A TREATISE ON THE USE AND ABUSE

OF

MINERAL WATERS.

HE Medicinal Ufe of Mineral Waters thas at all Times engaged the Attention of the moft able Phyficians, who have purfued the Practice of Phyfic upon rational Principles; and Experience has convinced Mankind of the great Benefits which may be expected from them, when properly administered, even in the most debilitated Constitutions. But the noblest Bounties of Nature are oftentimes abufed; and the Folly of B 2 Man Man frequently perverts the Wildom of Providence.

In no one Inftance, perhaps, is this Obfervation more clearly exemplified, than by the abfurd and ridiculous Mode of administering these Waters. The present erroneous Maxims and Opinions disappoint thousands of Invalids of the Benefit they might receive from a proper Use of Mineral Waters.

Even the falubrious Waters of the Briftol Well are often brought into Difcredit, by the improper Conduct of Patients; and the Virtues of the Bath Waters are likewife called in queftion, by many Perfons who have returned to their own Homes with Difcontent, becaufe they have, by their own Imprudence, difappointed themfelves of the medicinal Efficacy of the Spring.

The fame Obfervation holds good with refpect to the improper Ufe of Sea Water. How many daily facrifice their Health and Strength by dofing themfelves with Sea Water? Many there are who, from a Kind of Fafhion, pafs a confiderable Part of the Summer at the various Bathing-Places upon our Coafts. They profeffedly go thither for Pleafure only, and punish themfelves, from the ftrong Force of of Example, by naufeous and daily Drenches of Sea Water—till at length they become fo relaxed and weak, they are no longer able to refift the oppreffive Heat of the Summer, and fall a Sacrifice to fome of the worft Kind of Fevers.

These Facts are so notorious that I need not dwell upon them. I mention them only to caution the Public at large against such pernicious Consequences.

At Bath, and at the Briftol Wells, there are able Phyficians; who will, *I truft*, direct their Patients in the proper Use of those Waters, if they are wise enough to apply to them, and prudently follow their Directions.

But with refpect to the Ufe of Sea Water, and alfo the Chalybeate Waters, Mankind in general are their own Phyficians. Thofe who frequent the Bathing-Places, the Chalybeate Spring of Tunbridge in Kent, or that of the New Tunbridge Wells near Iflington—*nineteen* out of twenty of them are governed by their own Opinions, or by the Example of others they meet at fuch Places, who are as much miftaken as themfelves.

Ta

To fuch Invalids, therefore, I particularly addrefs myfelf.—The World, it must be confeffed, are too fond of Quackery—but if they will continue to quack themfelves, it is at least meritorious to prevent them doing a real Injury to their Constitutions, by putting them in a better Way of managing themfelves.

I bowever think it my Duty, as a Well-wifher to Mankind, to advife every one who is really ill to confult the Perfon who has the Care of his Health, not only as to what fhould be taken preparatory to the Ufe of the Waters, but like wife as to the Quantity proper to be drunk, the Regimen neceffary to be purfued while he is drinking the Waters; and, in many Cafes; to be directed to fome little medicinal Aid, which may be thrown in, at proper Intervals, to affift the Efficacy of the Waters themfelves. Without thele Precautions, half of the Patients deprive themfelves of the Advantages they might receive from the Ufe of Mineral Waters.

With regard to the improper Use of the Sea Water *internally* I have already given a Caution. And perhaps many of those who frequent the Bathing-Places, may find some of the following Hints worthy their Attention, especially Invalids. I come now to fpeak of the native Chalybeate Water.—It is a powerful Remedy for the curative Intention of most chronic Complaints. Its Efficacy alone, when properly administered, will remove many Diforders. When aided and affisted by the Judgment of an able Practitioner, it will oftentimes combat the most obstinate and complicated Difeases.

Such are our Springs at both the Tunbridge Wells—in my Opinion, both equally good and excellent, and, drunk upon the Spot, *preferable* to those of the German Spa when brought to England. The Reasons are well known to such as are acquainted with Chemistry.

I call it a native Chalybeate Water, becaufe it cannot be counterfeited by Art.—In all artificial Solutions of Steel an Acid muft neceffarily be ufed; this gives a Roughnefs and Acrimony to the Water, which fufficiently diffinguishes the artificial from the real; and the artificial falls greatly short of the real in Point of its medicinal Virtues.

There is another Excellence in the Springs we are now speaking of:--they are totally free from any of those cathartic Salts, with which the Scarborough, and many other Mineral Waters are impregnated besides the Steel. Such F 8 1

pound Mineral Waters;—they are different in their Operation from those of the simple Kind we are now speaking of, and not to be compared with them in Point of their medicinal Efficacy.

It is foreign to my prefent Purpole to enter into the chemical Analylis of the native Chalybeate Waters, and indeed, at this Time, their component Particles are fo well known that it is altogether unneceffary. I am fpeaking to Invalids, who wilh only to experience their Virtues, and to be inftructed in the proper Method of using them.

The native Chalybeate Waters are falutary in most chronic Complaints.

Chronic is a Term of Art, derived from the Greek Word CHRONOS, Time, and comprehends every Diforder which has been of long ftanding: It is used in direct Opposition to acute Complaints, such as the general Kind of Fevers, &c. Acute Complaints necessarily confine Patients to the Bed, or the fick Chamber; and terminate quickly, either by a favourable, or an unfavourable Crifis. On the contrary, Patients are feldom confined by chronic Complaints, and these are not only tedious and troublesome, but often fatal in the End.

Under

Under this Head may be ranged all fuch Errors in the Conftitution as proceed from a debilitated and relaxed State of the muscular Fibres; or a Weakness of the nervous System.

Sometimes these Errors happen from the natural Tenderness and Delicacy of the Constitution; oftentimes from Indolence, or an inactive sedentary Life; frequently they are the unhappy Consequences of a long and painful Illness—of Intemperance—of the improper Use of violent, or mercurial Medicines.

Hereditary Evils frequently entail fuch Errors, and they often arife from a Variety of accidental Circumstances, that no human Wifdom can possibly foresee, or guard against.

The following are justly to be ranged under this numerous Tribe of chronic Complaints.

Nervous Difeafes of all Denominations. Hypochondriac and Hyfteric Complaints. Glandular Obstructions in both Sexes. Afthmas, especially those of the spasmodic Kind. Loss of Appetite and Indigestion. Nervous Head-achs and involuntary Twitchings. Dropsical Complaints of every Denomination. Dejection of Spirits and painful Watchings. Profuse Sweats and Hestic Fevers. Impurities in the Blood and animal Juices. C

[10]

Blotches and scorbutic Eruptions upon the Skin. All bilious Complaints without a Fever. Diforders in the urinary Passes. Paralytic and Gouty Complaints, &c. &c.

It is not my prefent Bufinefs to defcribe at large this terrible Lift of human Infirmities.-It is a painful Tafk to enumerate them. Unfortunately, the greatest Number are too well known, and too fenfibly felt, by Patients themfelves. The following Obfervations, however, may not be unseasonable. Nervous Symptoms deceive Men more than any others; and when these Errors have got fast hold of the Constitution, the Patient becomes intolerably wretched-he fancies at Times that he labours under most of the Diseases before-mentioned; and being wearied out, with trying different Prefcriptions in vain, his Patience is exhaufted, he despairs of Relief, and gives himfelf over as loft. Neverthelefs, his Cafe perhaps may not be fo bad as he fuppofes it to be, if there be any tolerable Degree of Strength remaining in the Conflictution. It is true, that his Misfortunes center in one general Evil; and produce, in the true and literal Senfe of the Word, a wandering Gout.

This is a formidable and a treacherous Enemy. It oftentimes affails us unexpectedly, and if the Patient be not happy enough, by fkilful Treatment, to have it eradicated altogether, or at leaft least thrown upon the Extremities, he falls a pitiable Sacrifice, and oftentimes pays the great Debt of Nature before half his Days are run.

ſ II]

These are serious Facts. But it is one great Point towards a Cure to know the Difeafe. I fpeak this from my own Feelings-from the Comfort I now experience, by enjoying a better State of Health than formerly. I have also the further Satisfaction of having been inftrumental, under Providence, in the reftoring of many miferable Beings, labouring under the Influence of this cruel and complicated Difeafe, to a State of Comfort, Health, and Happinefs .--They little imagined their Complaints to be a wandering Gout, till a regular Fit upon the Extremities proved the Truth of my Prognoftics, and relieved them from their Infirmities. Thefe are great Inducements to me to endeavour to put others upon a right Track, to recover their loft Health, together with their Strength and Spirits.

Chronic Complaints are totally opposite to inflammatory Difeases, which require Evacuations to reduce the quick, hard, and throbbing Pulse, and pull down the animal Strength. In chronic Complaints, muscular Motion is universally oppressed, the Pulse languid, and the Strength of the Constitution much below Par. Therefore, unless accidental Circumstances intervene, Bleed-

C 2

ing

ing is improper, violent Cathartics are injurious, and all Evacuations which tend to reduce the Strength of the Patient muft be avoided: fuch Practice is unwarrantable, unfkilful, fatal. Nature, in chronic Complaints, requires a Spur; and the native Chalybeate Water, when properly administered, is a powerful Spur indeed but many unfkilful Riders are continually thrown out of the Courfe, by using it too furiously.

It is a ludicrous, but a true Observation, that the World, in general, think they cannot have too much of a good Thing: Hence the common Bleffings of Life oftentimes become the Sources of Mifery. The hospitable Table is thus abused by the voracious Glutton, while the beaftly Drunkard has Reafon to curfe the gene-rous Juice of the Grape. But will any one presume, from these Considerations, to argue, that Food is not neceffary for the Support of Man? or that generous Wines are not refreshing Cordials to the Temperate and the Wife? It is not the proper Use, but the abfurd Abuse, that renders many Things poifonous, which are, in themselves, not only innocent, but even falutary to animal Life.

To bring this Observation home to our present Purpose—I mean first to speak against the Abuse of the native Chalybeate Water—It is a mistaken Notion and a vulgar Error, that Patients cannot drink drink too much of this Water.—I have often heard Men boaft of the very large Quantity they drink of it daily; and of its wonderful Effects in paffing off by the Bowels, efpecially by Urine. They ignorantly imagine that all its Virtues depend upon its paffing off quickly, and by this erroneous Conduct, many Perfons deprive themfelves of the Benefit they might otherwife receive from the Waters. A Pint of the Tunbridge Waters, for they are nearly fimilar, contains about four Grains of Steel. In my Opinion this is a fufficient Quantity for the ftrongeft Conftitutions, and too large a Dofe for delicate and nervous Patients. This Doctrine is *perbaps* new, but I hope to prove that it is true likewife.

I do not wish the Public to adopt it rashly. No Man has a Right to expect another to give up his own Opinions, unlefs he can convince him that they are wrong. So, likewife, no Man has a Right to expect another to think as he does, unlefs he can convince him that the Thoughts are right. It has ever been my Study, with all Perfons who labour under chronic Complaints, to endeavour to make them clearly comprehend the curative Intentions of the Regimen they are to purfue. By this Means their rational Confidence is engaged, and they steadily conduct themselves thro' the Course prefcribed. Such Patients must be convinced that a Phylician understands their Cafes, before they will fubmit themselves to his Directions. And, indeed.

indeed, it will be impracticable to give the intelligent Reader an adequate Idea of the daily Abufe of Chalybeate Waters, without entering a little into the immediate Caufes, as well as the curative Intentions, of chronic Complaints. For this Purpofe I muft introduce to his Acquaintance a moft accurate medical Inquirer: an Author that has ever been in the higheft Reputation with all Men of Learning who have perufed his Works. The following Aphorifms of Sanctorius are applicable to chronic Complaints, and will fully illuftrate the prefent Subject. His Authority is not to be doubted; and I beg the Aphorifms may be perufed with Attention.

SANCTORIUS'S APHORISMS.

" If a Physician who has the Care of another's "Health is acquainted only with the sensible Supplies and Evacuations; and knows nothing of the Waste that is daily made by Insensible Perspiration; he will only deceive his Patient, and never cure him.

" To evacuate teo much by Stool, Urine, or " Sweat, and perspire less than usual, is bad.

"Whenfoever Nature is disturbed in the Business of Perspiration, she soon begins to be defective in many more of the animal Functions.

"They who feed or purge in the Hours when they should most perspire, which are those in the Morning,

[15]

" Morning, are very much the worse for it, because thereby they hinder Perspiration.

"Imperceptible Perspiration lightens the Body more than all the sensible Evacuations together; for after Sleep every one may perceive himself lighter, without any of the sensible Secretions; because he REALLY is so, by about three Pounds.

"Sixteen Ounces of Urine are generally evacuated in the Space of one Night; four Ounces are evacuated by Stool, and forty Ounces and upwards by Perspiration.

"There is as much sarried off by insensible Per-"Spiration in the Space of a natural Day, as by "Stool in the Course of five Days.

"What must then be thought of those Physicians who, in all Manner of Distempers, have Regard only to what is evacuated by Stool and Urine, and never take any Notice of the Discharges by infensible Perspiration?"*

* Infenfible Perspiration is a very comprehensive Exprefion. It means not only what is daily carried off by the Pores of the Skin, but what passes off likewise by the Breath, which Sanctorius informs us amounts to half a Pound in the Course of a Day. It also comprehends the internal glandular Secretions. But fuch as with to be further informed, may confult his Aphorifms at large. I am well aware of the Difference of our Climate and Manner of Living. Sanctorius was Professor at Padua in Italy, where these Observations were made.—But Dr. Keil of Northampton confirms the Principles; although he differs fomething, but not to affect our Arguments, in the daily Evacuations. These Aphorisms being clearly comprehended, my Reader will be able to accompany me in the following Narrative without any Difficulty, and, I hope, with Pleasure.

Let us first take a curfory View of Nutrition. Animal Life is supported by the Food we daily receive. When the Aliments have paffed thro' a State of Digeftion, the groffest Parts, unfit for Nutrition, are carried off by Stool; the next impure Parts go off by Urine; and the Remainder, which may be fairly estimated at one half of our daily Nourishment, ought to be carried off by infenfible Perspiration; that is, by the Pores of the Skin, by the Breath, and the various glandular Secretions. So long as these Functions are properly performed, Man continues in Health; but when a Redundancy of crude and imperfect Particles are retained in the Blood and Juices, which Nature intended to be thrown off by infenfible Perfpiration, the Body becomes difeafed. The bold and forcible Efforts of the Conftitution to throw off this intolerable Load produce acute Complaints. The . feeble Efforts of a too delicate, nervous, and relaxed Conftitution, produce chronic Complaints. These may be properly stiled the immediate Causes; but as chronic Complaints differ from each other, fo alfo their first or remote Caufes are different: Nevertheless, it is this Load of crude and imperfect Humours which produce the general Errors in all Conftitutions, and the general

general curative Intentions are the fame. An active Stimulus is neceffary to be thrown into the Conftitution, to be retained in the Circulation—to ftimulate the excretory and internal Glands—to break, divide, and fubtilize thefe crude Particles floating in the Blood and Juices, fo as to expel them by Infenfible Perfpiration and ultimately to brace up the relaxed Fibres, and ftrengthen the nervous Syftem. Having thus explained the Nature of chronic Complaints in a fimple, plain, and familiar Manner, I truft that it is unneceffary to ufe any farther Argument to prove the Abfurdity of directing chalybeate Waters to pafs off quick by the Bowels, efpecially by the urinary Paffages.*

Before I proceed to Rules for drinking the Waters, altho' it is the Province of the Phyfician only to confider and to remove the first and remote Causes of chronic Complaints, I shall touch slightly upon some of them, well known to Patients themselves, with a View to guard against their pernicious Confequences. A Want of proper Air and Exercise, irregular Hours, and Intemperance; the Indulgence of irregular Passions, and all such Pursuits as relax the Constitution, and render the nervous System too exquisitely fensible. For this Reason delicate Habits of Body are continually subject to them;

* If my Reader be fatisfied in this Point, he will readily agree with me, that a Pint of thefe Waters is a full Dofe.

D

and they are the conftant Attendants of advanced Life. Even Difappointments and Vexations, from which no Mortal is exempt, by long Continuance will unhinge the animal Œconomy. Dwelling inceffantly upon difagreeable Objects enervates the Mind of Man; and fuch is the relative Connection betwixt the mental and corporeal Faculties, that the Mind cannot long fuftain great Afflictions, without the Body being difordered likewife.

Hence it is evident, that a Dejection of the Spirits alone will, in the Courfe of Time, produce real bodily Complaints; which must be removed before the natural Chearfulnefs of fuch Patients can return; and they oftentimes prove intolerable Burthens.

What can be more diffreffing than a Lofs of Appetite, and a Lofs of Strength, accompanied with a total Dejection of the animal Spirits? Nothing furely-except the daily Infult of being told, by their mistaken Friends, that they must keep up their Spirits-that they must not give way to their Complaints, and that they might be well if it was not their own Fault. Alas! they little think, or know, what fuch unhappy Beings feel. It would be more rational to tell them to change their Bodies - it being impossible for them to support their Spirits, till the Errors in their Conftitutions are removed. Such Patients are under the Influence of a real Difease. Were it

it possible for these mistaken Friends to change Situations, but for a fingle Hour, with those who are *pleasantly*, but *cruelly*, called *bippis*, a Tenderness and Concern for their Missortunes would take place of Anger and Rebuke.

RULES FOR DRINKING THE WATERS.

Preparatory to drinking the Waters, fome gentle Evacuations by Stool are neceffary. Mild Cathartics are to be preferred, efpecially fuch as cleanfe the first Passages; those of the more violent and heating Kind are to be avoided.

During the Summer Months, the chalybeate Waters should be taken fasting, and in the early Part of the Morning, before the Heat of the Day renders Exercise fatiguing.

Whatever be the chronic Complaint, no Medicine fhould be administered till Noon. Food should be first taken into the Stomach; and any other Breakfast is preferable to Tea.

During the Winter Months these Waters should be drunk betwixt the Time of Breakfast and Dinner. At this Season of the Year those Hours are the most proper for Exercise; and Exercise is effentially necessary to produce falutary Effects from the Use of chalybeate Waters; as will be shewn hereaster. May I be permitted to hope that I shall claim the Attention of the Public upon this Point? Many Persons refide near the Chalybeate Springs in Winter, who are at too great a Diftance, in the Summer Months, to reap any material Benefit from the Waters, which ought ever to be taken upon the Spot; and Experience has convinced us, that the Chalybeate Springs are in as high a State of Perfection in frosty Weather as at Midsummer. Other powerful Arguments present themselves upon this Occafion. In all Habits of Body, infenfible Perspiration is confiderably lessened, during the Winter Months. The Irregularity of a Town Life alfo tends to relax and debilitate the Conftitution. After passing the Night, in that Round of Diffipation which at prefent too much engages the Attention of the Public, even the Ladies themfelves must confess the uncomfortable Feelings of the Morning .- What, then, must the Men of Pleasure suffer, who too often indulge themfelves in every Species of Debauchery during their riotous Nights? The exhilarating Quality of the Chalybeate Waters will prove the best Cordial upon these Occasions, and tend to produce that Flow of Spirits which is the great Reward of Temperance,

Chalybeate Waters are not intended to promote any of the fenfible Evacuations. They are to be received into the Habit, to correct the Impurities of the Blood and animal Juices; to remove

remove glandular Obstructions; to promote infenfible Perspiration; to brace up relaxed Fibres; and to strengthen weak Nerves: Therefore an immediate Benefit can feldom be expected from them. Errors of long standing, that have taken fast Root in the Constitution, require fome Time to be eradicated. For this Reafon, fuch as are really ill should be very regular, for the first Month, in the daily Ufe of Chalybeate Waters. After that Period they may relax occasionally; but those Patients will act wifely who continue them pretty constantly for some Months. Such Perfons as reap an Advantage from the Waters need not be reminded of this, nor of returning to them again in the following Seafons. Inclination, if not Neceffity, will prompt them to revifit the reviving Chalybeate Springs.

We are now come to the moft arduous Part of our Subject, the Quantity proper to be taken of these Waters. We have already cautioned the Public against too large a Dose; but it is not so easy, in all Cases, to adjust the proper Quantity. In bilious Complaints, and where there are Errors in the first Passages, that Proportion will offend the Stomach, occasion the Cholic and other Inconveniencies, which may be taken with great Propriety where no such Disorders exist. But as I have before mentioned the Necessity of preparing the Stomach and Bowels, by some proper Evacuations, for the Reception of Chalybeate Waters, this Inconvenience cannot be more more effectually guarded against by general Directions.

In a Word, therefore, at all Times, and by all Patients, this should be the governing Rule of their Conduct-never to take fo large a Dofe of Chalybeate Water as to occafion a quick Difcharge by Urine, or to produce purging Stools; and, indeed, never to take fo large a Quantity as to become a Weight, that may oppress the Stomach, caufe Flatulencies and Tremblings, or render the Head light and uncomfortable, as if in fome Meafure intoxicated. Where the Conflitution is too delicate, and the nervous Syftem is too exquifitely fenfible, furprifing as it may appear to those who are unacquainted with these Waters, even small Dofes will fometimes produce a Giddiness; especially at the beginning of the Courfe. Thus much for general Rules .-To descend to Particulars; a Quarter of a Pint will be fufficient for weak and delicate Perfons to begin with; this Quantity may be gradually encreased, as their own Observations direct, fo as no fenfible Evacuations are too quickly promoted, or the Inconveniencies before-mentioned experienced. But half a Pint, or a little more, will prove a full Dofe for fuch Patients. I would recommend taking it at two or three Draughts, waiting a Quarter of an Hour or longer between. Perfons of ftouter Stamina, and whofe Conftitutions are not fo feeble, may begin with a little larger Dofe, using the fame Precautions; and fuch

fuch Patients may, if no Obstacle arises, take a Pint for their full Quantity.

But as accidental Circumftances will intervene, if any of the Inconveniencies before recited fhould be experienced, at any one Period during the Courfe of Chalybeate Waters, the Quantity muft be immediately decreafed, till fuch Difficulties be removed *.

It is farther to be remarked that Exercife fhould ever be used between the Draughts of the Water; and that of walking brifkly is preferable to all other Exercise. It wonderfully promotes the Efficacy of the Chalybeate Water, prevents its passing off too quickly by Urine, and if a gentle Perspiration, not amounting to a Sweat, can be promoted, it is a fure Prognostic of immediate Benefit; that Flow of Spirits which accompanies it, will convince every Patient of the Truth of the Observation.

I am the more particular in enforcing this Rule, becaufe the general Indolence which attends chronic Complaints is too apt to induce Patients to retire to the Rooms, and fit motionlefs, the Moment they have taken the Waters.

* I must add a friendly Caution, the Propriety of which fpeaks for itfelf, that whenever a costive Habit of Body prevails, and in fuch other Cases as render an opening Medicine necessary to be occasionally taken, it will be best administered at Bedtime; that the Operation of the Medicine may be over before the Waters are taken in the Morning.—One Thing farther may be proper to mention, that little or no Supper should then be taken. For their own Sakes I hope they will act otherwife*.

There is another Miftake, and in my humble Opinion a great one too, although it has received the Sanction of Men whofe Judgment upon moft Occasions is not to be doubted : I mean, that of taking off the Chill of the Chalybeate Water, by adding boiling Water : it immediately becomes turbid, and in fome Degree the Chalybeate is decomposed; which in a great Measure destroys the Efficacy of the Spring. I rather think this Advice has been given by Way of Indulgence to their Patients, and contrary to their own better Judgments.—It is, however, my Duty to speak of the Error, and to caution the Readers against this mistaken Practice.

Having now pointed out the Ufe, as well as the Abufe, of the native Chalybeate Waters, and having likewife added thofe Remarks which at prefent occur to me, for the Government of fuch Invalids as are not better informed, I fhall take my Leave of this Subject; and if the loofe Hints thrown out in thefe few Pages fhould prove beneficial in chronic Complaints, and tend to relieve the Infirmities of Human Nature, I fhall be happy to think that my Time has been fo well employed.

* It is much to be wifhed fome Amufement could be pointed out, that fhould invite Invalids to be continually in Motion, while they are at the Wells. Dancing is too violent, and (medically fpeaking) too irregular a Motion, to anfwer the Purpofe; but fome active Purfuit might poffibly be found out, if the Company were to pay a proper Attention to the Neceffity of it.
