JOHN FREDERICK BLUMENBACH, M. D. F. R. S.

TO

PROFESSOR OF MEDICINE, IN ORDINARY,

IN THE

UNIVERSITY OF GOTTINGEN, Sc. Sc.

DEAR SIR,

CANNOT fuppofe the fubject of the following Memoir uninterefting to any perfon engaged in practical or phyfiological medicine. It muft, however, be peculiarly interefting to a phyfician who has, for many years, cultivated the great fcience of Phyfiology with fo much attention and fuccefs as you have done.

As the difeafe of Goitre is extremely common in fome parts of Germany, and in other parts of Europe, the philofophical phyficians of those countries will not deem it an incurious point to examine, with attention, what affinity there is between the foil, the climates, and exposure of the European districts in which this difease prevails, and the foil, the climates, and exposure of those countries of America in which it also prevails. If the facts contained in my memoir should ferve to throw any light upon the nature of this complaint, I shall think the time which I have employed in the investigation has not been altogether misapplied.

PERMIT me to add, that from your correspondence, and from your valuable writings, I have derived much pleafure and improvement, especially in the inveftigation of one very interefting and difficult question : I mean the natural history of the phyfical differences among the various families of mankind. Your late publication* on this fubject is replete with ingenuity, and with various and extenfive learning. My refearches (part of which will fhortly be published) relative to this question, will, perhaps, have little to recommend them to the notice of fuch writers as yourfelf, and our common friend Profeffor Zimmermann, except the circumftance of my having examined fome of the moft interesting of the human varieties, and those too, by most authors, more imperfectly depicted than the reft, in the very countries in which they exift.

THAT you may long continue to cultivate the fciences of Phyfiology and Natural Hiftory, with the fame zeal, patience, and fuccefs, with which you have hitherto cultivated them,

Is the fincere wifh of, Dear Sir, Your friend, and humble fervant, &c. BENJAMIN SMITH BARTON.

PHILADELPHIA, December 8th, 1799.

* De Generis Humani Varietate Nativa. Editio Tertia. Gottingae, 1795.

PREFACE.

HE greater part of the following Memoir was written in the winter of 1797-1798, foon after my return from my journey through the weftern parts of the state of New-York. It was read to a very refpectable class of gentlemen, who attended my courfe of lectures on the Materia Medica, in that feafon, and again in the winter of 1798-1799. I confess that the paper was originally drawn up for the prefs; and I intended that it should have been published at a much earlier period than the prefent. From time to time, I delayed the publication, in hopes of being able to communicate fomething more worthy of the notice of phyficians, and of men of fcience. Unfortunately, however, I have been difappointed in my expectations of receiving information from a quarter where it would have been most easy to have procured anfwers to my queries. I now fling the memoir upon the public, much more from a defire to draw forth information, than from any hope of communicating a great deal that is new.

I INTREAT phyficians (who I cannot but think

are better qualified to fet in judgment in medical matters than other men, and who are, perhaps, as candid as any other large body of men): I intreat the phyficians, who may favour thefe pages with a reading, to recollect, that I am not attempting to give a complete history of the Goitre of our country. I aim at little more than a collection of FACTS relative to this fingular difeafe, as it prevails in various parts of America, particularly the United-States. Thus far, I may hope I have not failed in my attempt. That the lover of fystem will be disappointed, I clearly forefee. Indeed, I myfelf exceedingly regret, that the caufes of a difeafe which, even in its mildest form, is uncomely, and which, in an higher degree, is attended with much inconvenience to the patient, and often, in Europe at leaft, with the lofs of mental ftrength, fhould be fo imperfectly known. The opportunities which I have had of investigating the nature of this difeafe, though greater than those of many of my countrymen, were still very inconfiderable. I do not, therefore, think it neceffary to apologize for my want of decision on a fubject concerning which the decifions of preceding writers have, fo generally, been unfuccefsful, or unphilosophical. I know that the path to temporary glory leads through the fairy-land of theory: but the road to prefent and to future ufefulnefs lies through the field of facts and obfervation.

I HAVE not, however, in the following inquiry, omitted the confideration of the CAUSES of goitre. On the contrary, I have devoted a good deal of attention to the theories of feveral writers on the fubject. I have rejected most of those theories, in confequence of having fatisfied myfelf, that the caufes to which the difeafe has been afcribed do not always exift in those countries or districts, in which the complaint prevails, to a confiderable degree. If, in this part of my memoir, I have adduced any new facts or arguments to fhow the errors or defects of preceding theories, I may, perhaps, flatter myfelf, that I have made fome nearer approach towards a detection of the real caufes of the complaint. But how far I have been fuccefsful in this bufinefs, it must rest with the public, or with those who may have opportunities of more critically inveftigating the difeafe, to determine.

I HAVE ventured to take one ftep farther: to CONJECTURE, that the remote or primary caufe of goitre is a *miafm* of the fame fpecies as that which produces intermittent and remittent fevers, dyfenteries, and fimilar complaints. I cannot, in ftrict propriety, claim this theory as my own. It is hinted at, and rejected, by Mr. De Sauffure. If it be entitled to any attention, I have no doubt it will receive it. For ours is the age of medical theories: fo much fo, indeed, that a phyfician, who writes, can expect to do but little with the public, unlefs he learns to *fpeculate*. I fubmit my fpeculations to their fate—not very anxious what that fate may be,

I SHALL tranfmit fome copies of this memoir to gentlemen, particularly phyficians, refiding in thofe parts of our country where the Goitre prevails. I earneftly call their attention to the fubject. Whatever will tend to illustrate the history or the nature of the difeafe will be gratefully received and acknowledged by me. I shall be equally thankful for careful corrections of any of the errors into which I may have fallen. " J' aime autant une perfonne " qui me releve d'une erreur, qu'une autre qui " m'apprend une verité, parce qu'en effet une er-" reur corrigée eft une verité."

BUFFON.

INTRODUCTION.

A MONG the difeafes to which the human kind is fubject, there are few which, within the laft thirty years, have folicited more of the attention of travellers, of philofophers, and phyficians, than that which is generally known by the name of GOUETRE, or GOITRE. This is a tumour or fwelling of the anterior part of the neck, affecting more efpecially the thyroid gland.

THE great father of nofological fcience, the induftrious and learned F. B. De Sauvages, has mentioned four different fpecies of this difeafe, under the generick name of Bronchocele, or Gouëtre. Thefe are the Bronchocele Botium of Roncallus; the Bronchocele ventofa and the Bronchocele farcoma of the fame author, and the Bronchocele aquofa of Montaltus.

I HAVE not had an opportunity of feeing the works of Roncallus or Montaltus, and will not, therefore, pretend to fay, how far there is a foundation for the division of this difease into the four different species mentioned by these authors, and by Sauvages. It would feem, however, that neither the Bronchocele ventofa nor aquofa are the difeafe which is now fo much mentioned by travellers under the name of Goitre. This difeafe appears to be the fame as the Bronchocele Botium and the Bronchocele farcoma of Roncallus. Notwithstanding that Sauvages confiders these as two diffinct fpecies, I am inclined to believe, from his defcription of them, that they are the fame difeafe, differing in extent or degree, and from the combination of accidental circumftances. I shall here infert his descriptions. Speaking of the Bronchocele Botium, he fays, " Bergami familiaris eft, & bernia gutturis vocatur; est steatomatofus vel fcirrhofus tumor glandularum thyroidearum. Rufticos fæpiùs afficit quàm cives, & mulieres præ viris, quod tribuit eruditus Pasta debilitati harum partium ob vomitus frequentes gravidarum: fæpè hic tumor dependet à gutture adinstar pyri ; quandoque sponte in fuppuratum abit; fæpiùs ita indurefcit ut cartilaginis inftar refiftat.

" LICET hic morbus hominem deturpet, vocem ejus lædat, mentem hebetet, dyfpnæamque creet, pauci funt qui eum medicamentis aut ferro aggrediantur, ne difcuffo tumores graves, pectoris morbi, ut tuffis, afthma, fuccedant, imò phthifis, nifi tamen affectus recens fuerit, qui folus tutò poteft curari. Puerperas magis afficit quàm virgines." SPEAKING of the other fpecies, or Bronchocele farcoma, the nofologift fays, "Illa fpecies quæ non pendet à lymphâ fpifsâ in mufculorum interftitiis, textuque glandularum congestâ, sed ab ipsâ partium excrescentiâ, medicamentis infanabilis prorsùs est, sed quibus signis innotescit hoc non docet *Roncallius*. Familiaris est hic morbus Helvetiis, Germanis ad Goslariam, Pedemontanis, Brixianis in Statu Veneto, &c: an aquis nivalibus, an cibis craffis, ut castaneis, tribuendum?*"

A RESPECTABLE French phyfician[†], in a differtation *De Struma Bronchocele dicta et de Hemeralopia*, which was publifhed at Nancy, in 1787, has divided the goitre into ten fpecies; and, he informs me, that fince that period he has difcovered two other fpecies of this difeafe. Not having an opportunity of feeing this differtation, it is impoffible for me to judge of the propriety of the divifion which I have mentioned. I am inclined, meanwhile, to

* Nofologia Methodica fistens Morborum Classes juxtà Sydenhami mentem & Botanicorum ordinem. Auctore Francisco Boissier De Sauvages, &c. &c. Tomus Primus. p. 157 & 158. Amstelodami, 1768.

[†] Doctor Louis Valentin, lately chief phyfician to the French military Hofpitals, at Norfolk, in Virginia, and at prefent a phyfician in France. In a letter, which is dated Montpellier, August 20th, 1798, the doctor informs me, that besides the inaugural differtation, he has written an extensive memoire on goitres, which was read before the Academy of Surgery of Paris in the year 1789, and by them honored with a gold medal. fuppofe, that the ingenious author has fometimes confidered as *fpecies* what are, in reality, nothing but *varieties*. This is not an uncommon error among phyficians, particularly among the nofological writers, who, by unneceffarily dividing fpecies, and by crouding their pages with an intricate nomenclature, have effentially injured the important fcience which fhould teach the appropriate names, the diftinctions, and the arrangement of difeafes.

IT is not my intention, in this Memoir, to give an account of the difease of goitre in different parts of the world. I have neither the neceffary materials, nor the leifure for fuch a work. Neither is it my intention to fay any thing more concerning this difeafe in Europe, &c. except in fo far as I may deem it neceffary to illustrate my account of the difease as it exists in various parts of North-America. The reader, who wifhes to obtain farther information on the fubject, may confult the different authors whofe names, and the titles of their works or papers, are mentioned in this memoir. I am not ignorant, however, that feveral refpectable writers, whom I have not mentioned, have written on this difeafe. Their works are not in my poffeifion, and I have fometimes found it difficult to obtain a correct idea of the facts which they relate, and of the opinions and fpeculations which they adopt.

THE difeafe of which I am fpeaking is not confined to any one particular country. It may be confidered as endemial in certain diffricts of Germany, France, Switzerland, Italy, Bengal, Boutan, South-America, &c. in very different climates. I believe it has been obferved to prevail more efpecially in mountainous countries : hence Juvenal fays,

Quis tumidum Guttur miratur in Alpibus ?*

IT must not, however, be fuppofed, that the goitre is always to be met with in mountainous countries, as the strong passage of the Roman poet would lead one to suppose. On the contrary, this difease is entirely unknown in many mountainous countries; and Dr. Coste, "who was born in the neighbourhood of the Alps, afferts, that it is not more common there than it is in many of the provinces of France. This writer has remarked, that the city of Geneva is the only stuation near the Alps where the imputation of Juvenal is justified.[†]"

* " Quis tumidum guttur miratur in Alpibus? Aut quis In Meroë craffo majorem infante mamillam? Cærula quis flupuit Germani lumina, flavam Cæfariem, & madido torquentem cornua cirro? Nempè quòd hæc illis natura eft omnibus una."

SATIRA XIII. 1. 162-166.

† Recueil des Oeuvres Phyfiques et Medicinales, publiées en Anglois et en Latin, par M. Richard Mead, Medecin du Roi de la Grande Bretagne, &c. &c. Par M. Cofte, Medecin de l'Hopital Royale et Militaire de Nancy. I have not feen this work.

SECTION I.

OF THE DISEASE OF GOITRE IN NORTH-AMERICA.

IN a vifit which I paid to the Oneida-Indians, who are fettled at Oneida*, in the flate of New-York, in the beginning of August, 1797, I obferved that an old woman, the wife of the principal chief of the nation, had a confiderable goitrous tumour, principally on the anterior part of her neck. The old man, her husband, informed me, that this complaint is not uncommon among the Indians (Oneidas), and also among the Dutch fettlers. This was a clue to farther inquiries on the fubject, which I did not neglect to attend to, in the course of a very interesting journey which I had undertaken for the recovery of my health, and for the collection of materials for the natural history of the United-States.

Soon after I had received the information from the old Indian, I had an opportunity of feeing a

* The village of Oneida, commonly called the Oneida-Caftle, is fituated on the Oneida-creek, which runs into the Oneida-lake, about twentyone miles nearly fouth-weft of Old-Fort-Schuyler, which laft place is about ninety-fix miles, nearly north-weft by weft, from Albany. newly-married and very young Indian woman, of the fame nation, who was deformed by a fimilar fwelling. I was informed, that this young woman's fifter laboured under the complaint to fo great a degree, that, at times, it much impeded her refpiration. In my return to the village of Old-Fort-Schuyler, on the Mohock-river, I had farther opportunities of obtaining information concerning this difeafe. Lodging at a village of Indians, called the Brother-town-Indians, about fourteen miles from Oneida, I faw fome cafes of the complaint, and found that in this place feveral of the Indians were affected with it.

HERE I met with a young phyfician, who informed me, that the goitre is a *common* complaint in this part of the flate of New-York. He faid, he had known the difeafe to appear among fome people from Connecticut, foon after their arrival in this part of the country. He even affured me, that fome of the fettlers from New-England had returned to that country again, alarmed at the appearance and progrefs of the difeafe in the new countries to which they had moved their families.

• I HAVE faid, that the difease is not unknown among the Dutch inhabitants of New-York. I have lately been informed, that it is not uncommon at Fort-Herkemer, on the German-Flats, fixteen or eighteen miles nearly fouth-east of Old-Fort-Schuyler. It is also frequent at Fort-Dayton; and at a village, called Henderson-town, about feven miles fouth of Fort-Herkemer.

Some of the moft remarkable cafes of the difeafe are in a Dutch family which lives upon the north fide of the Mohock-river, immediately oppofite to Old-Fort-Schuyler. This family confifts of a father, a mother, and four or five children. Every one of them is afflicted with the goitre. The fwellings occasion fome of them to look hideous. This family removed from the river below this, to the place where they now* dwell, about fifteen years ago, at which time they had nothing of the difeafe among them.

IN the courfe of my journey from Old-Fort-Schuyler, fouth-weftward, to the Cayuga-Lake, a diftance of about eighty miles, I had an opportunity of acquiring farther information concerning the difeafe, which in fome parts of the country is known by the name of the "SWELLED NECK." In almost the whole of this tract of country, the goitre prevails to fuch a degree, that every adult I met

^{*} In 1797, fince which time I have heard nothing farther concerning this unfortunate family.

with was acquainted with the circumftance of its existence, and was capable of giving me fome information about it*.

THE goitre is very common in the Military Tract of New-York. As far as I can learn, it prevails to the greateft degree in the townfhip of Manlius[†]. It is alfo very common in the Onondago-Valley, as in the neighbourhood of the Onondago-Salt-Springs, &c. In this part of the country, it affects both Indians and Whites. I fhall afterwards have occafion to mention fome other parts of the ftate of New-York, in which this difeafe prevails.

THE goitre of the ftate of New-York affumes very different appearances, in different perfons. In many, it feems to be merely an enlargement of the column of the neck, without any very evidently circumfcribed tumour immediately in the region of the thyroid gland. In others, the whole anterior part of the neck is evidently fwelled, and protube-

* On the 8th of August, on my way to the Jenisseia-country, having alighted at the house of one Clock, fix miles south-west of Oneida, I faw an old (white) woman, who had a confiderable goitre. She informed me, that there were several perfons, in the neighbourhood, who had the fame complaint, and that, among others, her grand-fon's wife had it. I am induced to be thus particular, that future travellers, through this part of the country, may know where to look for the difease.

† In the county of Onondago.

rant. In fome, the protuberance hangs down like an enormous wen, and in others, again, it affumes the appearance of a pear, hanging from, or attached to, the throat. I obferved no inftances of this laft kind, but I am affured that they are not uncommon among the females at Henderfon-town, fouth of the Mohock-river, where a particular mode of drefs is frequently made ufe of to fcreen the deformity from common or inquifitive view.

THIS difeafe makes its appearance in perfons at various periods of life. Even infants at the breaft are not exempted from it. But I believe, fuch cafes are rare. The complaint is, certainly, much more common among adults. Along the Mohock-river, it is faid to be principally confined to adults. Perfons removing into the country, where it prevails, have been attacked with it, even at a very advanced age in life.

FROM all my inquiries concerning the goitre of New-York, I think there can be little doubt, that females are much more liable to it than males. I faw feveral females but not one male affected with it. At Brother-town, where there are a good many cafes of it, it is principally confined to the female-fex. A country phyfician, refiding in this neighbourhood, remarked that the complaint is more common among females than males. In Manlius, and in other parts of the Military Tract, where the difeafe is very frequent, I was conftantly informed, that women much more than men are affected with it. At Fort-Herkemer, Fort-Dayton, and at Henderfon-town, already mentioned, the difeafe is more common among females than among males, and is faid to be principally confined to adults. An intelligent friend of mine, Mr. James Geddis*, who refides at Onondago, informs me, that he cannot learn that it ever affects men in that part of the country. We fhall afterwards fee, that at Pittfburgh, and in fome other parts of Pennfylvania, it is more common among females than among males.

THESE facts are calculated to fhew the intimate relation of the goitre of our country and the fame difeafe as it has been obferved in Europe, and in other parts of the world. It is admitted, that the Bronchocele Botium affects women more than men; and we have feen that Pafta has endeavoured to explain the caufe of this circumftance.[†] All the writers on the goitre of Europe[‡] have obferved, that it is lefs frequent among men than among women. In Boutan, according to Mr. Saunders, the

* " From all the accounts I can get from the Cohofs-country in Connecticut, where this diforder prevails, and all my obfervations here (at Onondago), I cannot learn that it ever affects men." Letter to me, dated Onondago-lake, November 16th, 1798.

+ Sce page 2. ‡ Coxe, Gautieri, Foderé, &c. &c.

cafe is the fame*. I am inclined to think, that of a given number of goitrous perfons in the old and in the new world, the proportion of females in the latter is much greater than in the former. But I ought to be fenfible, that we are not yet prepared to make a calculation of this kind. Even in Europe, and in the other countries of the old world, our materials for fuch a calculation are too imperfect. But in America, they are peculiarly deficient. We are certain, meanwhile, that in both portions of the globe, the difeafe, in this refpect, preferves a common feature : females effectially are its victims.

THE goitre of the ftate of New-York is not confined to the human kind. In that part of the Military Tract which is called Manlius, I was affured that both fheep and young calves are fometimes affected with large fwellings of their necks. A calf, which had been weaned about three weeks, and fuffered to run loofe, after drinking the water of a certain ftream, became greatly affected with a fwelling of the neck. The animal was foon killed, fo that it is not known how much farther the dif-

* Philosophical Transactions, for the year 1789. Part First. " As those (Mr. Saunders observes) who labour most, and are the least protected from the changes of weather, are most subject to the discase, we universally find it in Boutan more common with the women than men."

cafe might have proceeded. About three or four miles to the east of Onondago, there is a brook the waters of which are faid to occasion great fwellings of the necks of men, of women, and even of theep. The water of this brook is, certainly, highly impregnated with lime-ftone, to which the mischief is ascribed. In this country, it is customary to turn out the fheep to graze upon the Beech and Maple lands, that is, lands whofe principal large vegetables or timber are the Beech*, and different kinds of Maple[†]. The fheep, being thus fet at liberty, have an opportunity of going to the brook which I have mentioned, where great numbers of them, it is fuppofed from drinking the water, become afflicted with large fwellings of their necks. Thefe fwellings have not, hitherto, been obferved to be attended with much inconvenience to the fheep, and it is worthy of obfervation, that in the winter-feafon, they fubfide, or leave them. I was informed, that neither horfes nor cows have been observed to be affected with fimilar fwellings, from this or other brooks. But Mr. James Geddis, whom I have already mentioned, has lately affured me, that both fheep and horned cattle are fubject to this difeafe. " It is apt, he fays, to be fatal to calves and lambs." " In Manlius, fays the fame

* Fagus ferruginea of Aiton.

† Acer faccharinum, or Sugar-Maple, &c.

gentleman, I have lately feen a fheep with a very large neck. She was fatting for the butcher, as fhe had always loft her lambs by this diforder^{*}."

IT is not a new obfervation, that other animals, befides the human kind, are afflicted with the difeafe of goitre. Mr. Coxe informs us, that in fome parts of Switzerland, even the dogs are fubject to "goitrous tumours," as he calls them[†].

I WISH it were in my power to afcertain, with abfolute certainty, the actual extent of country in which this difeafe prevails. If this could be done, it would be a matter of much importance. It would enable us to fpeculate with more confidence concerning its origin, or caufe. Knowing the limits of the difeafe, it would principally be neceffary to afcertain, what are the peculiarities in the climate, the foil, and the waters of the country. But we have, as yet, afcertained little on this fubject except the existence of the difeafe. Almost every thing valuable refpecting it remains to be difcovered. I have given the hint. I am anxious

* Letter to me, dated Onondago-lake, November 16th, 1798.

† Travels in Switzerland, in a Series of Letters to William Melmoth, Efq. Vol. I. p. 349. Dublin : 1789. Octavo. that it fhould be purfued by those who enjoy more extensive opportunities of observing the difease.

IN the meanwhile, it may not be altogether ufelefs to give a rude view of the range of the goitre in the ftate of New-York. I mean its range from eaft to weft. Of its extent from north to fouth I can fay nothing that deferves attention.

I FIND the difeafe in the vicinity of Old-Fort-Schuyler, about twenty miles from the head of the Mohock-River. Here, indeed, we obferve fome of the worft cafes of it*. It is not uncommon at Fort-Herkemer, on the German-Flats; at Fort-Dayton; and at Henderfon-town, as already mentioned. I am affured, that it has never been feen quite as low down the Mohock as the Little-Falls of this river, about fifty-fix miles weft of Albany. It is unknown at Schenectady, except by name.

FROM this view of the fubject, we may, perhaps, for the prefent, fix upon the Little-Falls of the Mohock, as the utmost limit, towards the east (I mean along the river), of this difease. From the vicinity of the Falls to the village of Old-Fort-Schuyler, it appears to prevail more or less; and from this place, westward and fouth-westward, through a confider-

* See page 8.

able extent of country, as at Brother-town, Oneida, Canafaraga*, Onondago, and in other parts of the military diffrict, to within a few miles of the eaftern banks of the Cayuga-Lake.

AT Geneva, which is fituated on the banks of the Canada-Saga, or Seneca-Lake, I could not find that any inftances of the goitre have been obferved. A phyficiant, who refides in this town, knew nothing of the complaint : nor has it, to my knowledge, been observed in any part of the country immediately adjacent to the lake. I did not hear of the difeafe in my progrefs, weftward, through the Jeniffeia-country. But an Indian, of the Wunaumeeh tribe, has informed me, that he has feen feveral cafes of it among the Seneca and other Indians, who inhabit the rich flats along the banks of the Jeniffeia-river. I think I can depend upon the information of this Indian, who is an intelligent man. From the Jeniffeia, weftwardly, to the outlet of lake Erie, the country is, in a great measure, a wildernefs, being inhabited, or rather wandered over, by a few Indian families. Of courfe, it is not eafy to fay, whether this latter diffrict contains much of the materials of the difeafe. This will be af-

* Canafaraga is a fmall Indian village, about thirty-two miles, fouthweft, from Old-Fort-Schuyler, and eleven miles, fouth-weft, from Oneida.

† Dr. Goodwin.

certained in the future population of the country. Meanwhile, I fhall obferve, that there are fome cafes of goitre among the Tufcaroras, who are fettled near the utmost western verge of New-York, about ten miles from the Falls of Niagara.

THUS, we are already in poffeffion of facts which evidently flow, that the difeafe of goitre has an extensive range in the flate of New-York. Future inquiries will, I doubt not, discover the difeafe in many other parts of this country, in which I have neither feen nor heard of it. I have already hinted, and fhall now proceed to show, that it is not exclusively confined to the state of New-York, but that it is a common complaint in various other parts of our continent.

CASES of the goitre have been observed in different parts of Lower-Canada, particularly in the low and marshy grounds, between St. John's and Montreal.

THE difeafe is alfo known in the flate of New-Hampfhire, on the Connecticut-river. In this part of the country, as well as in New-York, it is called the "fwelled neck." It is faid to be much lefs common now than it was twenty or twentytwo years ago. A GENTLEMAN, whom I met with in my journey through New-York, informed me, that the goitre is not uncommon in the county of Bennington, and ftate of Vermont*.

MR. James Geddis informs me, that this diforder " prevails" in the Cohofs-country, in Connecticut, where, from all he can learn, it never affects men[†].

WE are in poffeffion of more information concerning the existence of the goitre within the limits of Pennfylvania. Having been informed that this difease has been observed at Pittsburgh, and in other parts of the western country, I wrote to my friend Dr. George Stevenson, of Pittsburgh, on the subject. I here give a part of the information which he has communicated to met.

" CASES of goitre are met with among the inhabitants on the waters of the Allegheny and French-Creek, and at Sandusky; a few instances on Monongahela, and at this place, where, out of 1400 inhabitants, there are not less than 150 perfons who have it.

* This county is fituated in the fouth-west corner of Vermont, where it borders on the state of New-York.

† Letter to me, already referred to. See page 11. Note.

‡ In a letter, dated Pittfburgh, January 4th, 1798.

"IT is common to the natives and perfons lately fettled at those places, affecting both fexes, especially females, and children even at the age of 18 months.

"THE fwelling appears on either fide of the neck, or in front; fometimes it is an uniform enlargement of the neck, evidently increasing in winter, and fometimes decreasing in fummer."

It does not appear from Dr. Stevenson's letter, that the difease has, in any instances, arisen to a very troublesome or alarming height. The doctor, however, informs me, that some of the patients are not unwilling to apply for relief, though little has, hitherto, been done for their benefit*.

THE goitre is extremely common among the inhabitants on French-Creek, one of the principal branches of the Allegheny-river. It is there almost entirely confined to females.

My very intelligent and worthy friend, Mr. John Heckewelder, informs me, that he has obferved the goitre among the Indians, living on Big-

Beaver-Creek, and on the river Muskingum*. It was principally confined to the " women and girls." "With fome, fays he, as they grew up, the complaint increased; with others (especially where a remedy was applied) it wore away again, though there are few that think much of it." In the fummer of 1797, " I faw, fays Mr. Heckewelder, two women, whom I knew when girls at the age of ten or twelve years, and in whom this fwelling had then begun; now (1797) with fuch necks that it furprized me. This fwelling with one projected even before her chin. I asked one of them, whether the had never made use of any remedy to cure her. She faid, fhe had applied burnt and powdered muscle-shells, but to no effect. She felt no pain, fhe faid; and was the mother of two children +."

THERE are feveral cafes of the difeafe among the Canadians who are fettled at Detroit. It is principally confined to women, and is there thought to be owing to the drinking of the waters of the

* Big-Beaver-Creek, commonly called Big-Beaver, is a pretty confiderable branch of the Ohio, into which it empties itfelf, on the north fide, about twenty-nine miles below Pittfburgh. Mufkingum is a more confiderable branch, which falls into the Ohio, on the fame fide, about one hundred and fixty miles below Pittfburgh.

† Letters to mc, dated Bethlehem, December 2d, 1797, and January 13th, 1798.

In the prefent very imperfect flate of our knowledge of the goitre of North-America, thefe few notices concerning the fpread of the difeafe through our country will not be deemed unacceptable to the curious reader. They will affift him in inveftigating the caufe of the difeafe, a fubject of great importance, to which I will now turn my attention.

SECTION II.

OF THE CAUSE OF THE GOITRE.

IN entering upon this fubject, I think it proper to obferve, that wherever I travelled, in the ftate of New-York, the people to whom the difeafe was known, afcribed it to the water of the country*. I do not mention this as a *proof* that the water is, in any manner, concerned in the production of the

* It is but just to mention, in this place, that my friend, Mr. Geddis, thinks it "very problematical" that this difease is occasioned by the water. Letter to me.

difeafe: for the great mass of the people of a country are feldom remarkable for a talent of difcovering the connection between phyfical caufes and effects. But this opinion is entitled to a careful examination; becaufe feveral facts may be adduced in fupport of it; and becaufe fome refpectable European philosophers have attributed the goitre of Europe to the drinking of water, impregnated with certain terreftrial matters. The ingenious Mr. De Luc, in particular, has espoufed this notion. He fays, that the waters that are used by the people of the Alps, although to the eye they appear clear and pure, are neverthelefs highly impregnated with terrestrial matters. He imagines that these matters are circulated into the affected parts, where they obstruct the veffels, forming a kind of tophus, or cruft, and thus give rife to the difeafe*. Mr. Coxe, in his interesting Travels in Switzerland, without mentioning De Luc, alfo fuppofes that the calcareous matter called tuf is the caufe of the difeafe. " During my travels through Europe, fays this intelligent writer, I never failed to obferve that tuf, or this calcareous deposition, abounds in all those districts wherein goiters are common. I noticed goitrous perfons and much tuf in Derbyshire, in various parts of the Vallais, in the Valteline, at Lucerne, Friburgh,

* I am obliged to quote Mr. De Luc's opinion from memory

and Berne, near Aigle and Bex, in feveral places of the Pays de Vaud, near Drefden, in the vallies of Savoy and Piedmont, near Turin and Milan.

" To defcend, continues our author, to particular inftances. The inhabitants of Friburgh, Berne, and Lucerne, are much fubject to guttural excrefcences. With refpect to Friburgh, I obferved that one of the principal fprings which fupplies the town with water, iffues from a neighbouring ftonequarry, and has formed large depositions of tuf on the rock from which it bubbles. The pipes, alfo, which convey water to the public fountains at Berne, are extremely charged with the fame calcareous fediment; and a gentleman, on whofe veracity I can depend, affured me, that he is fubject to a fmall fwelling in the throat, which ufually increafes in winter, when he is chiefly refident at Berne, and diminishes in fummer, on his removal to other places, where the waters are not loaded with tuf.

"I was, moreover, informed by General Pfiffer, that at Lucerne all the waters, excepting one fpring, are impregnated with *tuf*, and that the natives, who dwell near that fpring, are much lefs fubject to goiters than the other inhabitants; that the fame difference is obferved among the members of the fame family, between thofe who drink no water but what is drawn from that fpring, and the others who do not use that precaution. The General shewed me also the tin vessel, in which water was every morning boiled for his use, and which was so speedily and thickly incrustated as to render it necessary to have it cleansed twice a week. The water which yields this deposition, is as transparent as crystal.

"I MAY add likewife, that I vifited many places which border upon those districts wherein goiters and *tuf* are frequent, and which have precisely the fame fituation and climate, yet whose inhabitants were not goitrous, and where I did not observe any appearance of *tuf**."

BESIDES Mr. De Luc and Mr. Coxe, feveral other writers are of opinion, that the goitre of Europe is occafioned by the drinking of water impregnated with lime, felenite (or gypfum), and other forms of calcareous earth. Nay, fome of thefe writers have even imagined, that the difeafe owes its origin to an atmosphere, impregnated with thefe terreftrial matters. This last opinion does not appear to me to be worthy of a ferious notice. But the former is now to be examined.

I HAVE already observed, that wherever I travelled, in the state of New-York, the inhabitants, ac-

* Travels, &c. Vol. I. p 347, 348, 349.

quainted with the difeafe, afcribed the goitre to the water of the country. Some of the more intelligent people conceived it owing to an impregnation of this water with a tuf, or calcareous matter. They afferted, that wherever the difeafe was feen fuch calcareous waters abounded. I heard much of a certain brook, a few miles eaft of Onondago, which has the character of producing confiderable fwellings of the necks of men, women, and fheep. This is a ftrong limeftone-water*.

IN Manlius, I was affured, that fome of the waters, which are thought to occafion the difeafe, are fo ftrongly impregnated with limeftone, that they often deposit it in the ftate of a mortar (as to confiftence) in the depressions, &c. of the ground, where these waters have run[†]. I had not an opportunity of feeing any proofs of this affertion. But I did not doubt the veracity of my informant; because I knew that water, besides disfolving a certain

* See page 13.

[†] Some of the fprings in the Onondago-Valley are fo ftrongly impregnated with limeftone, that they incruft the leaves, among which they run, fo firmly with the earthly matter, that the winter's froft has no effect in breaking the cruft, which continues as hard as a rock. In general, the incruftations that are formed by our petrifying waters do not refift the feverity of winter, but are crumbled into a fine powder, which contributes not a little to enrich the foil, in many parts of the United-States. This sparticularly obferved upon feveral of the branches of the river Potowmak, in Virginia. quantity of limeftone, might hold in diffusion a very large portion of this earth, fufficient to deprive it of its transparency, and to give it a great increase of specifick gravity. Moreover, in my passage through the western parts of the state of New-York, my attention was often solicited by an unufual aspect of a great deal of the limestone. It was less folid than what I had been accustomed to see in other parts of the country, and appeared evidently to have been formed, at no very remote period, by a deposition from water.

IN the vicinity of Brother-town, and in other parts of the country in which the goitre prevails, it is common to find the pebbles and ftones in the brooks incrufted with a calcareous covering. I poffefs fome pebbles of this kind that were collected at Brother-town, and fhown to me, as a proof of this theory, by a phyfician[†], whom I accidentally met there.

THESE facts may feem to favour the notion, that the goitre of our country is owing to the terreftrial matters which I have mentioned. The fupporters of this notion will, doubtlefs, be pleafed to learn, that in feveral of those parts of North-America where the difease prevails, we discover a great abun-

† Dr. Hopkins.

dance of those very materials to which Mr. Coxe and other writers have attributed the goitre and cretinism of Europe. But this theory appears to me to be the refult of a very limited view of the fubject. Indeed, I cannot help observing, that most of the writers on goitre have been contented, in affigning a cause for the complaint, to take a very narrow view of the question. I am far from fupposing, that my attempt towards an investigation of the cause of the difease will exempt me from that censure, which I have applied to others.

IN contemplating the *calcareous* theory of goitre, two obvious queftions will occur to every intelligent reader. These questions are worthy of being stated, and of an attentive confideration.

FIRST. It is natural to inquire, whether we difcover limeftone in all those parts of the United-States in which the goitre has been observed? I am not prepared to answer this question as fully as I could wish. Some facts, however, I have collected, and they are now to be mentioned. Mr. Heckewelder, whom I have already quoted, assures me, that he has observed this difease among the Indians in the western country, "where there was not a limeftone to be feen[†]." At Pittsburgh, where

† Letter to me, dated December 2d, 1797.
there is but little limeftone, the difeafe is common^{*}. There is no limeftone in the county of Bennington, where, I have already faid, the goitre is not uncommon[†]. The difeafe is known at Fort-Dayton, where, I am informed, no limeftone has hitherto been difcovered. Mr. Coxe positively afferts, " that wherever there are goiters there is tuf-ftone[‡]." This, with respect to the countries of Europe in which he has observed this difeafe, may *possibly* be true: but the inftances just mentioned, and I doubt not that in time we shall be able to adduce many more of a fimilar kind, are fufficient to show, that in North-America, there is not an *obvious* necessfary connection between the goitre and calcareous waters.

BUT even in Europe, Mr. Coxe's obfervation will not, I believe, be found to hold fo univerfally true as this gentleman has imagined. Mr. Foderé, who has lately publifhed a very interefting work on *Goitre and on Cretinifm*, remarks, that the waters of Maurienne, where this difeafe prevails to a very great degree, are much lefs impregnated with cal-

* " Limeftone here is fcarce, of a bad quality, and when calcined has the appearance of afhes." Dr. Stevenfon. Letter to me, dated Pittfburgh, January 4th, 1798.

+ See page 18. The water of this county is faid to be remarkably good.

‡ Travels, &c. Vol. I. p. 349.

careous matters than those of the higher countries, where it is less common*.

SECONDLY. If water impregnated with calcareous earth be the caufe of the goitre, why, it may naturally be afked, is not this difeafe more generally, or even conftantly, met with in thofe parts of our country, in which calcareous ftrata, and calcareous waters, abound?

I BELIEVE it may be faid, with a good deal of confidence, that there are few parts of the world more abundant with limeftone, and other forms of calcareous earth, than many extensive portions of the United-States. It is not my business, in this place, to exhibit a minute view of the diffusion of this earth through one country. This will be done in a work† in which I am now engaged. At prefent, it will be fufficient to fay, that the difease of goitre is entirely unknown in fome of the most calcareous parts of the country. In the county of Lancaster[‡],

* Effai fur le Goitre et le Crétinage, &c. Turin: 1792. 8vo. I exceedingly regret that I have not had an opportunity of confulting this work, of which, however, I have been fo fortunate as to procure a copious analyfis, in the *Medicinifche Bibliotbek* of Professor Blumenbach. See Dritten Bandes, viertes Stuck. Gottingen, 1795.

† Travels through part of Pennfylvania, Virginia, New-York, &c, &c,

} In Pennfylvania.

calcareous earth is the predominant ftone. It is fpread upon the furface, and is found to be the prevailing ftratum at the depth to which wells, &c. are dug. The water of this county is, in general, of that kind which we call hard. It is fo ftrongly impregnated with limeftone, that it is common to find the wooden troughs, through which the water of meadows, &c. is conveyed, incrusted with the earth; and a fimilar incrustation is frequently found formed over the whole internal furface of the tea-kettles, &c. in which water has been boiled. In fome parts of the county of Dauphin*, particularly in the neighbourhood of Harrifburgh, and along the Swatara above Middletown, there are immense collections of limestone. At Bethlehem, at Eafton, and other places in the county of Northampton, the prevailing ftone is limeftone; and water impregnated with this earth is the common drink of the inhabitants. But in none of thefe places is the difease of goitre seen. And here we should expect to find it, as the counties which I have just mentioned are fome of the most thickly

I DO not affert, that these arguments are conclusive in disproving the calcareous origin of goitre. But, I prefume, it will not be denied, that they

* In Pennfylvania.

fettled of any in the United-States.

have their weight. On the one hand, we have feen, that there is little or no limeftone, or any other fpecies of calcareous earth, in feveral of those parts of our country where the goitre prevails. On the other hand, the goitre is entirely unknown in fome of the most calcareous districts of America.

MR. Coxe observes, that " although it appears that wherever there are goiters there is tuf-ftone; yet the reverfe is by no means true, that wherever the waters deposit tuf, there are always goiters. For perhaps the natives do not drink of the fprings which are loaded with tuf; or that fubftance is not fufficiently diffolved in the waters; abfolute folution being, perhaps, neceffary to produce thefe fwellings*." On this paffage, I fhall only obferve, that it is certain, that in many parts of the United-States, as in the county of Lancaster, there are no cafes of goitre, although the inhabitants do drink the waters, which hold in folution a confiderable quantity of calcareous earth, thefe American waters being, like those mentioned by Mr. Coxe, "as transparent as cryftal."

IT remains for me to mention another argument in fupport of the notion that this difeafe owes its origin to calcareous earth. Mr. Coxe calls it " the

* Travels, &c. Vol. I. p. 349. Note.

ftrongeft proof, in favour of this opinion." " A furgeon, whom I met at the Baths of Leuk, informed me, fays the traveller, that he had not unfrequently extracted concretions of *tuf-ftone* from feveral goiters; and that from one in particular, which fuppurated, he had taken feveral flat pieces, each about half an inch long. He added, that the fame fubftance is found in the ftomachs of cows, and in the goitrous tumours to which even the dogs of the country are fubject*."

It is not neceffary to call in queftion the veracity of this furgeon. Several very refpectable writers have found fimilar matters in the thyroid gland. Haller found cyfts enveloped with a firm cartilaginous covering, bony concretions†, &c. Morgagni, to whofe invaluable work I must refer the reader, who is defirous of obtaining a great deal of interesting information concerning the diseafes of this gland, fums up, in a few words, the experience of various writers; " that most of them met with hard bodies of a cartilaginous, bony, or stony

* Travels, &c. Vol. I. p. 349.

† "Vidi in glandula thyreoidea cyftides, etiam cartilagineo velamento firmatas, & effufum fabulum, alias offea concrementa in glandula difperfa, partemque glandulæ in pinguis lardi fpeciem degenerem." Elementa Phyfiologiæ Corporis Humani. Tomus Tertius. p. 400. Laufannæ, 1766. nature, and fometimes even found the gland itfelf become bony, or of a ftony nature*."

THE existence of calcareous matters in the thyroid gland of goiters does not appear to me to be a proof, that the difease which I am confidering is, in any degree, owing to the drinking of water impregnated with this earth. Such matters are very frequently found in other parts of the bodies of perfons who, perhaps, had never been accustomed to drink calcareous waters[†]. I may add, that Mr. Foderé did not find in any of the tumours which he examined any thing like this earth.

FROM the various facts and objections which I have ftated, I am compelled to reject the fyftem which afcribes the difeafe of goitre to the ufe of water impregnated with calcareous earth. I muft confefs, however, that until I came to take a nearer and more minute view of the fubject, the fyftem did not appear to me an implaufible one. Some of the facts related by Mr. Coxe feemed almost to car-

* The Seats and Caufes of Difeafes inveftigated by Anatomy, &c. Vol. 111. Letter L. Articles 30, 31, 32, 33, 34, 35, 36, and 37. English translation. London, 1769.

† Whilft I was a ftudent of medicine, in the Univerfity of Pennfylvania, I diffected, at the anatomical theatre, the body of an old emaciated woman, whofe lungs were full of pieces of calcareous earth. Similar appearances have been difcovered by Morton, Curtius, Fernelius, Francus, Morgagni, and many other writers. See Appendix. ry conviction along with them,—as to the caufe of the difeafe in Europe. The facts mentioned to the traveller by the gentleman whofe goitre commonly increafed while he refided at Berne, and thofe mentioned by General Pfiffer, are peculiarly ftriking*. Some of my readers will not, therefore, be furprifed to learn, that I once adopted Mr. Coxe's notion, efpecially when I found, that the waters of thofe parts of the ftate of New-York, in which I first became acquainted with the goitre, are ftrongly impregnated with calcareous earth. But I now take my leave of this fystem, and proceed to the confideration of fome others, which have, at different times, been proposed by writers to account for the origin of the difeafe.

WHILE it appears improbable to me, that calcareous earth is the caufe of the goitre, I am even inclined to doubt, whether this complaint is, in any manner, occafioned by the drinking of the water of the countries in which it is obferved to prevail. Dr. Haller, before me, feems to have entertained a fimilar fkepticifm. The following are this great phyfiologift's words : "Nulla in Helvetia vallis eft, quae fuo rivo careat, nullus fere pagus, quem vivi aquarum fontes non reddant lactiorem. Vix noti

* See pages 23 and 24.

putei, nifi paucifiimis locis, ubi nulla declivitas eft. Quare neque credo ab aquarum vitio ftrumas nafci. Etfi enim in Valefia incolae lutofas aquas bibunt, Bernae tamen puriffimae funt, neque ideo ftrumae in utroque fexu infrequentes*." Thus it appears, that although the difeafe is known in Valais, where the inhabitants drink waters impregnated with terreftrial matters, it is alfo known, and not uncommon, at Berne, where the waters are very pure[†].

I MUST not conceal, that the water of that part of the ftate of New-York in which I have obferved the goiter to prevail, befides holding in folution and diffusion a portion of calcareous earth, appeared to be otherwife very impure, and was certainly unpleasant to the tafte. In the military township of Pompey[‡], the water is fo difagreeable, that many of the inhabitants have supposed it to be the cause of a malignant bilious fever, called the

* Alberti y. Haller Historia Stirpium Indigenarum Helvetiæ Inchoata. Tomus Primus. Præfatio, p. vi, vii. Bernæ, 1768. Folio.

† It is worthy of obfervation, that Dr. Haller and Mr. Coxe differ in their affertions refpecting the water of Berne. The first of these writers afferts, that it is very pure, whereas Mr. Coxe fays, that the pipes which convey water to the public fountains at Berne are extremely charged with a calcareous fediment. See page 23. On this fubject, Mr. Coxe appears to have been better informed than the great Swifs philosopher.

‡ In the county of Onondago.

" yellow water," which has carried off many of their horfes. I fufpect that a chemical analyfis of fome of thefe waters will fhow, that they hold in folution a confiderable portion of gypfum; whilft others hold in diffufion a portion of fulphur. Both gypfum and fulphur are very abundant in feveral parts of the ftate of New-York: the former, in particular, abounds in fome of thofe very parts of the country in which the goitre is a common complaint.

THE following fact, communicated to me by Dr. Stevenfon, will, perhaps, be thought to have fome weight in difproving the notion, that the goitre is owing to the water ufed as drink by the inhabitants. "Formerly the inhabitants of Pittfburgh drank the waters of the neighbouring rivers*: of late, wellwater only is in ufe. The increafe of inhabitants confidered, the difeafe is not more frequent than formerly[†]."

THE goitre has often been afcribed to the ufe of fnow-water, ufed as a drink. But there can be very little foundation for this idea, though it has been fupported by feveral refpectable writers. It is

* The Allegheny and Monongahela.

+ Letter to me, already referred to.

certain, at leaft, that the inhabitants of the ifland of Sumatra are greatly afflicted with this difeafe, and yet no fnow ever falls in that ifland. On the contrary, the difeafe has never been feen in Greenland, though in that inhofpitable portion of the earth, fnow-water is the common drink of the inhabitants. The refpectable Dr. Watfon obferves, that he never met with a cafe of the complaint, in the county of Weftmoreland, in England, "where there are higher mountains and more fnow than in Derbyfhire, in which county the complaint is very common^{*}."

LINNÆUS tells us, that this difeafe is entirely unknown in Lapland, where, it is unneceffary to obferve, water in which fnow has been diffolved muft often, and very largely, be drunk. In his beautiful apoftrophe on the happinefs of the Laplanders, the immortal Swede confiders their exemption from goitre, as one of their felicities. "Tuus potus, fays he, aqua cryftallinæ pelluciditatis, quæ nec cerebrum infania adficit, nec ftrumas in Alpibus tuis producit[†]."

* Chemical Effays. Vol. II. p. 158. London, 1787.

† Flora Lapponica. I quote the paffage from memory. Here I may obferve, that tuf, fuppofed by Mr. Coxe to produce goitre, is common in Lapland. Speaking of this fubftance (the Tophus Ludus of Linnæus), the Swedifh naturalift fays, "*Habitat in littoribus fluviorum glareofo-argillaceis* Lapponiae, Dalekarliae, *aliifque.*" Syftema Naturae, &c. Tomus III. p. 186. Vindobonae, 1770. See Appendix. IT would be eafy to adduce inftances of many other countries, the inhabitants of which drink fnow-water, although the difeafe of goitre is entirely unknown among them. But, perhaps, it is not neceflary to purfue the fubject any farther. Some other objections to this theory will, however, be taken notice of immediately.

A LATE writer, Dr. Gautieri, confiders "expofure to cold, and the drinking of very cold water," as "a principal caufe" of the goitre. He remarks, that all the waters ufed by the people of Stiria and Carinthia, who are fubject to this difeafe, "are those which flow down the fides of the mountains, the tops of which being perpetually covered with fnow, render those ftreams of an exceflive degree of coldness." Dr. Gautieri entirely rejects the bad qualities of the fnow-water as productive of this difeafe, "any further than as it operates by its coldness fimply*."

MR. George Forster fays, that during his voyage round the world with Captain Cook, in the year

* Tyrolenfium Carynthiorum, Styriorumque Struma. A Jofepho Gautieri, M. D. Obfervata et Defcripta. Vindobonæ, 1794. I have not feen this work, and know nothing of it but what I learn from an analyfis of it in The Medical and Chirurgical Review, &c. Vol. I. p. 377-387. London: 1795. 1773, the greater part of the crew having drunk of the water that was procured by melting ice, were affected " with fwellings in the glands of the throat." " Water (fays this ingenious writer) melted from fnow or ice, is known always to have this effect, and the conftant use of it in mountainous countries produces those enormous wens (goitres) which are common among Alpine nations." Forster attributes the effects produced by the water to its having lost its fixed air*.

My objections to the fyftems of Dr. Gautieri and Mr. Forfter may eafily be collected from what has already been faid. The difeafe is common in Sumatra, and fome other hot countries, where no fnow or ice water is ever feen. Mr. Forfter is, moreover, greatly miftaken in afferting, that water melted from fnow or ice is known " always" to produce goitre; for this difeafe is unknown in fome of thofe countries where, to ufe the words of Haller, an " æterna glacies†" prevails.

THESE objections, then, are decifive. They most plainly demonstrate, that neither fnow-water, nor any other water of an extreme degree of coldness, is the cause of the disease. In addition to these facts,

* A Voyage round the World, &c. Vol. I. p. 107, 108. London, 1777. 4to.

† " Æternæ glaciei moles."

I may remark, on the authority of Mr. Foderé, that it is obfervable, in Maurienne, that the goitre is entirely unknown among the people who drink the water, near its fource, on the mountains, whereas it is common among those who drink the fame water as it flows downwards, and becomes more like fpring-water*.

MR. Foderé likewife remarks, that the goitrous tumour commonly increafes in fummer, and decreafes in winter, efpecially if the weather, in this latter feafon, be dry inftead of moift*. This obfervation, which, certainly, goes fome way to prove, that the difeafe is not occafioned by the drinking of cold water, is perfectly agreeable to one which I have already made, in a former part of this memoir; that the goitre of New-York has frequently been obferved to fubfide or leffen during the winter feafon; and, in particular, that, at this time, the fwellings of the necks of fheep fubfide or leave them[‡].

* Effai, &c.

[‡] See page 13. The queftion concerning the increafe and decreafe of goitre, in cold or warm weather, is one of confequence, and has not been fufficiently attended to. The coincidence between Mr. Foderé's obfervation and that of the people in the ftate of New-York is ftriking. I do not find, that Dr. Gautieri, who afcribes fo much to the influence of cold air and very cold water, has faid any thing on the fubject. Dr. Stevenfon's remark muft not be forgotten. This gentleman fays (fee page 19), that the goitre at Pittfburgh " evidently" increafes in winter, and " fometimes" decreafes in fummer. I DO NOT, by thefe obfervations, mean to deny, that glandular fwellings are often induced by cold. This is a fact which is familiar to every phyfician. The fact related by Mr. Forfter, and already quoted*, is a ftriking one. I have, more than once, experienced, in the fummer-feafon, a confiderable fwelling of the glands of my throat, a very flort time after eating a pernicious luxury, which has come into very general ufe in our city. I mean ice-creams. But neither in this cafe, nor in the inftances related by Mr. Forfter, was there any evidence that the thyroid gland was efpecially, or at all, affected. The fwelling (in my cafe, at leaft) appears to have been principally confined to the internal tonfils.

(41)

It is the opinion of fome perfons, with whom I have converfed on the fubject, that the difeafe of goitre is occafioned by the drinking of water fupplied by fprings near beds of foffil-coal. This theory has been the refult of very partial obfervation. The difeafe is common at Pittíburgh, where coal abounds. But there are many extensive coal-countries of America, in which this difeafe has not been obferved. I may fay the fame of Europe. On the contrary, the goitre has an extensive range in

* See page 39.

that part of the ftate of New-York in which no coal has ever been difcovered.

MR. Saunders, who has given fome account of the goitre of the country of Boutan, informs us, that " on finding the vegetable productions of Boutan the fame as those of the Alps, in almost every inftance, it occurred to him, that the difease might arise from an impregnation of the water by these plants, or the foil probably posses of both countries, with very few exceptions, being fo nearly alike*."

I COULD adduce but one argument (if indeed it were one), that the goitre of our country (I particularly mean of the ftate of New-York) is owing to an impregnation of the waters by certain vegetables. It is this, that in that tract of the country where the goitre prevails, there are many of the plants of those alpine countries of Europe, in which the fame difease has been observed. But on this fubject a general remark may be made: that as we approach the northern parts of our continent we find a great many of the plants of northern Europe. This fact may feem to favour the notion which I have mentioned. But here I must observe,

* Philosophical Transactions, for the year 1789. Part First.

I DO NOT KNOW whether it is very important to obferve, that fome of our Indians imagine, that the goitre is produced by certain infects inhabiting the water, which they drink. There was a time, during the reign of what might be called the ANI-MALCULAR SYSTEM, when a fact or notion fuch as this would have been greedily caught at by fome ingenious man; by a Bonomo, a Calvoli, or a Linnæus.

A COARSE and unwholefome food has been affigned as one of the caufes of the goitre. Among other articles, chefnuts have been particularly accufed of favouring the difeafe. Dr. Gautieri remarks, that thefe nuts are produced in great plenty among the Tyrolefe (where the goitre is a common complaint), and are eaten by the poorer inhabitants, with great avidity. Children, he tells us, are obferved, in fwarms, furrounding the trees, greedily devouring both the ripe and the unripe fruit. The natives make the nuts into puddings, which are very difagreeable to ftrangers, but are much relifhed

* See Appendix.

by the people themfelves*. " Hogs flefh is much fought after amongft them, but this is taken in fuch a dry, hardened, ftate that it can fcarcely afford wholefome nourifhment. They greedily devour the fat of the meat, and that without any condiment, not even falt, which might render its digeftion more eafy. Thus the worft kind of food, and prepared in the worft manner, without any regard to cleanlinefs, the ufe of wine of a bad quality, and drinking fpirituous liquors to excefs, afford ample caufe for a vitiation of the whole habit[†]."

It is not, at all, improbable, that a coarfe, or rather unwholefome, food may predifpofe the fyftem to goitre. But there is no reafon to fuppofe, that fuch food is capable of producing the difeafe. Whole nations of mankind fubfift upon a diet as crude and as unwholefome as that of the Tyrolefe, without ever experiencing the difeafe. On this fubject Mr. Foderé has favoured us with an obfervation, which is peculiarly ftriking. He tells us, that no food can be coarfer than that which is ufed by the people of the mountains, where the goitre is unknown, and none richer and better than that of the rich of the cities in the vallies, who are neverthelefs afflicted with the difeafe[‡].

* See Appendix.

† The Medical and Chirurgical Review, &c. p. 385, 386.

‡ Effai, &c.

In our own country, there does not appear to be any neceffary or obvious connection between the goitre and the nature of the food of thofe who labour under this complaint. For although the difeafe is not uncommon, in feveral parts of the country, among the Indians, who occafionally labour under a deficiency of good food, yet I do not know, that it is more common among thefe favages than among the whites (inhabiting the fame tract of country), who, purfuing the bufinefs of agriculture, have at all times an abundance of found and nourifhing aliment. I may add, that the difeafe is entirely unknown among fome of thofe Indian tribes who more frequently labour under a fcarcity of food than any of the other tribes of our continent.

I PROCEED to the confideration of fome other fuppofed caufes of goitre.

DR. Gautieri is of opinion, that one of the "exciting" caufes of this difeafe is the cuftom which the common people have " of drawing carriages like cattle up the hills, which they do by cords placed over the fuperior part of the thorax. By the preffure they occasion, and by the frequent impediments to refpiration, the blood is prevented from returning with freedom by the jugular vein^{*}."

* The Medical and Chirurgical Review, &c. p. 386.

THE opinion of Dr. Gautieri receives confiderable fupport from a fact communicated to me by Mr. Heckewelder. This gentleman, who has feen a good many cafes of the goitre among the Indians, particularly the women and girls, in the weftern country, afcribes the complaint to the heavy burdens which they carry, " bearing all the weight they have on the back, by a band which is fixed at their forehead. I have taken notice, fays he, when it first made its appearance in girls, which was never until they were employed in carrying burdens*. The men generally carry their burdens with a band fixed at their breaft, wherefore they are not fo fubject to this difeafe.[†]"

THESE facts are interefting. They feem to render it highly probable, that the goitre, or at leaft fome fpecies of bronchocele, may be occafioned by fimple preffure, producing an impediment to a free and regular refpiration. Whether the difeafe thus produced be the *true* goitre, I will not pretend to determine. It is, most probably, that fpecies of bronchocele which Sauvages, after Roncallus, calls Bronchocele ventofa[†].

OTHER caufes, confiderably fimilar to the one

* See Appendix.

+ Letter to me, dated Bethlehem, December 2d, 1797.

Se e page I.

just mentioned, have been affigned for the production of goitre, or a tumour of the thyroid gland. It was the opinion of Andreas Pasta, one of the pupils of Morgagni, that the reafon why women are more fubject than men to the Bronchocele Botium, is this, that a debility is induced in the thyroid gland, in confequence of the frequent vomitings to which the fex is liable, during the period of their pregnancy*. Lalouette, a French writer, fays, that the thyroid gland is frequently affected with aerial tumours, which he afcribes to the throes of women in labour. In this cafe, he imagines, that the air is forced from the trachea into the cellular texture of the gland. Haller, from whom I quote what I have just faid, does not difpute the theory of Lalouette. The great phyfiologist informs us, that Theophilus de Bordeu inflated the thyroid gland from little orifices above, or immediately in, the first ring of the bronchia, and by a very small duct; and that he also introduced briftles through thefe paffagest.

* See page 2.

† " Addi poteft, frequentes tumores aereos in glandula thyreoidea a nixu parturientium oriri, qui cellulofam telam diftendant, manifefto argumento, vias effe ex afpera arteria, per quas aer in thyreoideam glandulam exeat, eoque, & in laryngis ventriculos liquidum glandulæ per lymphatica vafa effundi poffe fufpicatur vir cl. (Lalouette). Sunt denique fuper primum bronchi anulum oftiola, aut in ipfo primo anulo, & minimus ductus, per quas vias *Theophilus* de Bordeu glandulam thyreoideam inflavit, & per quas fetas immifit." Elementa Phyfiologiæ Corporis Humani. Tomus Tertius. p. 398 & 399. MR. Foderé remarks, that during pregnancy, the goitre will eafily arife, often fuddenly, becoming painful, and feldom difappearing, unlefs due attention is paid to the complaint, particularly in a country or diffrict where it is endemial. Our author does not doubt that, in these cases, air is the cause of the difease. This, he thinks, is proved by the fuddenness of the fwellings, which often arise after passions of the mind, when breathing, as well as in the case of pregnancy, is impeded. Tumours from these causes are not, according to Mr. Foderé, exclusively confined to the thyroid gland, but also affect the neighbouring parts*.

THE theory of thefe aerial tumours of the thyroid gland feems, at prefent, to be more eafy of explanation than formerly. Late inquiries appear to have more completely eftablished the fact, that there is an immediate communication between this gland and the larynx. Mr. Foderé blew air into a larynx, which had been well cleanfed, and foaked a while in water, and fecured by a ligature below. In confequence of this, the thyroid gland fwelled up. He alfo found, that on filling a larynx with spirit of wine, the fmell of the liquor was plainly perceived in the thyroid gland*.

* Effai, &c.

SECTION III.

OF THE CAUSE OF THE GOITRE, CONTINUED.

area but little elevated above

er sand sure anon plauna, Aleis, therefore, of opi-

THE learned and ingenious Mr. De Sauffure has proposed a new theory of the cause of goitre and cretinifm*. This gentleman's inquiries fully convinced him, that the goitre is not occafioned by melted fnow or ice, nor by water impregnated with terrestrial matters, nor by drunkenness, coarfe food, nor debauchery. After travelling along the greater part of the Alps, and directing his inquiries, with particular attention, to this interefting fubject, he affures us, that he has not feen a fingle village fubject to the difeafe, that was fituated at a greater height above the level of the fea than five hundred or fix hundred toifes; that is, between three thoufand two hundred, and three thoufand eight hundred and forty English feet. He has never seen the difeafe in plains opened on all fides. He has ob-

* Mr. De Sauffure treats of goitre and cretinism, as the fame complaint. He allows, indeed, that many goitrous perfons are not crétins, but he fays, that all the crétins he has seen are affected with goitre. It is a circumstance well calculated to show that the goitre and idiotism are not necessarily connected with each other, that although the swelled neck is a common complaint in many parts of North-America, it is very rarely seen in connection with idiotism. See Appendix. ferved that it is common in the narrow vallies, and that it generally ceafes where the vallies terminating expand into open plains. He is, therefore, of opinion that the caufe of the complaint, is to be fought for in fome modification or condition which is exclufively confined to vallies but little elevated above the level of the fea. This modification, in the opinion of our author, is an heated and ftagnated air, owing to the confined fituation of the vallies.

Some of the facts mentioned by Mr. De Sauffure, and other facts which I have collected, give confiderable weight to this theory. The Swifs philofopher obferves, that generally, in pretty wide vallies, where there are houses on both fides of the valley, those villages that are fituated on the fide the most exposed to the fun, which receives his direct rays, and the heat reflected back from the rocks over them, are more fubject to the difeafe than the villages which are exposed to the north. Thus, he observes, that the village of Branfon*, which is fituated oppofite Martigny, contains a much greater number of crétins, becaufe it is fituated to the fouth, at the foot of a rock, from which circumstances, it is more liable to be heated than Martigny.

MR. DE SAUSSURE is aware, that the heat alone

* In the Vallais.

of the fituation cannot be the fole caufe of the difeafe, fince the plains of many fouthern countries affected with a fuffocating heat are not fubject to it. He imagines, that the air which is confined in the vallies being much heated by the fun's beams, affumes a kind of corruption, the nature of which is not well underftood by us. This hot and vitiated air, principally affects the tender fibres of children, producing that relaxation of the fyftem, which appears to be a very general concomitant of the goitre and cretinifm of the vallies of Switzerland, and which, in the opinion of our author, is the caufe of the goitrous tumour, independently of any obftruction of the thyroid gland*.

It is a circumftance greatly in favour of Mr. De Sauffure's theory, that the goitre, in almost every part of the world, feems to prevail in the valleyfituation[†]. Thus, to confine my remarks, at prefent, to our own country, the difeafe is very common in the Onondago-Valley, in the state of New-York. This is a narrow and unwholesome valley. It is not uncommon in the vallies of the county of Bennington, in Vermont; and we have seen, that it

* Voyages dans les Alpes, &c. Par Horace-Bénedict De Sauffure, Professeur de Philosophie dans l'Académie de Geneve. Tome II. p. 480, &c. A Neuchatel, 1779.

+ See Appendix.

is very common at Pittsburgh. The situation of this last place is very fimilar to that of many of those parts of the old-world in which the difease prevails. It is a vale, or perhaps rather bafon, entirely furrounded by hills, except at the three openings which are formed by the triangular junction of the rivers Alleghaney and Monongahela. In other words, there is an opening, through the hills, down the Ohio, and one up each of the two The openings on the Ohio and Moother rivers. nongahela are not greater than the breadth of the rivers. But that up the Allegheny is much more confiderable, being near half a mile wide on each fide of the river, near two miles in length on the west fide, and five miles at least on the east fide. The whole area of the bason is about a mile and a half in diameter from north to fouth, and one mile from east to weft. The fouthern bank of the Monongahela, on the fouth fide of the town, is a pretty confiderable hill +, fuppofed to be between fix and nine hundred feet high. The hills which furround the town, on the other fides, are more remote from it, broken more gradually into ridges, and floping more away[†].

+ Called the Coal-Hill, from the vaft quantities of coal which it contains. See page 41.

‡ I am indebted to Mr. Hugh Brackenridge for this particular account of the fituation of Pittfburgh. I take this opportunity of acknowledging my obligations to that gentleman for his kind attentions to the fubject of FROM this account, it is evident that the fituation of the town of Pittsburgh is rather a confined one, and perhaps favourable to that heat and stagnation of air which, in the opinion of Mr. De Saussure, is especially concerned in the production of goitre and cretinism.

as upon the waters of Big.Beaver. M. dei

I WISH it were in my power to give a particular account of the fituation of other parts of our country in which the goitre prevails. But upon this fubject, my collection of facts is very fcanty. The topographical hiftory of the goitre muft be much more complete, before we can afcertain, with certainty, the caufe of the complaint. Meanwhile, the following facts deferve to be mentioned. They, at leaft, flow, that the goitre is not exclusively confined to vallies, or to mountainous countries.

I HAVE already observed, that the goitre is a common complaint in the Military Tract, and in other parts, of the state of New-York*. In this part of the country, it is often met with in stuations by no means entitled to the appellation of vallies. It is not uncommon at Fort-Herkemer on the German-

this memoir. 1 fhall afterwards have occasion to avail myfelf of other information communicated to me by Mr. Brackenridge.

* See pages 6, 7. 8, 9, 14, 15, 16, 17, &c.

Flats*, a beautiful plain, or large piece of wellopened land, which is confiderably elevated above the tide-water of the river Hudfon.

THE goitre is a common complaint in different parts of the country north-weft of the river Ohio, as upon the waters of Big-Beaver, Muskingum, Sioto[†], and at Detroit[†]. In none of thefe places, has it been obferved to prevail in the vallies. Indeed, in the whole of the tract of country which I have just mentioned, there are no mountains, or confiderable ridges fufficient to form vallies. I am acquainted with a good deal of the country that is watered by Big-Beaver. It is a flat or level country, abounding in favannas, or natural meadows. The head-waters of this creek are, I think, confiderably higher than the level of Lake-Erie. They are, certainly, fome hundred feet higher than the level of Lake-Ontario, near the fouthern border of which (I mean in the Onondago-Valley, on the

* See page 8.

+ Since the preceding pages were printed off, I have been informed, that the goitre is a common complaint among the Shawnees-Indians refiding on the Sioto, a confiderable river which empties itfelf into the Ohio, below the mouth of the Muſkingum.

‡ I have already obferved, that there are "feveral cafes of the difeafe among the Canadians who are fettled at Detroit" See page 20. I have fince been informed, that there are at leaft forty cafes of goitre at this place, and that it is wholly reftricted to the Canadians. Jenisseia-river, &c.) the goitre prevails to a confiderable degree.

THE Sioto is bordered with rich flats, or meadows. This river overflows in the fpring-feafon, and then fpreads about half a mile, though when it is confined within its banks it is fcarce a furlong wide*.

DETROIT is fituated upon an extensive flat or level piece of ground, on the banks of the Strait of St. Clair. There are no mountains in the neighbourhood, or within fight.

I HAVE already faid, that the goitre has been obferved, " in the low and marfhy grounds, between St. John's and Montreal[†]." Thefe grounds are very fimilar to thofe on which Detroit is fituated. They are beft known by the names of flats, and table-lands. Cafes of the difeafe have likewife been obferved, in the fame fituations, at different places along the banks of the St. Lawrence, between Montreal and Quebec.

IT is evident, from the facts which I have mentioned, that the goitre of North-America is not

† See page 17,

^{*} See Hutchins's Topographical Defcription of Virginia, Pennfylvania, Maryland, &c. &c. page 24. London: 1778.

exclusively confined to the vallies of this continent. On the contrary, it prevails, to a great degree, in fome of the high and level plains of the country, where there is no reason to suspect that the air is in an impure or ftagnated ftate, from confinement by mountains, or by hills. It also prevails in the flats, or intervale lands, along the margins of fome of our rivers, where often the neighbouring hills are of a very inconfiderable height, and feem incapable of increasing the heat or impurity of the air. I may add, that this difeafe is altogether unknown in many of the vallies, both fuch as are more fpacious and those which are more narrow and also deeper, in various parts of North-America*. Upon the whole, I cannot adopt the theory of Mr. De Sauffure, though I am willing to allow that it is ingenioufly fupported, which, perhaps, is as much as can, in rigid propriety, be faid of any of the many theories that have been offered to account for the caufe of the goitre. In justice, alfo, to this learned naturalist, I cannot help here observing, that I am of opinion, that a more extensive and critical inquiry into the topographical hiftory of the goitre will ferve to fhow, that a peculiar modification of the air (derived, I believe, principally from terrestrial exhalation) is fomehow effentially concerned in the production of this difeafe.

* See Appendix.

I MUST not conclude this topographical view of the goitre of North-America without obferving, that the facts hitherto collected feem to flow, that, in general, this difeafe prevails to the greatest degree in the neighbourhood of the lakes of the country, or about the first fources of the rivers which arife near these lakes. Thus we find the goitre near those waters of the Mohock-river which take their rife near the lakes Ontario and Oneida. We find it at Oneida and at Onondago, near the waters of the fame lakes; on the waters of Frenchcreek, near Lake-Erie; and at Detroit between Lake-Huron and Erie. In this refpect, as well as in many others, the American goitre bears a close affinity to the goitre of Europe. The difeafe is extremely common in Switzerland, in the neighbourhood of the lakes of that country, or about the waters which empty themfelves into those lakes. It must not, however, be forgotten, that the goitre prevails, in many parts of the world, at a great diftance from any lakes whatever. Thus, in our country, it is common at Pittfburgh, which is not in the neighbourhood of any of the lakes.

I NOW proceed to offer my own opinion relative to the caufe of the goitre. On this fubject, however, I shall not take up much time: for the facts which I have collected in fupport of my opinion are but few in number, and are not always afcertained with as much accuracy as I could wifh. In the prefent fcantinefs of correct information upon this fubject, I fhould manifeft, were I pofitively to fay what is the caufe of the difeafe, but a fmall portion of that cautious forbearance which is, perhaps, too rarely found among theoretical phyficians, but which is of the higheft importance in the inveftigation of difficult medical queftions, fuch as that in which I am now engaged.

As glandular affections, of different kinds, are not unfrequent in countries in which intermittent fevers prevail, I was early led to conjecture, that the goitre might be occafioned by the fame matter, or matters, which induce thefe fevers. This fufpicion, I foon found, could be fupported by plaufible reafonings. Those very tracts of New-York in which the goitre is most common are extremely fubject to intermittents, to remittents, and to dyfenteries. But in the farther investigation of this question, I could not but discover, that many other parts of our country are equally fubject to thefe fevers, where, however, the difeafe of goitre is entirely unknown. This remark applies, with peculiar force, to most of the Atlantic towns of the United-States.

IT is not a new fuspicion, that the goitre is owing to the agency of the fame caufes which induce intermittent and other fevers. Mr. De Sauffure has mentioned, and rejected, this theory. " It is poffible, and even probable (fays this naturalift), that exhalations from marshes, fituated at the bottom of fome vallies in which cretinifm prevails, may contribute to the production of this diforder : but I believe, it is rather owing to the heat which these exhalations render the air fusceptible of, and to the relaxation which they produce, than to the putrid miafmata arifing from the marshes : for, I repeat it, the countries of plains the most afflicted with marshy vapours are subject to fevere, and other grievous diforders, but no crétins are to be feen. And, on the other hand, we fee villages cruelly afflicted with the cretinism, without having any marshes in their neighbourhood. Villeneuve d'Aofte * is a ftriking example of this truth +."

ON this quotation I shall make an observation, which would, perhaps, have some influence upon the mind of Mr. De Saussure. "I repeat it, fays he, that the countries of plains the most afflicted with marshy vapours, are subject to severs, and to other grievous diforders, but no crétins are to be

^{*} See Appendix.

[†] Voyages dans les Alpes, &c. Tome II. p. 486.

feen." This observation, perhaps, applies to those countries of Europe, in which the Swifs philofopher made his remarks on this difeafe. But, it does not apply, with equal force, to the countries of North-America. On the contrary, the difeafe of goitre appears to prevail, to a very remarkable degree, in fome of the great plains of our country, which are fubject to intermittents, to remittents, and to dyfenteries. Indeed, fome of the very worft forms of these difeases annually appear in almost the whole of that tract of country in which the goitre is fo common. Inftances in illustration of this pofition will afterwards be mentioned. In the mean time, I shall make a few remarks on the condition of fome of those European vallies in which goitre is a very common complaint.

MR. DE SAUSSURE allows that there are marfhes in fome of the vallies in which the goitre is found; but he fuppofes that exhalations from thefe marfhes are no otherwife concerned in the production of the difeafe, than in as far as they render the air fufceptible of being more heated, or as they induce a relaxation of the fyftem. Mr. Foderé exprefsly fays, that the difeafe is most common in the lowest vallies of the Alps, where the houses, furrounded with many broad-leaved and very shady trees, are fituated in the neighbourhood of brooks,

rivers, lakes, ftagnant waters, marshes, and are very much exposed to the fouth and weft winds*. Dr. Haller's account of the fubalpine vallies of Switzerland would lead one, independently on any other facts, to fuppofe, that the goitre is partly, at leaft, owing to the influence of marsh exhalations. These vallies, where they are level, are, according to the immortal Swifs philosopher, for the most part marshy. The foil is a bluish clay. The fprings falling from the heights, ftagnate upon this clay, and give nourishment to those plants, which are perpetually bedewed with water. He thinks it is evident, from the large and rounded ftones, which are every where found, in digging cellars and wells, that those vallies have, in former times, been deluged by torrents of water. He fuppofes, from the trees which are found buried in the marshy ground, that these marshy meadows, or valley-flats, were once woodlands †.

* Effai, &c.

† "Valles fubalpinæ, frequenter, qua planæ funt, argillam fubcæruleam pro terra habent, quæ caufa eft, ut fere paludefcant. Aquarum enim ab acclivibus delabentium fcaturigines huic argillæ innatantes ftagnant, & ejusmodi ftirpes alunt, quæ aqua perpetuo amant irrigari. Super eam argillam torrentes aut lapidum ftratum, glareafque effundunt, aut tenues arenas, has rarius. Multiplices autem, antiquiffimis temporibus, fuiffe torrentum eluviones, magna & rotunda faxa demonftrant, quæ in effoffis cellis puteifque paffim reperiuntur. Paludofa prata olim fylveftria fuiffe, ex arboribus credas, quæ in terra paluftri paffim reperiuntur. Super lacus ubique, ut puto, aliquot leucarum planities eft, per quam parens ejus laFROM this account of the fubalpine vallies of Switzerland, there feems to be a clofe affinity between the foil and flate of those vallies and the foil and flate of many of those parts of North-America in which the goitre is most frequent. In America, this difease, as far as I am able to judge from the facts now in my posses of the parts of rivers in three different fituations, viz. first, in the flat or intervale grounds, along the margins of rivers and lakes; fecondly, in vallies; and, lastly, in the higher country, or country of wet plains, called natural meadows. On each of these three heads, I shall offer a few observations.

FIRST. The flats along the Mohock-river, the table-lands about Detroit, and those between St. John's and Montreal, and in short all the flat land adjacent to our lakes and rivers, are instances of the first kind of country in which the goitre is found. These flats are generally several feet higher than the adjacent waters, and, in ordinary times, are not subject to be overflown. They are, however, generally damp, and at times, after heavy rains, the water is liable to stagnate upon them. There are feveral reasons for believing, that these flats were once parts of the beds of the neighbouring lakes and rivers. It is not necessary, in this place, to men-

cus fluvius, media per paluftria plana decurrit." Alberti v. Haller Hiftoria Stirpium Indigenarum Helvetiæ Inchoata. Præfatio, p. v. tion thefe reafons. It is fufficient for my prefent purpofe to obferve, that the table-lands, of which I am fpeaking, are generally unhealthy fituations. The difeafes which they most commonly produce are intermittents, remittents, and dyfenteries. Mumps (cynanche parotidæa), croup or hives (cynanche trachealis), and putrid fore-throat (cynanche maligna) are not unfrequent complaints on thefe flats.

SECONDLY. The goitre prevails in the vallies of our countries. We have feen that it is common in the Onondago-Valley, and in the vallies of Vermont. I fhall afterwards obferve, that it is a very common complaint in fome of the vallies of Mexico and South-America*. I believe the valley-fituation, when the foil is very rich, and the air warm and moift, and efpecially if the grounds be marfhy, is, in general, peculiarly unhealthy. It is certain, at leaft, that fome of the moft unhealthy parts of America, are fome of the wet or marfhy vallies. The prevailing difeafes are malignant fevers, and dyfenteries.

THIRDLY. The goitre prevails in the higher country, or country of plains, where, however, the ground is generally wet, and often marfhy.

* See, in the Appendix, the note to page 5.
Such high plains are not uncommon about the head-waters of many of our rivers, efpecially in the western parts of the United-States. Intermittent fevers are the most common difeases of these fituations.

THE preceding observations are too imperfect to be of much confequence in elucidating the caufe of the goitre. They may, however, ferve to fhow, in opposition to Mr. De Sausfure's opinion, that this difease does often prevail in the fame fituations in which intermittents, remittents, and dyfenteries are common. This circumstance, I am aware, does by no means prove, that the goitre is occafioned by the fame caufes which induce those complaints : for difeafes of a very oppofite kind, whether we regard their original or their fymptoms, are frequently found to prevail in the fame fituations. The very general prevalence, however, of goitre in places that are exposed to the influence of marsh exhalations, would, perhaps, by most difpafionate inquirers, be deemed a circumstance in favour of the theory which I am endeavouring to render plaufible. It is a circumftance, which I fhall still further employ in the following inquiry, where I must, once more, regret the fewness of my materials.

Do intermittents and remittents prevail in those parts of the countries of North-America, in which the goitre is most commonly met with? I have already faid that they do*. Many facts, however, must be collected before this question can be anfwered as extensively as it ought to be. Meanwhile, I shall mention fome of those districts in which both these fevers and the disease of which I am treating are very common.

I HAVE already observed, that the Onondago-Valley, where goitres are frequent, is unwhole-Intermittents and remittents, and these fomet. fometimes of a very malignant kind, are frequent here. These complaints are frequent in Manlius, Pompey, and other parts of the Military Tract. They are frequent along the Mohock and Connecticut rivers; between St. John's and Montreal; about Detroit; on the Muskingum, and in almost all those parts of our country, in which the goitre is found. It has, indeed, been faid that intermittents are unknown at Pittfburgh. This is not strictly true. On the contrary, these complaints are known to exift in that place, and have evidently increased within a few years.

IN the prefent state of our information, it will be difficult to prove that the goitre does actually

+ See page 51.

^{*} See pages 58, 60 and 64.

owe its origin to the fame caufes which induce intermittent fevers. We are certainly not yet prepared to decide upon this fubject (as philosophers should decide upon every fubject which they undertake to investigate), with caution. I may add, that many difficulties oppofe themfelves to the conjecture which I have thrown out. In particular, it is not eafy to conceive how a general caufe, ftimulating the fyftem, and inducing the cold and hot ftages and other phænomena of fevers, should concentrate its action fo completely upon the thyroid and neighbouring glands of the head and neck, and give rife to the difease of goitre. Perhaps, however, an extensive view of facts relative to the production of difeafes by the mia/mata of marshes, would ferve to fhow the immense variety of ways in which these miasmata affect us, and the multifarious difeases which they induce in man and other animals. There is fomething very capricious in the operation of thefe agents. And I do not know that it is more inconceivable, that the effluvia of which I am fpeaking fhould efpecially affect the thyroid gland and induce goitre, than that they fhould efpecially affect the parotid glands, producing mumps; or the liver, producing hepatitis.

IT may, perhaps, give fome additional weight to the theory which I have proposed, to observe, that the marsh miasmata of some parts of our country exert a particular action upon the glands of the neck and throat. Kalm has given fome account of a difeafe, called by the Swedes, the "flitches and burning," which, at different times, has committed great havoc at Penn's Neck, in Jerfey. " It was (fays our author) a true pleurify, but it had a peculiarity with it, for it commonly began with a great fwelling under the throat and in the neck, and with a difficulty of fwallowing*."

THE complexion of many goitrous perfons, effecially those in whom the disease has arisen to a confiderable height, is an additional circumstance in favour of the opinion which I have advanced. "Their complexion (fays De Saussure, speaking of the crètins) is a yellow approaching to brown, from which probably they obtained the name of *Marons*[†], which is given to them in the valley of Aoste[†]."

I was informed that in the ftate of New-York, those perfons who are affected with goitre are commonly exempt from intermittents, though in the midft of perfons labouring under these latter

† Voyages, &c: Tome ii. p. 481.

^{*} Travels into North-America, &c. Vol. I. p. 376, 377, &c. Warrington: 1770. English translation.

⁺ The maron is a large kind of chefnut.

complaints. If this be a fact, it would rather ferve to fhow, that the goitre and the intermittent are owing to the fame caufe.

I AM far from imagining that the preceding facts completely eftablish the origin of goitre from the miasmata of marshes. I have offered this opinion merely as a conjecture or hypothesis. I cannot, however, help suspecting that future and more extensive inquiries will establish the fact, that there is a very intimate connection between the difease in question and the exhalations from marshy grounds. Persuaded I am, that there is a necessary connection between the difease and a moist atmosphere*.

MR. FODERE is of opinion, that a warm and moift atmosphere is the caufe of the goitre. This writer, whom I have fo often quoted, made his obfervations in Maurienne, where the difease is extremely common, perhaps more fo than in any other part of the world. It is remarkable, that the goitre prevails to the greatest degree in the western parts of North-America, where many obfervations have confpired to show, that there is a greater quantity of moisture in the atmosphere than

* I do not now fpeak of infolated or detached cafes of the complaint, for they occur every where; but of the difeafe where it a common complaint. Even those aerial tumours which arise in women after parturition, feem only to arise in those fituations, where the complaint from marsh miasmata, or from moisture, is endemial. See page 48. in the countries between the Atlantic and the Allegheny mountains. "From a variety of obfervations (fays Mr. Andrew Ellicott) I am convinced that the atmosphere in the western country, and particularly in the vicinity of the lakes, contains a greater quantity of moisture than in the middle Atlantic states. The wooden works which contained my instruments were always uncommonly swelled, and frequently very much injured in that country, though constantly defended from the rain, and occasionally exposed to the fun. The ivory and wood of my fectors with brass joints, always expanded above the metal; this expansion was not fudden, but effected by flow degrees*."

My own obfervations, which will be detailed at length in another work,[†] coincide with those of the ingenious gentleman just quoted. The greater degree of moisture in the neighbourhood of the lakes is, perhaps, the best explanation of the fact which I have already mentioned, that in general the goitre " prevails to the greatest degree in the neighbourhood of the lakes of the country, or about the first fources of the rivers which arise near these lakes[†]."

* Transactions of the American Philosophical Society. Vol IV. No. XXV. pages 225 and 226. Philadelphia: 1799.

† Travels through part of Pennfylvania, Virginia, New-York, &c. &c.
‡ See page 57.

MR. ELLICOTT has likewife obferved, that " fogs are very common, and of remarkable denfity," on the Ohio, and Allegheny, and their branches. This accords with my own obfervations. I cannot, however, agree with Mr. Ellicott, that thefe fogs do not contain " any portion of those noxious miasmata, which are fo frequently combined with the fogs on the eaftern fide of the mountains." On the contrary, I am perfuaded, that the fogs of the weftern as well as of the Atlantic country are often very infalubrious. I know, at least, that many parts of the country along the Ohio, and other western waters, are very unhealthy. I do not doubt that the dense fogs are one great cause of this unhealthines; and I believe, that fuch fogs are infalubrious chiefly by reafon of the miafmata which they contain. This is not the place to examine the contrary opinion, which has been adopted by Mr. Ramel.

SECTION IV.

OF THE CURE AND PREVENTION OF THE DISEASE.

I DO not think it proper to conclude this memoir without faying a few words concerning the cure and prevention of the difease which I have been confidering. This part of my fubject, however, fhall not detain me long. I have nothing new to fay; and I am not labouring to make an extensive compilation.

IF, as has often been afferted, the cure of a difeafe can only be completely underftood, when the *caufes* of fuch difeafe have been inveftigated with accuracy, it would follow, as a neceffary conclution, that we are not yet prepared to decide upon the beft mode of treating the difeafe in queftion: for I think I have fhown, that very urgent objections may be brought againft every hypothefis refpecting the caufe of the goitre. But the rational empiric will fay, that it is often an eafy tafk to point out the method of curing a difeafe, even when the caufe is hidden from the refearches of fcience. And this is a pofition which I fhall not deny.

THE remedies which have been recommended and ufed for the cure of goitre are numerous. They may be divided into two claffes, fuch as are more general, and fuch as are wholly or chiefly topical. It is not my intention to mention even the names of all these remedies. I shall speak of some of the principal of them, and that without much regard to method. I shall say nothing of the chirurgical management of the difease. AMONG the general remedies, I may mention blood-letting and purging. Sauvages tells us, that Pafta began the cure of the bronchocele Botium by bleeding and purging, after which he had recourfe to the fal prunellæ, fea-water, foap, and feveral other means, fome of which will afterwards be mentioned*. It is, I think, highly probable, that bleeding has been found very ufeful in the early or forming ftage of goitre. But candour compels me to acknowledge, that this opinion is more the refult of my theoretical notions concerning the caufe of the difeafe, than of any particular or detailed information refpecting the fuccefs of the practice.

MERCURY, which has been used with advantage in fo many difeases to which we are subject, has been tried in the difease of goitre. But it is probable that it has not had a fair trial. It is certain, at least, that it has sometimes been used whils the cause or causes which induced the difease continued to operate.

MR. SAUNDERS, whom I have already mentioned, informs us, that "a mercurial courfe feemed to check" the progrefs of goitre, " but did not prevent its advance after intermitting the use of mercury†."

* Nofologia Methodica, &c. Tomus Primus. p. 157 and 158.

+ Philosophical Transactions, for the year 1789. Part First.

(73)

DR. STEVENSON informs me, that he has heard of one gentleman who was "effectually" cured of the difease by mercury[†].

WITHOUT having had any experience in the treatment of this difeafe, I must confess that I should expect not a little from the powers of mercury in many cases of it. It must not, however, be concealed, that some writers have mentioned mercury as one of the medicines that are rather calculated to do harm than good in goitre.

MANY other remedies have been recommended for the cure of goitre. Among thefe, perhaps, none has been more celebrated than the calcined fponge. Mr. Foderé has always given it half burnt, made into an electuary with cinnamon and honey; and he aflures us, that he has conftantly found it fuccefsful. Of this electuary, the patient takes the fize of a nut three times a day, until the tumour difappears, which is faid to be generally the cafe within fourteen days. This author has alfo ufed foap fuccefsfully. When thefe remedies have failed to do good, he has had recourfe to the fulphure of pot-afh (liver of fulphur), diffolved in water. The daily dofe is thirty grains, diffolved in a bottle of water, and continued until the cure is effected.

+ Letter to me, already referred to.

MR. FODERE fays it is advifable, during the ufe of any remedy, to take at the beginning, and every fourteen days afterwards, a laxative. The patient must not fwallow the medicine immediately, but hold it for fome time in his mouth, fince experience has convinced him, that the remedy thus employed operates more ftrongly and more quickly. Laftly, he fays it is important to keep the tumour always covered and warm. This author thinks, the medicine has more effect when it is given during the wane of the moon :- an observation which will not, perhaps, increase our confidence in the efficacy of any of the means recommended by him, especially in America, where the influence of the moon in affifting the operation of medicines, or in varying the features of difeafes, is lefs acknowledged than in many other countries.

IN fome cafes, frequent rubbing with dry wellfmoked cloths, or faponaceous remedies, or camphor-falve, is faid to be of great advantage*.

" I HAVE directed (fays Dr. Darwin) in the early state of this difease, a mixture of common falt and water to be held in the mouth, particularly under the tongue, for a few minutes,

(74-)

* Effai, &c.

four or fix times a day for many weeks, which has fometimes fucceeded, the falt and water is then fpit out again, or in part fwallowed*."

a apph ainit sar of 100 .

PASTA has recommended a wine-glafs full of fea-water to be taken every morning for a month and a half, and the tumour to be bathed with the fame water. When more powerful remedies are required, he preferibes three feruples of foap diffolved in four ounces of water, or a bolus of foap, drinking afterwards a decoction of the faponaria, or foapwort (Saponaria officinalis). Laftly, this author advifes the frequent ufe of the vinegar of fquill (acetum fcilliticum) to be continued for a month, in the dofe of two table-fpoonfuls. He likewife recommends this vinegar to be applied externally to the tumour.[†]

OTHER external applications to the tumour have been recommended. Such are a fponge wetted with tepid urine and an eighth part of fal prunellæ[‡]; ether, and fomentations of acetated ammoniac §.

‡ Pafta. See Sauvages.

§ Darwin's Zoonomia. Vol. II. p. 115.

We have feen that the goitre prevails among the Indians of our country. It may, perhaps, be fuppofed, that they are in poffeffion of fome remedies for the difeafe. But to me this does not feem at all probable. For although I am willing to allow, that the Indians are in poffeffion of many active and valuable medicines, ftill I am perfuaded, that their fkill in applying them is not great. The following fact, which was communicated to me by an Indian, is not altogether unworthy of being mentioned. It will, at once, fhow the miferable flate of materia medica among thefe people, and how ludicroufly inert are the means which they employ for the removal of the difeafe which I am confidering.

ACCORDING to my informant, the following is the beft method of curing this difeafe. The tumour must be bathed with the spittle of a virgin, and by the virgin herself, dum fit in menstruis. I was affured, that the difeased person makes no other use of the virgin.

IN fome parts of our country, the Indians apply the powder of burnt mufcle-fhells to the tumour, " but to no effect". It is most probable that they have learned the use of this application from some of the whites.

• Mr. Heckewelder's letter to me, dated Bethlehem, December 2d, 3797.

I SHALL conclude these few and very imperfect notices concerning the cure of the goitre by observing, that I have heard of one case of the complaint in which it was thought that a watery infusion or steeping of the bark of the root of the "Key-Ash,*" was used with some advantage. The patient was a married woman, pretty well advanced in life. She drank a good deal of the infusion, and continued the use of it for some time. It was very difagreeable to take, and induced fweat.

• The Key-afh is the female of one of our native species of Fraxinus, most probably the Black-afh (Fraxinus nigra of Marshall, and Fraxinus fambucifolia of Willdenow). This tree is a native of various parts of the United-States. Of its medical properties, I know nothing from my own experience. I may observe, however, that in some parts of North-America, the bark and keys of the different kinds of ash are used as diuretic medicines. In Pennsylvania, the bark of Marshall's Fraxinus alba (which appears to be a variety of Linné's Fraxinus Americana) is nfed in intermittents, and is thought not inferior to the Peruvian bark.

APPENDIX,

CONTAINING

ILLUSTRATIONS AND ADDITIONS.

AGE 5. South-America. The goitre has been known for feveral centuries in South-America. The earlieft notice that I have been able to find concerning it is in the Royal Commentaries of Peru, by Garcillaffo de la Vega. This writer informs us, that the Inca Tupac, after having fubdued the province of Caffamarquilla, " proceeded to another people called Papamarca, from the Papas or Dewlaps, which are great bunches that hang from their throats*." It will not be doubted that thefe " great bunches" were goitrous tumours. The Papamarca are faid to have been very numerous. Tupac Ynca Yupanqui was the eleventh king of Peru. Mr. De Pauw fpeaks of the goitre as a difeafe of the Indians inhabiting the foot of the Cordilieres. He afcribes it to the use of fnow-water, and fays it is called in the language of the country, Coto. He quotes, as his authority, the voyage of Sieur Acarette to Perut. The Abbé Clavigero feems to fpeak of the goitre as a difeafe unknown in

* Royal Commentaries, &c. Translated by Sir Paul Rycaut. Page 305. London: 1688.

† Recherches Philosophiques sur les Americains, &c. Tome Premier, p. 128. A Berlin: 1777.

America*. I have not only fhewn that it exifts, but that it is a very common complaint, in many parts of North-America. I shall now show that it has long been known in that part of America in which Clavigero refided, for many years. Thomas Gage takes notice of the difeafe as frequently occurring at Sacapula, in Totonicapan. He first obferved it in the Prior of this place, " who, fays Gage, looked most fearfully with a bladder from his throat fwelled almost round his neck, which hung over his shoulders and breaft, and ftay'd up his chin, and lifted up his head fo, that he could fcarce look any whither but up to heaven. In our discourse he told me that disease had been upon him at leaft ten years, and that the water of that river (the river which runs through the valley) had caufed it in him, and in many others of that town.----When I came to the town I difcovered many men and women with bladders in their throats, like the poor Prior, which made me almost unwilling to drink there any chocolatte made with that water, or eat any thing dreffed with it, until the Prior did much encourage me, and told me that it did not hurt all, but only fome, and those who did drink it cold .---- The air is hot, by reafon the town ftandeth low, and compassed with high hills on every fide+."

As the veracity of Gage has, by fome writers, been called in queftion, it may, perhaps, be deemed neceffary to adduce fome other authority for the exiftence of the goitre in this part of America. I have lately been informed, by a very intelligent Spanish gentleman, that this dif-

* The Hiftory of Mexico. Vol. II. p. 340. London: 1787.

+ A New Survey of the Weft-Indies. p. 255 and 256. London: 1699.

eafe is very common in different parts of North-America, as in Nueva Galicia, Guatemala, Nicaragua, Santa Fe, &c. It prevails to the higheft degree in Guatemala and at Santa Fe. In the firft of thefe places, it is called *Güegüechos*, and in Santa Fe, *Catas*. It affects men, women, and children, but is never accompanied with cretinifm. Mr. Mútis, the celebrated botanift, has published a memoir upon the difeafe, which, it is faid, is evidently much more common now than it was eighty years fince. I exceedingly regret, that I have not had an opportunity of feeing this memoir.

It is a folly to attempt to prove that the climate of America is *peculiarly* healthy. Candour is too rare a virtue among philofophers; and the defire to eftablish fyftems has deluged the world with errors, and with fables. A list of the indigenous difeases of America (notwithstanding what the Abbé Clavigero has faid) would not be found much, if at all, less extensive than the list of these infirmities in other parts of the world.

Page 8. Fort-Dayton. This place is fituated upon a large flat, or piece of low ground, on the Mohock-river, about fixteen miles from Old-Fort-Schuyler. The whole of the flat is occafionally liable to be overflown by the waters of the river. Around the flat there is a tract of pretty high ground.

Henderfon-town. This place, the proper name of which is Anders-town, is about twelve miles to the foutheaft of the German-Flats. The lands in the neighbourhood are high and dry, but there are no mountains. "Swelled neck." In fome parts of New-York, this complaint is called the "thick neck." Either in this ftate, or in Pennfylvania (perhaps in both) it is called the "big throat." This nomenclature is fufficiently defcriptive for common ufe, and is likely to be retained in the countries in which the difeafe prevails.

Page 9. Manlius. I am informed, that the goitre is most common about the centre of this township. Manlius is one of the most eastern ranges of military townships. It is watered by some considerable streams which run into the Oneida-Lake, and by some small streams which run into the Salt-Lake of Onondago. It abounds in limestone (See pages 25 and 26), much of which appeared, from my examination, to be composed of shells.

Page 12. " The goitre of the ftate of New-York is not confined to the human kind." Sir George Staunton fays " whatever be the caufe which occafions goitres in the human frame, it has no perceptible effect upon other animals^{*}." This may, perhaps, be the truth, as far as refpects the vallies of Tartary, where he obferved the difeafe. But Mr. Coxe's obfervation, which I have mentioned (See page 14), ought not to have been forgotten by Sir George; and the facts which I have noticed (See pages 12, 13 and 14) inconteftibly fhow, that in the ftate of New-York, other animals, befide man, are affected with goitrous tumours. Hitherto, I have not learned, that our animals are fubject to fuch tumours in any other part of

* An Authentic Account of an embaffy from the king of Great Britain to the emperor of China, &c. &c. Vol. II. chapter iii. p. 63. Philadelphia edition. North-America. This fubject is well worthy of an attentive investigation.

Page 18. " The goitre is not uncommon in the county of Bennington, and state of Vermont." The difease is likewise known in the county of Chittenden, in the northwest part of the same state. I am not, however, authorized to say that it is a frequent case in Chittenden. The cases which were mentioned to me occur at Jericho, on Onion-river, which runs into Lake-Champlain. The states ation a valley, or as it is frequently called in the United-States, a "hollow." Chittenden, on the west, borders upon Lake-Champlain.

" Cohofs-country, in Connecticut." This is a miltake. The Cohofs is not, as Mr. Geddis fays, in Connecticut, but on the Connecticut-river, in the flates of Vermont and New-Hampfhire. The following is Mr. Morfe's account of this country. " Coos, or Cohos, the country called Upper and Lower Coos, lies on Connecticut-river, between 20 and 40 miles above Dartmouth college. Upper Coos is the country fouth of Upper Amonoofuck-river, on John and Ifrael rivers. Lower Coos lies below the town of Haverhill, fouth of the Lower Amonoofuck. The diftance from Upper Coos, to the tide in Kennebeckriver, was meafured in 1793, and was found to be but 90 miles*." The true Cohos is, I am informed, a flat, liable to be overflown by the fpring-floods of the Connecticutriver.

* The American Gazetteer, &c. article Coos, or Cohos. Boston: 1797. " Cafes of goitre are met with among the inhabitants on the waters of the Allegheny and French-Creek, and at Sanduíky." The lands near French-Creek, where the difeafe is frequent, are level, as are likewife those near Sanduíky.

" A few inftances on Monongahela." Mr. Brackenridge informs me, that there are fome cafes of the complaint at Brownfville, or Redstone Old-fort, a town on the foutheastern bank of the Monongahela, about thirty-feven miles nearly foutherly from Pittfburgh. Some of the worft cafes in the western parts of Pennfylvania occur at Brownfville. Mr. Albert Gallatin, member of Congress, has informed me, by letter, of feveral cafes in this part of the country. " All thefe cafes occurred in the country between the moft westerly ridge of mountains (called from Youghioghenyriver, northwardly, Chefnut-Ridge, and which, from that river, foutherly, to its termination on Cheat-River, in Virginia, about eight miles fouth of the fouthern Pennfylvania boundary, affumes the name of Laurel-Hill) and the Monongahela-River, not more than fifteen miles westward of the faid mountain; but how much farther weftward it may have occurred he does not know." Moft of the cafes, Mr. Gallatin informs me, * were flight, the fwelling not greater than he has frequently feen at Geneva, in Switzerland." Some of the cafes, however, were more ferious, particularly one or two at Morgantown (in Virginia), which is fituated upon the east fide of the Monongahela, about feven miles from the entrance of Cheat-River into that river. Morgantown is fituated upon open and elevated land, " not bottom-land, but of gentle afcent and level." One of the patients (a married lady) having applied a mercurial necklace to the tumour, caught cold, and died in a few days, about four years ago. I knew this lady in1785, at which time fhe refided upon one of the western branches of the Monongahela, called Muddy-Creek. She had, then, nothing of the complaint.

The face of the country in which the cafes mentioned by Mr. Gallatin occurred, is " very hilly," but less fo than that of many of the other western parts of Pennfylvania and Virginia. The water ufually drank, fpring; at Morgantown, well-water : in neither cafe (Mr. Gallatin believes) lime-ftone-water. " In every cafe I know, fays this gentleman, the fituation is open, no trees left ftanding, and large plantations cleared around." He particularly mentions two cafes occurring on a farm, about four miles north-eaft of Brownfville, the fame diftance from the Monongahela, ten miles from the Laurel-Hill, and half a mile from Dunlap's creek. " Situation of the house almost at the bottom of a hill, not very steep nor high, as it is cultivated to the very top; and on the verge of a valley containing about one hundred acres of meadow in front of the houfe. This meadow is croffed by a run, and part of it is liable to occafional overflowing. The land of the greater part of the plantation is first rate, and about two hundred and fifty acres are cleared*."

Mr. Brackenridge informs me, that there are a few cafes of goitre at Cannonfburgh, a fmall town fituated on the north-fide of the weft branch of Chartier's creek, about feventeen miles fouth-weft of Pittfburgh. Chartier's is a

* Letter to me, dated April 8th, 1800.

branch of the Ohio, into which it empties itself about five miles below Pittsburgh.

Page 19. " It does not appear from Dr. Stevenson's letter, that the difease has, in any instances, arisen to a very troublesome or alarming height." I am, however, informed, that in two cases (both females) in Pittsburgh, the tumour has grown " to an enormous fize." A young woman at Brownsville was, for years, affected with this tumour " almost to fuffocation." It was considerably larger than her breasts. The complaint was " removed" by a Dr. M.

Page 28. " There is no lime-ftone in the county of Bennington." I have fince been informed, that both limeftone and marble are very abundant in this county.

Page 35. Township of Pompey. This township is adjacent to Manlius, by which it is bounded on the north. It is watered by the fame principal streams which water Manlius. The Onondago-Creek, which is the western boundary of both the townships, runs northerly into the Salt-Lake of Onondago.

Page 37. Tophus Ludus. This is the Porus of fome of the old authors. The Tophus Polymorphus of Wallerius. Syft. Vol. II. p. 394. The Tophi of Kirwan, p. 25. It is called Duckstein by the Germans. Is formed by the gradual deposition of earths, especially the calcareous earth, which are diffused in water. Of a soft and porous texture (hence the old name Porus). These incruftations are very abundant in many parts of North-America, but perhaps no where more abundant than in the fame parts of the Military Tract, where the goitre is a common difeafe. See pages 25 and 26.

the row of the decision appagar to

Pages 42 and 43. " As we approach the northern parts of our continent we find a great many of the plants of northern Europe. This fact," &c. It has long been known, that the northern parts of America posses a great many of the vegetables of the north of Europe and Afia. Kalm fays near half of the plants which are met with at Lorette, in Canada, grow in the woods and moraffes of Sweden.* He tells us, that the forb-tree, or mountain-afh, the cranberry-bush, the juniper-tree, the fea-fide peafe, the Linnæa, and many other Swedish plants, are likewise to be met with at Bay St. Paul+. I am perfuaded, that fome of the plants mentioned by the Swedish traveller are not Specifically the fame in Europe and in America. But I am equally perfuaded, that (exclusively of the mosfes and other cryptogamick plants) there is a confiderable number of plants that are common to those continents. A lift of thefe, together with their comparative magnitude, extent of range through the country, &c. will be particularly attended to in the Introduction to my FLORA of Pennfylvania and the adjacent states.

Page 46. " I have taken notice, fays he, when it first made its appearance in girls, which was never until they were employed in carrying burdens." This observation of Mr. Heckewelder is a curious one, and deferving of at-

(87)

tention. Perhaps, however, it only flows that the goitre has often a peculiar tendency to appear about the age of puberty. Mr. Saunders, speaking of this difease, fays, " It generally appears in Boutan at the age of thirteen or fourteen, and in Bengal at the age of eleven or twelve; fo that in both countries the difeafe flows itfelf about the age of puberty.*" Several of the cafes of which I have received information first occurred about the age of puberty. Mr. I. O. at the age of fourteen, first " became fenfible of the fwelled throat," at Cannonfburgh, already mentioned. I cannot, however, from the few facts now in my poffeffion, pretend to affert, that the goitre is particularly difposed to appear about this time of life. It must be remembered, that many of the perfons affected with this difeafe, had not an opportunity of contracting the complaint until they had paffed the era which I have mentioned. Moreover, it is certain, that many perfons who have been born and bred in the diffricts where it pevails, have been feized with the fwelling long before the age of puberty. See page 19. I am informed that at Detroit it commonly makes it appearance in children about the age of three years. Mr. Fodere fays, it generally appears, in Maurienne, about the feventh or eighth year. However, he faw one cafe in which the tumour arofe as early as the fourth day.+

Page 49. Cretinifm. I have heard of fome cafes of cretinifm among the Indians inhabiting the neighbourhood of Sandufky. But fuch cafes are undoubtedly very rare in

* Philosophical Transactions, for the year 1789. Part First.

† Effai, &c.

North-America. This circumstance, as I have remarked, is " well calculated to fhow that the goitre and idiotifm are not neceffarily connected with each other." If, however, cretinifm be ever the confequence of goitre (and of this, I think, there can be little doubt), there is much reafon to fear, that at fome future period, crétins will not be uncommon in fome of those vallies and other fituations of America where goitre is now a frequent complaint. Time only may be wanting to produce the dreadful calamity, which depriving man of his phyfical and intellectual ftrength, and, by confequence, unfitting him for the various duties of life, reduces him to the condition of the brute. A fact mentioned by Mr. Foderé will show that my fuspicion is not entirely without a foundation. This writer, after remarking that the goitre is either hereditary or cafual, fays, if but one of the parents has a cafual goitre, it will not be inherited by the children: but if two perfons afflicted with the difeafe, intermarry; if this be continued through feveral generations, and if they remain in a neighbourhood where the difeafe is endemial, then the children of the fecond and third generation will be afflicted with the goitre, and cretinifm will generally follow*. In Europe, where this difeafe has been known for near two thousand years, as the observation of Juvenal showst, there has been time fufficient to give rife to cretinifmus, if a long continuance of time will produce it. In many

* Effai, &c.

[†] Juvenal was born about the beginning of the reign of the emperor Claudius, and is fuppofed to have died about the eleventh year of the reign of Adrian. He may be faid, therefore, to have lived between the years 41-46 and 127, after Chrift. It is evident from the passage which I have quoted (See page 5), that the "tumidum guttur," or goitre, was a very common complaint in the time of the great Roman Satirift.

parts of America, on the contrary, the caufes have not had an opportunity of producing all their full effects; for few of those districts in which the goitre is known to exift have been inhabited by the fame people during a period of even two hundred years. The aboriginal (or rather Indian) inhabitants of North-America have ever been diftinguifhed for their rambling disposition*. None of the European fettlements in America are three hundred years old, and many of those in which the goitre is most common are not forty. Some of the most ancient European fettlements in the new world are those of Guatemala, Santa Fe, and other parts of the fouthern countries of North-America: and it is in these countries that the goitre is most common. It was common at Sacapula, when Gage vifited that place, in the year 1626 : it is still common there. At the village of Iacaltenango, in the neighbourhood of Sacapula, it is afferted that every one of the inhabitants has a goitre; and it is certain, that the difease is beginning to excite great alarm in these and other Spanish settlements of America+.

Page 51. " It is a circumftance greatly in favour of Mr. De Sauffure's theory, that the goitre, in almost every part of the world, feems to prevail in the valley-fituation." We have already feen that in Switzerland and Maurienne, the difease is chiefly confined to the vallies of those countries. Mr. Marsden fays, it is a very common complaint in the vallies of Sumatra, " through the whole extent of the island." He is perfuaded that the difease is

* See New Views of the Origin of the Tribes and Nations of America. Appendix, pages 10, 11, 12. Philadelphia: 1798.

+ See Gazeta de Guatemala. Tom. II. Num. 50, for February, 1798.

" immediately connected with the hilliness of the country." The people whom it effects are called in Sumatra Orong goonong.* Mr. Saunders observed the goitre in Boutan, at the foot of the hills+. Sir George Staunton fays, it is a frequent complaint in the vallies of Tartary, north of the great wall. The following are this refpectable author's words. " In villages difperfed through fuch vallies," -vallies " with a contracted horizon and darkened atmosphere"----- " many of the inhabitants were found labouring under a diforder obferved in fimilar fituations in the Alps, and known there by the name of goitre, or fwelled neck. The glands of the throat begin at an early age to fwell, and gradually increase, in some, to an enormous fize. The fwelling begins immediately below the parotid gland, and generally extends under the jaws from ear to ear, affecting all the fubmaxillary glands. Dr. Gillan eftimated that nearly one-fixth of the inhabitants he faw had this deformity; which is faid, however, not to appear fuch in the eyes of those villagers. Both fexes are fubject to these fwellings, but females more than males; the latter removing oftener from the fpots where the caufes exift, whatever they may be that occasion them t."

Mr. Park informs us, that goitres are "very common" in fome parts of the country of Bambarra, in Africa§. But he does not tell us in what particular fituations the difeafe is found.

§ Travels in the interior diffricts of Africa, &c. &c. page 312. Philadelphia edition. Page 56. "I may add, that this difeafe is altogether unknown in many of the vallies, both fuch as are more fpacious and thofe which are more narrow and alfo deeper, in various parts of North-America." Although the goitre is fo common at Pittíburgh, and in other parts of our weftern country, I have lately been affured, that it is unknown in the neighbouring vallies between the Allegheny-mountains. It is alfo unknown in the Cheerake-vallies, which, from the accounts I have received of them, are very fimilar to the goitre-vallies of Switzerland.

Page 59. Villeneuve d'Aofte. This town, which is fituated in a recess fhut in by pretty high mountains, is remarkable for the great number of crétins which it contains. The following picture of these miserable wretches is too interesting to be omitted. It will form a proper supple, ment to the note on cretinism. " The first time, fays Mr. De Sauffure, I went to Villeneuve, all the rational beings of the village had gone out of it, for the purpofe of attending to their agricultural labours; there remained, or at leaft we faw in the ftreets, only idiots. I was not then acquainted with the exterior figns of that discafe; I addreffed myfelf to the first I met, for the purpose of asking him the name of the village; and as he gave me no anfwer, I addreffed myfelf to a fecond, afterwards to a third; but a melancholy filence, or fome inarticulate founds were their only answer, and the stupid astonishment with which they looked at me, their enormous goitres, their big halfopen lips, their heavy and thick eye-lids, their under jaws hanging down, their fwarthy complexion, had fomething in them altogether frightful. One would have faid, that fome malignant genius had transformed into flupid animals all the inhabitants of this unhappy village, leaving them only fo much of the human countenance as was neceffary to enable us to know, that they had been men. I left it under imprefions of terror and fadnefs which will never be effaced from my remembrance^{*}."

Page 70. Fogs. Mr. Marsden ascribes the goitre of Sumatra to the fogs of that island. " From every refearch, fays he, that I have been enabled to make, I think I have reafon to conclude, that the complaint is owing, among the Sumatrans, to the fogginess of the air in the valleys between the high mountains, where, and not on the fummits, the natives of these parts relide." He fays, that " between the ranges of hills" there is a denfe mift, called the caboot, which is " visible for feveral hours every morning; rifing in a thick, opake and well defined body, with the fun, and feldom quite difperfed till after noon. This phænomenon, as well as that of the wens, being peculiar to the regions of the hills, affords a prefumption that they may be connected; exclusive of the natural probability, that a cold vapour, grofs to an uncommon degree, and continually enveloping the habitations, fhould affect with tumors the throats of the inhabitants. I cannot pretend to fay, continues our ingenious author, how far this folution may apply to the cafe of the goiters, but I recollect it to have been mentioned, that the only method of curing thefe people, is by removing them from the valleys, to the clear and pure air on the tops of the hills; which feems to indicate a fimilar fource of the diftemper with what I have pointed out +."

* Voyages, &c. Tome II. p. 389, 390.

† The History of Sumatra, &c. p. 42.

I had not an opportunity of confulting Mr. Marfden's work, until after the first eighty pages of this memoir were printed off. I confider the facts which he mentions as being very favourable to the theory of the caufe of goitre which I have advanced. I may add, that at Pittfburgh, where the difeafe is common, there is every morning, in the fummer and autumnal months, an extremely denfe fog, which is not difperfed until a good while after fun-rife. The people of this town, even those who fpeak in the higheft terms of the healthinefs of the place, do not attempt to deny, that the fog is remarkable, and very difagreeable to the feeling .----- Upon the whole, the farther I proceed in this inquiry, the more I am inclined to believe, that the principal remote caufe of goitre " is a mia/m of the fame fpecies as that which produces intermittent and remittent fevers, dyfenteries, and fimilar complaints." I pretend not to determine, what is the precife nature of that miafm. This and many other points which I have touched upon, in the preceding pages, I fubmit, for the prefent at leaft, to the judgment of those who have leifure, and more inclination than myself, to woo the " FAIRY FAVOURS+" of conjectural science.

† Dryden.

THE END.

PHILADELPHIA, May 26th, 1800.
