Annual Report of the Medical Officer of Health

Chairman and Members
Local Board of Health,
Edmonton, Alberta

Ladies and Gentlemen:

Following is a report of the activities of our Board and certain other health agencies of our city during 1954:

Births:

There were 7,091 births recorded, giving an increased rate of 35.2 per 1,000 population. Of these, 36.9% were first-born children. Compared to 1953, population increased 7.8%, births 11.2%, but marriages were reduced by a single marriage.

Deaths:

The general death-rate again showed a small decrease. The rate from heart disease gave a comforting reduction, but that from cancer showed little change. The death-rate of 4.5 per 100M population from tuberculosis is a marked continuing decrease in deaths from this disease. Unfortunately, the occurrence of new cases of tuberculosis remains at about the same rate as in recent years. We must increase our efforts in prevention of this infection.

Fourteen of our 32 citizens dying from auto accidents were killed within the city itself. This compares with 20 killed in the city during 1953. In the light of an increasing traffic, it would appear that our traffic control officers are making headway with this difficult problem.

A further lowering of deaths under one year of age gave an infant mortality rate of 20.1 per 1,000 live births, which is an all time low for our city.

No city mother died from childbirth during the year.

Communicable Disease:

Communicable diseases were at the lowest incidence in years. This was largely due, however, to the fact that we were at the lowest point on the cycle of both measles and rubella. Poliomyelitis gave 75 cases and 5 deaths, compared to 322 cases and 16 deaths in 1953. During the year 2,245 school children took part in the field trial of poliomyelitis vaccine.

The steady elimination of whooping cough has been a very satisfying occurrence.

Attendance at our immunization clinics increased by 7,203 to a total of 30,335.

Child Health Services:

Attendance at our clinics for medical and nursing supervision of babies and pre-school children increased by 3,180 to a total of 20,791.

An increase of 4,007 in our school population during the year necessitated the addition of two nurses to the school medical services. Our school nurses greatly increased their visits to homes to discuss child health problems with parents. They have also taken an increasingly active part in communicable disease control.

An additional school dental clinic was established in our South Side Health Clinic during the year.

We believe that our school medical services are developing along the most effective lines possible.

Sanitation:

Except for the apparently inevitable residue of debris left when our winter snow disappears, we are becoming, generally speaking, a clean city. There are still, however, a few delinquent citizens who have still to learn the elements of municipal housekeeping.

Our restaurants, grocery stores and other food-handling establishments are making a commendable effort to provide citizens with a safe and sanitary service. Our staff of sanitary inspectors has done much to bring this about by their friendly advice and co-operation. Substandard housing continues to present a major problem.

Our milk supply continues to meet a high standard of safety and food value. The milk is checked on the 493 dairy farms, in city milk plants and delivery wagons. More than 11,000 samples were tested for quality and purity.

The food processing in a third local abattoir came under the inspection of our staff veterinarian during the year.

General:

The continued valuable service rendered to our citizens by the Victorian Order of Nurses commands our admiration.

The continuing and rather overwhelming volume of dental caries amongst our citizens leads one to hope that fluoridation of our city water supply, advocated by our Board and supported by the major dental, medical and other scientific groups of our continent, may be permitted without delay.

The excellent co-operation of the Provincial Laboratory and other provincial services have added much to the effectiveness of our endeavors.

The Edmonton and District Dental Association have continued to give us invaluable advice and support in planning our dental services.

The Provincial and Federal Governments have, through health grants, permitted us to expand and improve health services to our citizens.

We acknowledge these gratefully.

Finally, I would say that the Board's thoughtful consideration of those problems which confront our staff members has done much to promote an effective service to the people of our city.

Respectfully submitted,

G. M. LITTLE,
Medical Health Officer

C—Cases D—Deaths										

Communicable disease was responsible for 18 or 1.3% of the 1,361 City deaths during 1954.

Of the above deaths 15 were over the age of 20 years. 7 deaths were due to Pulmonary Tuberculosis and 2 from other forms of Tuberculosis. Five deaths were caused by Poliomyelitis.

Venereal diseases accounted for 1,254 or 56% of the communicable diseases reported in 1954. Measles—219 cases or 9.8%; Scarlet Fever—197 or 8.8%; Whooping Cough—181 or 8.1%; Poliomyelitis—75 or 3.4%.

SCHOOL HEALTH SERVICES

In the fall of 1954, the School Health Services were extended to an additional six elementary schools which were previously without any service. Comprehensive coverage of elementary schools in the city was thereby achieved.

The total school population receiving service increased by 4,007 pupils. Consequent to this the school nursing staff was increased by two full-time nurses.

The general standard of health of our school children continues to be satisfactory, although in the correction of defects, more personal financial difficulties are being encountered.

Sixty-three children with defective vision were examined by eye specialists, and supplied with glasses at city expense.

Many school children took part in the Field Trial of the Salk vaccine for the prevention of Poliomyelitis. Six thousand five hundred and eighty-one inoculations were given. In the United States and Canada, a total of approximately 500,000 children received this treatment. The final results of this Trial are not yet available. However, there is considerable reason for hoping that a satisfactory preventive measure to forestall this disease is within reach.

Three cases of Diphtheria occurred in the city during the year. Two of these were children. In view of the effectiveness of Diphtheria toxoid and the adequate facilities for immunization, such cases are unnecessary. Children who are satisfactorily immunized do not contract Diphtheria.

Dental caries continues a serious problem. Nineteen thousand, five hundred and ninety-two pupils with defective teeth were found during the year. The need for that universal preventive procedure known as fluoridation cannot be doubted.

The School Dental Services were extended by the opening of a new, modern, fully-equipped Dental Clinic in the basement of the Health Department building at 104th Street and 83rd Avenue. A half-time dental officer and a dental assistant were taken on staff for this clinic. In the two clinics presently functioning, eight hundred and seventy-three dental operations were performed. One hundred and seventy-seven children were given complete dental repair.

Examinations by Medical Officers:

Complete periodic examinations	12,057
Examinations on special referral	936
Re-examinations	187
Partial examinations	268
Total number of examinations	13,448
