ANNUAL REPORT OF THE MEDICAL OFFICER OF HEALTH

Chairman and Members Local Board of Health Edmonton, Alberta.

Ladies and Gentlemen:

It is my privilege to present to you the following report for 1958:

The rapid growth of our city continued in 1958. Our population increased by 5.7% and our school populaton by 7.4%. Numbers of older houses are still crowded by multiple families. There is need for further construction of living accommodation at a cost which will make it available to lower income citizens, particularly those with large families.

In April the Board's new Eastwood Health Centre was opened, and the rapidly increasing use of the services offered has already verified the need for a centre in that area.

Our birth-rate of 33.3 per 1,000 population was the lowest since 1952, although the total of 8,408 babies born was still greater than any previous year. There were 82 sets of twins born to city mothers during the year, and one set of triplets.

The infant death-rate was slightly increased, but remained comparatively low at 22.2 per 1,000 live births.

The marriage-rate of 12.5 per 1,000 citizens is the lowest recorded since 1918. In past years, excepting war-time, the economic welfare of our people appears to have had an important influence on this rate.

The death of 1,565 citizens of all ages gave a decrease in the general death-rate. Cancer and tuberculosis both gave lower rates. Of the 45 citizens dying from automobile accidents, 15 perished inside the city as compared to 18 the previous year. Most of such deaths are preventable, but only when we find some means of impressing upon every citizen his personal responsibility as a pedestrian or driver.

No extensive epidemics of communicable disease occurred during the year. A single case of diphtheria was reported. In six of the past ten years we have had only a single case of this disease, but have yet to achieve a year entirely free from diphtheria. However, this is a far cry from the years when our cases of diphtheria were numbered in their hundreds. A single case of typhoid fever in a baby, acquired from a relative identified as a carrier, and a single case of poliomyelitis in a unprotected 26 year old man were the extent of these diseases.

Another marked increase in attendance at our Health Centres occurred during 1958. We regard these preventive services primarily as a safeguard to the health of babies and pre-school children. A total attendance of 76,531 during the year gives adequate assurance that parents appreciate the value of such protection.

Over 80% of our citizens under 20 years of age have been protected against poliomyelitis. However, not more than 10% of those between the ages of 20 and 40 years have availed themselves of this protection. It will be obvious why a greater percentage of the cases are appearing in the older group across our country.

Our school health services have cared for a rapidly increasing school population which, in turn, has required an increase of personnel in this service. Early identification of physical defects, and immunization where necessary for more than 50,000 pupils, indicates the sizeable task delegated to this division.

The constant supervision of water, milk and other food supplies in restaurants, stores, warehouses, local abattoirs, and on dairy farms is an important contribution by our division of sanitation. Inadequate housing is also one of their still frequent problems.

We are keenly aware that we are part of a larger team. Many of our problems are solved with the help of other City departments. The provincial health services have contributed much material and technical assistance to our efforts, as have various departments of the University of Alberta. To all these, and to the members of this Board for their firm support, we offer our grateful acknowledgment.

Yours truly,

G. M. LITTLE, Medical Health Officer.

SCHOOL HEALTH SERVICES, 1958

In 1958 the total number of pupils attending the Schools served by this staff reached 50,173, an increase of 3,491 over the corresponding previous figure. In all, the Public, Separate and Parochial schools opened approximately 166 new rooms during the year.

The staff of the Service was increased by three full time nurses. The total nursing staff in School Health is thirty-two full time nurses. The appointment of a clerical assistant in 1957 proved to be a successful venture. Nurses were relieved of repetative documentation and the time thus gained devoted to Public Health nursing. It follows that only a limited amount of such documentation can be performed by non-nursing personnel, however, another clerical assistant was appointed to devote half her time to this useful endeavor.

The year has been almost spectacularly quiet in the communicable disease field. Problem families are fortunately rare, however, one family produced a Diphtheria case and a Diphtheria carrier of school age. These children were not immunized.

The Spring term saw the completion of the Poliomyelitis immunization scheme through the schools. Every school pupil had been offered this protection. Routine Diphtheria and Tetanus immunization and vaccination against Smallpox are recommended in the Fall term.

Routine audiometry of grade four pupils was again instituted in the Fall term. The screening test is that developed in Massachusettes. Referees are given an audiogram by the teacher in charge of the Special Class for the Partially Deaf of the Public School Board.

Fifty-seven pupils, children of indigent parents, who had defective vision, were refracted by ophthalmologists and where necessary provided with glasses at the expense of the Local Board of Health.

Under a similar scheme, 8,040 dental operations were performed by the Dental Division. Five hundred and forty-nine children were rendered dentally sound.

The annual dental survey of children in grades two to eight inclusive revealed that approximately 83 per cent of pupils had defective teeth. The need for Fluoridation of public water supplies continues unabated.

During the summer months, the Department examined 518 children prior to attending summer camps for the economically under privileged.

Five thousand one hundred and ninety-nine grade one pupils were submitted to the Vollmer Patch Skin Test. Eighty-eight pupils were positive and referred to the Tuberculosis Division of the Provincial Health Department for investigation and follow up.

Ninety-three children of school age in this city are receiving penicillin free from the Provincial Health Department for the prophylaxis of strep infection following Rheumatic Fever.

Examinations by Medical Officers:

Complete periodic examinations	14,984
Examinations on special referral	723
Re-examinations	169
