# WHOOPING COUGH MORBIDITY Medicine

EDMONTON, 1931 - 1951

WA28

This disease has been characterized by a high peak of incidence every third year until Sauer-type vaccine was introduced in 1942. Since that time these peaks are markedly lowered and are further apart. This has occurred during a period of rapid increase and overcrowding in our population.

### Annual Report of the Medical Officer of Health

Chairman and Members, Local Board of Health, Edmonton, Alberta.

Ald. Mrs. Field and Gentlemen:

Following is a report of the activities of our Board and certain other health agencies of our City during 1951:

#### BIRTHS:

Resident births numbered 5,055; being an increase of 433 over 1950. The ratio of births to population showed no significant change.

#### DEATHS:

Resident deaths numbered 1,133; being a slight actual decrease from the previous year. Our two greatest causes of death, heart disease and cancer, both showed a decrease in number. This is an encouraging circumstance in view of the considerable increase in population during this period.

Our infant mortality rate of 23.1 per 1,000 living births was the lowest ever attained in the City, and amongst the lowest of this continent.

More than one-third of the deaths from accidents were caused by motor vehicles. In this, as in many of our community problems, regulation can produce only limited results until we promote in our citizens a sense of individual responsibility.

#### COMMUNICABLE DISEASE:

The total of communicable disease was reduced from the previous year. The single case of typhoid fever was from drinking untreated river water. The raw water of the North Saskatchewan at this point is not safe for drinking until purified. For the same reason, it is unsafe for swimming.

A peak was expected in the number of cases of whooping cough during 1951. The accompanying graph shows the progressive reduction in these peaks since an effective whooping cough vaccine became available in 1952.

A single case of diphtheria prevented us from having a perfect year in this regard.

A reduction of venereal disease during these times of rapid industrial development was a tribute to the Provincial Division of Social Hygiene clinics.

Our clinics showed a slight reduction in attendance during 1951 due apparently to unusually unsettled weather during the summer months. However, attendance at our Well Baby and Pre-school clinic was 14,453 for the year, and 1,992 home visits were made to problem cases and very young babies. Plans are being considered for decentralization of this service.

Attendance of our Inoculation Clinic was 19,770. It is in good part due to the efforts of this clinic that whooping cough is gradually following diphtheria into the class of rare diseases.

#### SANITATION:

Sanitary hazards have been steadily eliminated, and there are now few areas in our City open to complaint. However, there is a great deal of rubbish such as candy wrappers, cigarette boxes and other papers continually thrown on our streets by careless citizens. This material does not constitute a serious health hazard, but is untidy and objectionable. It is impossible for City services to keep our streets free of this rubbish without the co-operation of citizens generally.

The sanitary condition of restaurants, stores and other food-handling establishments has shown steady improvement as indicated by the results of over 1,200 bacteriological tests made on utensils used in these places.

The sanitation of rooming houses and certain other dwellings still presents many problems. To correct overcrowding of living space and occupation of substandard dwellings requires that other acceptable accommodation be available to citizens living under such conditions. Unfortunately, our City has not yet arrived at this happy state. It is still a very formidable problem. Many citizens have complained of such undesirable premises in their neighborhood. It is obvious that the answer cannot lie in attempting to enforce regulations which are impossible on account of lack of housing. Yet we must persist in our efforts to solve this problem, for it is closely bound up with the mental and physical health and also the happiness of many citizens.

Daily samples of our water supply have been examined. Early in the year, a number of cases of typhoid fever occurred in people drinking raw water from the river upstream from the City. The fact that no case occurred amongst the citizens using our municipal water supply is a tribute to the effectiveness of the city water treatment plant.

Our veterinarian condemned 34,000 pounds of diseased meats during the year. The greatest single cause continues to be tuberculosis in pork, which accounted for over 18,000 pounds.

Inspection of the 436 dairy farms in our milk shed was maintained, as well as supervision of local dairy plants. The results of over 11,000 tests made on milk samples indicates a high level of safety in our milk supply.

#### GENERAL:

During the last nine months of 1952 the Provincial Government made available to us substantial sums of money for public health purposes. These grants were derived from both provincial and federal funds. It is heartening that these senior governments should recognize our needs and are willing to help us meet them with such tangible support. The funds have permitted us to strengthen and extend health services to our citizens. The grants are continuing.

Our City has reached a size at which we must gradually decentralize certain health services in order to serve our people adequately.

Our population is a comparatively healthy one. Our climate, given adequate food, clothing and shelter, is a healthy one and to many of us the most desirable for year-round living. Our hospitals and medical services are amongst the best in the land. We are attempting to make our preventive health services as effective as modern medical science and a well trained staff of health workers can accomplish.

Many very difficult problems are presented to all such services by the rapid increase in our population; but with the co-operation of citizens, tinctured perhaps by a little tolerance, we believe that Edmonton can become known as a most healthy and happy place to live.

Respectfully submitted,

G. M. LITTLE, MEDICAL OFFICER OF HEALTH.

#### ISOLATION HOSPITAL

Seven hundred and fifty-five patients were admitted to the Isolation Hospital during 1951. There were 39 outpatients and 2 patients died.

The admissions to the hospital were for the following causes:

Scarlet fever	402	Erysipelas	13
Diphtheria	1	Measles	
Poliomyelitis		Rubella	
Meningitis (mening.)	8	Whooping Cough	53
Tuberculosis		Chickenpox	
Typhoid Fever	5	Mumps	
Paratyphoid	2	Septic sore throat	
Encephalitis	2	Vinent's Angina	
		Others
