exceed a large Egg; and what's the more furprizing, is, that in some Constitutions they are not long before they grow to that Bigness. I knew a Taylor, in Holles-street Clare-Market, who had a Stone extracted which weigh'd fix Ounces; and, four Years after, had another weigh'd eight; which cannot be attributed but to the digestive Faculty being entirely imbecillitated.

The different Colours of the STONE.

THE different Arrangement, Position, or Order of the constituent Parts of the Stone causes their ferent Colours; but especially the Closeness of the exture of their outward Coat; for the more the Corscles which enter in the Composition, or rather form at Coat, are uniform in their Angles, they are the ofer join'd together, provided the too great Imperuty of the igneous Particles, proceeding from a veheent Heat, don't disorder their Cimetry, by working at Texture with too much Precipitation: The closer ey are joined together, the more compact is their rface; the more compact is their Face, the greater the Reflection of the Light, and the lighter is the plour of the Stone; for if on the contrary, the Stones e spongious, as it happens, when their constituent irts have been affembled together, tumultuoufly and ith too great a Precipitation, by the Impetuofity of e igneous Particles, the Rays of the Light, lodge emselves in the Intervals left between those constitut Parts, which giving but an imperfect and obliquous eflexion, make the Stone appear of a darker Colour, r their are no real Colours but what proceed from the effection of the Light, and its a gross Error to believe at each Body has its identical One?

f the Number of the STONES in the KIDNEYS and BLADDER.

Stones are formed, render their Number greater less; for if the Reins, for Example, are affected with ræternatural and immoderate Heat, from thence flow atinually and with Imperuosity a vast Number of igous Corpuscles, which seize the viscous, earthy and glutinous

26

glutinous fecreted Phlegm, and as they are quick in the Operation, they formed a Stone or Gravel, before a new Secretion can supply with other Phleg to enlarge their Volume; but, if on the contrary, theat is moderate, and surnishes but a moderate Quant ty of igneous Corpuscles, and likewise those temperation their Action by the watry Menstruum, as does the Refrigeratory of an Alembick, they leave Time for ther Phlegm, to come and conglomerate itself with the they are working upon, and thereby encrease the Volume of the Stone. The Multiplicity of the Stone proceed likewise often, from the Thinness and Friability of their Texture broken into several Pieces, by the verslowing of the Urine, or some violent Concussion the Body?

A daily Experience confirm our Opinion, that the it a confiderable Quantity of Stones in the urinary Par but I'll never believe those who pretend to have void Stones by Hunderds, unless they will confess that the are almost imperceptible, or at least very little bigg

than the fandy Sediment of the Urine.

When there is a Number of Stones in the Bladde their Surface is thick or less Spongeous than when there but one; for being continually roll'd against each other by the Fludity of the watry Menstruum, they politheir Surface and appear like a Piece of Marble.

Symptoms of the Paroxisms of the Nephr Tick, when the Stone or Gravel does n pass from the Kidneys to the Bladder.

Having taken a general View of the urinary C gans (as I judge it necessary for my intended Pupose) and established the Causes both remote and immediate of the Gravel and Stone; it is sit I should speat present of the different Symptoms of the cruel and dangerous Maladies, but to proceed likewise with son Order, in that necessary and useful Enquiry, I'll beg by the Diagnostick of the Gravel and Stone, when does not pass from the Kidneys into the Bladde

A New TREATISE on the STONE. 2

t thereby, we might be more capable to relieve efmally the Patient in his excruciating Tortures; for ess we know perfectly well the different Symptoms ich accompany the Gravel or Stone in their diffet Paroxisms, it is impossible we should form a just

ognostick, and apply the necessary Remedies.

The Paroxism of the Stone, happens, or at the anges of the Season of the Year, or after some viote Exercise, or some Excess of Drinking or Eating, of some immoderate Pleasure, since those Accidents, changing the Position of the Stone, causes an exordinary or unnatural Tension in the Parts, and netimes an Excoriation where it is the most adherent, was the Stone to keep always the same Situation, let be ever of so large a Volume, provided it leaves Room the Evacuation of Urine, it causes little or no Pain, I the Patient scarcely knows when he is afflisted brewith, but by feeling a considerable Weight in the rt.

By the sudden Rarefaction of the Air in the Spring Atoms of the Atmosphere being more intimate in air Approaches and more coadnuated together, give greater Strength to the Column perpendicular to each rpuscle, of the watry Menstruum, which being forth, by their globulous Figure, to give Way to Comession, and by a more precipitate Rotation, in supplycontinually each others Place, causing a greater Atation in the Urine, may thereby give some Seconses the Stones, and causes a Paroxism, which might also occasioned by the Air alone, without the watry enstruum, by its extraordinary Compression on the dy of the Stone itself.

That the sudden Agitation of the Urine, might give ne strong Secouses to the Stone, is evident, by what see in the smallest Brook, whose Waters when calm I tranquil, are not capable to move the smallest ones; but when agitated by the Wind, or otherwise,

ry all before them.

In the Winter, when the Air does not enjoy that mperature of the other Seasons, but on the contrary,

E

Paroxisms of the Stones should be more frequent, and consequently excruciating, since the Intervals are too small, to give Time to the Parts affected, to strengthen

themselves against a new Attack or Fit.

Some Authors pretend, that the Air puts no other wife the Stone in Motion, than by enforcing the Circu lation of the Blood, and the Secretion of the Juices which encreases the Action of the most intimate Fibre of the Kidneys and Bladder, we should be much obli ged to those Gentlemen, if they would make their Words good, and give us some Reason of their Affer tion, fince, thereby a Patient troubled with the Stone would never be subject to its Paroxisms, but every Be ginning of the Spring or Autumn, when we are cor vinced by Experience, that it happens otherwise, an that the Paroxisms are as frequent, if not more, in th Winter, than in the Spring or Autumn. Besides, I don fee, why the Action of the Fibres should be encreased by the Increase of the Circulation of the Blood, fine that Increase must be supposed to proceed from the V vacity of the vital Spirits, which the greater it is, th easier the Blood unburthens itself of its Superfluities and therefore the easier the organick Parts perform the Functions. I'll agree with them, if they pleafe, that the Pores of the Veffels having been ceas'd by the Inch mency of the Winter, the Blood by the Return of the Spring, acquires a new Vivacity, which by rende ring it more precipitate in its March, makes it fore with some Impetuosity the Obstacles, which could be met in the smallest Vessels, and that Impetuosit giving an extraordinary Motion to those Vessels, migh caule an Ebranlement of the Stone and confequently Paroxism, but however that should happen, but one for the Blood circulates, and the Secretion is made more easy, when its Substance is impregnated with greater Quantity of Spirits, than when continually of structed by the Crassity of the Air, which must cau a greater Embarrasment of the Fibres in the Secretio than by its impetuous Fludity, fince the frequent E forts the Blood makes, for the Seperation of the phle mati

tiek Limpha, cannot be without a great Commotion the organick Parts, and confequently of the Stone, ich happens oftner in the Winter, than in any other alon of the Year.

A vast Quantity of phlegmatick, earthy, and windy iments, not to entirely or perfectly digested in the omach, or elaborated in the Chilification, enter the Mass the Blood, loaded with earthy and viscous Corpuses, which by obstructing the Circulation, cause a ension in the Vessels, and which Tension cannot be thout an extraordinary Commotion of the Fibres, d of the Stone.

All Sort of violent Exercise, such as Riding, Runig, Jumping, &c. capable to cause a sudden Concusin of the Body as to alter the Position of the Stone to put it in Motion, occasion a Paroxism, since those violent Agitations, the Stone grates against the rvous Tunick of the Bladder, and if it be rough its Surface, by wounding the tender Membrane of e Tunick, cause Inflammation and Excoriation, allys attended with excruciating Pains.

A bloody Urine, a scalding Heat in the Evacuation, e Indications of an Inflammation and Excoriation of e inner Membrane of the Bladder, and if in Process Time, the Urine comes mixed with a fætid Pus,

e Part must be ulcerated.

The Paroxism of the Stone proceeds often, without ly previous Accident, from the Efforts of Nature, id from the mechanical Faculty of the Fibres, that impose the Kidneys, which, in Concert exert themlves to dislodge so troublesome a Guest, which obstruct heir Functions. Therefore it is a general Opinion at the Fibres of the Kidneys, like the Membranes of ie Womb, contract their Manicula, for the Discharge f all little Stones, that lodge themselves in the Orans, eipecially when they are of fo large a Volume, to obstruct their Action, which Obstruction is on nat Occasion, the Cause of their Motion, for the me Harmony whi h subfit between the integrante arts of our Body, for the Relief or Ease of each ther, is to be met with betwixt the interne organick E 2 nes. DIAG-

DIAGNOSTICK of the different PAROXISMS the GRAVEL and STONE.

THE Difference of the Volume of the Grav and of their Polition, render the Paroxism longer or shorter, and more or less vehement; for while there is only Sand or Gravel in the Kidney if any of those Accidents heretofore mentioned, or the overflowing of the Urine, happens to cause a Paro ism, as their Volumes are not large enough to cau in their Paffage, an extraordinary Dilatation of the Tubuli Urinarii, the Paroxism is of a very short D ration, and very little Dolorous; but if on the co trary, that fandy Matter happens to be concreted in a Stone, and that Stone put into Motion or forced either the Impetuofity of the Urine or some Ac dent, thro' the urinary Organs, as it occasions then, extraordinary Dilation of those Organs, the Pain violent and felt especially in the Small of the Back, t wards the Region of the Loins, affecting often all t vicineous Parts, but those only by Compassion.

There is a very great Difference between the Pai of the Paroxism of the Stone, when lodged in the Substance of the Kidneys, and when in the Tubuli Unarii, or Carunculæ Papillares; for as there is alwas a greater Sensation, in the Parts which receive mo Nerves into their Composition, and there are no Nerve in the Paranchisme of the Kidneys, while the Stocontinues in it, let it be ever so often altered in the Position, or subject to many different Motions, the Pais never sharp, but on the contrary, dull, heavy, as attended with a Weight upon the Part. The same cannot be said of the other urinary Organs, which bein nervous, are subject to the most excruciating Pains.

Peop'e are often mistaken in the Symptoms of a A phritick and a common Cholick, when the Difference so easily made, as well as to the Seat of the Mai dy (the one affecting the Intestines, and the other b

ing lodg'd in the urinary Organs) as to the Sharpness of the Pain, which is far greater in the Paroxism of the Stone, for the Reasons heretofore mention'd, than in a Fit of common Cholick.

It might be objected, that I have but just now, said that the Paroxisms of the Stone, while lodg'd in Substance of the Kidneys, are attended but with obtuse and dull Pains, which might hinder them from being differencied, from those of a common Cholick? To which I answer, that the Difference then consists in that a Nephritick Cholick, when it affects the Substance of the Kidneys, or any other urinary Organs, the Bladder excepted, is always attended with a vomiting, which does not happen in a common Cholick of the Intestines, except in the Illiac Passion or Miserere, those Vomitings in the Nephritick, which happen especially after a full Meal, proceed from the extraordinay Bigness of the Stone, in the Substance of the Kidneys, by diffracting the Fibres of the Organs it possesses, far above their natural Capacity of Contraction, and thereby the Tone of the Stomach is fo impaired, that that Viscera cannot be easy, till by Vomiting, it has unburthen'd itself of the ingested Meats; It happens likewise some reaching, tho' the Nephritick proceeds but from the Gravel, especially when it obstructs the Caruncula Papillares or Tabuli Baldiani, and is of so rough a Surface as to cause an Excoriation in the Texture of the Fibres, as it will be plainly demonstrated in the following Article.

Of the Indications and Symptoms that affeet the several Organs in the Passage of the STONE in the KIDNEYS and BLADDER.

T is evident by what we have already mentioned, that from the Bigness of the Stone proceeds the Vehemency of its Symptoms, for when it is put in Motion, the natural Propensity it has in Common with

all heavy Bodies, force it downwards, and consequent ly causes an extraordinary Dilatation of the Fibres which endeavouring to reaffume their natural Situation contract themselves and force the Stone through th Carunculæ Papillares and Tubuli Urinarii, into the Pel vis; the Pains become very sharp and encreases whe the Stone is arrived at the Head of the Ureter; muc more if it is of so large a Volume, as to be impossible to pass the Cavity of the Ureter without a Laceratio of the nervous Membrane of that Organ; for then th Nerves being drawn into Spalfms and Convulsions, th Torture becomes exquisite and almost intolerable, at tended with Retchings and Vomitings, and fucceeded by a violent Heat and Inflammation about the Region of the Loyns, a Difficulty of walking or standing Upright, from the Convulsion and Contraction of the Nerves of the Ureter, and a Numbness of the Thigh and Leggs, from the Stone pressing against the psoa Muscle of the same Side of the Ureter affected by it.

The Testicles and Scrotum, are likewise affected in the Paroxisms of the Stone; the Testicles suffer a Retraction from the Convulsion of their Nerves, and the Scrotum a Contraction. These last Symptoms happer likewise in a common Cholick, with this Difference, that in the Nephritick, there's but one Testicle retracted, and that on the Side of the Stone, while in a common Cholick, both Testicles are drawn up; befides in a windy Cholick, for Example, the Pain is never fixed in the same Place, but varies; sometimes in the Back; sometimes in the Belly or Sides: But in the Nephritick the Pain moves gradually downward, and when the Parts are lacerated, is attended with a bloody Urine, with a thick, turbid, and fandy Sediment, and a most exquisite Torture, which is always greater at the Beginning of the Paroxism, than afterwards, for this Reason; that at the Beginning of the Paroxism, the Stone forces its Passage with such Violence thro' the narrow Orifices of the Tubuli Urinarii and Ureters, that what with fuch extraordinary Dilatation, and often the Laceration of the Membranes, the Patient must suffer inexpressible Pains, which cease being

being so accute, when once, by the extraordinary Dilatation of the Cavity of those Parts, the Stone meets with

less Opposition in its Passage.

A Strangury is another Symptom, which happens during the Paroxism, and which some are pleased to atribute to the Obstruction caused by the Stone in the Ureter; and others to the Convulsion of the Sphineter of the Bladder. For my Part, I would be apt to think, that it proceeds from both; for tho' I acknowledge, that the Urine can have its Course through the Ureter, which is not affected by the Stone, I deny that Nature having appointed two Canals for the Evacuation of the Fluid, its natural Course is not intercepted by the Obstructions of one of those Canals, and the one lest free is capable to supply entirely the Deficiency of the other; or that the Urine forgetting all on a sudden, its natural Course, will carry itself to that Part, without endeavouring to force the Obstacles, it meets with in the Ureter obstructed by the Stone.

DIAGNOSTICK of the STONE in the BLAD-DER from the Symptoms of its PAROXISMS.

OME Authors are of Opinion that it is almost) impossible to discover, if the Stone be in the Bladler, or the Kidneys, without the Help of the Catheer. Others pretend to discover it in the Bladder, by hrusting a Finger up the Anus: For, say they, if one presses towards the Bladder, is a Stone be lodg'd here, it will feel hard. As for the Use of the Catheer, I'll agree that it is the furest Method to discover he Stone in the Bladder; but I reject that Invention of the Finger, as utterly ridiculous; for a Stone night be lodg'd in the Bladder, and not to be felt by he Finger. I would rather have Recourse to some symptoms, which are as fure almost as the Catheter, such (as if the Stone be little and light) a certain Unafiness and Itching at the Region of the Pubis, and at he Gland of the Penis, and a thin, pale, and watery Urine

Urine, if a Stone grow bigger, a Weight is felt toward the Region of the Loins, or affect the Pirenæum.

If the Stone by having staid for a considerable Time in the Bladder, has acquired a large Volume, that Uncasiness changes into Pains, and the Weight becomes dolorous. The Patient is afflisted with a Tenesmus, or a continual Inclination to go to Stool, proceeding from the Irritation of the Branches of the Nerve, equally inserted in the Bladder, Intestinum Rectum and Sophinster Ani: The Patient is also troubled at the same Time with a Strangury, and tho' at each Motion of the Stone, which are then very frequent, he finds Inclination to make Water, he is too often frustated in his Attempt; and when he does it, it is in a very little Quantity and great Dfficulty, attended with a violent Heat and Pain towards the Perforation of the Gland.

A fandy Sediment which subside, and barkens at the Bottom and Sides of the Urinal, is another strong Diagnostick of the Stone in the Bladder, since it is an evident Sign that the sabulous Matter is much impregnated with a large Quantity of viscous and tenacious Corpus-

cles, and therefore inclinable to Concretion.

DIAGNOSTICKS of the ULCERS in the KID-NEYS OF BLADDER, occasioned by the Roughness of the GRAVEL or STONE.

have often been mistaken in the Diagnostick of the Ulcer in the Kidneys or Bladder, from the Analogy or Simili ude of the Symptoms. Those of an Ulcer in the Intestines, being often the same, with those of an Ulcer in the Kidneys or Bladder it generally is differencied from that in the Intestines, by being attended with a violent Heat, a Fever and excruciating Pain, which if felt in the Back, indicates the Ulcer in the Kidneys, if near the Os Pubis, in the Bladder. These sirst Symptoms are succeeded (if not timely remedied) by a Tumour, with an Instammation proceeding from the Obstruction of the arterial Branches

ches of the Organs, that causes a Beating and an extraordinary Tension of the Part, which continues, till the Abces (occasioned by the Accumulation of the Matter in the Texture of the Fibres) break; for immediately after the Patient feels his Pain confiderably abated, small Flakes or Fileaments, not much unlike the thin Parings of Leather, are evacuated with the Urine, succeeded afterwards by a Purulent Pus, which if the Ulcer be in the Bladder, smells stronger and more offensive, than

when in the Kidneys.

Those Symptoms are less dangerous, and easier to be remedied in a Patient of a found Constitution, and moderate in his Diet, than in a caeochimous, or a Man that can't refrain his Appetite, and abandon himself to all Kind of Excess whatsoever; for by those Disorders, and the evil Habit of the Solid and Fluids, the Texure of the Organs is so impaired, that they are render'd incapable to refift the Virulency of the Matter of the Inflammation, which thereby turns to an Ulcer, hat Ulcer to a Gangreen, and that Gangreen to a Spha-

ele, from thence ensue an inevitable Death.

The grating of the Stone (when rough and pointed n its Surface) against the nervous Coat of the Bladder. hrow its fphineter Muscle into Convulsion, and thereby ccasion very dangerous Symptoms; for without menioning the Pain, which is intolerable, the Patient by total and continual Suppression of the Urine, which verheats the Body, is seiz'd with a violent Fever, vith Deliriums, Phrenzy, and Thirst; and which, if f a long Continuance, must be attended with Death. ince it is Galen's Opinion, that a total Suppression of Irine, could hold no longer than fourteen Days, without mminent Danger for the Life of the Patient.

ROGNOSTICKS of the STONES from the Intensness and Frequency of its PAROXISMS.

TE have made the preceeding general Observations on the different Caules, Progress, and Diagnosticks of the Gravel and Stone, with no other Delign

Defign, than to render us capable to form a just Prog nostick of that tedious and violent Malady, which, hereditary, must be almost incurable; for the Mass of the Blood, being impregnated or rather vitiated from the first Instant of Sui Salintis Puncti, with tha vilcous Phlegm, which is the immediate Cause of th Gravel and Stone, its impossible for that Focus to b entirely eradicated; it cannot be reasonably expected that any Dissolvent, or eventhe Lithlotomy itself cou' be a Specifick for that Distemper; for than a Stone of Gravel is no sooner extracted, but another supplys its Place If I be asked, how this Sentiment agree, with my havin admitted the Imbecility of the Tone of the Stomach for the remote Cause of the Stone: I'll answer, tha the one does not destroy the other; fince the Bloo which is the first Principle of our Animal Life, an the first Motor of all our organick Parts, being vitiate in its Origin, render consequently the Functions of th organick Parts imperfect; neither can the Stomachbe fup posed to escape the common Fate; therefore I think it needless and infignificant, for a Patient, who has recei ved fuch awful Inheritance from his Parents to under go the Operation of the Lithotomy, in Hopes of a per feet Cure, fince it cannot avail him otherwise, than to give him some Relief for a very short Space of Time And I wou'd never advise him to submit to a second Operation, which would be far more dangerous than the first, from the Callosity, the Operator shou'd be obliged to cut near, or perhaps upon. Some Remedies may be administred to give a temporary Ease, but one can never expect a Specifick, and all those who pretend to have found one, are Charlat ns, or Impostors.

Women are less subject to the Stone than Men; for this Reason, that their Organs admitting of a greater dilatation, the sabulous Matter is carried off with the Urine, before it can be formed into a Concretion; not that I would pretend, that all Womenkind are free from Gravel and Stone; but even those affected with it, have this Advantage, that by the Largeness of their urinary Passages, they can void all small Stones and Gravel before they have acquired any considerable Volume, and

thole

hose might be extracted with a proper Instrument, without having Recourse to the Section, which is at all

Times, and on all Occasions; dangerous.

When the dangerous Symptoms, such as an inflammatory Fever, Delirium, Phrenzy, excruciating Pains, &c. which accompany the Paroxism of the Stone, are not to be assuaged; and the Patient receive no visible Relief from the Remedies administred to him by a learned Physician; his Case is dangerous, and there remain little Hopes of his Recovery.

A Physician can form a very favourable Prognostick, when his Patient, after a copious Evacuation of Sandor Gravel, with the Urine, seel the Violence of the Symptoms abated; for it is a Sign that there is no Concretion, or if there is, that it must be so frivilous, as not to be capable to resist the Impetuosity of the Urine.

All Stones of an extraordinary Bigness or Volume are dangerous, even when attempted by the most skilful Lithotomist, since it cannot be extracted without a great Dilatation of the Orifice of the Wound, which breaks the Continuity of the Texture of the Fibres, and render

the Re-union almost impossible.

A Stone of an extraordinary polished Surface, or so wrapt up in a Capsule, as to adhere to the Membranes, is not to be touch'd, since it is impossible, it should be dissolved by the strongest Dissolvent, that Pharmacy could invent, and to attempt the Operation is to carry the Patient to an unadvoidable Death.

The Number of the Stones, provided they be small ones, is never dangerous, since they can be dissolved or forced thro' the urinary Passage, or easily extracted

by the Operation.

If a Stone be thought to adhere to the Urether in its Passage from the Kidneys to the Bladder, or cannot be dissolved, or forced from thence, nothing but Death can

be expected.

An Ulcer in the Kidneys or Bladder is always dangerous, but seldom mortal; unless in old Men, and those of a cacochimous Constitution, since their Strength being already debiliated by Age, or the ill Habit of their Body, cannot resist long to the Vehemency and Frequency

of

of the Paroxisms, besides their Blood being divested a vast Quantity of those Spirits, so absolutely necessar to give it a Vivacity, capable to resist to the Morbisco Matter; the Part must be soon sphaceled, it is likewing very dangerous, and almost needless for Persons much advanced in Years to undergo the Operation; for the or ly Benefit they can expect from it, is a transitory East of sew Months, perhaps not so long, which is soo succeeded by their Death, if it does not happen in sew Days after the Operation, since their exhauste Strength and impaired Constitution deprive the lacerate Parts of the glutinous and nutritive Juices, absoluted necessary for their Re-union.

The Manner how to proceed in the Cure of the Stone, with an exact ANALYSIS of Mr. Stephen's Medicines.

THE more difficult is the Cure of a Malady the more occult are its Causes, and the more a experienced Physician is puzzled to discover its Pro gress, the more the Physical Stage swarms with Quack and Impostors, who with an uncommon Impudence and Arrogance, vend their poisonous Nostrums, as an infallibl Specefick for it, administred by them without Learning Experience, or Judgment, to the Detriment of the Pa tient's Health, and but too often to the Danger of hi Life; I am not surpriz'd that those Knaves, under those false Pretences, endeavour to cozen People out of their Money; but I cannot imagine, how Perlops of Senfe fusser themselves to be entrapp'd by them; let it be granted that there are Speceficks for all Chronick, and the most dangerous Malady, but even those should never be administred, but by the Direction of a skilful Physician capable to judge pertinently of the different Constitutive on of their Patients and of the Temperature of the Climate, order their Diet, draw just Inferences of Pro gnosticks from the Symptoms, and preseribe judici oufly the Doses of the Remedies.

That it is absolutely necessary for a Physician, before he administers his Remedies, to know as well as posfible, the Constitution of his Patient, is evident from the different Operations of the same Remedy, and administred for the same Malady, in Persons of different Constitutions; that the same Remedy which has cured fome Persons, prove ineffectual in others, and sometimes encreased the Malady, it was administred for ; even the Length and Tediousness of the Distemper, or the Difference in its Symptoms, changes the Qualities of the Remedies: The Stone or Gravel can be rank'd among those Maladies, on which the most infallible Nostrum, of the most famous Empyrick has seldom any Effect, unless it be a contrary one to what was expected: The Vulgar allured by the Cheapnels of those poylonous Ripopees; or by the Sanction of some ignorant or scandalous Physician, who divide the Prey with the Retailer, or frighted at the exorbitant Fees of a learned one, flock to those Poysoners of the human Race, and put their Lethalis Potio in Vogue; but those of a superior Rank, and who pretend to foar above the Commonalty, for Sense and Judgment, had always, till lately, condemned or despised such vile Practices. Our Ancestors had been ashamed to be thought capable to give an open Sanction in Form of Law, or to purchase out the publick Funds. A sham Secret, composed of a pernicious Mixture of nauseous Drugs, part of which, if administed asunder cannot be thought, or ever be suspected, by Persons who claim any Pretence to Sense or keason, much less by those who have the least Tincture of Chymistry, to contain any Virtue or Quality of what Kind foever, neither can they acquire any by being mixed together, or by Fermentation, unless it is some evil ones, and destructive of our Constitution, as I am going to make appear by the impartial and exall Analysis, of a Secret whose infignisicant Discovery has been purchased at so dear a Rate, and publickly approved by a learned Physician, for Reasons best known to himfelf.

ANALYSIS of Mrs. STE PHEN'S MEDICINE fo the STONE.

Efore we examine the different Ingredient which enter into the Composition of the misterious and dearly bought Remedy, we must remember, first, that so often repeated Aphorism, Sublata causa tollitur Effective

dy, without eradicating the Cause; 2dly, What we have mentioned heretofore, that it is impossible to eradicate entirely the Cause of the Stone, especially when there is in the Mass of Blood, a Focus for its Generation; as it happens, when the Stone is hereditary 3dly, That there are some Stones of such Bigness and stompact in their Texture, that it is impossible for the strongest Dissolvent to make the least Impression upon it, much less to dissolve it entirely: Let us consider first how Mrs. Stephens's Medicine can eradicate the Focus of the Stone, which must be placed in the Stomach.

Every rational Man, without being a Physician, efpecially if he be pleased to read with some Attention, what I have said of the Causes of the Stone, must agree that the Focus can't be eradicated, but by repairing the Tone of the Stomach, or sharpening its Ferment or Difsolvent, which has been blunted and imbecillated, by Excess, or improper Dyet; for it is in the Stomach that the Medicine must begin its Operation. Let's consider at present whether Mrs. Stephens's Medicines are capable to answer those ends, and if it can help the Digestion so far as to procure a more perfect Separation of the Chile from the gross Excrements; or if on

he contrary, such a nauseous Mixture is not rather Bane to the digestive Faculty, a heavy clogg to the Dissolvent, and capable by the excessive Irritation it causes in the Membranes, to break the Texture of their Fibres, and thereby rather Increase the Imbecillity of he Stomach, than strengthen its Faculty; this I design o make appear, in the following Examen, Article by

Article, of that Medicine.

My Medicines, says Mrs. Stephens are a Powder, a Decoction and Pills; but why different Preparations or a Diffolvent? Are not one or two medicinal Prepaations nauseous enough, confidering our natural relucancy to take Physick, without burthening the Stomach, vith a greater Number; or is it to make the Vular believe, that they have something for their Money? or in fact there are People stupid and ignorant enough, o believe that they cou'd never be cured, without aking a vast Quantity of Physick; and it would be a Kind of a Crime in a Physician, to do it otherwise. Therefore Mrs. Stephens, to obviate to such Inconveiency, and to humour the Fools (as I suppose) has unningly divided her Diffolvent into three different reparations; for the must be forced to confess, that ne could have reduced it at least, to two; and made f the Powder and Pills but one Composition; but the retended Cure had not been attended with fo much reparation and Ceremony, and therefore had appeard too easy, and consequently not so much taken Notice

This is a Remedy by Excellence, and such a one, s had never been thought possible before; for even nose who had pretended, that a Stone could be dissolved in the Bladder or Kidneys, had always excepted ome Cases, in which such Dissolution was not to be spected; such as old Age, a Complication of Distemers, the extraordinary Volume of the Stones, the compactness of their Texture &c. But here there re no Obstacles which might not be surmounted; age, Complication, Dyet, Excess, nothing can hinder the Effect of this sovereign Remedy; it would be in ain, if Nature itself should attempt to struggle against it

But

But however let's Consider, if Mrs. Stephens might no be mistaken in her Calculation, and does not want to impose upon us; or if the Worthy ------ who hat took so much Pains to compile together the marvellou Cures She has operated, without savouring us with the least of his learned Restections on the Manner the Medicine operates, is not some near Relation of that sa mous Surgeon, who some Years ago, was so fortunate to divide the Cash with the RABBET WOMAN; I hop he'll not take it amiss, if without contenting mysel of a Negative, as he has done of an Affirmative, I'l proceed to make my Negative good, by Restecting on his Dissolvent; and as his Friend Mrs. Stephen begun her Secret by the Powder, we'll begin our Analysis by the said Powder.

Analysis of Mrs. Stephens's POWDER

RS. Stephens's Powder confifts of Egg-Shells and Snails, both calcined, and thus prepared. "Take Hen's Egg-Shells, well drained from the Whites, dry and clean; crush them small with your " Hands, and fill a Crucible of the twelfth Size " (which contains near three Pints) with them lightly " place it to a wheel Fire, and cover it with a Tile, till the Egg-shels be calcined to a greyish White, " and acquire an acid falt Tafte; this will take up eight " Hours at least. After they are thus calcined, put " them into a dry, clean earthen Pan, which must be " bove three Parts full, that there may be Room for the Swelling of the Egg-shells in slaking. Let the Pan " stand uncover'd in a dry Room for two Months and 66 no longer; in this Time the Egg-shells will become " of a milder Taste, and that Part which is sufficiently calcined will fall into Powder of fuch a Fineness, as " to pass through a common Hair Sieve, which is to " be done accordingly.

smedy; it would be in

NALYSIS of this Preparation of the EGG-SHELLS, and of its Virtues.

Will admit with the Chymists, that Egg-shells are of a corrofive Quality, not while the Texture of ir costituent Parts subsist, and are left to themselves, when broken by some strong Menstruum, whose d Corpuscles, penetrating their Substance, unfold the ts which enter into their Composition from off the aginous Particles they were wrapp'd in, put them in otion, and direct them to Action; for an Egg-shell to itself, without Fermentation, or any other Preation has no Virtue, else should corrode the Pellicule, te there is a great Difference, betwixt Salts wrapt in ir Capfules, and those directed to Action; neither ild it be expected, that a Stone wrapt ever fo long an Egg-shell, could be dissolved, let the Egg-shell never to corrofive.

But however, why should the Shell of an Egg be ferr'd in that Operation? Since its corrofive Faculcannot be attributed to any Thing elle, but its Salts, I the more the Egg-shell abounds in saline Corpuscles, greater must be its Virtue: Therefore I must be Opinion that the Shell of a Turkey or a Duck's re abundant in Salts, shou'd answer better the Den of the Artist, or of the Physician, who is to prebe the Remedy. To dry and clean the Shells, is, my Opinion, a needless Circumstance, as well as thing them small with the Hands, since this last Cirnstance is only to reduce them into a narrower Coms, therefore bruifing them in a Mortar would answer fame End. The Bigness of a Crucible, methinks, is as little Signification, fince bigger or leffer, it cannot otherwise than full, neither can I believe that the eration should be sooner or later ended, from the mess of the Crucible.

Mrs.

Mrs. Stephens has no need to caution us about the D gree of Fire, fince there are very few Calcinations ma without a clear Fire, but the Length of Time for h Calcination of a few Egg-Shells, feems to me prodigiou the Calcination of Antimony, for a Vitrification, whi is made in the same Manner, is accomplished in a s leffer Time; the Precaution used in it of Covering t Crucible with a Tile, is more reasonable, fince without it, the most Volatile Corpuscles (the whole being p in a vehement Agitation, by the Vivacity of the igner Particles) would be evaporated with the fuliginous one which meeting with that Obstacle in their ascent, precipitated, and form on the Surface of the Matter Calcination, a kind of Nets, in whose interstites the line Corpufcles coming to lodge themselves more large, are thereby more directed to their Action; I cannot conceive how fuch a long Time should be quifite for to form that new Texture, if ever it was be supposed that such a one should be formed at all; a if on the contrary, fuch violent Fire, and of fo long Duration, should not be capable to Consume and nihilate the few oleaginous Corpufcles to be met w in the Shell of an Egg, without which fuch a Text is not to be formed: I am apt to think, that the Acridi found in the Matter when the Calcination is perfect proceeds from the igneous Particles diffufed thro' fince almost all Calcinations have the same Acridi Lime is Acrid till it has been flaken, the Preparation .Antimony for to make it Diaphretick is Acrid, till af its Lotions. Old Leather calcined is Acrid, and in t Acridity, proceeding from the continual Motion of igneous Particles, which direct the Salts to Action, or fifts its caustick Virtue: But what Virtue can an Es Shell have? Which after a tedious Calcination, the b ter as I have supposed already, to unfold its Principl Tharpen the Points of its Salts and direct them to Activ is put afterwards to a still more tedious Digestion, wh. by the enfuing phænomenons, must destroy the Des of the Calcination; for, fays -- Mrs. Stephens --- 1 Egg-Shells fwell in Slaking, which is an evident I monstration of the Conflict of the igneous Particlelog

ed in the interstiftes or diffused throughout the whole Substance of the Egg Shells, against the watery Menfruum, to which the Fire is forced at last to leave the Place, as it appears by the Slaking of the Matter.

I have observed, that this long Digestion of two Months, must infallibly frustrate the Intention of the Calcination, which is to open and unfold the Principles, till then confounded together in the Egg-Shells, and direct them to their Action; and as that Action confifts chiefly in their faline Corpuscles, those Corpuscles are by the Calcination, freed from the earthly Capfules, which did keep them inactive; their Points sharpened and indued with more Vivacity. If after this first Operation, the Egg-Shells were only to undergo two or three Lotions, like the Diaphoretick of Antimony, to free it from the igneous Particles it might contain, and which might render it a Caustick; I should be perhaps more apt to beleive, that there is some corrossive Virtue, in such Preparation of the Egg-Shells, for by those Lotions, the Texture of the faline Corpufcles cannot be broken, or their Points or Angles blunted; but a long Fermentation, must not only disorder, but destroy the Cimetry and Arrangement of the faline Corpufcles, and force them to return into their former Principles, great deal weaker than they were before the Operation, as it appears by the Powder being precipitated At last to the bottom of the Pan, which kept on the Surface of the watery Menstruum, as long as the Texture of the saline Corpuscles, cou'd resist the Dissolution of its Parts: Therefore 'tis my Opinion, that there is not the least Virtue left, in that Powder found at the bottom of the Pan, as being destitute or divested of all saline Corpufcles.

ANALYSIS of the Preparation of the SNAILS.

Here is nothing in the whole Creation, from the most infignificant Reptile, to the Masterpiece of he Divine Architect, which has not some Virtue or Qualty conducive to the Preservation or Restauration G 2

of

of our He Iths. By a curious and affidous Labour, have found the Secret to draw Cardiacs and Antido from the rankest Poisons: The Viper which is one the most dangerous Reptiles, furnishes a skillful Art with Antidotes, Cardiacs, Sudorificks, Refloratives,& And why not the least offensive among them, such the Snails? daily administred with such vast Success least in some People's Opinion) in the Peripneum Consumptions, or any other Affections of the Lun under the Supposition, that the Snails abounding with vaft Quantity of oleaginous, fulphureous and gluting Corpuscles, little or no Acid, but a great deal of i Alkaly, which being carried with the Chyle into t Blood, break or blunt the Angles of those acrimonic Salts, therewith it most abounds, stops the Vehemen of their Motion, and hinders them from irritating, cerating or breaking the Continuity of the Texture the Fibres, and thereby become a Specifick (as p. rended) for all Affections of the Lungs: But we m confid r, that the Preparation of the Snails, in fu Cases, is a very Simple one, never exceeding a fing Decoction in Milk or some oleaginous Menstruum: A I cannot conceive, how they shou'd retain any of the Vertues, after an Hour's Calcination at a clear Fir fince their Vertues must consist in their faline Corpusc (as Mrs. Stephen's feems to intimate by ordering them be chose in the Spring, when their common Food a the most impregnated with Salts.) Those saline Co puscles, at least the most Volatiles, being evaporat with the fuliginous ones; and what's left in the Crue ble, cannot be reckon'd any thing elfe but a kind of Caput Mortuum or a burnt viscous Matter, aboundit with a vast Quantity of earthly Corpuscles, impregna ed with some fixed Salts, which for ought I kno might have a feeble diuritick Vertue; but the Obtufn of its Angles, renders it incapable of making the les Impression on the Stones. Thus far on the Preparatio of Mrs. Stephen's Powder for a Diffolvent for the Stone which, by what we have observed, can be of noU in that Malady, far from being a Specifick. Lets pr ceed to her Decoction.

ANALYSIS of the DECOCTION.

" A K E (fays Mrs. Stephens) four Ounces and a half of the best Alicant So p, beat it in a Morter with a large Spoonful of Swines Creffes, burnt to a blackness, and as much toney as will make the whole of the Confistence of Paste; let this be formed into a Ball.

" Take this Ball and Green Camomile Flowers, fweet Fennel, Parsley and Burdock Leaves, of each one Ounce: When there are not Greens, take the same Quantity of Roots, cut the Herbs or Roots, flice the Ball and boil them in two Quarts of foft Water, half an Hour, then strain it off and mix it with Loney.

Sure this is not a Medicine to repair the Tone of the Stomach, to strengthen its Membranes or to help the Digeftion? Quite contrary: Since the Herbs or Roots excepted, the rest is known by the frequent Rullus it auses, to be a Bane to the digestive Faculty, and by rritating the Texture of the Fibres, of the nervous Membrane, capable to throw it into Convulfions, and

even break the Continuity of its Texture.

But (fays Mrs. Stephens, or he from whom she has eceived that Secret) nothing that enters in that Deoction, is administred in Substance, fince the Alicant loap, for Example, is made use of only to have the Menstruum impregnated with its lixivious Salts, which miting themselves with the Chile in the Stomach, are hereby conveyed to the Blood, which they accomany in its Circulation, till it comes to the fecretory Veffels of the Kidnies, were they take their leave nd following the Lympha In the Secretion, meet with he Stone in the Urinary Organs, on which they fix hemselves in order for its Dissolution. All that would e very well; and I would not pretend to ful ect in he least the Operation of Mrs. Stephen's Medicine, if he could warrant me that those lixivious Salts, are bliged to follow the Road prescribed to them by er's or could do it without meeting with any Obflacle

washed away by the continual flowing of the Uri They may be, 'tis true, reinplaced by others, those others are Subject to the same Inconvenient and were they even, to make each of them some and were they even, to make each of them some pression on the Stone, its entire dissolution cou'd not expected before the Dissolution of the Patient himse especially if the Stone was of any considerable Bigne I will likewise suppose their Cohesian to the Stone, at that they are in a Quantity sufficient to operate; he they any Activity of themselves? And if not; he are they to be put into Motion, or directed to Action

difunite

Where's the Menstruum, to cause a new Fermentation or the necessary Heat, without which they must remain Inactive? The Urine passing but in a very small Quantity at once, especially through the Kidneys and Treers; and its stay being but a very short in those Parts, cannot be accounted a sufficient Menstruum on that Occasion, or the Heat of the Reins, intercepted by the Frigidity of the Stone, a fufficient Heat: Thereore those Lixivious Salts (if it cou'd be reasonably supposed that Mrs. Stephen's Decoction could be impregnad with any) cannot have Force or Virtue to operate when they arrive at the Place appointed for their Acion; I say, if there are any in the Decoction, for I annot be perfuaded that a Ball made of Alicant Soap and wines Creffes, beaten together in a Mortar, cou'd be capable to communicate any extraordinary Quality to a vatery Menstruum,, in which it has been boiled for alf an Hour, for it must be granted that the dissolvent Virtue expected from that Ball, should confist cheisly n the faline Corpuscles of the Ashes, which enter inb the composition of the Soap; but how can these sane Corpuscles be unfolded from that vast Quantity of ne oleaginous Ones, they are wrapt in? Especially afer the Composition, by being beat in a Mortar, is beome more compact in its Parts, and thereby less easy be penetrated.

The Stephenists expect perhaps, that their lixivious Decoction will produce the same effect in the Kidneys r Bladder, it has upon foul Linnen, &c. But they hust consider, that in a washing Tub the whole subance of the Soap is applyed, which still could have no 'ffect, without Arong and repeated Frixations, I'll aree that in a running Lixivium, the lixivious Salts feem perform fomething near what Mrs. Stephens would ave her Decoction operate in the Kidneys and Blader; but she must consider, that there is a great deal f Difference; for in a running Lixivium, the lixivious alts have not only been put in Motion, by a violent leat, but are likewise continued such by a graduate ne, till the whole Operation is accomplished, and ven then, they have no other Effect than to relax and

distunite the constituent Parts of the Body they work up on, that it might be the easier dissolved, by a quite dif ferent and stronger Operation; so that if that Body was kept a Year under the lixivious one, it could neve be diffolved without the Help of the other: Tho' the lixivious Salts are not only applyed immediately and well directed to the Body, which is to be diffolved, bu likewise receive continually a fresh Supply of new and bomogeneous Corpuscles of equal strength, and as well di rected; which cannot be faid of those Salts, in the human Body, where they are subject to so many Changement or Viciflitudes; were they meet with fo many Obstacle and Oppositions from beterogeneous Bodies, that they must be supposed entirely exhausted when they come t

the Place of their Destination.

I'll confess however, that, tho' Mrs. Stephen's De coction cannot be accounted, in Concert with her Pow der, a Diffolvent for the Stone, it might have a ftrong diuretick Quality, not from the lixivious Salts of th Soap and Swines Creffes, but from the Simples which enter into it, and which abounding with volatile Salts proper to procure a more perfect and quicker Seperati on of the Serum, and consequently a more abundan Secretion, The Impetuofity of the Urine at that Time might force the Gravel or fmall Stones it could mee with in its Passage, thro' the Urinary Organs; but it i my Opinion, that the Operation should be attributed to the volatile Salts of the Simples, wherewith the wa tery Menstruum is strongly impregnated, and not at al to the Ball of Soap and Swines Creffes, which I don't suppose to be of any other Service on that Occasion than was the Flint Stone to the Jesuit, with which he would have perfuaded fome Country People, he could make some exellent Soupe, if they would furnish him with the other necessary Ingredients.

Muracions in the Stomach with the other Aliments.

ANALYSIS of Mrs. Stephens's PILL

AM convinced at present, that my Observations on Mrs. Stephen's Medicine in general, are just, and at the could have reduced them to one or two Comfitions, fince her Pills are nothing else than a Comndium of the two others, as it plainly appears by

following Recipe.

"Take (concludes Madam Stephen's) an equal Quantity by Measure of Snails calcined as before, of wild Carrot Seeds, Burdock Seeds, Ash Keys, Hipps and Hawes, all burnt to a Blackness, or which is the fame thing, till they have done Smoaking, mix them together, rub them in a Morter, and pass them thro' a Cypress Sieve, then take a large Spoonful of this Mixture and four Ounces of the best Alicant Sorp, and beat them in a Morter with as much Honey as will make the Whole of a proper Confistance for Pills, Sixty of which are to be made out of every

Ounce of the Composition.

This is then, Mrs. Stephen's finishing Stroke upon the ne, and fuch a heavy one as to reduce it to Atoms. d as the Snails have begun the Operation, they must ewise finish it, tho' dress'd in another Habit, and apiring under another Figure or Shape; I shan't atipt to examine their Virtues in the Pills, fince I don't pose them a greater Specifick thus prepared, than en in Powder. Therefore I'll proceed to some Retions on the Vegetables or Simples, which she ors to be burnt to a Blackness, I can scarcely underid, what is meant by burning those Vegetables to lackness, unless it is by breaking the Texture of their pres to render the Salts they contain more fit for a ond Operation, which Operation must be accomh'd in the Stomach, before those Salts can be thought per for any Action whatfoever, fince they must be irely freed from their Scories or Drofs, and the Subice of the Chile entirely impregnated therewith, bethey can be directed to Motion: Those Vegetables H being

being of a nutritive Quality, might undergo the fam Mutations in the Stomach with the other Aliments, and perhaps a more perfect and eafier Digestion, because the Fire has effected, what the Diffolvent or the Fermen of the Stomach must have done, the breaking the Tex ture of their Fibres; but are those saline Corpuscle thus freed from their Capfules which hinder their Mo tion of a Corrofive Quality? and if they could be fur posed such, while inclosed in the Plant or Seed, do the not acquire some other Propreties, when in some Mea fure fublimated in the Stomach, and as they are divide betwixt the Acid and Alkaly, the Alkaly being eve Supposed Predominant by the Effect of the Calcination which must have infallibly evaporated the most volatil Corpufcies, and fixed the rest: Why should they no be thought Diaphoretick, Sudorificks, &c. as well a Corrolives or Diureticks; why shou'd they be suppose inactive through the whole Course of the Circulation till they come to the Stone, and if they are put in Mo tion and directed to Action, as foon as they are mixe with the Chyle, why should they not make some senf ble Impression on the different Humours which enter int the Composition of the Blood, by fixing them, an thereby caufing fome dangerous Accident throughou the whole Mass? Since its porous Substance is easier t be penetrated, than the Texture of the Stone, it can not be objected, that they are more at Liberty to ac after the Secretion, than whilft driven in the whol Mass of the Blood; fince nothing is more proper to di rect them to Action than the Vehicle of the Blood, and that graduate Heat which accompanies it in its Circula tion! If it is faid, that in the Blood the acute Angles of those saline Corpuscles, are blunted in their Encounter with so many different beterogeneous Bodies they mee with, I'll ask, how they can be sharpened again in th Secretion? And if they are, why don't they make the first Operation on the Membranes of the urinary Or gans? What Reason can be alledged for their nature Antipathy to the Stone, rather than to any other Part But Experience convinces us, that those Salts fixed the Calcination have no other than a Diaphoretick, St dorific

rifick or Diuretick Virtue; and that even often but er a Lixivation, Filtration and Evaporation; perhaps ey acquire that Virtue by being mixed with the oer Ingredients, the Pills are composed with such as e Alicant Soap and Honey; Soap and Honey when plied in Substance are both Deterfives, and are both cceffively administred to clear the Primierps Vous. e Honey is so loaded with viscous and glutinous Corscles, and its Principles so well united together, that is with the greatest Difficulty they are seperated in e Stomach, therefore the whole Operation of the ferent and of the native Warmth on its Substance is to blimate its most sulphureous Particles, which are ther Anodynes than Corrofives, and more proper to eeten the Mais of the Blood, than to be secreted th the Serum, for the Corrosion of the Gravel or one: The constituent Principles of the Soap are so mpact, that I'll never believe when taken in Substance, ey can be difunited; or that it can produce any oer Effect, than by irritating the Fibres of the Stomach, uses a Vomiting. Therefore the whole Virtue of e Grand Preparation confift in the Decoction, and is other than a fimple Diuretick; from whence I conade that it is ridiculous to believe a Diffolvent for e Stone.

Preceding MEDICINES.

WHEN there is a Stone in the Bladder, the Powder is to be taken three times a Day, viz. in a Morning after Breakfast, in the Asternoon about Five or Six, and at going to Bed; the Dose is a Drachm Averdupois or sity six Grains, which is to be mixed in a large Tea Cup, sull of White Wine, Cyder or small Punch; and half a Pint of the Decostion is to be drank either Cold or Milk Warm, after every Dose.

The Method which Mrs. Stephens observes in the dministration of her Medicine confirms almost what

H 2

I have faid already, that there is very little or no Virtue in any of her three Preparations, but in the Decoction, since hal a Pint of it must be taken after every Dose of the Powder, as a Vehicle to it; (as I suppose) neither does she think that Vehicle sufficient, since she orders the Powder to be mixed in a large Glass of another Divretick, such as White Wine, Cyder or Small Punch; and I really believe, that was a Patient to leave off the Powder, and confine himself to the Glass of White Wine or Punch, and to the half Pint of the Decoction, he would receive as much Benefit from it, as if he had took both Preparations; which confirms like wife that the three Preparations might have been very well reduced to two, or that the Powder could be taken in the Decoction, without making too nauseous a Draught of it; unless the Stephenists be pleased to inform us if the taking the Powder in a Diuretick, dif ferent from the Decoction, Arengthens its Virtues of adds some new Qualities to it; or if it should lose some of it, if taken in the Decoction: Which last cannot be supposed, fince half a Pint of the Decoction must be taken immediately after the Powder, as if they were both to act in Concert; or rather, as if in Fact, that one of them had no other Virtue, than to serve as a Vehicle to the other.

Three Drenches of the Powder, and three half Pints of the Decoction must be taken every Day, one in the Morning after Breakfast; for I find it must not be taken Fasting, tho' I would be apt to believe, that drowning the Stomach with fo confiderable a Quantity of Physick, immediately after the taking of the Aliments would disorder the Ferment, render the Coction imperfect, and instead of being a Remedy for the Stone, helps towards increasing its Focus. Mrs. Stephen's does it perhaps, on Purpose to have the first Coction impregnated with the supposed Corrosive Salts of her Medi cine; but (that Corrofive Virtue always supposed) it would be a great deal better for the just Oeconomy of the whole Mechanism, if the Blood was not visited at his Petit Levee by fuch troublesome Guests, who could perhaps surprise the Spirits when they are scarce

wake, and cause some Disorder in the Circulation; out however, there is nothing to be feared on that Side, ince, methinks that I have sufficiently demonstrated, hat there is not the least Corrosive Corpuscles in ither of Mrs. Stephen's Preparations; and therefore, Patient might in all Safety, after Breakfast, or Fastng, as he shall think fit, take Mrs. Stephen's Powder nd Decoction; the' for my own Part, I should rather huse to take it Fasting, since the Decoction which I have already acknowledged to be a good Diuretick, neeting at that Time little or no Obstructions (the Passage being pretty free) would force its Way with greater Ease, towards facilitating the Separation of the Verum, its Secretion through the urinary Organs, force erhaps fome Gravel or small Stones through the freters into the Bladder, or from the Bladder through he Urethra, but never make the least Impression on a tone of a larger Volume, otherwise than (if it be of friable Texture, by increasing the Impetuosity of the Jrine, thereby the Stone is extraordinarily agitated) o break that Texture, and reduce that large Stone ino leveral imall ones.

These Medicines (fays again Mrs. Stephen's) causes nuch Pain at first; and well they may, when they rove to be a Bane to the digestive Faculty, a Clogg o the Stomach, and to irritate the Fibres of its Memranes so far, as to cause often a Convulsion in those Parts; Mrs. Stephen's would then have, her Patient ake some Opiates or other, without mentioning what ort of Opiate, if Purgative or Corroborative; unless ne means by an Opiate, a Narcotick to ease the Pain, tupify the Part, and take away the Sense thereof: for I know one Leicester, a very learned Apothecary, Native of Ireland, who had the Impudence to face ne, that there are no other Opiates in the Pharmacy, han the different Preparations of the Opium, from thence, fays he, the name of Opiates is derived, I hay perhaps find some other Occasion to give the ublick some new Instances of his Ignorance.

The Lenitive Electuary prescribed by Mrs. Stephen's 1 Case some of her Patients were to be Costive, during

the Use of her Medicine, is a Secret not worth much Money, and fuch Advice is not worth the Fee of that famous French Quack, Inspector of Urine, so well known fome Years ago among the French themselves, by the nick Name of Doctor Piffeure, the Doctor of Piss or Urine : for every body knows without the Advice of a Physici n, that they must take some Laxative, when they are Costive, but can they grow Costive, when they take her Medicines? Since she confesses, that, tho' the Powder is aftringent, the Decoction is laxative, therefore by being taken both at the same Time, they must keep each other in a just Equality of Qualities, and Virtue; but however, fays she, if one is more predominant, you must increase the Dose of the other; and if neither will do, we must take the Advice of Physicians: We are pretty well off, truly, to give so much Money for the Discovery of a Secret, whose Success is so uncertain, and whose Operation by Confession of the Person from whom it has been purchased, might be attended with so many Accidents, that instead of curing the Patient of one, it might chance to increase the Number of his Distempers. But, however, Mrs. Stephen's has some Cunning, and for what the French call One Echapatrire, and the English, a back Door open to fave herfelf, she cautions, as against a Loofeness, which she pretends, would carry off the Medicine, and hinder their Efficacy; and as fuch naufeous rijopee, must infallibly, unless when administreed to a very strong Constitution, by impairing the Stomach, precipitating the Digestion, and rendering it impersect, occasion a Looseness; Mrs. Stephen's expects to appeale the Clamours of the People against her, for the Inefficacy of her Medicine, by alledging that fuch Looseness has been the Occasion of it; but will fuch an Excuse prevail with the most tensible Part of Mankind? Will they believe that Remedies, with which the Substance of the Chile must be impregnated and conveyed by it, thro' its different Meatus into the Substance of the Blood, before they can produce any good Effect, might be carried away with the gross Excrements by a Looseness? Unless those Remedies, by

impairing

A New TREATISE on the STONE. 57 impairing the Tone of the Stomach, cause themselves that Looleness, and likewise such excessive a one, as to be a strong Indication of the digestive Faculty being entirely extinct; for altho' a Looseness be a sure Diagnostick of the Impersection of the Coction of the Aliments in the Stomach, it is not always a Sign that there is no Seperation made of some Chile from the gross Excrements, or that the whole Substance of the Aliments are carried away by stools, for then a Loofeness should always prove Mortal; therefore I should think, that it would be more agreeable to the Principles of Physick, to believe that a Loosenels (not an immoderate One) would rather help than hinder the Es ficacy of Mrs. Stephen's Medicine, fince the longer a Remedy stays in the Stomach, the more it looses of its Virtue; for by its Conflict with the Ferment, which endeavours to change it into Aliments, Part of its faline Corpuscles are entirely destroyed, or by being evaporated, or by being really changed into Aliments, and the rest remaining so weak as not to be capable of making the least Impression on the Humours.

" Mrs. Stephens orders her Patients to abstain, during the Use of her Medicines from SaltMeats, Red Wines, and Milk, to drink few Liquids, and use little Exercise, that so the Urine may be more strongly impregnated with the Medicines, and the long-

er retained in the Bladder.

I am of Mrs. Stephen's Opinion, that Salt Meats or all other Aliments, capable to over heat the Mass of the Blood, are not proper for a Person affl sted with the Gravel or Stone; but I cannot put Red Wine in the ame Rank; for tho' it is the common Opinion, that Red is not so diuretick as White Wine, I believe however, that Red would serve better Mrs. Stephen's Turn; specially it being a Cardiac and Astringent, to prevent that Looseness, which she seems to be so much as a fraid of: Besides, as her Remedy is not only a Diuretick, but must be a Dissolvent likewise, methinks that Red Wine being more impregnated with tartarous Particles, han White, it might supply Mrs. Stephen's Medicines with some Corrosive Corpuscles, of very great Service

in the Diffolution of the Stone; she forbids likewish her Patients drinking but few Liquids, and using bu little Exercise, that the Urine might be more impreg nated with the Medicines, and the longer retained in the Bladder: The drinking but few Liquids (and in Fact I don't know, what else we could Drink but Li quids) and using but little Exercise, is not always fure Expedient to hinder the too frequent Evacuation of the Urine, siince it is not always the Quantity of Urine, but its Acrimony irritating the Sphintler vesica which Causes a frequent Evacuation: It is not alway the Quantity of Drink that occasions the Quantity of Urine, but often the Constitution of the Body; a Per fon of an excessive hot Constitution evacuates a lesse Quantity of Urine, than those of a cooler, the great Part of the Serum of a hot Constitution being absorbed by native Heat, and the great Effervency of the Hu mours it circulates with; the Urine of a weak Constitu tion is likewise in a leffer Quantity, because the Pore of the Body being much opened, Part of the Serum i evacuated through Sweats or infensible Perspiration. o administration of

Ridiculous Precautions used by Mrs. Stephens in administring her MEDICINES.

"WHERE the Person, says she, is aged, of a weak Constitution, or much reduced by loss of Apretite or Pain, the Powder must have a greater Proportion of the calcined Snails, than according to the foregoing Direction, and this Proportion may be in created suitable to the Nature of the Case, till there

" be equal Parts of the two Ingredients.

The ridiculous Notion which has fo long prevailed among the Vulgar, and of which we have not seen yet any good Essel, has certainly induced Mrs. Stephen's to add a greater Quantity of Snails to her Powder, when her Fatient is of a weak Constitution, without considering that by the Calcination, this must have changed their Qualities, and that by a different Position of the Angles of their saline Corpuscles; those which

were Alkalines, must have Corrosive, or else wou'd be of no Efficacy in her Medicine, administred not as an Anodyne, but as a strong Dissolvent: If she could find a Vehicle to her Powder which could hinder its Corrofive Quality, till it comes to the Secretion, fuch expedient would be of some Service in a weak Constitution; but to fay, that by leffening the Quantity of a Dissolvent and encreasing the other, is a judicious Precaution; it is triffing with the Publick, unless she will confess, that there is no corrosive Quality but in her Egg-Shell, and that the Snails are added to it as a Corrective, to hinder the too great Impetuofity of its corrofive Corpufcles: Befides, she does not confider, that this Precaution destroys her System; for if the Corpuscles can effect the Constitution of the Patient, they must be Active on the substance of the Blood, thro' which they pass to the Kidneys; and if they are, what else can be expected from it, but in process of Time, a fixation of the Humours, and strange disorders throughout the whole Mass? For my part, I had thought tillnow, that those Corpuscles were kept inactive, till they came to the Stone, to which they were directed.

" Instead of these Herbs and Roots (continues Mrs. Stephens) I have sometimes used others, as Mallows, Marsh-Mallows, Yarrow, red and white, Dandelion, Water Cresses and Horse Reddish Root, but do

not know of any material Difference.

Really I believe her, fince every body that has the least Knowledge of Simples, will agree, that these are as good Diureticks to the full as those before-mentioned; and I'll insist again in this Place, that the Decoction the Ball of Soap excepted) is the only good Preparation in her whole Medicine; for if there is any Thing capable to cause that immoderate Looseness, some seem to be afraid of, it must be the Soap.

This is Mrs. Stephens's manner of giving the Powder

nd Decoction.

As to the Pills, says she, their chief Use is in Fits of the Gravel, attended with Pains in the Back, and Vomiting, and in suppression of Urine from a stoppage in the Ureters; in these Cases the Person is to

" take five Pills every Hour Day and Night when a-

" wake, till the Pain be removed.

I would ask Mrs. Stephens, or her Patrons, if there is ever any Fit of the Gravel without being attended her the greatest Part, if not always, with all the forementioned Symptoms? That she uses that Restriction, attended with Pains in the Back, &c. And if there was, would then her Pills be of no Use in such Fits, or would any of her other Preparations ease the Patient? For it is what she is indispensably obliged to let us know; but however, when the Fit is attended with those Symptoms, the Person is to take five Pills every Hour Day and Night. She supposes then, that not one: or even three or five, or perhaps tweny Doses, are

fufficient to give Eafe.

One thing worthy of our Notice in Mrs. Stephens'! Direction, is, that she would have us take those Pills only when awake. Take five Pills every Hour Day and Night, fays she, when awake; a very reasonable Precaution! Has then Mrs. Stephens ever heard of any body taking any Thing, especially Physick, when a fleep? or has she ever known any of her Patients that could fleep in the violent Tortures of the Gravel, fucl as she is pleased to represent; for my part, I have al ways believed that the Fit was over, when the Patien could take some Repose, and if that whole Cargo of Pills are administred to appeale the Fit, I don't see why he would be awaken'd to take them, when he i no more in need of them; for if they are administred likewife, to prevent the Formation of the Gravel an Stone, as the pretends, methinks the Patient shoul not be obliged to disturb his Rest, and might chuse more convenient Time for it.

COROLLARIUM.

on of the urinary Organs, of the Manner of Secretion, Filtration, Evacuation, and the different Qualities of the Urine; of the Causes both remote and in imediate of the Gravel and Stone, of their Formation in the

the Kidneys and Bladder, of their constituent Parts, of their different Texture, Bigness and Number, of the Fit or Paroxism, of the different Symptoms, the Diignoffick and Prognostick, of that cruel and dangerous Malady, &c. That it is impossible to find out a Medicine, or a Dissolvent for a Stone in the Kidneys and Bladder, especially if the Stone is of any considerable Bigness, and so compact in its Texture, as to be capable to refift the Impetuofity of the Urine: That therefore Mrs. Stephens's Medicine is an Imposition on the Publick; for if a Diffolvent for the Stone could be found, her's, after the exact Analysis we have made of t, will never be accounted such by any judicious Peron. It is true, an ingenious Physician has been so complaisant to present the Publick with a Compilation of a hundred and fifty five Cases, which he calls, a View of the present Evidences, for and against Mrs. Stephens's Medicine as a Solvent for the Stone: But it is very eafy to discern through his affected Impartiality, that he favours the Lady as much as possible; tho', anong so vast a Number of Evidences he is pleased to produce in her Detence, very few of them pronounce afirmatively; but suppose, that even ten in twenty were to pronounce affirmatively, and declare that they have peen cured by using Mrs. Stephens's Medicine; are not he ten others lest Uncured a sufficient Evidence against the infallible Efficacy of her Medicines, and therefore 10 Specifick? Since a Specifick must cure in all Cases, even the most difficult, as it was set forth at first. That Mrs. Stephens's Medicine is not a Specifick, and

That Mrs. Stephens's Medicine is not a Specifick, and loes not cure in all Cases, is evident by her own Friend's Confession of an infinite Number of Cases, in which it has miscarried, and which, were I to relate here, would render my Work too voluminous; therefore I'll content myself with a few of them extrasted from Dr. Hartley's View of the present Evidence, &c.

CASE XII.

Mr. Cutler in Wapping-Dock-Street, Wapping.

E says in a Letter dated February 1, 1738-9, That he has taken seven of Mrs. Stephens's Balls (and Powders in Proportion I suppose) is neither better nor worse, has voided neither Grit nor Stone, and that his Illness was still a violent Pain in

" his Back and in making of Water.

This is a direct Negative, which proves plainly that Mrs. Stephens's Medicine is not a Specifick for the Stone, fince the Patient declares, that he received not Benefit from it. Let us examine the following one, which might chance to prove more favourable to the Stephenists.

CASE XIII.

Mrs. Killick, Wife to Mr. Killick a Surgeon, in Great Russel Street.

BOUT five Years ago she was much afflicted with Pains in the Neck of the Bladder, she made bloody Matter two or three times, once had a Suppression of Urine for two Days; Mr. Killick then patied the Catheter and sound a Stone in the Bladder she took Mrs. Stephens's Powders for about a Months and her Water about that Time deposited much Seed diment, which became very hard when dry; She was much better, tho' not quite free from Pains, for about two Months after the use of the Powders; and then died of a Fever.

This Case does likewise very little for Mrs. Stephens for it does not prove that the Patient voided, during the use of the Powders, any gravellous or petrified Substance, but only that the Urine deposited much Sediment, which is a common Phænomenon, and migh

hav

ave happened without the help of the Powders; thich Evacuation eased the Patient, but not freed her uite from Pains; and she died in two Months after, of ever: Some ill minded Persons wou'd perhapse lay er Death to Mrs. Stephens's Charge, and pretend that ne Fever was occasioned by the frequent use of the owders, which had so disordered the Tone of the tomach and imbecillitated he digestive Faculty, as to ender the Coction of the Aliments imperfect, and hereby so infected the Mass of the Blood by an exraordinary Quantity of heterogeneous Corpuscle, as cause such an extraordinary Effecency of the Huiours, not to be conquired by the most proper Renedies; tho' Mr. Hartley pretends, That this Case faours the Medicines in the first Enquiry; which is, that Ars. Stephens's Medicines do not generate the Stone. or my Fart, I am apt to think, that if fuch Things were offible, and it cauld be supposed, that those Powders ccompany the Serum in the Secretion, when it is once garated from those Spirits, which keep it in a perpeial Agi ation, while is circulated with the Blood, it light chance, when it acquires more Repose to concrete self, or form the Gravel or Stone, or at least a ndy Substance, which might have caused the thick Seiment in this Case.

The fillowing Case is another very strong Negative the Efficacy of Mrs. Stephens's Medicines.

CASE. XIX.

Mr.Blenclave of Marston, near Brackley, Northamptonshire.

Pain and Wreatching, afterwards became subject to make b'oody Matter upon Riding, consulted an eminent Physician, who judged that he had a Stone in the Kidney, too large to pass; took his Medicines for a Year. About Christmas, 1736, took Mrs. Stephens's Powders wit an Herb Tea for a Week.

" they

they were so diuretick, and made him so costive that he was forced to leave them off without any Benefit, and has had greater Sharpness of Urine and Pain in his Kidneys ever since. Mr. Hartley excuses the Inesticacy of Mrs. Stephens in this Case, on Mr. Blenclave's not taking the Liquids with the Powders, while in other Cases he seems to triumph for the Powders alone without the Help of the Liquids.

The XCIId does more against Mrs. Stephens's Medicine than any heretofore mention'd, and is as follows

CASE. XCII.

Mr. Floyd's in Maggot's Court over-against Si James's Church, Piccadilly.

" Ourteen Years old, had Pains in making Water violent pressing upon the Neck of the Bladder trequently has taken Mrs. Stephen's Medicines for a months, but continues to have the same Complaint In this Case the Patient neither voids thick Sedimen

Gravel, or Scales of the Stones, but quite the contrary for the has taken for so long as thirtee Months Mrs. Stephens's Medicine, continues in the same Pains without any Relief; neither was M. Hartley, who relates this Case amongst the rest, pleas to inform us of the Reason of such Inefficacy, for I cannot excuse it, as he has done in some other Cause on the Preparations not; having been taken; since to Patient declares, that he has took Mrs. Stephens's Medicines without Exception.

Upon the whole, it manifestly appears, that Mi Stephens's Medicines are not to be depended upon and therefore, if such People are encouraged, we make the foon expect to see the Nation swarm with Females.

Quacks, and Noftrum Imposters.
