AN SS H UPON URSIN G. AND THE Management of CHILDREN, om their BIRTH to Three Years of Age. WILLIAM CADOGAN of Bristol, M. D. ALETTER to one of the Governors of the FOUNDLING HOSPITAL. blished by Order of the General Committee for ansacting the Affairs of the said Hospital. The Fourth EDITION, with ADDITIONS. LONDON: Prined for J. ROBERTS in Warwick-Lane. MDCCL. (Price 6 d. R.

SIR,

T is with great Pleasure I see at last the Prefervation of Children become the Care of Men of Senfe: It is certainly a Matter that well deferves their Attention, and, I loubt not, the Publick will foon find the good nd great Effects of it. The Foundling Hofpial may be of more Use to the World, than was erhaps at first imagin'd by the Promoters of it; will be a Means not only of preventing the lurder of many, but of faving more, by inoducing a more reasonable and more natural lethod of Nurfing. In my Opinion, this afiness has been too long fatally left to the anagement of Women, who cannot be fupfed to have proper Knowledge to fit them. fuch a Tafk, notwithstanding they look upit to be their own Province. What I mean, Philosophic Knowledge of Nature, to be uired only by learned Observation and Expence, and which therefore the Unlearned must incapable of. They may prefume upon the amples and transmitted Customs of their at Grand-mothers, who were taught by the rficians of their unenlighten'd Days; when ficians, as appears by late Discoveries, were taken in many things; being led away by A 2 hypohypothetical Reasonings to entertain very wild Conceits, in which they were greatly bewilder'd themselves, and misled others to believe I know not what ftrange unaccountable Pow ers in certain Herbs, Roots, and Drugs; and also in some superstitious Practices and Cere monies; for all which Notions, there being n real Foundation in Nature, they ought to b looked upon as the Effects of Ignorance, c the Artifices of defigning Quacks; who foun their Account, by pretending to great Know ledge in these occult Qualities, and imposin upon the Credulous. The Art of Phyfick ha been much improv'd within this last Century by observing and following Nature more clos ly, many useful Discoveries have been mad which help us to account for Things in a n tural Way, that before feem'd mysterious an magical; and which have confequently man the Practice of it more conformable to Reaf and good Senfe. This being the Cafe, there great room to fear, that those Nurses who y retain many of these traditional Prejudices, a capitally mistaken in their Management Children in general, and fancying that Natur has left a great deal to their Skill and Contr vance, often do much harm, where they inter to do good. Of this I shall endeavour to col vince them, by shewing, how I think Chi dren may be cloath'd, fed, and managed wi much lefs Trouble to their Nurfes, and in nitely greater Eafe and Comfort to the lit ones.

THE Foundlings under the Care of the Hospital, I presume, will be bred in a very plain, fimple Manner: They will therefore infallibly have the more Health, Beauty, Strength, and Spirits; I might add Understanding too, as all the Faculties of the Mind are well known to depend upon the Organs of the Body; fo that when these are in good Order, the thinking Part is most alert and active; the contrary, when they are disturbed or difeased. When these Advantages appear in Favour of Children fo brought up, as I am confident in time they will, it may ferve to convince most Nurses, Aunts, Grand-mothers, &c. how much they have hitherto been in the wrong, what Mifchief is done to Children, and what Multitudes are deftroyed or spoiled, as well by cramming them with Cakes, Sweetmeats, &c. till they foul their Blood, choak their Veffels, pall the Appetite, and ruin every Faculty of their Bodies; as by cockering and indulging them, to the utter Perversion of their naturally good Temper, till they become quite froward and indocile.

WHEN a Man takes upon him to contradict received Opinions and Prejudices fanctified by Time, it is expected he fhould bring valid Proof of what he advances. The Truth of what I fay, that the Treatment of Children in general is wrong, unreafonable, and unnatural, will in great meafure appear, if we but confider what a puny valetudinary Race most of our People of Condition are; chiefly owing to bad Nurfing,

Nurfing, and bad Habits contracted early. But let any one, who would be fully convinced of this Matter, look over the Bills of Mortality; there he may observe, that almost half the Number of those, that fill up that black List, die under five Years of Age : So that Half the People that come into the World, go out of it again before they become of the least Use to it, or themfelves. To me, this feems to deferve ferious Confideration; and yet I cannot find, that any one Man of Senfe, and publick Spirit, has ever attended to it at all; notwithstanding the Maxim in every one's Mouth, that a Multitude of Inhabitants is of the greatest Strength and best Support of a Commonwealth. The Misconduct, to which I must impute a great Part of the Calamity, is too common and obvious to engage the Idle and Speculative, who are to be caught only by very refined Refearches; and the bufy Part of Mankind, where their immediate Interest is not concerned, will always overlook what they fee daily : It may be thought a natural Evil, and fo is fubmitted to without Examination. But this is by no means the Cafe; and where it is entirely owing to Mismanagement, and possibly may admit of a Remedy, it is ridiculous to charge it upon Nature, and suppose, that Infants are more subject to Disease and Death than grown Persons; on the contrary, they bear Pain and Difease much better, Fevers especially, (as is plain in the Cafe of the Small-Pox, generally most favourable to Children) and for the fame Reafon that

that a Twig is lefs hurt by a Storm than an Oak. In all the other Productions of Nature we fee the greateft Vigour and Luxuriancy of Health, the nearer they are to the Egg or the Bud: They are indeed then moft fenfible of Injury, and it is Injury only that deftroys them. When was there a Lamb, a Bird, or a Tree that died becaufe it was young? These are under the immediate Nurfing of unerring Nature, and they thrive accordingly. Ought it not therefore to be the Care of every Nurfe and every Parent, not only to protect their Nurfelings from Injury, but to be well affured that their own officious Services be not the greatest the helples Creatures can fuffer?

(7)

In the lower Class of Mankind, especially in the Country, Disease and Mortality are not fo frequent, either among the Adult, or their Children. Health and Posterity are the Portion of the Poor, I mean the laborious : The Want of Superfluity confines them more within the Limits of Nature : Hence they enjoy Bleffings they feel not, and are ignorant of their Caufe. The Mother who has only a few Rags to cover her Child loofely, and little more than her own Breast to feed it, fees it healthy and strong, and very foon able to shift for itself; while the puny Infect, the Heir and Hope of a rich Family lies languishing under a Load of Finery, that overpowers his Limbs, abhorring and rejecting the Dainties he is crammed with, till he dies a Victim to the mistaken Care and Tenderness of his fond Mother. 'In the Course of

of my Practice I have had frequent occasion to be fully fatisfied of this, and have often heard a Mother anxioufly fay the Child has not been well ever fince it has done puking and crying. Thefe-Complaints, tho' not attended to, point very plainly to their Caufe. Is it not very evident, that when a Child rids its Stomach feveral times in a Day, that it has been over-loaded ? when it cries, from the Incumbrance and Confinement of its Cloaths, that it is hurt by them? While the natural Strength lafts (as every Child is born with more Health and Strength than is generally imagined) it cries at, or rejects the superfluous Load, and thrives apace : that is, grows very fat, bloted, and distended beyond measure; like a House-Lamb. But in Time, the fame oppreffive Caufe continuing, the natural Powers are overcome, being no longer able to throw off the unequal Weight; the Child, now not able to cry any more, languishes and is quiet. The Misfortune is, these Complaints are not understood ; it is swaddled and cramm'd on, 'till after Gripes, Purging, &c. it finks under both Burdens into a Convulfion Fit, and escapes any further Torture. This would be the Cafe with the Lamb, was it not killed when it is full fat.

THAT the prefent Method of Nurfing is wrong, one would think needed no other Proof than the frequent Miscarriages attending it, the Death of Many, and ill Health of Those that survive. But the perfuading you of it may be a needless Task; if you have ever thought about it t, I doubt not but you are already convinced t is fo. However, fince you defire my Sentinents upon the Subject, taking it for granted rou think with me, that most of our Nurses re got into a wrong Method, I will endeaour, in as few Words as possible, to tell you what I think a right one.

You perceive, Sir, by the Hints I have aleady dropp'd, what I am going to complain of , that Children in general are over-cloath'd nd over-fed, and fed and cloath'd improperly. 'o these Causes I impute almost all their Difuses. But to be a little more explicit. The first eat Mistake is, that they think a new-born fant cannot be kept too warm; from this rejudice they load and bind it with Flannels, Irappers, Swathes, Stays, &c. commonly lled Cloaths; which all together are almost ual to its own Weight; by which means a althy Child in a Month's Time is made fo nder and chilly, it cannot bear the external r; and if, by any Accident of a Door or indow left carelessly open too long, a reshing Breeze be admitted into the fuffocatg Atmosphere of the Lying-in Bed-chamber, e Child and Mother fometimes catch irrecorable Colds. But what is worfe than this, the End of the Month, if things go on aprently well, this Hot-bed Plant is fent out o the Country, to be rear'd in a leaky oufe, that lets in Wind and Rain from every arter. Is it any Wonder the Child never ives afterwards? The Truth is, a new-born R Child

Child cannot well be too cool and loofe in it Drefs; it wants lefs Cloathing than a grown Person, in proportion; because it is naturally warmer, as appears by the Thermometer ; and would therefore bear the Cold of a Winter Night, much better than any adult Perfor whatever. There are many Inftances both an cient and modern of Infants exposed and de ferted, that have lived feveral Days. As was the Practice of ancient Times, in man Parts of the World, to expose all those, whor the Parents did not care to be encumber' with ; that were deform'd or born under ev Stars; not to mention the many Foundling pick'd up in London Streets. These Instance may ferve to fhew, that Nature has mad Children able to bear even great Hardship before they are made weak and fickly by the mistaken Nurses. But besides the Mischi arifing from the Weight and Heat of the Swaddling-cloaths, they are put on fo tigh and the Child is fo cramp'd by them, that i Bowels have not Room, nor the Limbs an Liberty, to act and exert themfelves in the free eafy manner they ought. This is a ver hurtful Circumstance, for Limbs that are no ufed, will never be ftrong, and fuch tender Be dies cannot bear much Preffure : The Circi lation restrained by the Compression of an one Part, must produce unnatural Swelling in some other; especially as the Fibres of In fants are so eafily distended. To which doub lefs are owing the many Diffortions and D formiti

formities we meet with every where; chiefly among Women, who fuffer more in this Parcicular than the Men. I would recommend he following Drefs : A little Flannel Waistcoat without Sleeves, made to fit the Body, and ie loofely behind; to which there should be a Petticoat few'd, and over this a kind of Gown of the fame Material, or any other, that is light, hin and flimfy. The Petticoat should not be uite fo long as the Child, the Gown a few nches longer; with one Cap only on the lead, which may be made double, if it be hought not warm enough. What I mean is, hat the whole Coiffure should be fo contrived, hat it might be put on at once, and neither ind nor prefs the Head at all : The Linnen as fual. This I think would be abundantly ifficient for the Day; laying alide all those wathes, Bandages, Stays and Contrivances, hat are most ridiculously used to close and keep he Head in its Place, and support the Body. s if Nature, exact Nature, had produced her nief Work, a human Creature, fo carelessly nfinish'd, as to want those idle Aids to make perfect. Shoes and Stockings are very needis Incumbrances, befides that they keep the egs wet and nafty, if they are not chang'd very Hour, and often cramp and hurt the eet : a Child would stand firmer, and learn walk much fooner without them. I think ey cannot be neceffary 'till it runs out in the irt. There should be a thin Flannel Shirt r the Night, which ought to be every way B 2 quite

quite loofe. Children in this fimple, pleafant Drefs, which may be readily put on and off without teazing them, would find themfelves perfectly eafy and happy, enjoying the free Use of their Limbs and Faculties, which they would very foon begin to employ, when they are thus left at Liberty. I would have them put into it as foon as they are born, and continued in it, 'till they are Three Years old ; when it may be changed for any other more genteel and fashionable: tho' I could wish it was not the Cuftom to wear Stays at all; not becaufe I fee no Beauty in the Sugarloaf Shape, but that I am apprehensive, it is often procur'd at the Expence of the Health and Strength of the Body. There is an odd Notion enough entertained about Change, and the keeping of Children clean. Some imagine that clean Linnen and fresh Cloaths draw, and rob them of their nourishing Juices. I cannot fee that they do any thing more than imbibe a little of that Moisture which their Bodies exhale. Were it, as is supposed, it would be of service to them; fince they are always too abundantly fupplied, and therefore I think they cannot be changed too often, and would have them clean every Day; as it would free them from Stinks and Sourneffes, which are not only offenfive but very prejudicial to the tender State of Infancy.

THE Feeding of Children properly is o much greater Importance to them than thei Cloathing. We ought to take great Care to b righ

right in this material Article, and that nothing be given them, but what is wholefome and good for them, and in fuch Quantity, as the Body calls for towards its Support and Growth; not a Grain more. Let us confider what Nature directs in the Cafe : If we follow Nature, instead of leading or driving it, we cannot err. In the Bufinefs of nurfing, as well as Phyfick, Art is ever destructive, if it does not exactly copy this Original. When a Child is first born, there seems to be no Provision at all made for it; for the Mother's Milk, as it is now managed, feldom comes till the third Day; fo that, according to this Appearance of Nature, a Child would be left a Day and a half, or two Days without any Food. Were this really the Cafe, it would be a fufficient Proof that it wanted none; as indeed it does not immediately ; for it is born full of Blood, full of Excrement, it's Appetites not awake, nor it's Senfes opened; and requires some intermediate time of Abstinence and Reft to compose and recover the Struggle of the Birth, and the Change of Circulation (the Blood running into new Channels) which always put it into a little Fever. However extraordinary this might appear, I am fure it would be better, that the Child was not fed even all that time, than as it generally is fed; for it would fleep the greatest part of the time, and, when the Milk was ready for it, would be very hungry and fuck with more Eagerness; which is often necessary, for it feldom comes

comes freely at first. But let me endeavour to reconcile this Difficulty, that a Child should be born thus apparently unprovided for. I fay apparently, for in reality it is not fo. Nature neither intended that a Child should be kept fo long fasting, nor that We should feed it for Her. Her Defign is broke in upon, and a Difficulty raifed, that is wholly owing to mistaken Management. The Child, as soon as it is born, is taken from the Mother, and not fuffered to fuck till the Milk comes of itfelf; but is either fed with strange and improper Things, or put to fuck fome other Woman, whofe Milk flowing in a full Stream, overpowers the new-born Infant, that has not yet learn'd to fwallow, and fets it a coughing, or gives it the Hiccup: the Mother is left to ftruggle with the Load of her Milk, unaffifted by the Sucking of the Child. Thus two great Evils are produced, the one a Prejudice to the Child's Health ; the other, the Danger of the Mother's Life, at least the Retarding her Recovery; by caufing what is called a Milk Fever; which has been thought to be natural, but fo far from it, that it is entirely owing to this Misconduct. I am confident, from Experience, that there would be no Fever at all, were things managed rightly : Were the Child kept without Food of any kind, till it was hungry, which it is impossible it should be just after the Birth, and then applied to the Mother's Breasts; it would suck with Strength enough, after a few repeated Trials, to make the

the Milk flow gradually, in due Proportion to the Child's unexercifed Faculty of fwallowing, and the Call of it's Stomach. Thus the Child would not only provide for it's felf the best of Nourishment, but, by opening a free Paffage for it, would take off the Mother's Load, as it increased, before it could oppress or hurt her; and therefore effectually prevent the Fever ; which is caufed only by the painful Diftention of the lacteal Veffels of the Breafts, when the Milk is injudicioufly fuffered to accumulate. Here let me describe a Case of pure Nature, in order to illustrate this material Point yet further. When a healthy, young Woman lies in of her first Child, before the Operations of Nature have been perverted by any abfurd Practices, her Labour would be ftrong, and, as I have chose to instance in the Cafe of a first Child, perhaps difficult; but in a few Minutes after her Delivery, she and her Child, if it be not injured, would fall into a fweet Sleep of fix or leven Hours: the Mother would awake refresh'd, the Child hungry : a little thin Broth with Bread or fome fuch light Food should be then given her, and foon after, the Child be out to fuck: in one Hour or two the Milk would infallibly flow; and, if nothing elfe be given it, the Child would grow ftrong, and he recover perfectly in a few Days. This is he conftant Course of Nature, which is very ittle attended to, and never followed. The eneral Practice is, as foon as a Child is born, to

to cram a Dab of Butter and Sugar down its Throat, a little Oil, Panada, Caudle, or fome fuch unwholfome Mefs. So that they fet out wrong, and the Child ftands a fair Chance of being made fick from the firft Hour. It is the Cuftom of fome to give a little roaft Pig to an Infant; which, it feems, is to cure it of all the Mother's Longings. I wifh thefe Matters were a little more enquired into, for the Honour of the Sex; to which many Imperfections of this kind are imputed, which I am fure it does not lie under.

HEREI may be asked what is to be done with a Child born fick, that inftead of fleeping, cries inceffantly from the Birth, and is hardly to be quieted by any means. Let good Care be taken that it is not hurt by the Dreffing, or rather let it not be dreffed at all, but wrapp'd up in a loofe Flannel. If notwithstanding this Precaution, it still continues crying; instead of feeding it, for it is certainly a prepofterous thing to think of feeding a Child because it is fick, tho' possibly this may stop it's Mouth for a little while; let it be applied to the Mother's Breaft, perhaps it may bring the Milk immediately; which would be the best Medicine for it in fuch a Cafe ; or the Nipple in it's Mouth may quiet it tho' it does not bring it. And it is certainly better it should be quieted without Food than with it, which must necessarily make it worse. Sometimes indeed the Child may be fo very ill, that it will not even attempt to fuck. In fuch a Cafe, which (17)

which I think can happen but rarely. Let the Phyfick I shall recommend a little further on, where Children are unavoidably to be drynurfed, be given, a little every Hour till it takes Effect; still attempting to bring it to fuck the Mother's Milk, which is the best Phyfick or Food it can take.

WHEN a Child fucks its own Mother, which, with a very few Exceptions, would be best for every Child, and every Mother, Nature has provided it with fuch wholfome and fuitable Nourishment; supposing her a temperate Woman, that makes fome Ufe of her Limbs; it can hardly do amifs. The Mother would likewife, in most hysterical, nervous Cafes, establish her own Health by it, tho' fhe were weak and fickly before, as well as that of her Offspring. For these Reasons I could wish, that every Woman that is able, whose Fountains are not greatly disturbed or tainted, would give fuck to her Child. I am very fure, that forcing back the Milk, which most young Women must have in great abundance, may be of fatal Confequence : fometimes it endangers Life, and often lays the Foundation of many incurable Difeases. The Reasons that are given for this Practice are very frivolous, and drawn from falfe Premifes; that fome Women are too weak to bear fuch a Drain, which would rob them of their own Nourishment. This is a very mistaken Notion; for the first general Cause of most People's Diseases is, not Want of Non-**(**]

Nourishment, as is here imagined, but too great a Fulnefs and Redundancy of Humours good at first, but being more than the Body can employ or confume, the whole Maís becomes corrupt, and produces many Difeafes, This is confirmed by the general Practice of Phyficians, who make Holes in the Skin, perpetual Blifters, Isfues, &c. to let out the Superfluity. I would therefore leave it to be confider'd, whether the throwing back fuch a Load of Humour, as a Woman's first Milk, be most likely to mend her Constitution, or make her Complaints irremediable. The Mother's first Milk is purgative, and cleanses the Child of its long hoarded Excrement; no Child therefore can be deprived of it without manifest Injury. By degrees it changes its Property, becomes less purgative, and more nourishing; and is the best and only Food the Child likes, or ought to have for fome time. If I could prevail, no Child should ever be cramm'd with any unnatural Mixture, 'till the Provivision of Nature was ready for it; nor afterwards fed with any ungenial alien Diet whatever, the first three Months : For it is not well able to digest and affimilate other Aliments fooner. There is usually Milk enough with the first Child; sometimes more than it can take: It is poured forth from an exuberant, overflowing Urn, by a bountiful Hand, that never provides sparingly. The Call of Nature should be waited for to feed it with any thing more substantial, and the Appetite ever precede the

the Food; not only with regard to the daily Meals, but those Changes of Diet, which opening, increasing Life requires. But this is never lone in either Case, which is one of the greateft Mistakes of all Nurses. Thus far Nature, if he be not interrupted, will do the whole Business perfectly well; and there seems to be nohing left for a Nurse to do, but to keep the Child clean and sweet, and to tumble and toss t about a good deal, play with it, and keep it a good Humour.

BUT now the Child (I mean when it is bout three Months old) requires more folid ustenance, we are to enquire what, and how such, is most proper to give it. We may be ell affured, there is a great Mistake either in ne Quantity or Quality of Childrens Food, or oth, as it is usually given them; because they e made fick by it. As to Quantity, there is nost ridiculous Error in the common Practice; r it is generally supposed, that whenever a hild cries, it wants Victuals; and it is acrdingly fed, ten, twelve, or more times in a ay and Night. This is fo obvious a Mifapehenfion, that I am furprized it should ever evail. If a Child's Wants and Motions be igently and judicioufly attended to, it will found that it never cries but from Pain : ow the first Sensations of Hunger are not atided with Pain; accordingly a Child (I ean this of a very young one) that is hunv, will make a hundred other Signs of its ant, before it will cry for Food. If it be C 2 healthy

healthy and quite eafy in its Drefs, it will hardly ever cry at all. Indeed thefe Signs and Motions, I fpeak of, are but rarely to be obferved; becaufe it feldom happens that Children are ever fuffered to be hungry. In a few, very few, whom I have had the Pleafure to fee reafonably nurfed, that were not fed above two or three times in four and twenty Hours, and yet were perfectly healthy, active and happy; I have feen thefe Signals, which were as intelligible as if they had fpoke.

THERE are many Faults in the Quality of their Food : It is not fimple enough. Their Paps, Panada's, Gruels, &c. are generally enriched with Sugar, Spice, and fometimes a Drop of Wine; neither of which they ought ever to tafte. Our Bodies never want them : they are what Luxury only has introduced, to the Deftruction of the Health of Mankind. It is not enough that their Food be fimple, it should be alfo light. Several People, I find, are mistaken in their Notions of what is light; and fancy that most kinds of Pastry, Puddings, Cuftards, &c. are light, that is, light of Digestion. But there is nothing heavier in this Senfe than unfermented Flour and Eggs boil'd hard, which are the chief Ingredients of those Preparations. What I mean by light, to give the best Idea I can of it, is any Substance that is eafily separated, and soluble in warm Water. Good Bread is the lighteft thing I know; the Power of due Fermentation, in which confifts the whole Art of making it, breaks and attenuates

nuates the tenacious Particles of the Flour, fo as to give it these Qualities I mention, and make it the fittest Food for young Children: Cows Milk is also fimple and light, and very good for them; but it is injudiciously prepared: it should not be boiled, for boiling alters the Taste and Property of it, destroys its Sweetnefs, and makes it thicker, heavier, and lefs fit to mix and affimilate with the Blood. But the chief Objection is, that their Food is wholly vegetable; the bad Confequence of which is, that it will turn four in their Stomachs. The first and general Cause of all the Diseases of Infants, is manifestly this acescent Quality of all their Food. If any of these vegetable Preparations I have named, be kept in a Degree of Heat equal to that of a Child's Stomach, it will become four as Vinegar in a few Hours time. These Things are therefore very improper to feed a Child wholly with. Some Part of its Diet should be contrived to have a contrary Tendency; fuch as we find only in Flesh, which is the direct opposite to Acid, and tends to Putrefaction. In a due Mixture of these two Extremes, correcting each other, confifts that Salubrity of Aliment our Nature feems to require. As we are partly carniverous Animals, a Child ought not to be fed wholly upon Vegetables. The Mother's Milk, when it is perfectly good, feems to be this true Mixture of the animal and vegetable Properties, that agrees best with the Constitution of a Child; readily paffes into good Blood, re-

(21)

requiring but a gentle Exertion of the Powers of Circulation to break and fubdue its Particles and make them fmooth and round, and cafily divifible. I would advise therefore, that one half of Infants Diet be thin light Broths, with a little Bread or Riceboiled in them; which last is not fo acefcent as any other kind of Meal or Flour. These Broths should be made with the Flesh of full grown Animals, because their Juices are more elaborate ; especially if they have never been confined to be fatted. The Juices of a young Ox, taken from the Plough, make the finest flavour'd and most wholfome Soup. I believe it is for the fame Reafon, the Flesh of all wild Animals has a higher Taste than that of tame, faginated ones; and is therefore most agreeable to the Palates of the Luxurious; but this is to be understood of those Creatures that feed on Corn or Herbage. The other Part of Childrens Diet may be a little Bread and Water boil'd almost dry, and then mix'd with fresh Milk, not boiled. This, without Sugar, Spice, or any other pretended Amendment whatever, would be perfectly light and wholfome, of fufficient Nourishment, something like Milk from the Cow, with the additional Strength and Spirit of Bread in it. Twice a Day, and not oftener, a fucking Child should be fed at first; once with the Broth, and once with the Milk thus prepared. As to the Quantity at each Time, its Appetite must be the Measure of that; its Hunger should be satisfied, but no more ;

more; for Children will always eat with fome Eagerness full as much as they ought : therefore it must be very wrong to go beyond that, and stuff them 'till they spue, as the common Method is. They should not be laid on their Backs to be fed, but held in a fitting Posture, that fwallowing may be eafier to them, and that they may the more readily discover when they have had enough. When they come to be about fix Months old, and their Appetite and Digestion grows strong, they may be fed hree times a Day; which I think they ought never to exceed their whole Lives after. By Night I would not have them fed or fuckled t all, that they might at least be hungry in a Morning. It is this Night-feeding, that nakes them so over-fat and bloated. If they e not used to it at first, and perhaps awaked n purpose, they will never seek it; and if ey are not disturbed from the Birth, in a Veek's time they will get into a Habit of eping all, or most part of the Night very ietly; awaking poffibly once or twice for a w Minutes, when they are wet, and ought be changed. If it be thought necessary to ve them any thing between Meals, a little ilk and Water is best. Their Meals, and in y Opinion their fucking too, ought to be stated Times, and the fame every Day; at the Stomach may have Intervals to dift, and the Appetite return. The Child ould foon be quite eafy and fatisfied in the bit; much more fo, than when taught to

ex-

expect Food at all times, and at every little Fit of Crying or Uneafinefs. Let this Method be observed about a Twelvemonth, when, and not before, they may be weaned; not all at once, but by infenfible Degrees; that they may neither feel, nor fret at the want of the Breaft. This might be very eafily managed, if they were suffered to suck only at certain times. Were this Plan of Nurfing literally purfued, the Children kept clean and fweet, tumbled and tofs'd about a good deal, and carried out every Day in all Weathers; I am confident, that in fix or eight Months time most Children would become healthy and ftrong, would be able to fit up on the Ground without Support, to divert themselves an Hour at a time, to the great Relief of their Nurfes, would readily find the Use of their Legs, and very soon shift for themfelves.

IF it be afked whether I mean this of Children in general, and that weakly Ones born of unhealthy Parents fhould be treated in the fame Manner; I anfwer, that it is not fo common for Children to inherit the Difeafes of their Parents, as is generally imagined; there is much vulgaf Error in this Opinion; for People that are very unhealthy feldom have Children efpecially if the bad Health be of the female Side; and it is generally late in Life when chronick Difeafes take place in moft Men when the Bufinefs of Love is pretty well over Certainly Children can have no Title to thof Infirmities, which their Parents have acquire

by Indolence and Intemperance long after their Birth. It is not common for People to comlain of Ails they think hereditary, 'till they re grown up; that is, 'till they have contriuted to them by their own Irregularities and xceffes, and then are glad to throw their own aults back upon their Parents; and lament a ad Conftitution, when they have spoiled a ery good one. It is very feldom that young hildren are troubled with Family Diftemers: Indeed when we find them affected with rophulous, venereal, or high fcorbutick Comaints, we may reasonably conclude the Taint have been transmitted to them; but these afes are very rare, in Comparison of the any others that are failly, and without the aft Foundation, imputed to Parents, when e real Caufe is either in the Complainants emfelves, or bad Nurfing, that has fixed em early in wrong Habits. In one Senfe any Difeases may be faid to be hereditary, rhaps all those of male Formation ; by which mean not only Deformity and Diffortion, it all those Cases where the Fibres and Vefs of one Part are weaker in Proportion an the reft; fo that upon any Strain of the dy, whether of Debauch or too violent Excife, the weak Part fails first, and diforders e whole. Thus Complaints may be proced fimilar to those of the Parent, owing in ne measure to the Similitude of Parts, which flibly is inherited, like the Features of the ice; but yet these Diseases might never have D

ap-

(25)

appeared, but for the immediate acting Caufe, the Violence done to the Body. Most Diftempers have two Caufes; the one, a particular State of the Solids and Fluids of the Body, which difpose it to receive certain Infections and Impulses; the other, the Infection or Impulse itself. Now what I contend for is, that that tho' this predifponent State or Habit of the Body be heritable, yet the Difeafes incident to these wretched Heirs may be avoided, by preventing the active Caufe; which may be done in many Cafes by a due Attention to the Non-naturals, as they are called; in plainer Words, by a regular, temperate Life: in Children, by good Nurfing. Therefore l conclude, that inftead of indulging and enfeebling yet more, by the common Methods Children fo unhappily born ; that which I an recommending, together with the wholfome Milk of a healthy Nurfe, is the beft, the only Means to remedy the Evil, and by which alone they may by degrees be made healthy and strong. And thus, in a Generation or two of reasonable, temperate Persons, every Tain and Infirmity whatever, the King's Evil, and Madnefs not excepted, would be totally wor out.

THE plain natural Plan I have laid down is never followed; becaufe moft Mothers, c any Condition, either cannot, or will not un dertake the troublefome Tafk of fuckling thei own Children; which is troublefome only fo want of proper Method; were it rightly ma naged

naged, there would be much Pleafure in it, to every Woman that can prevail upon herfelf to give up a little of the Beauty of her Breast to feed her Offspring; tho' this is a mistaken Notion, for the Breasts are not spoiled by giving fuck but by growing fat. There would be no fear of offending the Husband's Ears with the Noife of the fqualling Brat. The Child, was it nurs'd in this Way, would be lways quiet, in good Humour, ever playing, aughing, or fleeping. In my Opinion, a Man f Senfe cannot have a prettier Rattle (for lattles he must have of one kind or other) han fuch a young Child. I am quite at a ofs to account for the general Practice of ending Infants out of Doors, to be fuckled, r dry-nurfed by another Woman, who has ot fo much Understanding, nor can have fo uch Affection for it, as the Parents; and ow it comes to pass, that People of good nfe and eafy Circumstances will not give emfelves the Pains to watch over the Health id Welfare of their Children; but are fo relefs as to give them up to the common ethods, without confidering how near it is an equal Chance, that they are destroyed them. The antient Cuftom of expofing em to wild Beasts, or drowning them, would rtainly be a much quicker and more huane way of difpatching them. There are ne, however, who wish to have Children, d to preferve them, but are mistaken in eir Cares about them. To fuch only I D 2

would

would address myself, and earnestly recommend it to every Father to have his Child nurfed under his own Eye, to make use of his own Reafon and Senfe in fuperintending and directing the Management of it; nor fuffer it to be made one of the Mysteries of the Bona Dea, from which the Men are to be excluded, I would advise every Mother that can, for her own fake, as well as her Child's, to fuckle it If the be a healthy Woman, it will confirm her Health; if weakly, in most Cases it will restore her. It need be no Confinement to her, or Abridgment of her Time: Four time in four and twenty Hours will be often enough to give it Suck; letting it have as much as i will take, out of both Breafts, at each time It may be fed and drefs'd by fome handy reasonable Servant, that will submit to be di rected; whom likewife it may fleep with No other Woman's Milk can be fo good fo her Child; and dry-nurfing I look upon to b the most unnatural and dangerous Method c all; and, according to my Obfervation, no one in three furvives it. To breed a Child i this artificial Manner, requires more Know ledge of Nature, and the animal Oeconomy than the best Nurse was ever Mistress of, a well as more Care and Attention than is gene rally bestow'd on Children: the Skill of good Phyfician would be neceffary to manage it rightly. I am very glad this is not the M thod of the Hospital: I believe there is no the least Colour of Objection to any Part t

the Management of that most useful and excellent Charity, as far as it depends upon the Directors of it. Sending the Children out to Country Nurses, under the Care of Inspectors, is undoubtedly the best Method they could take; but how far these Nurses and their Infpectors (who, I fuppofe, are to be fome good Gentlewomen in the Neighbourhood) may be perfuaded out of their old Forms, to treat their Nurfelings a little more reafonably, is matter of much Doubt. I fear they will be too tenacious of their Prejudices, as well as opinionated of theirSkill, to be eafily convinced they are in the wrong ; and who shall undertake the Tafk? However, I despair not of feeing a Reformation one Day or other; and to contribute to it as much as lies in my Power, I will give you my Opinion as to the Precautions, neceffary to be taken, in the Choice of these Nurses; and likewise a few Reasons why the Children, entrusted to their Care, should be treated fomewhat differently from those, who are nurfed in a more natural Way, and fuck their own Mothers. I make no doubt, but great Care is taken, that the Nurfes, recommended to the Hofpital, be clean and healthy Women. But this is not enough, the Preference should be given to the middleaged; because they will have more Milk than the very young, and more and better than the old. This is a material Confideration, as I suppose, they have each her own Child to fuckle befides. Those between twenty and thirty

thirty are certainly of the best Age. But what I think of the utmost Confequence is, that great Regard should be had to the Time of their Lying-in, and those procured, if poffible, who have not been brought to bed above two or three Months. The Reason of this is, that Nature intending a Child fhould fuck about a Twelvemonth, the Milk feldom continues good much longer. About that Time, Women in general, though they give Suck, are apt to breed again; fome indeed, that are very fanguine, will breed fooner; thefe, notwithstanding their Milk, are apt to be troubled with the Catamenia, which disturb it greatly; and therefore are not fo proper to be made Nurses of. But, whether they breed or not, it is my Opinion, that after a Year's Time, or thereabouts, however it may agree with a Child that has fucked it from the first, their Milk will become stale and vapid, at least very unfit for a new-born Infant; that if it be deprived of its own Mother's Milk, ought undoubtedly to have what is most like it: the newer it is, the more fuitable in all respects to its tender Nature. Yet it is a common thing for a Woman to fuckle two or three Children fucceffively with the fame Milk.

A NURSE ought to have great Regard to her Diet: It is not enough that fhe be fober and temperate, her Food fhould confift of a proper Mixture of Flesh and Vegetables : She should eat one hearty Meal of Flesh-meat every every Day, with a good deal of Garden-fluff, and Bread. Thin Broth or Milk would be beft for her Breakfaft and Supper. Her Drink fhould be fmall Beer, or Milk and Water; but upon no Account fhould fhe ever touch a Drop of Wine or ftrong Drink, much lefs any kind of fpirituous Liquors: Giving Ale or Brandy to a Nurfe is, in effect, giving it the Child; and it is eafy to conclude what would be the Confequence.

THE Children likewife, thus fent out, require a particular Treatment. The Plan I would lay down, could I prevail, should be that of Nature, excluding Art and foreign Aid entirely. But when this is broke in upon, a little adventitious Skill becomes indifpenfibly neceffary; that if we were not perfectly right in following closely the Defign of Nature, we may co-operate a little, and not be totally wrong in counter-acting it, as is too often the Cafe. What I mean is, that every Child, not allowed the Mother's first Milk, whether it be dry-nurfed, or fuckled by another Woman, hould be purged in a Day or two after the Birth; and this purging continued for fome ime; not by regular Dofes of Phyfick, that nay operate all at once; but fome lenient laxative should be contrived, and given two r three times a Day, fo as to keep the Child's Body open for the first nine Days, or Fortight; leffening the Quantity infenfibly, 'till be left off. It should be so managed, that ne Operation of the artificial Phylick may

re-

refemble that of the natural. This is fo material, that for want of it, most Children within the first Month break out in Pimples all over; the Nurses call it the red Gum, and look upon it to be a natural thing, and that the Children will be unhealthy that have it not. So indeed they will be in all likelihood; and it is better that these Foulnesses, which become acrid and hot by remaining too long in the Body, should be discharged through the Skin, than not at all; or that they fhould be lodged in the Blood, or fall upon the Vitals, to lay the Foundation of numberless future Evils: but it is chiefly owing to the Neglect of this Method at first. A Child that fucks its own Mother, unless it be greatly over-fed, or kept too hot, will never be troubled with this Humour at all. If the Children that are brought to the Hospital be not above a Month old, and if it be found, upon Enquiry, that they have not fuck'd their own Mothers, fomething of this kind prefcribed them would not be too late, nor improper. The following Form may be used: Take Manna, Pulp of Caffia, of each half an Ounce; diffolve them in about three Ounces of thin Broth. Let the Child take two Spoonfuls three times a Day, varying the Quantity according to the Effect ; which at first ought to be three or four Stools in four and twenty Hours.

ORDERS should be given these Nurses to keep the Children awake by Day, as long as they

they are disposed to be so, and to amuse and keep them in good Humour all they can; not to lull and rock them to fleep, or to continue their Sleep too long; which is only done to lave their own Time and Trouble, to the great Detriment of the Childrens Health, Spirits, ind Understanding. With regard to Feeding hem, as it is not likely they fhould have Milk nough to support two, their own, and the Iospital Child; it is best they should begin mmediately according to the Method I have ecommended, if they or their Infpectors can e perfuaded to think it right, which, howver, I would not have underftood fo strictly, ut it might sometimes be a little varied, preerving only the Intention. I would advise, owever, if it be thought proper, now and nen to give them a little Bread and Butter; nat the Butter be perfectly fweet and fresh, nd allowed but in very small Quantity; otherrife it will be apt turn bitter and rancid in the omach, and foul all the Juices of the Body. . Child may be allowed any kind of mellow ruit, either raw, stewed, or baked ; Roots f all Sorts, and all the Produce of the Kitchen arden. I am fure all these things are wholme and good for them, and every one elfe, otwithstanding the idle Notion of their being indy, which they are only to very debauch-Stomachs; and fo is Milk; but no Man's lood wants the cleanfing, refreshing Power Milk more than his, whose Stomach, used E

to

to inflammatory things of high Relifh, will not bear the first Chill of it. To Children, all this kind of Food, taken in Moderation, is perfectly grateful and falutary. Some may think that they carry into the Stomach the Eggs of future Worms; but of this I am not very apprehenfive : for I believe there are few things we eat or drink, that do not convey them. But then they can never be hatch'd in a healthy Infide, where all the Juices are fweet and good, and every Gland performs its Office: the Gall in particular would deftroy them: Bullocks Gall has been found to be a good and fafe Vermifuge. It is my Opinion we fwallow the Eggs of many little Animals, that are never brought into Life within us except where they find a fit Neft or Lodgment in the acid Phlegm, or vitiated Humour of the Stomach and Bowels. Were thefe to tally discharged every Day, and the Food o yesterday employed or thrown off to the last Grain, no Worms could ever harbour in our Vitals. As foon as the Children have any Teeth, at fix or eight Months they may by degrees be used to a little Flesh-meat; which they are always very fond of, much more fe at first, than of any Confectionary or Pastry Wares, with which they fhould never debauch their Tafte.

BREEDING Teeth has been thought to be and is, fatal to many Children; but I am confident this is not from Nature: for it is no Dif

Disease, or we could not be well in Health 'till one or two and twenty, or later. Teeth are breeding the greatest Part of that Time; and it is my Opinion, the last Teeth give more Pain than the first, as the Bones and Gums, they are to pierce, are grown more firm and hard. But whatever Fever, Fits, or other langerous Symptoms feem to attend this Opeation of Nature, healthy Children have fomeimes bred their Teeth without any fuch bad Attendants; which ought to incline us to fufbect the Evil not to be natural, but rather the Effects of too great a Fulnefs, or the corrupt Jumours of the Body put into Agitation by he stimulating Pain the Tooth causes in breakng its way out. This, I believe, never hapens without fome Pain, and poffibly a little ever; but if the Blood and Juices be perctly fweet and good, and there be not too reat a Redundancy of them, both will be ut flight, and pass off imperceptibly, without ny bad Consequence whatever. The chief itention of the Method I am recommending to preferve the Humours of the Body in is State; and therefore if it fucceeds, Chilen so managed will breed their Teeth with fs Pain and Danger than are commonly obrved to attend this Work of Nature.

As I have faid that the first and general aufe of most of the Diseases Infants are liable , is the acid Corruption of their Food; it ay not be amis just to mention an easy and E_2 cercertain Remedy, or rather Preventive, if given timely, at the first Appearance of predominating Acid; which is very obvious from the green Stools, Gripes, and Purgings occafioned by it. The common Method, when these Symptoms appear, is to give the Pearl Julep, Crab's Eye, and the testaceous Powders, which, tho' they do abforb the Acidities, have this Inconvenience in their Effect, that they are apt to lodge in the Body, and bring on a Costiveness, very detrimental to Infants, and therefore require a little Manna, or fome gentle Purge to be given frequently to carry 'em off. Instead of these, I would recommend a certain fine infipid Powder, called Magnefia alba, which at the fame time that it corrects and fweetens all Sourneffes, rather more effec. tually than the testaceous Powders, is likewife a lenient Purgative, and keeps the Body gent ly open. This is the only alkaline Purge know of, and which our Difpenfatories have long wanted. I could with it was more univerfally received among us, and think it well de ferves the Rank in our Books of Pharmacy which it already has in fome foreign ones. have taken it myself, and given it to others fo the Heart-burn, and find it to be the best and most effectual Remedy for that Complaint. I may be given to Children from one to two drams a Day, a little at a time, in all their Food 'till the Acidities be quite overcome, and th concomitant Symptoms disappear entirely,

hav

(37)

have often given it with good and great Effect, even when the Children have been far gone in Difeafes first brought on by prevailing Acid.

THERE are fome other little Niceties, that, were they observed in the nursing of Children, would be of fome Ufe to them ; fuch as putting them foon upon their Legs, in order to forward their walking; accustoming them to use both Hands alike ; for employing one more than the other, will not only make the Hand and Arm fo used, but also that Side of the Body, bigger than the other. This is fometimes the Caufe of Crookednefs. It would likewife not be amifs to forward their fpeaking plain, by speaking plain distinct Words to them, instead of the Namby Pamby Stile, and giving them back their own broken inarticular Attempts; by which Means, I believe, fome Children fcarcely fpeak intelligibly at feven Years of Age. I think they cannot be made reafonable Creatures too foon.

THESE few loofe Thoughts on the Subject of Nurfing Children, I fend you for your private Satisfaction, if they be lucky enough to give you any. I have neither Time nor Patience to think of Form and Order, or fupporting them by affected Demonstrations taken from mechanical Principles and Powers. All I have endeavour'd is to be intelligible and useful; and therefore I have avoided, as much as possible, all Terms of Art; together with learned learned Quotations, as often produced out of Vanity, and to fhew deep Reading, as for the fake of Proof. If you think it may be of any Ufe to publifh this Letter, I am not unwilling it fhould appear; if not, do with it what you pleafe. I deliver it up as a *Foundling* to be difpofed of as you think proper. I fhall only add by way of Perfuafive to those who may be inclined to make Trial of the Method I recommend, that I am a Father, and have already practifed it with the most defirable Success.

FINIS.
