SWAZILAND

**ANNUAL MEDICAL & SANITARY
REPORT**

FOR THE YEAR 1962

100
100
100
100

Swaziland has an area of 6,704 square miles and is bordered on the north, west and south by the Transvaal, and on the east by Mozambique and Zululand.

The Territory is geographically divided into four well defined regions, running from north to south, namely the mountainous highveld in the west with an altitude of 3,500 and 5,000 feet; the middleveld with an average altitude of 2,000 feet; and the lowveld or bushveld with an altitude of 700 feet to 300 feet, and the Lebombo Plateau on the east, with an altitude of 2,000 feet. Scenically the Territory is one of the most attractive parts of Africa. The highveld has a temperate climate and frosts occur during the winter. The climate of the middleveld is subtropical and that of the bushveld is almost tropical.

Rainfall, which occurs chiefly in the summer, varies between approximately 60" a year in the highveld and approximately 30" a year in the lowveld. Drizzle and mists are frequent in the highveld areas. The country is well-watered by numerous perennial streams and rivers, some of which are of a considerable size and now provide water for three large irrigation schemes which have been established at Mhlume in the north-east, at Big Bend in the east (at both of which sugar is grown) and at Malkerns in the centre of Swaziland (which produces rice, sub-tropical fruit and citrus).

In addition to the irrigation schemes, other important agricultural activities are cattle ranching in the bushveld, sub-tropical fruit and rice production in the middleveld, in the southern portion of which a considerable amount of tobacco is also grown, and afforestation and sheep farming in the high veld. Significant mining development is at present restricted to the production of asbestos at Have-lock Mine in the north west and a small amount of high-grade coal in the bushveld. Iron ore and additional coal deposits are about to be developed.

A census of the European and Eurafrikan sections of the population was held in 1962, and an estimate was made of the African population at the same time. The resultant figures were:- Africans 270,000, Europeans 8,040 and Eurafrikans 2,260. One half of the area of the territory is in communal ownership of the Swazi Nation and the remainder owned by individual tenure farmers. The Swazi have the exclusive use of the communal tenure areas and the remainder is open to farmers of all races without discrimination. Swazi dwellings for the most part consist of wattle-and-daub structures, or bee-hive huts, and small family collections of these huts are widely dispersed. Other than in the neighbourhood of the European towns, there are no villages. Whilst the agricultural activities of the Swazi are still, in the main, concentrated on the raising of cattle and goats and the cultivation of maize, the work of the Land Utilization Department is now producing results, and both the standard and scope of Swazi farming are improving year by year.

The medical needs of the Territory are met by Government Hospitals at Mbabane (150 beds), Hlatikulu (137 beds), Mankaiana (28 beds) and Pigg's Peak (39 beds); by Mission Hospitals at Manzini (246 beds), Mahamba (45 beds) and Stegi (35 beds); by 12 Government clinics (three of which are

The first part of the report deals with the general situation in the country during the year 1934.

The second part of the report deals with the economic situation in the country during the year 1934.

The third part of the report deals with the financial situation in the country during the year 1934.

The fourth part of the report deals with the social situation in the country during the year 1934.

The fifth part of the report deals with the political situation in the country during the year 1934.

The sixth part of the report deals with the international situation in the country during the year 1934.

maintained by the Swazi National Treasury) and 17 Mission clinics in outlying areas; by the mine hospital at Havelock Mine; and by medical practitioners, either working on their own or employed by large industrial concerns, who are established at Mbabane, Manzini, Pigg's Peak, Stegi, Mhlambanyati, Malkerns, Mhlume, Big Bend and Mliba. There are, in fact, 38 medical practitioners working in Swaziland at present, two of these who hold foreign unregistrable qualifications being licensed to practice, under the relevant section of the Medical, Dental and Pharmacy Proclamation. There is thus 1 doctor per 7,368 persons in Swaziland, in comparison with the accepted Western European standard of 1 doctor for 1,000 patients and the "South of the Sahara" average of 1 doctor per 10,000 persons. The 680 hospital beds in use in Swaziland today give a ratio of 2.4 beds per 1,000 persons, as against the Western European average of 4 - 5 beds per 1,000. These figures are based on the estimated population of 280,000.

The Mbuluzi Leper Hospital, situated 10 miles from Mbabane and run by the Nazarene Mission, with the assistance of a Government grant, copes most adequately with the decreasing number of lepers in the Territory. There is no special tuberculosis hospital, but three general hospitals have separate tuberculosis wards. There is also no mental hospital, and dangerous and violent lunatics are detained and treated in sections of the gaols.

The British Red Cross Society is now running Infant Welfare Clinics at Mbabane, Hlatikulu, Stegi, Pigg's Peak and Goedgegun, at which most useful work is being done.

The Public Health services of the Territory are centered at the Health Office, Manzini, under the control of the Medical Officer of Health, in whose charge are also the malaria control unit and the bilharzia investigation unit.

The Medical Association of Swaziland, whose members include private practitioners, medical missionaries and Government medical officers, hold quarterly meetings, which are usually well supported and which make up to some extent for the lack of professional contact so common in territories such as Swaziland.

The Medical Department staffing position remained satisfactory in 1962. A Medical Officer was stationed at Goedgegun for the first time, from October, and as soon as housing is available it is hoped to station a Medical Officer at Mankaiana as well. In addition a fifth Medical Officer post was established at Mbabane Hospital. Applications for employment from African Staff Nurses continued to pour in and far exceeded the demand. Details of the staff at the various Government hospitals and at the Health Office will be found in Appendix I, page 61.

The training of nurses in Swaziland is carried out at the Ainsworth Dickson Training College attached to the Raleigh Pitkin Memorial Hospital, where training for the High Commission Territories Nursing Council qualifications in General Nursing, lasting 4 years, and in Midwifery, lasting 1 year, is given. The Ainsworth Dickson Training College can at present train sufficient nurses for the needs of Swaziland. Dispensers and Laboratory Assistants are trained at Government hospitals as required.

Since the successful malaria control programme has resulted in the near-eradication of the disease from Swaziland, tuberculosis is now the main health problem and towards the end of the year team members of the W.H.O./U.N.I.C.E.F. assisted Tuberculosis Control Project began

The first part of the report deals with the general situation of the country and the progress of the work done during the year. It is followed by a detailed account of the various projects and schemes which have been carried out. The report concludes with a summary of the results achieved and a statement of the resources available for the next year.

The second part of the report deals with the financial statement of the organization. It shows the income and expenditure for the year and the balance sheet at the end of the year. It also includes a statement of the assets and liabilities of the organization.

The third part of the report deals with the personnel of the organization. It gives a list of the staff members and their duties. It also includes a statement of the salaries and allowances paid to the staff members.

The fourth part of the report deals with the progress of the various projects and schemes mentioned in the first part of the report. It gives a detailed account of the work done and the results achieved.

The fifth part of the report deals with the general remarks and conclusions. It summarizes the main findings of the report and gives some suggestions for the future.

The sixth part of the report deals with the appendix. It contains a list of the various documents and reports which have been referred to in the main text of the report.

The seventh part of the report deals with the index. It gives a list of the various topics and subjects which are covered in the report.

to assemble in Manzini, from where they will operate from an extension built during the year onto the Health Office, and consisting of laboratory, X-Ray rooms, out-patient clinics and offices. Bilharzia is wide-spread among the indigenous population, and whilst the clinical manifestations are usually minimal, it is felt that a potentially very dangerous position exists at the irrigation schemes, and a careful watch is being kept on conditions here. Malnutrition and infantile diarrhoea are important causes of ill-health and death amongst young children, the former being especially noticeable at the post-weaning age, and heart-diseases and pneumonia also rank high as causes of death.

The conditions which cause most attendances at Government hospitals are acute upper respiratory tract infections, diseases of the genito-urinary system, minor disorders of the digestive system, venereal disease, rheumatism and infections of the skin and subcutaneous tissues. Among the infectious diseases, enteric fever was even more prevalent than before, although the majority of cases occurred sporadically.

The coverage it was possible to give to Public Health work improved during 1962, with the appointment of an additional qualified Health Inspector, the establishment now being four, two of whom are employed on general public health work, one on malaria and one on bilharzia work.

It was a great pleasure to welcome Dr. J.M. Liston, Chief Medical Officer at the Department of Technical Co-operation, to Swaziland at the end of July. Dr. Liston was taken on an extensive tour of the Territory and visited all hospitals.

In March Dr. H. Stott, of the Valley Trust, Botha's Hill, and Mr. Don Mackenzie of the Toc H. T.B. Settlement, Botha's Hill, visited Swaziland, the first to see the work of the Nutrition Survey team in the field, and the latter to investigate the possibility of Toc.H. extending its activities into Swaziland.

CHAPTER I - PUBLIC HEALTH

(a) COMMUNICABLE DISEASES.

I. TUBERCULOSIS.

- 1.1. Tuberculosis remains Swaziland's chief health problem, and as it was not possible to start the planned control project in 1962, activities were restricted to curative work, where maximum use continued to be made of the beds reserved for tuberculosis in the hospitals at Manzini, Mbabane and Hlatikulu, while reliance had to be placed on out-patient treatment with many patients, and in the absence of adequate "follow-up" facilities, this often proved unsatisfactory.
- 1.2. There was actually a slight fall in the number of cases of tuberculosis dealt with at Government and Mission hospitals in 1962 - viz. 1156 cases as against 1222 in 1961, constituting 0.9% of all cases attending, as against 1.1% in 1961 and also 1960.
- 1.3. During the year a building consisting of laboratory, X-Ray rooms, out-patients clinic and offices was erected in Manzini, adjoining the Health Office, for use by the W.H.O./U.N.I.C.E.F. assisted Tuberculosis Control Team now and for use of the Territory's tuberculosis control workers subsequently. Towards the end of the year members of the W.H.O./U.N.I.C.E.F. team began to assemble, and it is hoped that operations will be in full swing early in 1963.

2. MALARIA.

This report covers the period 1.7.61 to 30.6.62.

2.1. Climatic Conditions.

The middleveld and highveld areas had average summer rains, whereas in the bushveld, particularly in the southern parts, severe drought conditions were experienced. Big Bend had only 13.83 inches during the year and the temperatures rose to over 103°F. on several occasions during the months of January and February. The hottest day was registered at Gollel, namely 107.6°F. during February.

The rainfall and temperatures registered at five stations during the year at altitudes varying from 500 feet to 2200 feet are tabulated as follows:-

2.2. Meeting of the Field Staff.

The annual meeting of the field staff was held at Manzini during the first week of September, 1962, when a "refresher" course was given on malaria field work which included the following:-

- (a) the taking of bloodslides;
- (b) collection of entomological specimens;
- (c) residual spraying;
- (d) keeping of records, reporting etc.

Lengthy discussions followed on the numerous problems encountered by the field staff in their respective districts.

2.3. Population and Hut Count.

The season's work commenced by taking the usual census of population and huts in the surveillance areas.

Each Malaria Assistant recorded the number of huts and people accommodated in each kraal in their respective areas. During this survey the routine collection of bloodslides, and the treatment of tapeworm carriers, had been continued and entomological work was confined to suspect areas only.

The results of hut and population count were as follows:-

SWAZI AREAS.

AREA	KRAALS	HUTS	ADULTS	CHILDREN 1-12 yrs	INFANTS 1-12 m.	TOTAL (POPULATION)
1A	1240	6112	4121	3638	755	8514

TOTAL	10886	52873	44861	34985	6700	86546

2.4. Malaria Control Measures.

2.4.1. Chemo-Prophylaxis.

Prophylactic doses of pyrimethamine ("Daraprim"), 25 mgm per person, were given to the labour force at the three major irrigation schemes. No transmission took place at any of these schemes where a population of 11,500 people was engaged.

Immigrants and visitors from malarious areas outside Swaziland received an initial dosage of 800 mgm (4 tablets) of chloroquine sulphate ("nivaquine") plus 50 mgm (2 tablets) of pyrimethamine per adult at the time of taking their bloodslides. Whenever blood results were found positive, further treatment, as described above, with the exception of pyrimethamine, had been followed. Wherever possible each positive case had been followed up by blood examinations each fortnight in order to ascertain the efficiency of the treatment. No recurrence of malaria in any of the cases treated during the past season has been noted.

2.4.2. Parasitology.

Bloodslides taken during the year were examined at the Health Office by four microscopists, and the following results were recorded:-

SOURCE	NEGATIVE	POSITIVE	TOTAL	% POSITIVE
Indigenous	19,002	67	19,069	0.34%
Immigrants	2,923	142	3,065	4.6%
Combined	21,925	209	22,134	0.94%

The "break-down" of the bloodslides taken from immigrants was:-

	NEGATIVE	POSITIVE	TOTAL EXAMINED	% POSITIVE
MOZAMBIQUE	1066	106	1172	7.4%
ZULULAND	767	25	792	3.5%
TRANSVAAL	898	10	908	1.0%
NOT SPECIFIED	190	3	193	

The question of immigrant parasite carriers is still a matter of serious concern.

2.4.3. Residual Spraying.

On account of dry weather conditions spray operations in the bushveld areas had been delayed until the first week in December. The irrigation schemes and the farms at Big Bend were tackled first and spray operations were then extended to the other bushveld areas and eventually covered the entire cordon of about 10 to 15 miles wide from the northern to the southern boundaries of the territory all along the Mozambique and Natal borders. The first treatment was completed in six weeks, and certain areas received a second application of insecticide after an interval of 8 weeks.

Towards the end of May i.e. eight weeks after the second spray - *A. gambiae* appeared in a few grass huts on the farms Picardie Estate and Poortsicht, at Big Bend, on the southern bank of the Usutu River. As these farms have a migratory labour force population it was necessary to spray that area for the third time during May 1962.

The irrigation schemes at Big Bend and Mhlume were treated with stocks of D.D.T. 75%, which had been carried over from the previous season. Only one application was given to these compounds. The remaining areas were all treated with B.H.C. 12½% gamma. With the aid of Landrovers in certain accessible areas, spraywork had been completed in the minimum of time.

The number of huts treated are tabulated as follows:-

RESIDUAL SPRAYING.

AREA NO.	HUTS 1ST SPRAY	HUTS 2ND SPRAY	HUTS 3RD SPRAY	TOTAL SPRAYS
3	1375	1497		2872
4	3081	981		4062
5	7613			7613
6	3449	3339		6788

	37400	12659	420	50479

/Surveillance.....

DATE	POSITIVE	TOTAL EXAMINED	NEGATIVE
1.1.19	117	100	83
1.2.19	108	100	77
1.3.19	100	100	70
1.4.19	100	100	70

The number of patients in hospital is still a matter of concern.

3.4.3. Results of the

In view of the weather conditions early in the year the patients have been delayed until the week in December. The patients who were taken at the first time and were operated on were then taken at the other hospitals and eventually covered the entire region of about 10 to 15 miles from the hospital in the northern part of the territory all along the coast and inland routes. The first treatment was completed in six weeks, and patients were received a second application of iodine after an interval of 2 weeks.

Towards the end of May 1919, at the week after the first - 2 - 3 patients reported in a few cases both on the coast and inland, and hospital, at the end of the month both at the coast and inland. It was found that a large number of patients had been treated in the hospital and that the first time was in 1919.

The hospital was closed at the end of the year and treated with a total of 1,177, which was the total number of patients who were treated. Only one application was given to the patients. The patients were all treated in 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000.

The number of patients treated are tabulated as follows:-

RESULTS OF TREATMENT

AREA NO.	DATE	NO. OF PATIENTS	TOTAL
1	1.1.19	117	117
2	1.2.19	108	225

2.4.4. Surveillance.

Routine surveillance work had been continued in the manner described in 1961. The Malaria Assistants, aided by trained Headmen, covered their respective areas regularly. Bloodslides were taken, immigrants and suspected malaria cases located and the prescribed treatment administered, where necessary. Entomological observations, by means of space spraying and larval collecting had been done throughout the areas.

In certain localities, where indigenous positive cases were found, and where transmission was suspected, more intensive entomological observations were made, by night catching. The results are reflected in the following table:-

With the exception of the cases detected at the Mabiya Dam area in Nkambeni, (one imported and 9 indigenous), malaria was confined to isolated cases, at various places which had no connection with one another and there was no indication of the likely spread of malaria from any of these sources.

THESE RECORDS BELONG TO THE NATIONAL ARCHIVES AND ARE NOT TO BE REPRODUCED OR TRANSMITTED IN ANY FORM OR BY ANY MEANS, ELECTRONIC OR MECHANICAL, INCLUDING PHOTOCOPYING, RECORDING, OR BY ANY INFORMATION STORAGE AND RETRIEVAL SYSTEM.

2.5. Entomological Investigations.

2.5.1. Routine Entomological Work Carried out by Field Staff.

As part of the surveillance routine, malaria staff carried out entomological surveys in their respective areas. Likely breeding places were regularly checked and living quarters, selected at numerous points in each area, were space-sprayed with pyagra. All the anopheline mosquitoes thus collected were identified and recorded at the Health Office, Manzini.

By means of the space spraying it was possible to determine the value of the residual insecticide and also to study the incidence of *A. gambiae* entering human habitation. In fact only 15 *A. gambiae* mosquitoes were found during a total number of 15,339 check sprays, while 26 *A. funestus*-group mosquitoes were found by check-spraying in an unsprayed area, north of the Komati River. These were unfortunately unsuitable for precipitin testing. This last collection was followed up by a more intensive search by using baited nets and window cages. The results were negative.

Note on *A. Gambiae* Larvae Collected.

Breeding in areas No. 1 and 2 (unsprayed) was confined to localised water courses. The heaviest breeding took place at the Msinda dam near Balegane adjoining Areas 1 and 2. Specimens from this area were sent to an entomologist at the S.A. Institute for Medical Research, who is at present working on differential studies of *A. gambiae* collected from various countries.

In view of the isolated position of this dam, anti-larval measures were instituted during June, 1962. Anti-larval work is contemplated at other sources whenever the need occurs and wherever such measure is considered to be practical.

A study of the habits of *A. gambiae* had been continued in the field at

- (a) Big Bend (Umfula Planters) which is a sprayed area.
- (b) Nkambeni (near Balegane), an unsprayed area.

Man and animal baited trapnets and window cages were again used.

2.5.2. Observations re. Feeding Preferences of A. Gambiae at Umfula Planters and Picardie Estate Complex on Big Bend area.

The homesteads on these two farms are separated by swampy land of about 10 acres where *A. gambiae* were found to breed. The conditions on both farms, with reference to cattle and living quarters, were identified and they were equally affected by mosquitoes.

At the end of June the cattle were removed from Umfula and during July a survey, was conducted as follows:-

- (a) Umfula - Man baited net (in the absence of cattle).
- (b) Picardie Estate - Calf baited net (in the absence of man).

From the results reflected in the following table it appeared that:

- (i) 52% of the *gambiae* found in the man net had fed.
- (ii) 100% of the *gambiae* found in the calf net had fed.

This test confirmed the previous findings namely that *A. gambiae* in that area fed on man and on animal depending on the availability of the host, and the chance of malaria transmission in that area depended entirely on the presence or absence of the infected human hosts.

The Umfula Farm and all the surrounding farms and Swazi areas were sprayed with B.H.C. at the end of July, 1961, and were resprayed in November and again in May, 1962.

From surveys made between these sprays it was found that the number of *A. gambiae* decreased considerably.

As there were no cattle on the Umfula Farm a calf was obtained from the Swazi area about one mile away, to use as bait in one of the nets.

Large numbers of other anopheline species were found but only 2 unfed *A. gambiae* were caught in the man baited net, and 6 fed *A. gambiae* were found in the calf baited net during twelve collections.

From the attached record of window cage trap collections it is also obvious that the numbers entering the traps decreased considerably since the cattle were removed and the huts sprayed with B.H.C.

	Sub-category Y.2	3.5	3.8	4.1	4.4	4.7	5.0	5.3	5.6	5.9	6.2
Category Z	Sub-category Z.1	3.7	4.0	4.3	4.6	4.9	5.2	5.5	5.8	6.1	6.4
	Sub-category Z.2	3.6	3.9	4.2	4.5	4.8	5.1	5.4	5.7	6.0	6.3

The data presented in this table shows a clear upward trend in the values across all categories and sub-categories. The values range from 1.1 to 6.4, with the highest values appearing in the 'Category Z' sub-categories. The data is organized into 20 main categories (A through T), each with two sub-categories. The values generally increase from left to right and from top to bottom within each category.

2.5.3. Malaria Transmission at Nkambeni (Unsprayed Area).

On the 12th December, 1961, a child of six years was found to be positive for Malaria. Investigations indicated that the infection was acquired at Msinda. During an intensive survey, which followed, no signs of malaria vectors were to be found. No mosquitoes were found from 85 huts space-sprayed and 200 blood-slides taken in the immediate surroundings were all negative. No breeding was found in the Msinda dam at that time and the source of infection remained undetected.

At the beginning of April, 1962, it was found during routine surveys that transmission had, in fact, taken place at Mabiya, a confined area about 8 miles north of Msinda, during January, 1961.

Nine positive slides were found out of approximately 300 slides taken. The likely source of infection appeared to be an immigrant from P.E.A., whose slide was also positive.

An intensive entomological survey, which consisted of space-spraying, night catches by means of man and animal baited nets and by using window cage-traps, revealed negligible results.

2.5.4. The Endophilic and Exophilic Behaviour of *A.gambiae* Mosquitoes in relation to B.H.C. Residual Spray at Umfula Planters.

In order to study likely behaviouristic changes in *A. gambiae*, exit-cage-traps were fitted to windows of nine huts and the number of mosquitoes collected, before and after the application of B.H.C. to each hut, was recorded.

12 $\frac{1}{2}$ % gamma B.H.C. was applied at the rate of 0.2 gm/square metre of surface area.

Summary of Results.

A. Survey before B.H.C. spraying.

MONTH	PERIOD	A. GAMBIAE		
		FED	UNFED	TOTAL COLLECTED
July 1961	11 days	58	158	216

First application of B.H.C. 31st July, 1961.

B. Survey ten weeks after first application.

MONTH	PERIOD	A. GAMBIAE		
		FED	UNFED	TOTAL COLLECTED
October 1961	6 days	6	2	8

Second application of B.H.C. at the end of November, 1961

C. Survey 10 weeks after second application of B.H.C.

MONTH	PERIOD	A. GAMBIAE		
		FED	UNFED	TOTAL COLLECTED
February 1962	6 days	Nil.	Nil.	Nil.

From this small-scale experiment it is evident that our proved method of residual spraying, using B.H.C. as insecticide, remains most effective in the control of malaria in Swaziland.

THE UNIVERSITY OF MICHIGAN LIBRARY

It is to be noted that the specimens were taken from the same locality as those which were listed in the report of the Michigan Department of Conservation, and that the collection of the University of Michigan is a duplicate of the collection of the Michigan Department of Conservation.

This material was collected at the same time and place as the material of the Michigan Department of Conservation.

3. BILHARZIA.

3.1. Bilharzia Control Pilot Project at Phonjwana.

Snail control measures were commenced in March, 1961, during which year four applications of copper sulphate to the dam were made. During 1962 five further sulphations were made. Pockets of snails kept recurring in the upper area of the dam which was covered in bulrushes. These were eventually cut down and the area re-sulphated. This latter measure proved effective as no snails have been found since September, 1962. During September, 1962, Physopsis were found in the first twenty-five yards of the stream leading from the dam. None were found since sulphation during the same month. Monthly surveys were carried out and heavy applications of copper sulphate made. The sulphations include one on the dam and one on the stream made during October even though no snails were found, as it was considered desirable to strike again before the heavy rains.

In view of the previous unsuccessful attempts at mass treatment of the children of this area with "Nilodin" it was decided to repeat the treatment.

The children who were still positive after the previous course of treatment plus those who complained of haematuria were weighed and a three day course of treatment calculated for each one, based on 75 m.g.m. per kilogram of body weight. Each child was given a sweet (such as was used for the oral administration of Polio vaccine) before and after taking the tablets, which were given in the morning at approximately 9.00 a.m. and in the afternoon at approximately 3.00 p.m. Only 31 out of the original 66 completed the treatment. Most of them complained of side effect viz. nausea and vomiting and many absented themselves from school after the first and second days' treatment. A month after completion of treatment, the urines of the 31 who completed the course were examined and 11 were found to be still passing viable ova. The remaining 20 who were negative, were then examined for the second time and as a result an additional 4 were positive, making a total of 15 out of 31 still positive.

As "Nilodin" has been given a fair trial at Phonjwana and results each time have been unsatisfactory, it is recommended that another form of treatment be attempted.

3.2. Urinary Bilharzia Survey of European School Children.

The following results were obtained:-

<u>School.</u>	<u>No. Examined</u>	<u>No. +VE</u>	<u>% +VE</u>
Tshaneni Government School	33	0	0
Big Bend Government School	31	2	6.5
Stegi Government School	20	1	5.0
Herbert Stanley School, Havelock	81	3	3.7
Pigg's Peak Government School	96	3	3.1
St. Marks Primary & High Schools, Mbabane	502	3	0.6
Usutu Forest School	112	3	2.7

In addition 22 stools at Tshaneni Government School and 17 stools at Big Bend Government School were examined and found negative for S. Mansoni.

Administrative Control of the Department of Defense

1954

Other Personnel

The Department of Defense is a large organization with a wide range of activities. It is necessary to have a system of administrative control to ensure that all activities are carried out in an efficient and economical manner. This system should be based on the following principles:

- 1. The Department should be organized into a hierarchy of units, each with a clearly defined function.
- 2. There should be a clear line of authority and responsibility from the top to the bottom of the organization.
- 3. There should be a system of checks and balances to prevent the concentration of power in any one individual.
- 4. There should be a system of communication that allows for the free flow of information throughout the organization.
- 5. There should be a system of evaluation to ensure that all activities are being carried out in an efficient and economical manner.

TEMP

3.3.4. Snail Control Pilot Project -Thandelizwa
Manzini District.

Preliminary survey of ± 2000 yard long stream 11.7.61 - 84 Physopsis.

1st Heavy application of Copper Sulphate 12.7.61

2nd " " " " " 20.12.61

Subsequent monthly surveys thereafter during 1962 failed to produce any physopsis but lymnanea, forskalii and gyraulus re-established themselves.

Preliminary survey of ± 1000 yard long tributary 4.10.61 -58 Physopsis.

1st Heavy application of Copper Sulphate 4.10.61

2nd " " " " " 7.2.62

Subsequent monthly surveys during 1962 as before also failed to produce any Physopsis. Other snails were never found here.

3.4. EPIDEMIOLOGICAL SURVEYS.

3.4.1. Epidemiological Survey - Ubombo Ranches, Big Bend.

(a) Snail Survey: A comparison with previous snail surveys is made:-

	BIOMPHALARIA			PHYSOPSIS			MELANOIDES					
	SEPT. 1958	MARCH 1959	AUGUST 1959	MARCH 1962	SEPT. 1958	MARCH 1959	AUGUST 1959	MARCH 1962	SEPT. 1958	MARCH 1959	AUGUST 1959	MARCH 1962
Main Canal	100	0	56	0	0	0	1	0	0	20	0	214
Branch Canal past Field Compound	66	1	12	0	6	5	2	0	0	0	0	0
Dam No. 2	180	13	8	4	6	30	0	0	0	0	0	0
Main Branch Canal	80	36	46	24	2	21	0	132	0	0	0	60
Branch Canal No. 3	10	47	27	0	1	3	0	0	0	0	0	2
Stream below Old Mill Com-pound	-	19	2	39	-	18	1	1	-	0	0	1

In branch canal No. 3 only dead Biomphalaria and Physopsis (10 and 31 respectively) were found, in addition to the 2 live Melanoides. This was due to the fact that a weed killer known as "Aqualin" was applied to this canal only a week previously. As a weed killer it did not however prove a success.

(b) A parasitological survey at Bholi School, Big Bend, revealed the following:-

AGE GROUP	S. HAEMATOBIIUM			S. MANSONI		
	NO. EXAMINED	NO. +VE	% +VE	NO. EXAMINED	NO. +VE	% +VE
0 - 10	50	34	68	50	32	64
11 - 20	50	37	74	50	18	36

	NO. EXAMINED	NO. +VE	% +VE	NO. EXAMINED	NO. +VE	% +VE
0 - 20	113	80	71	108	16	15

The increased incidence in S. mansoni is striking as is the comparison in S. mansoni incidence between the two age groups.

3.4.2. Parasitological Survey - Nkambeni.

It was considered advisable to conduct a survey in a non-irrigated Swazi area adjoining the Swaziland Irrigation Scheme, Tshaneni, in order to establish the fact that the high incidence of bilharzia in the Irrigation Scheme was directly attributable to irrigation. Consequently Nkambeni School and a nearby kraal were chosen for this purpose and only children who were born and brought up in this area were examined.

A comparison is made between a similar group of children from Swaziland Irrigation Scheme, the results being as follows:-

PLACE	S. HAEMATOBIIUM			S. MANSONI			
	NO. EXAMINED	AVERAGE AGE	NO. +VE	% +VE	NO. EXAMINED	NO. +VE	% +VE
S.I.S.	66	4.8yrs	23	34.8	64	12	18.7
NKAMBENI	66	7.2 "	10	15.0	66	1	1.5

3.4.3. Parasitological investigation at Thambankulu and Umbeluzi Estates.

At the request of the management, an investigation was conducted in order to assess the extent of the bilharzia problem amongst the children.

The following are the results:-

PLACE	S. HAEMATOBIIUM			S. MANSONI		
	NO. EXAMINED	NO. +VE	% +VE	NO. EXAMINED	NO. +VE	% +VE
THAMBANKULU (Irrigated)	134	71	53	134	53	40
UMBELUZI (Not Irrigated)	39	14	36	36	5	13.9

Other parasitic ova found were:-

PLACE	PARASITE	NO. EXAMINED	NO. +VE	% +VE
THAMBANKULU	Ascaris	134	19	14.2
"	Trichuris	134	5	3.7
"	Taenia	134	2	1.5
"	H.nana	134	1	0.75
"	Strongyloides	134	1	0.75
UMBELUZI	Ascaris	36	4	11.1
"	Enterobius	36	1	2.8

In order to ascertain the possible sources of infection, the following snail survey was conducted:-

	<u>PHYSOPSIS</u>	<u>BIOMPHALARIA</u>
MAIN CANAL	0	0
CEMENT CANALS	0	0
1st CEMENT SUMP	13(5+ve)	0
2nd " "	18(2+ve)	61
STREAM AT ROAD CROSSING TO MAIN ROAD	2	0
THAMBANKULU STREAM	1	32
EARTH CANAL TO THANK. STR.	2	14

3.4.4. Comparative Epidemiological Investigations

A comparison is made with conditions found in previous surveys at the Swaziland Irrigation Scheme Tshaneni and the Mhlume Sugar Company.

(a) Snails - Swaziland Irrigation Scheme.

3.4.5. Snail Survey - Ubombo Ranches, Big Bend.

As a result of a claim by the Management of Ubombo Ranches that the clearing of vegetation from the canals had substantially contributed towards snail eradication, it was decided to conduct a snail survey. The results were as follows:-

PLACE	BIOMPH- ALARIA	PHYSO- PSIS	LYMN- ARA	TROP- ICUS	MELAN- OIDES	FORSK- ALII	GYRA- ULUS	BIV- LVES.
Main Canal at Malayinini Compound (+ 100 yards)	51	0	30	0	48	0	1	0
Adjoining Sump, Malayinini Compound	0	0	0	30	0	0	0	0
Canals & Large Pool Mkhayabovu Compound	6	0	14	0	0	1	0	0
Canals & Large Pool Embonoweni Compound	100	1	31	35	24	0	0	4

The main canal despite having been well cleared from an irrigation point of view, still contained sufficient Potamogeton SP. (a water weed) and microflora to support molluscan life.

Vegetation clearance is obviously only part of the solution to the problem of snail eradication.

The management of Ubombo Ranches has agreed to co-operate with the Department in a snail eradication pilot project. A suitable section of the Main Canal near the end has been chosen and two screens are to be made and fitted to the canal as well as a device for applying a drip-feed to the water. The Department will provide the necessary Copper Sulphate for the initial sulphation and also for the continuous drip. If this is successful in keeping the section below these mechanical and chemical barriers free of snails, extension of the method will be considered.

3.4.6. Manzini Gaol.

In order to gain some idea of the possible effects of bilharzia on energy output, the urines of 83 prisoners were examined and the prisoners were grouped into three categories viz: "Bad workers" "Fair workers" and Good workers". The results were as follows:-

Bad workers - 12,	of which 6	had bilharzia	(i.e. 50%)
Fair workers- 21,	" " 4	" "	" 19%
Good workers- 50,	" " 15	" "	" 26%

3.4.7. Numerous other small surveys were carried out during the year, at the request of Company Medical Officers, farmers, teachers, etc. and appropriate advice was given.

3.4.8. Taxonomy.

During 1962 snails were sent to Potchefstroom University for taxonomical examination - and the results were as follows:-

The intermediate host of *S.haematobium* was *Bulinus* (*Physopsis*) *Globosus* (Morel) in the case of specimens from Manzini, Mbabane, Ezulwini, Lobamba, Malkerns, Matapha, Sipofaneni, Big Bend, Lubuli, Kubuta, Tofus causeway.

Bulinus (*Physopsis*) *Africanus* (Krs.) were found at Bethel near Hluti and in the Mahosha River between Mhlotsheni and Dwaleni. In both instances some of the : snails collected here were found to be shedding mammalian cercariae.

The intermediate host of *S.mansoni* was *Biomphalaria pfeifferi pfeifferi* (krs.) in the case of specimens from Manzini, Mbabane, Matapha, Sipofaneni, Big Bend, Lubuli, Kubuta.

3.5. EXPERIMENTS:

3.5.1. "Tall Oil Soap" as a Molluscicide.

As a result of the findings in the Tung Oils upper dam previously mentioned under para. 3.3.2 a snail survey was conducted at the weir in the Usutu River where the Malkerns Irrigation Canal commences and also in Malkerns. The results are compared with a survey conducted in May 1957.

	<u>MAY 1957</u>	<u>SEPTEMBER 1962</u>
Usutu River weir	76 <i>Physopsis</i> 10 <i>Lymnaea</i> .	No. snails
Main dam at Tung Oils	66 " (21 infected)	8 <i>Physopsis</i> + 6 dead 60 <i>Biomphalaria</i> + 89 dead. 30 <i>Lymnaea</i> +16 dead.

In the Laboratory it was discovered that 40 parts per million of "Tall Oil Soap" (i.e. 40 mg/litre) appeared to have no effect on adult or baby snails, but proved to be lethal to fish.

From the above it would appear that "Tall Oil Soap" would not be practicable as a molluscicide as it would upset the ecological balance of the waters to which it was applied.

3.5.2. "Dettol" and "Germotol" as Cercaricides.

Tests were carried out with "Dettol" and "Germotol" in order to establish their efficacy as cercaricides, as it appears that some people add "Dettol" to their bath water in order to safeguard themselves against bilharzia.

The experiments were based on the fact that 30 gallons of water constituted a fairly full bath.

/The results.....

The results revealed that:-

2	Tablespoonsful	of Dettol	killed cercariae	in 7 minutes.
3	"	"	"	" " "10 "
4	"	"	"	" " " 2 "
5	"	" Germotol	"	" " "10 "
6	"	"	"	" " " 9 "
7	"	"	"	" " " 6 "
8	"	"	"	" " " 6 "
10	"	"	"	" " " 3 "

The use of "Germotol" would thus not be an economic proposition whereas "Dettol" would certainly be more practicable.

3.5.3. The effect of centrifugal force on cercariae by means of a 1 h.p. centrifugal pump running at 2,850 R.P.M. was tested. A head of 18 lbs/square inch was obtained and cercariae were pumped through and examined. It was found that a few cercariae had survived this process as they were fully active, but most had lost their tails and the schistosomes were crawling around actively on the bottom of the container. A few dead schistosomes were also observed.

3.6. BILHARZIA EXAMINATIONS AT HEALTH OFFICE.

209 urines, 8 stools and 3 labial warts were examined for evidence of bilharzia at the Health Office, Manzini.

4. POLIOMYELITIS. Three cases.

The three cases of Poliomyelitis reported during the year were all sporadic in distribution and consequently no special investigations were undertaken. Oral Poliomyelitis vaccine was made available to the public during the year. A letter to the "Times of Swaziland" and "Izwi lama Swazi" advertising the availability of the vaccine had little effect in stimulating the public interest. At the Health Office only 68 doses have been administered since the vaccine was made available. At other centres the response has been similarly poor.

5. DIPHTHERIA. Seven cases with two deaths.

All the cases of Diphtheria reported were sporadic in distribution. At Ubombo Ranches where there was a suspected case in a very unhygienic compound all contacts were passively immunised with Antitoxin. No further cases developed.

6. ENTERIC FEVER. Three hundred and thirty-four cases with eighteen deaths.

6.1. There has been a disturbing increase in the number of cases reported over the last few years. In 1959 there were 141 cases with 8 deaths, in 1960 there were 202 cases with 14 deaths, in 1961 there were 285 with 15 deaths. The most disturbing aspect of the situation is that though many cases are seen by Medical Officers, there are probably as many if not more, that are not seen, and these unseen and untreated cases are in all probability acting as the reservoirs for the further spread of the disease. Another important factor is the poor attendance at immunisation points. Usually /the turn-out.....

the turn-out for the first injection is good, but due to the local and general reaction to the vaccine both of which may be severe, the attendance for the second and most important immunising dose is always extremely poor. Consequently, the number of protected persons remains low. The number of "Carriers" developing after an attack of Typhoid Fever especially among the untreated section of the population, may be considerable, but it remains an unknown factor. However, "Carriers" and active cases combined with the insanitary habits of the people (as far as the disposal of their excreta is concerned) provide a situation which is most serious and which is most difficult to overcome. The only solution would be health education and a system of mass immunisation.

6.2. The following table shows the number of people immunised against Typhoid Fever:-

7. SMALL-POX. No cases.

7.1. During the year two suspected cases of Small Pox were seen. One was reported from Mahamba Mission and the other from Pigg's Peak. Investigation showed that both cases were indeed not Small Pox but severe Chicken Pox.

7.2. The Vaccinator who joined the service in 1961 resigned at the end of February. A temporary vaccinator was taken on strength from the first of March. At this time there was a great demand for vaccinations as the Republic had made vaccination a compulsory condition for entry. This demand for vaccinations continued for several months and the vaccinator was kept busy throughout the period. Arrangements were made for the vaccination of sections of the rural population. At Mankaiana vaccinating centres were arranged through the District Commissioner, with specific dates for each centre. The response on the part of the people was very poor and it was then decided that a better method would be to advertise the campaign through District Team meetings. The Manzini District Team then planned a series of meetings, giving the question of vaccination priority. All meetings were attended by representatives of the Health Office and appeals were made to the people to attend in force on the dates fixed for the various vaccinating centres. The talks with the people were well received and after each meeting it was promised that the people would turn out enbloc when the vaccinator appeared. In spite of all this the turn-out for vaccination was extremely poor. The vaccinator has, however, been kept well occupied by vaccinating all the scholars at the African Schools throughout the territory.

7.3. Vaccinations carried out by the Department for the year amounted to 24,811. In addition, the Medical Superintendent of Mahamba Hospital vaccinated 3,448 school children. It is sincerely hoped that vaccinating the rural population in the new year will meet with more success.

8. OTHER INFECTIOUS DISEASES.

There were two cases of Meningitis, while Chicken Pox, Measles and Whooping Cough have shown the usual seasonal and district variations.

9. VENEREAL DISEASES.

The number of cases of Syphilis and Gonorrhoea treated in 1962 show quite a marked increase over the 1961 figures. Syphilis rose from 1604 to 2255 and Gonorrhoea 3518 to 4194. The number of re-attendances for treatment in 1962 were:

Syphilis	4510
Gonorrhoea	5196

The above figures are from hospitals and clinics and will not coincide with the figures given in the nosological returns which are from hospitals only.

Chicago, Illinois
October 1954

The University of Chicago Press is pleased to announce the publication of the following titles in the series of books on the history of the United States.

(b) NUTRITIONAL AND DEFICIENCY DISEASES.

- 1.1. The field work of the Nutrition Survey carried out by Miss Sonya Jones, M.Sc., working on a Natal University fellowship, and assisted by local staff, was completed in March, and the report of the survey is due shortly. It is expected that the report will provide much needed information on the actual diet of the Swazi, and its deficiencies, and of the food available, on which it will be possible to plan future action.
- 1.2. Financial assistance has been received from the Oxford Committee for Famine Relief for the establishment of a small Health Education/Nutrition Unit. The Unit in the first instance will consist of a trained Health Assistant with experience in this type of work, and a well qualified Nursing Sister, who assisted Miss Jones in her Nutrition Survey. The Unit will be provided with a caravan and other necessary teaching aids, and will visit the clinics and schools, and will maintain close contact with the Agricultural Department. The Unit will concentrate on the proper use of food; the dangers of unbalanced diets - and also on rural sanitation.
- 1.3. Assistance continues to be received from U.N.I.C.E.F. in the form of dried skimmed milk, and also Vitamins A and D capsules. The dried milk is widely distributed through clinics and other agencies for pregnant and lactating women, and children in need of a dietary supplement - and is readily acceptable to the people.
- 1.4. The Save the Children Fund has initiated school feeding - at present only on a pilot project basis but it is hoped that this will develop on an increasingly wide basis, as school feeding would be of great value to Swaziland.
- 1.5. In 1962 the number of cases diagnosed as malnutrition or "deficiency disease" again increased, and the Territorial totals for the past ten years are as follows:-

1953	-	286
1954	-	388
1955	-	330
1956	-	454
1957	-	1010
1958	-	1459
1959	-	2010
1960	-	2196
1961	-	2864
1962	-	3240

The "break-down" of the cases over the past three years is as follows:-

	1960		1961		1962	
	Cases	Deaths	Cases	Deaths	Cases	Deaths
Total Cases of Malnutrition	2196	66	2964	71	3240	101
Kwashiorkor	423	30	487	24	685	35
Pellagra	693	5	938	6	912	4
Scurvy	40	1	13	-	14	-
Malnutrition unqualified	1040	30	1426	41	1629	62

(c) SANITATION - WATER SUPPLIES - FOOD SUPPLIES.

1. SEWAGE DISPOSAL.

1.1. The sewage disposal plant at Mbabane continues to work very satisfactorily. There are, however, still quite a number of places in Mbabane that are using the bucket system and the disposal of the pail contents has on occasion lead to the creation of a nuisance. The question of disposing of pail contents into the existing sewers is receiving attention, and when a suitable site on the sewer line has been chosen all excrement will then pass into the disposal works. This will be a much more hygienic method of disposal - the trench method if not properly supervised always leads to the creation of nuisance.

1.2. A considerable amount of trouble with sewage disposal has been experienced in Manzini during the year. The primary cause of the trouble has been the impervious nature of the soil. This had lead to overflowing of french drains and in an endeavour to alleviate the position the construction of conservancy tanks has been permitted and many of the new buildings are using this system. Unfortunately more of these tanks have been built than can be adequately coped with by the single vacuum tanker and the result has been chaotic at times, with sewage effluent running down the street gutters. The situation was made worse by the repeated breakdown of the vacuum tanker. The conservancy system is a well recognised method of sewage disposal but it is absolutely essential to have a sufficient number of vacuum tankers to dispose adequately of all effluent received into the tanks, and a sufficient number to allow all tanks to be emptied in the event of the vehicles breaking down. Manzini is badly in need of a sewage disposal works to overcome the really great danger to the public health caused through the above-mentioned drainage problems. A start on the works was made during the latter months of the year and it is hoped that the system will be operating by the end of 1963. Unfortunately only a portion of the town will be served initially, but it is going to alleviate a great deal of the trouble.

1.3. The smaller towns in the territory all have pail closets in the older buildings but all new houses are equipped with waterborne systems. The aim is the gradual elimination of all pail closets and their replacement by water-borne systems.

1.4. Unfortunately, the pit privy system is still in use in some places. This is often a most unhygienic method of disposal as the pits are seldom constructed according to plan and as a consequence are not fly proof and therefore a considerable danger to health. Aqua Privies have proved their worth when they have been properly constructed and properly supervised. On the other hand, where they have not been so constructed and supervised they have been most unhygienic and offensive. The R.O.E.C. system has been introduced into the territory and where properly constructed it is giving good results. This system needs no water and due to the method of construction no odour is produced.

2. RURAL SANITATION.

Rural sanitation is virtually non-existent. The Swazi people do not attempt any form of hygienic disposal of their excrement. The nearest bush, clump of grass or donga serves as the "lavatory". This would not be a bad system if an attempt were made to cover the faeces, but unfortunately this is never done and it does not require much imagination to understand how disease can spread from this habit. There are generally abundant numbers of flies around the kraals and these play a most important role in the spread of disease. Very often a dry stream bed is used for these very insanitary practices and when the rains come the excreta may be washed into the drinking water stream.

The increase in intestinal diseases can be attributed to this lack of rural sanitation, and it is of the utmost importance that a system of Health Education be developed to help overcome this most unhealthy state of affairs.

3. REFUSE REMOVAL.

The larger towns have reasonable refuse removal services with proper enclosed refuse removal vehicles. The refuse in these towns is taken to selected sites where it is dumped and covered. In Manzini refuse is used for the reclamation of lost ground along the Mzimnene River at the Show Grounds. Unfortunately in some places the refuse is dumped without being covered with earth and it is in situations like this that nuisances due to odour, fly attraction and fly breeding occur.

4. WATER SUPPLIES.

4.1. There has been a great improvement in the quality of water supplied to the smaller towns. Manzini and Mbabane have excellent supplies, but it would appear that quantities produced are insufficient for the needs of these rapidly expanding towns, and it will be soon necessary to enlarge the pumping and purifying capacities of these plants.

4.2. The following tables show the number of water supplies submitted for bacteriological examination.

PLACE	DATE	COLLECTION POINT	PRESUMPTIVE E. COLI	FAECAL E. COLI

GENERAL INFORMATION

The purpose of this report is to provide a general overview of the project and its objectives. The project is designed to address the current challenges in the field of [unclear] and to provide a comprehensive analysis of the data collected. The results of the study will be presented in a series of reports, which will be made available to the public. The project is being conducted in a systematic and thorough manner, and the findings will be of great value to the community. The project is being conducted in a systematic and thorough manner, and the findings will be of great value to the community.

PROJECT OBJECTIVES

The primary objective of this project is to [unclear] the current state of [unclear] in the region. This will be achieved through a series of data collection and analysis activities. The project will also aim to identify the key factors influencing [unclear] and to develop strategies to address these issues. The project is being conducted in a systematic and thorough manner, and the findings will be of great value to the community.

PROJECT SCOPE

The project will focus on the [unclear] region and will cover the period from [unclear] to [unclear]. The data will be collected from [unclear] sources and will be analyzed using [unclear] methods. The project is being conducted in a systematic and thorough manner, and the findings will be of great value to the community.

5. FOOD IN RELATION TO DISEASE.

5.1. Trade Premises.

The usual routine inspection of all foodhandling trade premises were carried out throughout the year. Wherever unsound food stuffs were found these were seized and destroyed. More attention has been given to rural trade premises since the two new Health Inspectors have joined the staff and it is hoped that a great increase in the standard of these premises will develop with stricter control.

The following articles were seized and destroyed:-

2	x	1 lb	Tinned Food (unlabelled)
15	x	2 "	Loganberry Syrup
2	x	10 oz.	Vienna Sausages
1	x	15 lb	Pilchards in Tomato

The State of Texas, County of ...

Know all men by these presents that ...

Table with multiple columns containing names, dates, and other details. The text is very faint and difficult to read.

Witness my hand and seal of office this ... day of ... 19...

5.2. Abattoirs.

5.2.1. The Mbabane and Manzini abattoirs are under the direct control of Health Inspectors and it is only at these two abattoirs that the meat is thoroughly inspected prior to removal to the butcher shops. The other abattoirs unfortunately only receive periodic inspection. The abattoir attendants have had short courses of instruction in meat inspection, but, as has been stated before, they are not very reliable, as no carcasses, apparently, are ever condemned for "measles" apart from those at the Manzini and Mbabane abattoirs, and this is definitely not an indication that meat inspection is being well done.

5.2.2. The abattoirs at Mbabane and Manzini are too small for the amount of slaughtering taking place. These two towns have grown to such an extent that the abattoirs cannot cope with the demand for meat. The design of both abattoirs are poor and the time has come for the construction of new abattoirs in both towns or alternatively, the construction of a large central abattoir that could serve these two major towns and possibly Stegi as well. The new abattoirs should include a Freezing Chamber so that all measly carcasses can be frozen under proper supervision. At present measly carcasses are handed over to the butchers for freezing and the possibility exists that carcasses may be removed for sale to the public before the required period of freezing has elapsed. Also, the temperature of the freezing chamber should be kept constantly at -10° C but with butchers frequently opening and shutting the freezer it is doubtful if this regulation temperature is maintained constantly.

5.2.3. The following table shows the number of animals slaughtered at the Manzini and Mbabane abattoirs and the numbers of carcasses either frozen, cooked or condemned for measles.

ABATTOIR	NO. CARC. EXAMINED			NO. CARC. FROZEN			NO. CARC. COOKED			NO. CARC. DESTROYED			INCID. OF C. BOVIS	INCID. OF C. CELL
	B	P	S	B	P	S	B	P	S	B	P	S

Bovine livers	{Flukes}	=	3
Sheep "	{ " }	=	12

5.3. Butcheries.

Butcheries in the Urban Areas have always been regularly inspected by the Health Inspectors. The rural butcheries have, in the past, only been inspected occasionally, but now, with the increase in the inspectorate staff, more attention is being given to these and an effort is being made to make the owners bring them up to a reasonable standard. During the year a new butchery was opened in Manzini and it is pleasing to note that it is considered the best butchery in the territory.

5.4. Milk Supplies.

5.4.1. There has been a gratifying improvement in milk supplies of the territory during the year. Several new dairies of high standard have been established. There is now no need for anybody living in Manzini or Mbabane to receive milk from unregistered sources as the dairies now operating can supply the needs of these towns. Some dairymen have welcomed inspection and advice and have requested bacteriological examination of their supplies and have generally shown that they are eager to produce a milk supply of high quality.

5.4.2. A start has been made on the Tuberculin Testing of dairy herds. This is a most welcome step, which will lead to a still better quality milk, when all herds are free of reactors.

6. HOUSING.

There is still considerable room for improvement in the standard housing provided for labour on some of the larger irrigation projects.

7. PARASITOLOGY.

7.1. Tape Worm Treatment.

The treatment by the malaria field staff of people suffering from tape worm infestation, has been continued throughout the year. The drug Dichlorophen is still used and is giving good results. The dosage scheme was revised on instructions from the manufacturers - the adult dose being increased from 12 to 18 tablets.

The number of persons treated for the year is 5,705 and the total number treated since the start of the campaign in 1957 is 30,893. These figures do not include people treated by farmers and by hospitals in the territory.

Cysticercosis Bovis.

The following table shows the decline in infected animals as seen at the Manzini abattoir, since the start of the tape worm campaign in 1957.

<u>YEAR.</u>	<u>PERCENTAGE OF INFECTED CARCASSES.</u>
1957	8.0
1958	7.0
1959	5.0
1960	4.3
1961	3.9
1962	3.7

These figures seem to indicate that the treatment of tape worm infestation in the people, has a definite bearing on the amount of C.bovis found in cattle.

7.2. Bed Bugs.

These insects have developed a definite resistance to DDT and BHC and this tendency is noted throughout the territory. This is probably due to the use of these insecticides in anti-malaria work in the past. The number of bugs appear to be increasing at an alarming rate, according to the number of applications received daily for assistance in eradicating them. The field staff report that in every part of the territory the people complain about bugs and that they are more interested in "Medicine" to kill bugs, than "Medicine" to kill mosquitos. In some areas the bug menace is so severe that people do not sleep indoors anymore.

Fortunately other insecticides are available and the less toxic phosphorus products (Diazinon) and the carbamate insecticide known as Sevin (Karbaspay and Sevkol) have been used with good results. The people are reluctant to buy these insecticides for use themselves and they would rather have the work done by the Health Department spray staff, and pay for it, even though it is more expensive this way. There is not the staff available to adequately meet the demand for bug spraying and one wonders to what extent this new insect menace will increase without proper control methods. The future does not look very promising.

Spraying had been done for the public at a cost of 15 cents per hut or room but this has now been increased to 25 cents to cover the cost of insecticide and transport expenses.

7.3. Cutaneous Myiasis.

There have been many cases of cutaneous myiasis in the middle and low veld areas. This disease is caused by the fly Cordylobia anthropophaga which lays its eggs either directly on to the skin or on to clothing hanging on the line. The eggs hatch and the larvae burrow into the skin. They feed on the tissues and the reaction gives an appearance rather like a boil. Many cases occurred in Manzini, where babies and young children were mostly involved though some adults also showed the infestation.

EXHIBIT OF INVESTIGATION

7.4. Congo Floor Maggot.

A report was received, that people living in the neighbourhood of the Usutu Gorge were being attacked by some blood sucking worms. Investigation showed that this was so, the area being heavily infested with the Congo Floor Maggot - the larval stages of the fly Auchmeromyia luteola. The number of maggots found in a small area of the floor of a hut was surprising and lead one to believe that this insect might yet prove to be quite a menace.

It is not confined to this area, as specimens of the adult fly have been caught in the mosquito Window Traps in several places. Further investigation into the distribution of this fly will be undertaken in the future.

7.5. Lice.

Not many complaints about lice are received, but it was found that the prisoners at Mbabane gaol were heavily infested. The application of suitable insecticides usually eradicates these vermin without any trouble.

8. HEALTH PROPAGANDA AND LECTURES.

As far as health propaganda is concerned not much has been done on these lines due to shortage of staff. During District Team Meetings the opportunity was taken to put across a certain amount of propaganda. The main theme during the year was the question of immunisation against disease.

At the Annual Agricultural Show the Health Office Exhibit was built up around the theme "Food Hygiene". The exhibit showed how to keep food fresh and clean and a good deal of interest was shown on the part of the public. We hope that the principles embodied in the theme have made an impression and that they are being carried out in practice in the homes of all who visited the exhibit.

Lectures were given to the Trainee Cattle Guards at the Mpisi Government Farm and to Domestic Science teachers attending a refresher course.

Lecture-Demonstrations on Malaria and Bilharzia control were given to Trainee nurses from the Raleigh Fitkin Memorial Hospital.

The first part of the report is devoted to a description of the general situation in the country. It is followed by a detailed account of the political and economic conditions. The report concludes with a summary of the findings and a list of recommendations.

The second part of the report is devoted to a description of the general situation in the country. It is followed by a detailed account of the political and economic conditions. The report concludes with a summary of the findings and a list of recommendations.

The third part of the report is devoted to a description of the general situation in the country. It is followed by a detailed account of the political and economic conditions. The report concludes with a summary of the findings and a list of recommendations.

GENERAL CONCLUSIONS

The general conclusions of the report are as follows: The country is in a state of economic and political crisis. The government is unable to meet its obligations and the people are suffering from poverty and unemployment. It is recommended that the government should take immediate steps to reform the economy and improve the living conditions of the people.

The general conclusions of the report are as follows: The country is in a state of economic and political crisis. The government is unable to meet its obligations and the people are suffering from poverty and unemployment. It is recommended that the government should take immediate steps to reform the economy and improve the living conditions of the people.

Handwritten text on a page with horizontal lines. The text is extremely faint and illegible, appearing as light grey or brownish marks. It seems to be organized into several columns or sections, possibly a ledger or a list of entries. Some faint characters like 'H', 'I', 'O', and 'F' are visible, but they cannot be definitively identified as part of the text.

CHAPTER II

HOSPITALS AND CLINICS

1. GOVERNMENT HOSPITALS AND CLINICS.

During the year a clinic was built at Dwalile in the Mankaiana district, with the assistance of the Prisons Department who provided a warder builder and prison labour, and of the local people who provided certain of the building material while the construction was supervised by the District Commissioner. Dwalile is near the western border of Swaziland but supports a school of 200 students and adjoins a Swazi area with no medical facilities.

Extensions to Pigg's Peak Hospital consisting of 17 additional beds and alterations to existing accommodation to provide a small operating theatre and other improvements were completed and occupied in December whilst earlier in the year an X-Ray plant had been installed there.

The funds for Dwalile Clinic and the Pigg's Peak Hospital extensions were provided from C.D.&W. sources.

As from April the New Haven Mission Clinic was visited and supervised by Hlatikulu Hospital medical staff.

The number of in-patients and out-patients treated at Government hospitals rose during 1962, particularly in respect of in-patients at Hlatikulu Hospital. Clinic attendances fell slightly, probably due to the imposition of stricter control over the free medical attention previously given to school children.

Details of the work done at the various hospitals and clinics and of the staff dispositions at the hospitals are as follows:-

...

2. MISSION HOSPITALS.

The three Mission hospitals in Swaziland which are subsidised by Government, continue to render most valuable service to the Territory, and during 1962 they again worked at full pressure.

With the assistance of C.D.&W. funds, much needed extensions to the private patient block and to the probationer nurses' home at the Raleigh Fitkin Memorial Hospital at Manzini was started towards the end of the year and are expected to be completed early in 1963.

Details of the work done in the Mission hospitals and clinics follows:

/Mission Hospitals...

REVISIONS

The Commission on the
Administration of the
Federal Government
has completed its report
and is submitting it
to the President.

The report contains
a number of recommendations
for the improvement
of the Federal Government
and is being
distributed to the
President and the
Cabinet.

The report is being
distributed to the
President and the
Cabinet.

MEMORANDUM FOR THE RECORD

3. HAVELOCK MINE HOSPITAL.

The number of Africans who were not mine employees or their dependants who were treated at Havelock Mine Hospital during 1962 was as follows:-

Number of admissions	231
Number of out-patients (new cases)	359
Number of out-patients (re-attendances)	270
Daily number of in- patients	4.1

4. MEDICO-LEGAL POSTMORTEM EXAMINATIONS.

The number of medico-legal postmortem examinations carried out at the various Government and subsidised Mission hospitals in 1962 was as follows:-

Mbabane Hospital	84
Hlatikulu Hospital	34
Pigg's Peak Hospital	17
Raleigh Pitkin Memorial Hospital	73
Good Shepherd Hospital	15

5. MEDICAL EXAMINATION OF SCHOOL CHILDREN.

The routine medical examination of the children in the Methodist Mission schools in southern Swaziland was continued during the year by the Medical Superintendent of Mahamba Hospital, and the number of children with defects of some kind was again high - 41% in the boys and 45% in the girls, which is very similar to the figures obtained in 1961.

The detailed results were as follows:

.../REPORT ON SCHOOL HEALTH SERVICE
CONDUCTED FROM MAHAMBA
METHODIST HOSPITAL - 1962

HOSPITALS WITH PATIENTS

The number of Alaska hospitals which were not included in their reports or their departments who were included in this report is as follows:

191	Number of hospitals
192	Number of departments
193	(New cases)
194	Number of out-patients
195	(In-patients)
196	Daily number of in-patients

HOSPITALS WITH PATIENTS IN ALASKA

The number of hospital-level patients carried out at the various Government and non-Government hospitals in 1905 was as follows:

197	Alaska Hospital
198	Alaska Hospital
199	Alaska Hospital
200	Alaska Hospital
201	Alaska Hospital
202	Alaska Hospital

GENERAL EXPLANATION OF TABLES

The tables show a comparison of the number of patients in the various hospitals in Alaska in 1905. The number of patients in each hospital is given in the first column, and the number of patients in each department is given in the second column. The number of patients in each hospital is given in the third column, and the number of patients in each department is given in the fourth column. The number of patients in each hospital is given in the fifth column, and the number of patients in each department is given in the sixth column.

The detailed results are as follows:

This report is based on the data received from the health department.

ADDITIONAL INFORMATION

There were no deaths from any of the diseases listed above. The total number of cases reported for 1960 was 201 and for 1961 was 265. The total number of cases for both years combined is 466.

CHAPTER III

MATERNITY AND CHILD WELFARE SERVICES.

Ante-natal clinics are held at all Government and Mission Hospitals, and at most of the outlying clinics. In previous years, it was necessary to encourage Swazi women to come into hospital for their confinements, but the maternity wards are now so popular that overcrowding may in the future necessitate restricting admissions to primiparous women and others in whom difficulty is expected.

The number of antenatal examinations and confinements carried out during the past 4 years has been as follows:-

	Antenatal Examinations				Confinements			
	1959	1960	1961	1962	1959	1960	1961	1962
Mbabane Hospital	2068	1704	2130	2311	436	611	705	802
Hlatikulu Hospital	1373	1315	1298	1596	247	375	409	528
Mankaiana Hospital	694	1798	983	535	154	171	188	180
Pigg's Peak Hospital	636	807	930	1087	146	168	221	241
Raleigh Fitkin Mem. Hospital & Clinics	4998	5722	4996	3049	1054	1276	979	574
Good Shepherd Hospital	1242	791	972	917	137	132	139	161
Mahamba Methodist Hospital	584	550	192	571	76	84	79	74

Child Welfare clinics have continued at the Nazarene Mission health centres and also at the Government clinics at Sipofaneni and Lubuli and Hlatikulu Government Hospital where the following attendances were recorded -

Sipofaneni	794	
Lubuli	148	(January to March only)
Hlatikulu Hospital	1615	(May to December only)

MATERNITY AND CHILD HEALTH SERVICES

Maternity and child health services are provided at all Government and Municipal Hospitals and at some of the voluntary hospitals. In previous years, it was necessary to encourage women to visit the hospital for their confinements, but the maternity wards are now so popular that Government hospitals are unable to accommodate the increasing number of confinements and women in these districts are referred to other hospitals.

The number of maternal examinations and confinements carried out during the year is given in the following table:

Hospital	Maternal Examinations					Confinements				
	1951	1952	1953	1954	1955	1951	1952	1953	1954	1955
Madras Hospital	100	110	120	130	140	80	90	100	110	120
Madurai Hospital	150	160	170	180	190	120	130	140	150	160

Madhavaram Hospital	950	960	970	980	990

CHAPTER IV

TRAINING OF NURSES.

Nurses are trained at the well-equipped Ainsworth Dickson Nursing College, attached to the Raleigh Fitkin Memorial Hospital at Manzini, for the High Commission Territories Nursing Council certificates in General Nursing and Midwifery, the syllabuses of which are based on those of the South African Nursing Council. In the past training was also offered for the Swaziland Executive Nursing Committee certificates in General Nursing and Midwifery, which are of a lower standard and for which the educational requirement is only Standard VI. As a sufficient number of candidates with the higher educational standard required by the High Commission Territories Nursing Council (viz. Junior Certificate) are now coming forward, candidates for training for the Swaziland Executive Nursing Committee certificates are no longer accepted, although the training of those who have already started this course, of course, continues.

The results of the examinations held during the year were as follows:-

HIGH COMMISSION TERRITORIES NURSING COUNCIL

	<u>Passed</u>	<u>Failed</u>
Preliminary Examination in General Nursing	16	1
Final Examination in General Nursing	4	2

SWAZILAND EXECUTIVE NURSING COMMITTEE

Final Examination in General Nursing	1	1
Midwifery Examination	8	-

The number of nurses in training at end of December 1962 was

General Nurses	1st year	16
	2nd year	19
	3rd year	14
	4th year	6
Midwifery Students		<u>11</u>
		<u>66</u>

CHAPTER IV

TRAINING OF HORSES

Horses are trained at the well-equipped Alameda Horsemanship College, situated in the Alameda Public Hospital, for the High Commission Test. The training is conducted in General Training and Military Training. In the past training was also given for the General Executive Training Commission. The General Executive Training Commission is a body which and for which the educational requirement is set out in 77. As a sufficient number of candidates with the educational standard required by the High Commission Test, the Training Commission (see Training Certificate) are now given forward, candidates for training for the General Executive Training Commission candidates are no longer accepted. The training of those who have already started this course of training continues.

The results of the examinations held during the year are as follows:-

HIGH COMMISSION TESTS AND GENERAL TRAINING

Exam	1955	1954	1953
General Training	10	10	10
High Commission Test	2	2	2
<u>General Executive Training</u>			
General Training	1	1	1
Military Training	2	2	2

The number of horses in training at end of December 1955 was

General Training	10
High Commission Test	10
General Executive Training	10
Military Training	10
<u>Total</u>	40

CHAPTER V

LABORATORY SERVICES.

The Pathology Laboratory in Mbabane continues to function satisfactorily - and to fulfil a very useful purpose in dealing with serology, cultures, sensitivity tests and blood chemistry on a territorial basis.

Histological examinations and certain other investigation continue to be carried out at the South African Institute for Medical Research in Johannesburg, whilst the small laboratories at Mbabane Hospital, Hlatikulu Hospital, Raleigh Fitkin Memorial Hospital, Good Shepherd Hospital and Mahamba Hospital continue to deal with the less complicated laboratory work.

The routine examination of blood slides for malaria parasites and of urines and stools for bilharzia ova, are carried out at the Health Office at Manzini, and the results of these examinations are reported under the sections dealing with malaria and bilharzia, and are not included in the figures which follow:-

(a) PATHOLOGY LABORATORY, MBABANE.

LABORATORY SERVICES

The Pathology Laboratory in Madras continues to function satisfactorily - and to fulfil a very useful purpose in dealing with serology, cytology, sensitivity tests and blood chemistry on a territorial basis.

Histological examinations and certain other investigations continue to be carried out at the South African Institute for Medical Research in Johannesburg, whilst the main laboratories at Madras Hospital, Madras Hospital, Kalinga Nigra Hospital, Hospital, Good Shepherd Hospital and Madras Hospital continue to deal with the less complicated laboratory work.

The routine examination of blood films for malarial parasites and of urine and stool for diarrhoeal organisms, was carried out at the Health Office as usual, and the results of these examinations are reported under the sections dealing with malaria and diarrhoea, and are not included in the figures which follow:-

(a) PATHOLOGY LABORATORY - MADRAS

Other Examinations	-	22	29	-	-

CHAPTER VI - VITAL STATISTICS

The registration of births and deaths is compulsory only in the case of European inhabitants of Swaziland, and available statistics are consequently of limited value. They are as follows:-

Total European population (1962 Census)	8,040
European births 1962	138
European deaths 1962	38
Deaths of European infants under 1 year in 1962	3

CHAPTER VII - PRISONS

Regular medical inspections of the prisons at Mbabane, Hlatikulu, Manzini and Stegi have been carried out, and in spite of overcrowding and antiquated buildings, sanitary conditions and the health of the prisoners have been satisfactory on the whole.

Mentally disordered patients in need of care and supervision are cared for in the prisons - the majority being housed in Mbabane Gaol. This is a most unsatisfactory state of affairs - and a mental hospital in Swaziland is urgently required.

CHAPTER VIII - LEGISLATION

Legislation affecting the Medical Department enacted during 1962 was -

Government Notice No. 26 of 1962 - Amendment of Government Hospital Charges.

/Chapter IX

CHAPTER VI - VITAL STATISTICS

The registration of births and deaths is compulsory only in the case of European inhabitants of Swaziland, and available statistics are consequently of limited value. They are as follows:-

2,500	Total European population (1952 Census)
134	European births 1952
38	European deaths 1952
	Deaths of European infants under 1 year in 1952

CHAPTER VII - PRISONS

Regular medical inspections of the prisons at Mbabane, Mafikeng, Maseru and other places have been carried out, and in spite of overcrowding and antiquated buildings, generally conditions and the health of the prisoners have been satisfactory on the whole.

Weekly dispensary visits in the case of sick and aged prisoners are carried out in the prisons - the Mafikeng being housed in Mafikeng itself. This is a very satisfactory state of affairs - and a special hospital in Mafikeng is especially important.

CHAPTER VIII - LABORATORY

Legislation relating to the Medical Department was passed during 1952 and -
Government Notice No. 25 of 1952 - Amendment of Government Medical Orders.

CHAPTER IX - FINANCE.

The financial statement of the Department for the period 1st April 1961 to 31st March 1962 is as follows:-

<u>Revenue</u>	R	R
Hospital, Health Centre and other fees		16,777
 <u>Expenditure.</u>		
Personal Emoluments	173,200	
Travelling Expenses	8,430	
Operation & Maintenance of Vehicles	3,931	
Other Transport Charges	10,294	
Allowances & Fees - Medical	5,471	
Maintenance of Patients	63,522	
Maintenance of Mental Patients	7,485	
Lighting and Heating	5,665	
Purchase of Plant and Equipment	12,398	
Upkeep of Grounds	174	
Anti-Malaria Measures	4,949	
Bilharzia Control	452	
Laboratory Services	1,523	
Public Health Measures	235	
Sample Nutrition Survey	3,559	
Grants to Missions	33,633	
High Commission Territories Nursing Council	262	
Polio Immunisation Campaign	<u>4,398</u>	339,581
 <u>C.D.W. Schemes Expenditure</u>		
D.4912 Extensions to Medical Services	4,740	
D.4913 T.B. Control	11,572	
D.4453 Construction of Clinics	<u>1,160</u>	<u>17,472</u>
Total Expenditure on Medical & Sanitary Services		R357,053
<hr/>		
Total Revenue of Territory		R3,335,256
<hr/>		
The relationship of medical expenditure (territorial) to total revenue of Territory		10.40%
<hr/>		

CONCLUSION.

I wish to express my sincere appreciation of the loyal and efficient manner in which members of the Department carried out their duties during the year, often under extremely difficult conditions.

B. D. WHITWORTH

DIRECTOR OF MEDICAL SERVICES.

2 - 3 "	4
3 - 4 "	3
4 - 5 "	5
	<u>23</u>

/Classification...

VII. Classification on Admission.

<u>Type</u>	<u>Admissions</u>
Lepromatous	5
Neural	23

VIII. Average Age on Admission - 33.9 years

IX. Proportion of Children to Total Admissions.

There were 2 admissions of children under the age of 16 years out of a total of 23 admissions, i.e. 8.7%

X. Diseases treated.

Arthritis	2
Conjunctivitis	8
Cystitis	1
Diarrhoea	11
Dental Caries	13
Epistaxis	4
Influenza	12
Lepra reaction	12
Malnutrition	3
Otitis Media	2
Sciatica	1
Tapeworm	3
Trophic ulcers	18

XI. Laboratory Report.

	<u>Skin - Positive</u>	<u>Skin - Negative</u>
Lepromatous	17	19
Neural	-	46
	<u>17</u>	<u>65</u>

XII. Financial.

The running costs for the year ending 31st December, 1962 were as follows:-

Food	R1150.29
General Supplies	610.55
Medical Supplies	366.42
Salaries and wages	1822.08
Repairs	170.57
Telephone and Office Supplies	24.53
Transportation and Railage	233.20
Insurance	37.92
Inpatients Hospital Fees (R.F.M. Hospital)	100.25
Cow Feed	139.41
	<u>R4655.22</u>

/Conclusion...

Conclusion.

Dr. David Hynd, who has retired and is assisting in the running of the Leper Colony, has submitted the following remarks.

"Treatment has been the same as last year. Etisul inunctions have been continued and seem to be of definite help. Lepra reactions have been treated with A.C.T.H. injections or Prednisolone tablets.

Rev. Samuel Dlamini retired after 13 years service as Chaplain.

The school continued throughout the year for the 6 children isolated in the Colony.

The Resident Commissioner and Mrs. Marwick attended the Christmas Party and Nativity Play given by the patients, and distributed Christmas gifts to the patients.

The regular monthly visits of Mr. Cuthbert Pretious, M.B.E. of the Mbabane Division of the Red Cross, with comforts for the patients are greatly appreciated.

Dr. Teale of the Veterinary Department showed great interest in the care of the Dairy Herd at the Colony, and the resultant supply of milk forms a staple article of the patients' diet. Agriculture and vegetable gardening by the patients helps to supplement to some extent the patients' diet, but much more could be done along this line if someone with expert knowledge in agriculture and animal husbandry could be added to the staff.

Grazing camps for the cows have been fenced off during the year."

We wish to express our gratitude to the staff, the Red Cross Society, the Mission to Lepers, the Swaziland Government, the Church of the Nazarene and many others, who have helped to make the running of the Leper Colony a success during the past year.

K. A. STARK

MEDICAL SUPERINTENDENT.
