## مقدمہ

تتقید بر کیفیت نظم و نسق سررشدہ طبابت و صحت عامہ سرکار عالی

رپورٹ نظم و نسق سررشدہ طبابت و صحت عامہ سرکار عالی بابت سہ ۱۳۴۶ ف  
مرتبہ نظامت طبابت و صحت عامہ سرکار عالی بیٹس و لائنڈ ہوئی۔  
تبصرہ:۔

۱- حسب سال گذشتہ سال زیر تقید میں بھی نظامت طبابت و صحت عامہ سرکار عالی  
کے فرائض کرنل جے نارمن واکرسی - آئی - ای - آئی - ایم - ایس (ریٹائرڈ) انجمن  
دیئے رہے۔

۲- دوران سال زیر تقید میں دو جدیدہ دو خانہ جات کا افتتاح عمل میں آیا گیا  
دو خانہ جات سرکار عالی بشمول امدادی کی تعداد بہ نسبت سال گذشتہ (۱۳۸) کے دوران  
سال زیر تقید میں (۱۵۰) رہی۔

۳- سیول سرجنوں کے کیڈٹری کی ایک جائیداد پتھالوجسٹ منظور ہونے سے ختم سال  
زیر تقید پر طبی اسٹاف حسب ذیل رہا:۔

سیول سرجن - ۳۹

اسسٹنٹ سرجن - ۷۷

سب اسسٹنٹ سرجن - ۱۹۱

۴- سرکار کو اس اطلاع سے مسرت ہوئی کہ سال زیر رپورٹ میں مدراس نرسز اور  
ہڈوائف کونسل (Madras Nurses and Midwives Council) نے عثمانیہ ہسپتال

ٹریننگ اسکول کو دایگان کی تعلیم کے ادارہ کی حیثیت سے تسلیم کیا ہے اور دایگان کے اسماء درج رجسٹر کے جانے سے بھی مستحق ہے اس کے قبل اس مدرسہ کو کونسل مذکور نے (Sick Nursing) کا تعلیم کے لئے تسلیم کیا تھا۔

۵۔ سال گذشتہ کی طرح اس سال بھی سررشتہ کے حسن انتظام کے باعث دو خانہ جات کی ہر دلعزیزی عوام میں بڑھنے سے مرصاء ذکور و اناث کے مرجوعہ میں اضافہ ہوا ہے جس کی نسبت اظہار خوشنودی کیا جاتا ہے۔

۶۔ تعمیر عمارت دو خانہ جات کا کام بھی دوران سال زیر تنقید میں قابل اطمینان رہا۔

۷۔ دارالسلطنت کے اہم ادارہ جات دو خانہ عثمانیہ اور وکٹوریہ زنانہ ہسپتال ہیں ان ہر دو کے کام کی صراحت تفصیل کے ساتھ متن رپورٹ میں درج ہے ہر اعتبار سے ان دو خانہ جات کا کام قابل اطمینان ہے اور امور ذیل کو سرکار مسرت کے ساتھ نوٹ کرتی ہے :-

#### دو خانہ عثمانیہ

۱۔ باوجود اس کے کہ اس دو خانہ میں (۴۰۰) اندرونی مرصاء کی رہائش کا انتظام تھا لیکن دوران سال زیر تنقید میں روزانہ اوسط (۶۳۴، ۶۸) رہا اور ۱۷ شہریور سے ۳۶ ف کو تو اندرونی مرصاء کی تعداد (۶۷۱) رہی۔

۲۔ بیتھالو جیکل یا بورٹری میں پہلی مرتبہ (Lang's Gold Chloride Cure) کا عمل کیا گیا۔

۳۔ انسٹھنٹ ڈپارٹمنٹ کے تحت یہ صراحت کی گئی ہے کہ باوجود (۲۱۶۳) مرصیوں کو (Anaesthetized) کیا گیا لیکن ایک بھی موت واقع نہیں ہوئی علاوہ انہیں (Boyle's modified apparatus) مکمل ساز و سامان سے نصب کیا گیا ہے جو مفید ثابت ہوا۔

#### وکٹوریہ زنانہ ہسپتال

۴۔ اوٹ بیٹھنٹ ڈپارٹمنٹ میں سہ پہر کے وقت خاص طور پر امراض خبیثہ اور (قبل زچگی) کلیٹک کا افتتاح کیا گیا ہے جو اس دو خانہ کے لئے بالکل جدید عمل ہے۔

۸۔ سررشتہ کا شعبہ صحت عامہ اہم ہے اس کے اغراض و مقاصد وسیع ہیں اضلاع میں صحت عامہ کے کام ڈسٹرکٹ بورڈ کے توسط سے انجام پاتے ہیں اور اس بورڈ میں سررشتہ کی نمائندگی ضلع کا سیکول سرجن کرتا ہے اور وقتاً فوقتاً فنی مشورہ دیتا ہے رپورٹ زیر تنقید میں اضلاع کے صحت عامہ کے کام کی جو صراحت کی گئی ہے وہ قابل اطمینان ہے۔ یہ امر بھی باعث مسرت ہے کہ سررشتہ مال کے تعاون کے باعث یہ شعبہ اپنے اغراض و مقاصد کی تکمیل کر رہا ہے۔

۹۔ امراض متعدی کے انسدادی تدابیر بھی تشفی بخش طور پر انجام پائے امراض چیچک اور بلیگ سے دوران سال زیر تنقید میں جو اموات واقع ہوئیں ان کی تعداد یہ نسبت سال گذشتہ ۱۱۶۶ اور ۲۳۹ (علی الترتیب) کے ۲۳۵ و ۲۱۴۵ (علی الترتیب) رہی اسی طرح مرض کالرہ سے اموات کی تعداد میں یہ نسبت سال گذشتہ کے (۱۵۴) کی کمی رہی۔

۱۰۔ سال زیر تنقید میں شہر حیدرآباد میں مرض بلیگ سے (۵۲۰) مبتلا ہوئے اور (۲۵۹) اموات واقع ہوئیں۔ رپورٹ میں اس امر کی وضاحت کی گئی ہے کہ ہر سال یہ دیکھا جا رہا ہے کہ اوائل ماہ شہر یور اور دوران ماہ مہر میں بلیگ اولاً اضلاع میں شروع ہوتا ہے اور متاثرہ مقامات سے جب لوگ بلدہ میں منتقل ہوتے ہیں تو یہاں بھی شروع ہو جاتا ہے گذشتہ (۸) سال میں جو انتظامات انسداد بلیگ شہر حیدرآباد میں لائے گئے اس سے یہ حقیقت واضح ہے کہ شہر حیدرآباد میں اولاً مقامی باشندہ مبتلا نہیں ہوا۔ ان حالات میں سرکار متوقع ہے کہ اس مرض کا استیصال سررشتہ کی سائنٹیفک جدوجہد سے بہت جلد ہو جائے گا۔

۱۱۔ کرنل نارمن واکر ناظم صاحب طبابت و صحت عامہ سرکار عالی کا حسن انتظام سرکار عالی کی عین خوشنودی و اطمینان کا موجب ہے۔

۱۲۔ ناظم صاحب طبابت و صحت عامہ کے زیر ہدایت و نگرانی جن افسران و ملازمین نے اپنے مفوضہ کام کو عمدگی سے انجام دیا ہے اور جن کے اسماء رپورٹ زیر تنقید میں

نوٹ کئے گئے ہیں اُن کی نسبت بھی سرکار سے اظہارِ پسندیدگی کیا جاتا ہے فقط

MILITARY AND MEDICAL DEPARTMENT.

*Medical Section.*

RESOLUTION NO. 4 DATED 27TH DAI 1348 FASLI.

SUBJECT:—*Review on the Administration Report of the Medical and Public Health Department.*

Read the Administration Report of the Medical and Public Health Department, for the year 1346 Fasli.

REVIEW.

1. Colonel J. Norman Walker, C.I.E., I.M.S., (Retd.), continued as Director, Medical and Public Health Department.

2. During the year under review two new dispensaries were opened. The number of Government and Aided Dispensaries was 150 against 148 in the preceding year.

3. With the sanction of the post of a Pathologist in the Civil Surgeon's cadre the Medical staff at the close of the year under review was as follows:—

Civil Surgeons	..	..	..	39
Assistant Surgeons	..	..	..	77
Sub-Assistant Surgeons	..	..	..	191

4. The Government is pleased to note that during the year under review the Osmania Hospital Training School was recognised by the Madras Nurses and Midwives Council, as an institution for the training of Midwives and their registration by the above Council. The school was previously recognised by the Council for training in Sick Nursing.

5. It is appreciated that the efficient management of the Department leading to the increasing popularity of its institutions has, as in the preceding year led to a further increase of male and female attendance at the hospitals.

6. During the year under review the work of construction of dispensary buildings was satisfactory.

7. The important institutions of the Capital Town are the Osmania and the Victoria Zenana Hospital. The details of work done in these institutions are incorporated in the Report. In every respect the work of these hospitals was satisfactory. The Government notes the following points with pleasure:—

OSMANIA HOSPITAL

(i) Though the accommodation provided in this Hospital was for 400 in-patients only, the average number of in-patients during the year was 634.68 and on 17th Shahrewar 1346 Fasli the number had reached 671.

(ii) Lang's Gold Chloride Cure was done in the Pathological Laboratory for the first time.

(iii) Under the Anæsthetist's Department it is reported that out of 2164 patients anæsthetized not a single death had occurred. Boyle's modified apparatus with complete equipment was installed during the year and proved useful.

#### VICTORIA ZENANA HOSPITAL.

(iv) A special afternoon Clinic for venereal diseases and an ante-natal clinic are new features of the Outpatient Department of this Hospital.

8. The Public Health Section of the Department with vast and varied aims and objects is very important. In the District towns the Public Health works are carried on through District Boards. The District Civil Surgeon represents the department in the board and offers technical advice. The Public Health activities detailed in the Report are satisfactory. It is gratifying to note that with the co-operation of the Revenue Department the Public Health Department is succeeding in its aims and objects.

9. The measures adopted for prevention of epidemics were satisfactory. The number of deaths from smallpox and plague during the year was 245 and 2145 respectively against 1166 and 2397 respectively in the preceding year. There was a decrease of 1547 in cholera cases compared with those in the previous year.

10. During the year under review there were 520 attacks and 259 deaths with plague. It is stated in the report that it has been observed every year that plague first breaks out in the District towns towards the close of Shahrewar or during the month of Mehir. It spreads in Hyderabad when the people from the infected places migrate into Hyderabad. The anti-plague measures adopted in Hyderabad City during the last eight years reveal the fact that no local resident was first attacked. Under these circumstances the Government hopes that the department's scientific activities will soon eradicate this disease.

11. The efficient management of Colonel J. Norman Walker, Director, Medical and Public Health Department is a source of real pleasure and satisfaction to Government.

12. The Government also appreciates the work of the Officers and staff who have efficiently discharged their duties under the guidance and supervision of the Director, Medical and Public Health Department and whose names have been mentioned in the Report.

**THE MILITARY SECRETARY.**

MEDICAL AND PUBLIC HEALTH DEPARTMENT,  
H.E.H. THE NIZAM'S GOVERNMENT.

Administration Report for the year 1346 Fasli.

PART I.—MEDICAL.

*Direction.*—I continued as Director, Medical and Public Health Department assisted by Dr. C. F. Chenoy, Deputy Director, Public Health Department and Moulvi Syed Lutf Ahmed Saheb, Personal Assistant.

Lt.-Colonel Mohamed Ashruff, Deputy Director, Medical Department retired on pension on the 1st Isfandar 1346 Fasli and was replaced by Dr. Hasan Ali Khan, M.B., Ch.B., 1st Physician Osmania Hospital as Deputy Director.

The two posts of Assistant Directors sanctioned previously in the Health Scheme were abolished and transformed into one post of Deputy Director of Public Health.

*Medical Staff.*

(a) *Civil Surgeons.*—The number of Civil Surgeons both permanent and temporary was 39 during the year under review as the following details show :—

Chemical Examiner	..	1	permanent.
Special Plague Officer	..	1	temporary.
Chief Malaria Officer	..	1	temporary.
Osmania Hospital	..	12	{ 11 permanent, and 1 temporary.
Victoria Zenana Hospital	..	4	permanent.
Civil Hospital, Chaderghat	..	1	permanent.
Mental Hospital	..	1	temporary.
City Police Hospital	..	1	temporary.
District Hospitals	..	15	permanent.
Deputy Director of Medical Department and Deputy Director of Public Health Department	..	2	permanent.

A temporary post of Pathologist was sanctioned for the year and recommendations have been made to Government for a permanent post of Pathologist on the staff of the Osmania Hospital.

*Assistant Surgeons.*—The total number of permanent Assistant Surgeons including 3 Assistant Surgeons employed in Jails and one in the Sarf-e-Khas Mubarak was 74. The 3 posts of Assistant Surgeons in the Plague and Malaria Departments and for the Medical Inspection of Schools remained 'temporary.'

*Sub-Assistant Surgeons.*—The permanent Sub-Assistant Surgeons numbered 186 as in 1345 Fasli. The 5 posts of Sub-Assistant Surgeons (3 in the Plague Department and 2 in the Malaria Department) continued to be 'temporary.'

*Extensions.*—An extension of one year was granted in the service of Mrs. O. Watts, Woman Assistant Surgeon, Victoria Zenana Hospital from 4th Isfandar 1346 Fasli to 3rd Isfandar 1347 Fasli.

*Retirements* :—

1. Lt.-Colonel Mohamed Ashruff, Deputy Director, Medical Department retired as noted above.
2. Major M. R. W. Hart, Civil Surgeon, Osmania Hospital retired on the 9th Mehir 1346 Fasli.
3. Dr. Miss A. I. Shaw, Woman Civil Surgeon, Victoria Zenana Hospital retired on 29th Isfandar 1346 Fasli.
4. Assistant Surgeon Eshwant Rao Bhide, Osmania Hospital was invalided on 20th Dai 1346 Fasli.
5. Assistant Surgeon Abdur Rahman of Mahboobnagar retired on 27th Mehir 1346 Fasli.

*Honorary Appointments.*—The 4 Honorary Posts of Specialists in Ear, Nose and Throat; in Skin and Venereal diseases; in the diseases of Eye; and in Dentistry continued. Dr. Miss A. Shaw was appointed to the vacant post of Honorary Surgeon at the Sultan Bazar Hospital. The other honorary post previously held by Mrs. Maqbool Ali fell vacant owing to her transfer to the Victoria Zenana Hospital as officiating Woman Civil Surgeon.

*Post-Graduate Training.*—6 Assistant Surgeons, 5 Sub-Assistant Surgeons and 7 Pro-Assistant Surgeons were deputed to the Osmania Hospital for Post-Graduate study. The technical experience and the knowledge of routine thus acquired by Doctors fresh from Medical Colleges and Schools is of real value to themselves and to the department.

#### DEPARTMENTAL EXAMINATIONS.

*Urdu Zabandani Examination.*—As usual the Half-yearly Zabandani Examinations were held in Farwardi and Mehir 1346 Fasli. Out of 7 Medical Officers who appeared 5 passed.

*Grade Examination.*—Two Grade Examinations were held in Farwardi and Mehir 1346 Fasli. In all 14 Medical Officers appeared and 11 passed.

*Training Classes.*—Classes for the training of Nurses and Compounders were held at the Osmania Hospital. Midwives and Dais were trained at the Victoria Zenana Hospital and Vaccinators at the Government Vaccine Depot. Details regarding these classes are given under the respective institutions. Ward Boys and Dressers have to undergo a course and pass the examination under the Hyderabad Ambulance Board.

*Leprosy Training.*—During the year of report 11 Medical Officers were detailed to Dichpalli for training in leprosy, they all secured certificates of proficiency.

*D.P.H. Training.*—Dr. Syed Ali, M.B., B.S., and Dr. Abul Kalam Badruddin, M.B., B.S., are undergoing the D.P.H. Course in Calcutta.

*D.T.M. Training.*—Assistant Surgeon M. Damodaram Naidu, L.M. & S., was deputed to the School of Tropical Medicine, Calcutta for training in Tropical Medicines, but failed to secure the diploma.

*The Hyderabad Nursing Service.*—The Hyderabad Nursing Service was reorganized last year. The Reverend Mother M. Sapientia continued to work as Lady Superintendent. British Sister Stockton was appointed as Matron from 1st Farwardi 1346 Fasli.

In the Nursing Service there were 12 resignations, 2 retirements, 1 dismissal, 3 services dispensed with, and 4 deaths during the year under report. British Sister Hay Watson in charge of Maternity Ward resigned from 29th Bahman 1346 Fasli, and British Sister Ashton was appointed from 4-11-1346 Fasli. Other vacancies were filled up from among the qualified probationers and by direct recruitments.

Staff Nurse P. Remegius, Nurses N. E. Natiker and E. Napier were selected to undergo the Health Visitors' training at New Delhi in Lady Reading Health School with effect from 1st October 1937.

The Nursing Service worked efficiently in face of great strain imposed by the very large attendance of patients. But for the services of unpaid probationers the work would break down.

Regarding the Training School for Probationer Nurses, the following is a detailed statement of the results at the two examinations held during the year at the Osmania Hospital :—

Class	APRIL 1937		SEPTEMBER 1937	
	Appeared	Passed	Appeared	Passed
Preliminary probationers ..	15	12	10	10
1st Year ..	7	4	5	4
2nd Year ..	5	3	7	5
3rd Year (Final) in Sick Nursing ..	6	4	3	3
Midwifery ..	5	4	4	4

In the Nursing Service all vacancies could not be filled promptly as Mulki candidates are not available.

The sanctioned list of 12 Nurses employed at King Koti Mubarak remained unaltered throughout the year. In addition commands for extra Nurses for the Palaces both from the Hospital Staff and from outside were attended to. The average number working in the Palaces was 25.

It is recorded with the deepest regret that the tragic death of the following four efficient Nurses occurred as a result of a drowning accident.

Staff Nurse M. Jones.  
Nurse B. Culas.  
Nurse F. Dawson (Probationer).  
Nurse M. Reville (        „        )

During the year under report, the Osmania Hospital Training School was recognised by the Madras Nurses and Midwives Council, as an institution for the training of Midwives and their registration by the above Council. (Vide G. O. No. 2320—P.H., dated the 25th September 1937). The School was previously recognised by the Council for training in Sick Nursing.

The cadre of the Nursing Service remained at the beginning and end of the year 1346 Fasli as follows :—

Osmania Hospital	Superintendent Hyderabad Nursing Service	Matron	British Sisters	Home Sisters	Indian Sisters	Staff Nurses	Trained Nurse	
On 1-1-1346 F.	..	1	..	2	1	8	16	25
On 30-12-1346 F.	..	1	1	1	1	11	15	20
Probationers paid and unpaid.								
On 1-1-1346 F.	..	21	..	28				
On 30-12-1346 F.	..	22	..	24				
Victoria Zenana Hospital	..		Matron	Assistant Matron		Staff Nurses	Trained Nurses	
On 1-1-1346 F.	..	..	1	1	..	6	22	..
On 30-12-1346 F.	..	..	1	1	..	6	23	..
Sultan Bazars Hospital	..	Staff Nurses			Trained Nurses			
On 1-1-1346 F.	..	..	1	..	..	2	..	..
On 31-12-1346 F.	..	..	1	..	..	2	..	..
Isolation Hospital	..		Indian Sister			Trained Nurses		
On 1-1-1346 F.	..	..	1	..	..	3	..	..
On 30-12-1346 F.	..	..	1	..	..	3	..	..
Mental Hospital	..	One trained Nurse continued to work throughout the year.						

#### HOSPITALS AND DISPENSARIES.

The number of permanent Medical Institutions in the Dominions was 148 as last year.

Two new Dispensaries were opened at Nizamsagar and Kotgir in Nizamabad district. The details are as follows :—

1. Government	..	..	..	133
2. Aided by Local Fund	..	..	..	7
3. Sarf-e-Khas	..	..	..	5
4. State Aided	..	..	..	3
Total permanent institutions				.. 148
Dispensaries				.. 2 (sanctioned temporarily).
Total				.. 150

*Village Relief.*—In 1343 Fasli the Scheme of Subsidized Medical Practitioners framed to extend medical aid at remote villages was sanctioned and paid for by Government for 3 years.

At the end of the experimental period a modified scheme based on experience was recommended for permanent adoption. District Boards were asked to adopt the scheme permanently. All District Boards reported well on the scheme but they could not afford the increased financial demand. This valuable scheme had to be closed in the year of report, to the great regret of the Medical Department and the distress of the villagers.

*Medical Statistics.*—There was a marked increase in the attendance of patients in all the Hospitals and Dispensaries. The new patients treated during the year numbered 2,833,878 against 2,618,112 in the previous year. The daily average was 21,150.37 compared with 19,378 recorded in 1345 Fasli. The following comparative table shows the number of patients treated in the Hospitals and Dispensaries during the past five years.

Fasli Year.	Number of patients treated (new and old).	Daily average.
1342	.. 5,637,393	15,566
1343	.. 6,221,688	17,046
1344	.. 6,299,690	17,659
1345	.. 7,004,783	19,378
1346	.. 7,707,845	21,150.37

*In-Patients. (Statement No. 2).*

The number of new in-patients admitted in all the Hospitals and Dispensaries during the year was 37,782 compared with 36,982 in the preceding year, and the daily average rose from 1,498 to 1,630. The result of treatment afforded in the various Hospitals and Dispensaries was as follows :—

	1345 Fasli.	1346 Fasli.
Cured	.. .. 22,731	22,497
Relieved	.. .. 5,753	6,836
Discharged otherwise	.. .. 5,132	5,454

*Deaths.*—The deaths registered during the year in all the Hospitals and Dispensaries numbered 2,065 against 1,853 recorded last year.

*Beds.*—2,646 beds were available during the year against 2,479 in the previous year.

*Outpatients.*—The number of new outpatients registered in the various Hospitals and Dispensaries in 1346 Fasli was 2,796,096 compared with 2,581,130 recorded last year, an increase of 214,966 patients. The daily average attendance of outpatients was 1,951,957 against 17,880 last year. The details of the diseases treated are shown in Statement No. III.

*Surgical Operations.*—The Surgical Operations performed in all the Medical Institutions during the year amounted to 107,572 compared with 87,688 in the previous year. Of these 10,916 were Major and 96,656 Minor operations as compared with 9,998 and 77,690 respectively in 1345 Fasli.

The following comparative table shows the result of treatment :—

	1345 Fasli.	1346 Fasli.
Cured .. ..	81,262	98,566
Relieved .. ..	5,595	8,073
Discharged otherwise .. ..	571	664
Died .. ..	291	244
Remaining under treatment .. ..	235	260
Total .. ..	87,954	107,807

The ratio of deaths per cent. to total treated during the year was 0.22 against 0.27 in 1345 Fasli.

*Classification of Patients. Sex: (Statement No. VI).*

The classification of patients treated during the year is as follows according to :—

(a) Sex:	1345 Fasli	1346 Fasli.
Men .. ..	1,137,646	1,233,564
Women .. ..	560,186	587,861
Children (Male) .. ..	548,010	603,581
Children (Female) .. ..	372,270	408,872
Total .. ..	2,618,112	2,833,878

(b) Religion.

	1345 Fasli	1346 Fasli	+ Increase — Decrease
Muslims .. ..	1,376,418	1,474,677	+ 98,259
Hindus .. ..	1,189,926	1,302,064	+ 112,138
Christians .. ..	31,511	35,123	+ 3,612
Other Castes .. ..	20,257	22,014	+ 1,754
Total .. ..	2,618,112	2,833,878	+ 215,763

*Post-Mortem Examinations.*—804 Post-Mortem Examinations were made during the year against 960 last year.

*Medical Aid to Women.*—The full cadre of Woman Medical Officers of the Department consists of one Superintendent and 4 Civil Surgeons all working at the Victoria Zenana Hospital. 12 Assistant Surgeons and 23 Sub-Assistant Surgeons.

*Institutions.*—Qualified Woman Doctors were attached to the following institutions where there are reasonable arrangements for the privacy of women.

Osmania Hospital, Victoria Zenana Hospital, Chaderghat Hospital, Sultan Bazar Hospital, Mental Hospital, Police Hospital and Aliabad, Doodbowli, Suburban and Khairatabad Dispensaries all in Hyderabad City.

In the districts all the 15 Headquarter Hospitals and Jalna.

Women are also seen in all the hospitals of the State. The Victoria Zenana Hospital in Hyderabad and the Rani Shernapalli Hospital and the Aided Mission Hospital at Khammameth are special institutions where women are treated exclusively by women.

*Beds.*—The beds maintained for women in-patients numbered 1,049 against 985 in the preceding year.

*Woman Patients Treated.*—During the year 17,513 women including female children were treated as indoor patients against 17,264 admitted last year, and the total number of woman outpatients including female children was 979,220 against 915,192 in the preceding year.

*Maternity Work.*—5,024 Maternity cases were attended to in the various Hospitals and Dispensaries as against 4,284 in the previous year. Of these 3,627 were cases of normal labour, and 1,397 of abnormal labour against 3,413 and 871 respectively in 1345 Fasli. Further 2,398 labour cases (including abnormal) were conducted outside the Hospitals. The work done in the Gynæcological, Obstetric, Medical and Surgical sections of the Osmania, Victoria, Rani Shernapalli Zenana Hospitals is detailed in the following table.

S.No.	Particulars	Osmania Hospital	Victoria Zenana Hospital	Gulbarga Zenana Hospital
1	<i>Maternity Cases :</i>			
	(i) Normal. .. ..	926	2,378	139
	(ii) Abnormal. .. ..	256	212	25
	(iii) Anti-Natal cases .. ..	914	337	297
	(iv) Post-Natal cases .. ..	107	172	63
2	Maternity Operations .. ..	295	536	34
3	Gynæcological cases (Indoor) .. ..	891	1,035	40
4	<i>In-patients :</i>			
	(i) New .. ..	891	6,534	207
	(ii) Their treatment days. .. ..	9,161	79,116	1,950
5	<i>Outpatients:</i>			
	(i) New .. ..	28,100	33,264	8,982
	(ii) Return Visits .. ..	66,880	46,818	15,025
6	General Surgical Operations. .. ..	163	1,278	125

The figures for the Gulbarga Zenana Hospital are comparatively small. This institution had only 9 beds.

Besides the above figures 1,859 cases of labour were attended to in Hyderabad City, by trained Dais working under the control and supervision of the Helath Visitors of the 3 Infant Welfare Centres.

*Buildings.*—The following buildings were completed during the year 1346 Fasli.

1. Branch Dispensary at Pattan.
2. Branch Dispensary at Vijapur.
3. Branch Dispensary at Manvi.
4. Special design hospital at Latur.
5. Branch Dispensary at Ahmedpur.
6. Woman doctors' quarters at Karimnagar.

Maternity wards at Matwara and Raichur were built to commemorate the Silver Jubilee of H.E.H. the Nizam.

Administrative sanction of Government for the following works costing Rs. 40,250 chargeable to Shahi funds was received during the year and was communicated to the Public Works Department for construction.

1. Construction of Civil Surgeon's quarters at Bir.
2. Heightening the compound wall of Doctors' quarters at Raichur.
3. Special repairs to Civil Hospital, Raichur.
4. Special repairs to the Civil Hospital at Manthany.
5. Emergent repairs to Civil Dispensary at Chinnoor.
6. Installation of drying apparatus at Osmania Hospital.
7. Civil Surgeon's quarters at Bidar.

Administrative sanction of Government for the construction of Branch Dispensary with menials' quarters, latrine, well, wire-fencing and post-mortem room at Sultanabad costing Rs. 28,000 chargeable to Local Fund, was received during the year and communicated to the Chairman, District Board for construction.

*Inspections.*—I inspected 10 Headquarters Hospitals and 15 Taluq Dispensaries during the year of report besides occasional surprise visits to the City Hospitals and Dispensaries. In all I spent 51 days in camp.

I visited the Madanapalli Tuberculosis Sanatorium and the Anantagiri Hill in connection with the Tuberculosis Sanatorium and inspected the sanitation at the Singareni Collieries.

Dr. Hasan Ali Khan, Deputy Director, Medical Department inspected 5 Headquarter Hospitals and 15 Taluq Dispensaries including one Dispensary of the Sarf-e-Khas Mubarak.

The District Civil Surgeons visited all the Dispensaries in their jurisdiction twice besides their tours made in connection with Public Health matters.

The Civil Surgeon as District Health Officer assisted by other Inspecting Officers are touring more regularly. By private talks and official propaganda, the public interest has been aroused and co-operation of the people in measures recommended for the prevention and arrest of epidemics has been secured to a considerable extent. The District Health Officers are now known in their districts and there is not only a marked increase in the popularity of hospitals but improvement is appreciable in the control of epidemics and in general sanitation.

More intimate contact with outlying tracts has revealed a widespread infection of faws among aboriginal people living in the jungles and large numbers of these cases are being very successfully treated by special touring medical units. Several areas heavily infected with Malaria have been found, scientific surveys have been made and campaigns against Malaria are in progress or will be organized as soon as funds can be provided. Endemic areas of Plague are known and have been brought under control with marked benefit.

The Public Health Department is in touch with the Water Board, the Well Sinking Department and in Hyderabad City with the City Improvement Board. Steady progress is being made in improving water supplies and drainage. Sanitation and conservancy in the town is much improved and is constantly supervised by trained Health Inspectors.

Model grain markets, slaughter houses, meat and vegetable markets and latrines have been constructed on approved designs in a very large number of towns.

In all schemes of town planning and house extensions and with regard to building rules the Revenue Department consult the Public Health Department. Other departments responsible for public and educational buildings should more freely, seek advice from the Public Health Department.

*Schemes.*—The following schemes proposed last year remained under consideration of Government at the close of the year of report.

1. The scheme of provision of T. B. Sanatorium and two T. B. Clinics.
2. The scheme for the Registration of Medical Practitioners.
3. The scheme to establish a uniform scale of pay for employees of the Medical Department whether paid by Government, Sarf-e-Khas or District Boards.
4. The scheme for the establishment of a separate Eye Hospital on modern lines.
5. The scheme for the reorganization of the Police Hospital.
6. The scheme for provision of a Mental Hospital.

*Anti-Rabic Treatment.*—During the year under report Anti-Rabic Treatment was available at five Centres in the Dominions. A sixth temporary Anti-Rabic Centre was opened at Pargi in Mahboobnagar district as an emergency measure in the month of Ardibehisht.

[Statement.

The total number of new patients treated during the year was 868 against 963 last year.

Particulars	ANTI-RABIC TREATMENT CENTRES						Total for all Centres during 1346 Fasli.	As compared with 1345 Fasli.
	Chemical Laboratory Hyderabad	Temporary Centre, Pargi.	Aurangabad.	Nizamabad.	Gulbarga.	Warangal.

As compared with 1345 F. ..	902	15	23	5	30	19	994	..

5 per cent. Carbolised Sheep Vaccine obtained from Pasteur Institute, Coonoor, was used as in the previous years. The dose of Vaccine administered is based on :—

1. Situation of the wound.
2. Nature of the wound.
3. Age of the patient.

Accordingly the number of new patients treated during 1346 Fasli are classified as under.

Category of wounds	Male	Female	Children		Total during 1346 F.	Percentage to Total during 1346 F.
			Male	Female		
Class I ..	26	8	13	2	49	5.7
Class II ..	178	59	132	47	416	49.9
Class III ..	196	35	76	17	324	37.3
Class IV-a...	21	7	13	4	45	5.2
Class IV-b...	11	5	14	4	34	3.9
<b>Total ..</b>	<b>432</b>	<b>114</b>	<b>248</b>	<b>74</b>	<b>868</b>

<b>Total treated during 1346 Fasli ..</b>	<b>438</b>	<b>115</b>	<b>254</b>	<b>74</b>	<b>881</b>	

With reference to biting animals the number of new patients treated under the above classification is as follows :—

Nature of biting animals	Number of persons bitten under class						Percentage to total
	I	II	III	IV-a	IV-b	Total	
Dog ..	43	397	303	44	32	819	94.4
Jackal ..	1	10	6	..	1	18	2.0
Man ..	1	1	..	..	..	2	0.2
Other animals ..	4	8	15	1	1	29	3.4
Total ..	49	416	324	45	34	868	100.0

Result of treatment at the various Centres during 1346 Fasli is grouped as under :—

Particulars	Anti-Rabic Treatment Centres						Total for all Centres during 1346 Fasli	As compared with 1345 Fasli
	Chemical Laboratory Hyderabad	Temporary Centre, Pargi	Aurangabad	Nizamabad	Gulbarga	Warangal		
Number fully treated and discharged ..	262	6	13	8	30	17	336	519
Number did not complete the treatment ..	521	5	2	..	5	2	535	461
Number died during treatment ..	..	..	..	..	..	..	..	..
Number remaining under treatment at the end of the year ..	9	..	..	..	1	..	10	14
Total ..	792	11	15	8	36	19	881	994
As compared with 1345 F. ..	902	15	23	5	30	19	994	..

*Reaction.*—Patients belonging to Class IV-a and IV-b receiving 7 and 10 c.c. of Vaccine respectively invariably showed signs of severe local and general reaction during the course of treatment which had to be interrupted.

*Financial Aspect.*—Total quantity of Anti-Rabic Vaccine indented from Pasteur Institute, Coonoor for all Centres during the year was 22,307 c.c. costing B.G. Rs. 3,060 against 26,241 c.c. costing B.G. Rs. 4,200 for 1345 Fasli.

## FINANCIAL (MEDICAL).

## (a) Income.

The following statement shows the income from various sources during 1346 Fasli amounting to Rs. 60,242-0-8 against Rs. 60,463-3-9 in the preceding year.

S. No.	Particulars.	Income.		
		Rs.	A.	P.

Total ..	16,85,510	9 - 5	17,05,873	1 - 5

\*Including Rs. 287-12-6 of Medical Stores.

The expenditure of the undermentioned departments is shown under each separately :—

- Chemical and Bacteriological Laboratory.
- Special Plague Department.
- Chief Malaria Department.

---

COLONEL JOHN LAW ENDOWMENT FUND.

(Statement No. VII.A).

Rs. 3,226-8-10 stood to the credit of the Osmania Hospital in the Imperial Bank of India at the close of 1345 Fasli. This together with the dividend received from the John Law Fund during 1346 Fasli amounted to Rs. 7,055-12-8. Of this Rs. 4,135-13-3 were spent during the year on additional comforts for patients, such as, artificial limbs, fruit, patent medicines and foods.

The balance to the credit of Osmania Hospital at the close of the year was Rs. 2,919-15-5.

The Victoria Zenana Hospital had to its credit Rs. 904-13-0 at the close of 1345 Fasli. Rs. 1,854-4-2 were credited to this Hospital from the dividend of the John Law Fund during 1346 Fasli. Of this Rs. 1,915-0-10 were spent during the year on additional comforts for patients leaving a balance of Rs. 844-0-4.

## SULTAN-UL-HUKMA FUND.

(Statement No. VII—B).

There was a balance of Rs. 622-0-0 to the credit of the Osmania Hospital at the Imperial Bank of India. Rs. 375 were received as annual dividend during 1346 F. Rs. 20 per month were sent to the Dispensary at Narayanpet and Rs. 10 per month from Shehrewar 1346 Fasli to the District Hospital, Raichur to be spent on diet, milk, etc., for indigent patients as sanctioned by the Trustees. This together with the money-order fee amounted to Rs. 273-6-0. There was a balance of Rs. 723-10-0 at the close of the year.

## MEDICAL SUPPLIES.

*Purchase of "European Medicines."*

The annual allotment for purchase of "European Medicine" sanctioned by Government for 1346 Fasli, was H.S. Rs. 188,264. From Rs. 183,264 sanctioned for "European Medicine" a sum of Rs. 32,000 for Hospital Necessaries, a sum of Rs. 943 for Osmania Hospital and a sum of Rs. 500 for Accounts Branch, total Rs. 33,443 was transferred, leaving a net balance under "European Medicine" of Rs. 1,49,821. From this amount Rs. 1,49,814-1-4 had been utilized in providing drugs to all the Hospitals and Dispensaries of the Medical Department with a saving of Rs. 6-14-8.

*Purchase of "Surgical Instruments."*

The annual allotment for "Surgical Instruments" sanctioned by Government for 1346 Fasli, was Rs. 18,000. Of this Rs. 17,998-13-2 were spent leaving a saving of Rs. 1-2-10.

*Purchase of "Hospital Necessaries."*

The annual allotment for "Hospital Necessaries" is H.S. Rs. 20,000. Rs. 32,000 were reappropriated from the grant for "European Medicine" making a total of Rs. 52,000 in all. Out of this Rs. 51,945-7-6 had been spent leaving a balance of Rs. 54-8-6.

*"Country Medicine."*

The annual allotment for "Country Medicine" was H.S. Rs. 500 and sum of Rs. 200 for Sultan Bazar Hospital, making a total of Rs. 700, out of which Rs. 284-6-7 were spent leaving a sum of Rs. 415-9-5.

*Gauze and Bandage for City.*

The sanctioned allotment of Gauze and Bandage for City was Rs. 650; out of this Rs. 647-13-10 were spent leaving a sum of Rs. 2-2-2 unspent.

*Contingencies.*—Rs. 300 was sanctioned for contingencies, out of which Rs. 287-12-6 were spent leaving a balance of Rs. 12-3-6. All unspent balance lapsed to Government.

| Dr. Abdul Ali Khan, M.R.C.S., L.R.C.P.,                            | .. | .. | Anæsthetist.  |

Dr. D. B. Kulkarni, M.R.C.S., L.R.C.P., D.T.M., D.P.H., F.C.S., .. ..	Pathologist.
Dr. S. W. Hardikar, M.D., M.R.C.P., ..	Honorary Physician and Professor of Pharmacology.

*Honorary Staff is as follows :—*

Dr. R. Venkat Rao, B.Sc., M.B., B.S., D.L.O.,	Ear, Nose and Throat Department.
Dr. B. G. Ranade, M.B., B.S., .. ..	Skin and Venereal Department.
Dr. B. K. Phatak, M.B., B.S., D.O., ..	Eye Department.
Dr. C. J. Morris, L.D.Sc., .. ..	Dental Department.

On the transfer of Dr. M. Hasan Ali Khan, as officiating Deputy Director, Medical and Public Health Department, Dr. M. K. Pandit, Civil Surgeon, Aurangabad was appointed as First Physician. On 5-1-1346 Fasli Major M. R. W. Hart went on 25 days privilege leave preparatory to retirement on 10-8-1346 Fasli and Dr. V. G. Borgaonker who was acting for him was confirmed as Obstetric Surgeon.

With effect from 12-6-1346 Fasli, Dr. M. Ali Hussain Professor of Pathology ceased to work in the Pathological Department of Osmania Hospital, and Dr. D. B. Kulkarni was posted in the Laboratory.

Several of the newly appointed Medical Officers were posted as House Physicians and Surgeons for one year.

*Accommodation.*—The sanctioned number of beds for this Hospital is only 400, but the daily average number of in-patients was 634.68 in spite of concerted efforts to keep down the numbers. On 17-10-1346 Fasli a maximum of 671 in-patients was recorded. The practice of transferring chronic and incurable cases to other institutions and the majority of T. B. cases to the Lingampalli Hospital has been continued. As mentioned in previous reports the creation of a separate Eye Hospital would greatly relieve the constant strain on the out and in-patient departments.

Nurses for whom no accommodation was provided when the hospital was designed continued to occupy two wards which could not be opened to receive patients for want of additional staff and funds. Great strain was imposed on the medical and nursing staff throughout the whole year. Recommendations to increase the Nursing Staff are now before Government.

Patients treated	1342 F.	1343 F.	1344 F.	1345 F.	1346 F.
Outpatient Department	350,916	420,257	400,941	423,552	457,515
Daily average ..	961.41	1,151.38	1,096.42	1,160.42	1,253.32
In-patient Department	165,562	187,441	228,460	226,358	231,688
Daily average ..	453.59	513.51	621.08	621.70	634.68
Deaths ..	698	818	789	706	769
Deaths per 100 ..	7.02	6.92	5.94	4.98	5.89

As usual, one-fourth of the deaths occurred in cases admitted in a moribund condition terminating fatally in less than 48 hours.

Outpatients treated ..	34,830	34,747
Daily average .. ..	95.36	95.20
In-patients treated ..	33,876	31,121
Daily average .. ..	92.81	85.26
Operations performed ..	1,247	1,190

The all-round increase in figures fully justifies the creation of a separate Eye Hospital as mentioned in previous reports. Dr. B. K. Phatak, the Honorary Ophthalmologist, was given seven beds in Male Ophthalmic Ward and one operation day a week.

More than 12 beds per day were occupied by the Ear, Nose and Throat cases. For lack of accommodation more patients could not be taken in. This justifies the opening of a separate ward for these cases, not possible at present for want of staff and funds.

The Skin and Venereal Specialist is allotted 12 beds and these were always occupied and patients have to wait for an empty bed. Many cases were sent from districts and it is very difficult to meet the increasing demand for beds.

*Pathological Laboratory.*—There was a slight decrease in the number of specimens examined in the Pathological Laboratory, where one Pathologist is employed in place of two. The Physicians are to be commended for encouraging students to do more clinical Pathology in the wards and discouraging the use of the Laboratory for routine examination. Work requiring Laboratory technic has shown an appreciable increase. Lang's Gold Chloride Curve was done for the first time in this Laboratory.

*Maternity Department.*—The number of Maternity cases attended in 1346 Fasli, is 1,182. Of these 926 were normal and 256 detailed below were abnormal :—

Forceps .. ..	108
Curretage and Evacuation ..	77
Version .. ..	24
Podalic extraction .. ..	14
Craniotomy .. ..	9
Cæssarean Section .. ..	9
Vesicular Mole .. ..	5
Removal of Placenta .. ..	10
Total .. ..	256

Out of the 256 abnormal cases 117 were delivered in No. 2 Labour Ward having been handled unskilfully before admission into the Hospital. 107 post-natal cases delivered outside were admitted into Maternity Ward No. 2, and 19 Tetanus cases were treated in the admission room with five deaths.

The number of ante-natal cases was 2,161; of these 902 were treated as in-patients and the rest attended the special ante-natal clinic in the Gynæcological Examination Room on Tuesdays and Thursdays; and also in the Woman's Outpatient Department. The full number of deliveries during 1346 Fasli was 1,181 compared with 1,073 in 1345 Fasli.

In the Gynæcological Section, 891 new in-patients were treated. 526 Gynæcological operations were performed with only two deaths. The selected operations are as follows :—

Hysterectomy	..	..	37
Salpinjectomy	..	..	29
Overiotomy	..	..	22
Laparotomy	..	..	7
Gilliam's Operation	..	..	4
Perineorrhaphy	..	..	11
Woman's Outpatient Department	1346 F.		1345 F.
Number of cases treated	..	94,725	86,896
New cases	..	27,845	34,376
Old cases	..	66,880	52,520
Ante-natal cases	..	1,259	1,175
Operations	..	163	317

*Casualty Department.*—The number of casualty cases was 6,497 including 577 fractures, 133 cases of poisoning. There were 77 cases of acute abdomen, in spite of very late admission of acute abdominal cases, the emergent operations undertaken were 16 of which 11 were successful in saving life. The treatment of poisoning was very successful, only 18 cases proved fatal.

Two Sub-Assistant Surgeons are posted on "Casualty Duty" for 24 hours each on alternate days. One Medical Officer and one Woman Doctor are on hospital duty day and night for emergencies in the wards. The Resident Medical Officers are always available for consultation.

*Clinical Training of Medical Students.*—All students of the Osmania Medical College attend the Hospital for clinical work during the last three years of their course. It is proposed to further equip the clinical side rooms attached to Medical and Surgical Wards. This will increase the opportunities for practical experience. The routine clinical work, special clinical demonstrations and lectures in the in and outpatient departments and instruction in the special departments. The teaching combined with the enormous amount of clinical material gives our students unique opportunities for study.

It was decided in one of the staff meetings held in the Osmania Hospital that the Visiting Staff should give a series of lectures, subjects useful to private Medical Practitioners and Government Medical Officers as a refresher course. This was done in the summer vacation. The Visiting Staff merit thanks for doing the above work at some personal inconvenience. The Medical Practitioners appreciated this Post-Graduate course which is to be continued.

*Anæsthetist's Department.*—One Civil Surgeon and a Sub-Assistant Surgeon continued to work in this department. The number of patients anæsthetised during the year under report, by various methods is 2,164 compared with 1,750 during 1345 Fasli. The absence of mortality in such a large number of cases is worthy of note. An important feature this year was the installation of *Boyl's* modified apparatus for anæsthesia with full equipment. The number of cases anæsthetised with the help of this apparatus proved very successful.

*Medical Stores.*—One Sub-Assistant Surgeon is in charge of the Hospital Medical Stores. He is also responsible for the training of probationer Compounders. He also instructs the ward menial staff in First Aid.

The annual allotment for drugs and Hospital necessities is Rs. 33,000. In spite of enforcing great economy, the expenditure exceeded the allotment by over Rs. 8,000. Over 20 lacs of doses of medicine were issued at a cost of less than 4 pies per dose.

*Note on Colonel John Law's Fund.*—As in the previous years expenditure on proprietary and patent medicines not supplied by Government funds, artificial limbs, spectacles, and travelling charges for indigent patients was met from this fund.—a great boon to poor patients and a splendid memorial to Colonel John Law.

*Training of Compounders.*—Thirteen permanent Compounders assisted by the probationer Compounders worked throughout the year. One woman Compounder continued to work in the women's Outpatient Department.

25 probationer Compounders were recruited for training in the beginning of the year. These, with one who had not completed his course in the previous year were trained. Of these eight left the class, the remaining 18 appeared for the final examination and all qualified.

*Nursing Establishment.*—Miss M. Stockton was appointed Matron from the 1st Farwardi. Sister G. G. Ashton (British Sister) arrived from England and took charge of the Maternity Wards from 4th Mehir.

The cadre of Nurses in the Osmania Hospital remained the same as last year.

—	Matron	Home Sister	Indian Sisters	Staff Nurses
Remained at the beginning of the year ..	1	1	8	16
Remained at the end of the year .	1	1	10	15
—	Trained Nurses		Paid Probationers	Honorary Probationers
Remained at the beginning of the year ..	25		21	28
Remained at the end of the year ..	20		22	24

*Kitchen Department.*—The Steward continued to be in charge of the kitchen department, assisted by a Sister and the 2nd Resident Medical Officer supervised the whole department.

As before no private diet was allowed inside the Hospital and the Hospital kitchen supplied food to all the patients and the service was uniformly good.

The Chemical Examiner's reports regarding the analysis of articles of diet speaks for the excellent quality of diet provided. During the year, in no case did the Chemical Examiner find any adulteration or bad quality.

*Electrician and Pumping Department.*—No efforts were spared to cut down the cost of current by reducing the number of lights and stopping the fans for the cool months.

*Sanitation.*—The sanitary condition of the Hospital was well kept up. The annual maintenance work was partially done. Orders had been issued to instal a drying chamber and procure ironing table. This will relieve inconvenience in the Hospital laundry, especially during the monsoon months.

The ward boys and menial servants continued to render good service even under great strain. Many of these servants are given instruction in First Aid under the Hyderabad Central Ambulance Board.

*General Remarks.*—Early in the beginning of the year the Advisory Board met once. After the completion of the year, it met once again and noted that the pressure of work in all departments justifies a increase in staff, but particularly in the Nursing Staff.

There were two meetings of the Hospital Staff to consider improvements and matters relating to internal administration.

The Hospital was fortunate in having some distinguished visitors, who had expressed their appreciation in the following remarks :—

“ It was a great pleasure to visit this fine hospital and to be taken round it by Colonel Norman Walker. It is housed in a splendid building and I was particularly struck by the fine design of the wards—the happy blend of the spaciousness and restfulness.

Thanks to Colonel Norman Walker's thoughtfulness I was able to see not only the wards and the various other departments of the Hospital itself, such as the Eye Department, the X-Ray Department, Outpatients' Department and the Dispensing Department, but also those auxiliary departments, such as the Kitchen, Laundry and Carpenter's and Electrician's shops, the efficient working of which plays its own and by no means unimportant part in ensuring the comfort and well-being of the patients. In all I saw there was the excellence of equipment and the quiet efficiency of organisation that a hospital of this large size and high standard of working demands. There are surely few hospitals in India that are so well equipped and organised. Colonel Norman Walker and his staff have every reason to be proud of the fine work they are doing in this splendid hospital.”

(Sd.) C. H. GIDNEY,

*Resident at Hyderabad.*

27th July 1937.

" This is my second visit to this Hospital, my first being in August 1930. As I was escorted round the Hospital this time by Colonel Norman Walker, I found that, while on the one hand, this grand and splendid hospital had kept up its reputation for its efficient management and excellent supervision, it has on the other made tremendous strides in many other respects. The cleanliness of the kitchen and laundry departments leave nothing to be desired and the sanitary and feeding arrangements, in spite of the huge extent of the hospital, are quite up to the mark.

Some of the indoor patients were questioned about the treatment they were receiving. In reply they said that they were well-treated and looked after, that they had nothing to complain of, in short that they were quite happy and contented.

As regards the needs and requirements of the hospital, Colonel Norman Walker pointed out that there was provision for 400 beds only while a much larger provision was needed. This speaks volumes in favour of the growing popularity of the hospital.

I have been very favourably impressed with all that I had had the pleasure of seeing this time also in this fine and well-equipped hospital, and I heartily congratulate Colonel Norman Walker for the excellent management and supervision and his staff for the good work they are engaged in alleviating the distress of suffering humanity."

(Sd.) BASALATH JAH.

8-9-1937.

" The equipment and organisation of the Osmania Hospital are as good as anything I have seen in India and would compare very favourably with the best Hospital in Europe. It was a great pleasure to have seen this fine institution and the State are to be congratulated upon its great and obvious popularity and the splendid work of Colonel Norman Walker and his staff."

(Sd.) W. C. BRADFIELD, I.M.S.,  
*Director-General.*

10-9-1937.

#### VICTORIA ZENANA HOSPITAL.

Dr. M. F. Correa officiated as Superintendent up to the 15th Dai 1346 Fasli when Dr. M. V. Webb, C.B.E., F.C.O.G., W.M.S., (Retired) took over charge.

Besides the Superintendent, the Hospital was staffed with four Civil Surgeons, one Assistant Surgeon and four Sub-Assistant Surgeons.

*Nursing Staff.*—The Nursing Staff consisted of one Matron, 1 Assistant Matron, 2 Indian Sisters, 6 Staff Nurses and 23 Trained Nurses. The staff is still insufficient for the growing needs of the Hospital. Two Indian Sisters have been sent from the Osmania Hospital in place of two trained Nurses Dais and probationer Dais assist the Nursing. Recommendations have been made to Government to increase the Nursing Staff.

*Visits.*—Princess Niloufer Farhat Begum visited the hospital twice and the Hon'ble Mr. Gidney, Resident, once. Dr. Jean Orkney, V.M.S., Secretary, Victoria Memorial Scholarship Fund also visited the Hospital.

*Buildings.*—Much time has been spent on plans for new buildings and reorganisation, additions and improvements are essential. The installation of sanitary flush system was the most important event of the year. Many other minor improvements have been carried out but the buildings require very extensive improvements to conform with modern scientific requirements.

*Accounts.*—At the beginning of the year an audit was held. The first for 14 years. Naturally after such a long interval with frequent changes of staff, a few clerical errors were found, though none of a serious nature. The audit objections have been answered.

The annual grant during the year was Rs. 1,85,583 and expenditure Rs. 1,66,422 against Rs. 1,98,715 and Rs. 1,64,753-5-4 respectively in 1345 Fasli.

The income derived from John Law Fund amounted to Rs. 1,854-4-2 as compared with Rs. 2,222-12-8 last year. Rs. 1,915-0-10 were spent on patients' comforts and a balance of Rs. 844-0-4 remains. The total receipts from the rent of the paying wards amounted to Rs. 14,400 against Rs. 18,146 of 1345 Fasli.

At the beginning of the year bills in some cases, up to four months belonging to the previous year had to be paid leaving a deficit at the end of the year. To meet this deficit a special grant of Rs. 5,250 was sanctioned for 'Payment of Bills' which enabled the Hospital to start the new year free from debt.

#### STATISTICS.

*Outpatients.*—The outpatients attendance suffered a slight decrease which may be attributed to decline in the incidence of malaria and fevers. A special afternoon clinic for venereal diseases and an ante-natal clinic are new features of the out-patient department.

*In-Patients.*—The attendance of in-patients too showed a decrease 6,340 against 6,638 last year. The daily average fell from 245 recorded last year to 216.75. Out of 102 deaths, 17 cases were brought to the hospital in a moribund condition and died within 24 hours of admission. The result of treatment was as follows :—

	1345 Fasli.	1346 Fasli.
Cured .. .. .	5,990	5,574
Relieved .. .. .	256	345
Discharged otherwise .. .. .	222	325
Died .. .. .	131	102
Remaining under treatment .. .. .	194	188

Death-rate has fallen from 1.91 to 1.57.

*Maternity Section.*

1. Total number of admissions	..	..	..	3,460

## HONORARY LADY VISITORS.

The period of appointment of the following Honorary Lady Visitors was extended by Government from 16th Isfandar 1346 Fasli to the end of Aban 1348 Fasli.

1. Mrs. J. Norman Walker.
2. Mrs. George Nundy.
3. Mrs. Syed Mohd. Mehdi.
4. Mrs. B. Welinker.

Mrs. B. Welinker was absent for some time during the year and in her absence Miss K. Welinker was nominated by Government to act for her.

The recommendations made by these ladies during their periodical visits were duly attended to.

*Financial.*—The following table shows the details of the recurring expenditure incurred in 1346 Fasli as compared with the preceding year.

Serl. No.	Particulars	1345 Fasli			1346 Fasli		
		Rs.	A.	P.	Rs.	A.	P.
1	Salary and allowance of Gazetted Officers .. .. .	53,247	2	4	52,375	2	8

## CITY POLICE HOSPITAL.

Captain M. G. Saincher, I.M.S., as Police Surgeon was in charge of the Hospital. He was assisted by a woman Assistant Surgeon and a male Sub-Assistant Surgeon.

The attendance at the Hospital was as follows :—

	1345 Fasli.	1346 Fasli.
Daily average in-patients ..	14.33	14.45
Daily average outpatients ..	172.81	195.60

The 51 post-mortems performed during the year include :—

Homicides .. ..	12
Suicides .. ..	3
Accidents .. ..	16
Poisoning .. ..	10
Infanticides .. ..	1
Natural .. ..	4

122 lunatics were certified during the year and sent for admission to the Mental Hospital.

## CITY POLICE.

Medico-legal cases seen at the hospital included :—

Simple injuries .. ..	1,358
Grievous injuries .. ..	136
Drunkards .. ..	671
Rape cases .. ..	31
Unnatural offences .. ..	12

*Operations.*—60 major and 439 minor operations were performed compared with 45 and 450 in the previous year. One operation case died and 3 remained under treatment when the year closed.

## MEDICAL AID FOR WOMEN.

A woman Assistant Surgeon and a Dai constitute the staff.

The Maternity cases treated outside the Hospital numbered 3. 750 Gynæcological cases were treated during the year.

The average daily attendance of women was 1.72 in-patients and 106.24 outpatients.

## MENTAL HOSPITAL.

Dr. C. A. Sunder Raj continued to hold charge of the Mental Hospital during 1346 Fasli.

*Staff.*—There has been no addition to the staff. A Civil Surgeon, one Woman Assistant Surgeon, one Sub-Assistant Surgeon, one Nurse and two Compounders remained working as last year.

The Honorary Specialist in Ear, Nose and Throat diseases, the Venereal and Skin diseases Specialist and the Honorary Dentist paid weekly visits as in the previous year.

The menial staff is inadequate and convicts from the Jail are employed for menial work.

The fact that the recovery rate and the death-rate compare favourably with other Mental Hospitals in the East, reflects the greatest credit on Dr. Sunder Raj, the Superintendent and his staff. The accommodation provided is unsatisfactory. There is no purpose in going into the details of this temporary arrangement as Government have decided to lose no time in providing the funds and constructing a modern Mental Hospital.

*Accommodation.*—Both the male and female sections of the Hospital remained overcrowded throughout the year. The daily average number of patients was 370.86 and the largest number of patients accommodated was 393. The crowding of nearly 370 patients in wards meant for 225, not only means heavy strain but tells seriously upon their health and was a factor which favoured the outbreak of Beri-Beri which appeared at the close of the last year.

The figures tabulated below show a steady increase in the inmates of the Hospital, mainly due to the accumulation of chronic cases. Efforts are made to hand over quiet and harmless chronic patients to the care of their relatives but in many families this is not feasible.

Comparative statement showing the figures of the 5 years ending with 1346 Fasli is as follows :—

Year	Remained at the beginning of the year	Admission during the year	Discharged during the year	Remained at the end of the year	Daily average
1342 Fasli.	290	200	166	324	309.77
1343 Fasli.	324	213	183	354	344.20
1344 Fasli.	354	191	191	354	358.50
1345 Fasli.	354	223	207	370	359.10
1346 Fasli.	370	227	210	387	370.86

*Admissions.*—The year opened with 370 patients of whom 258 were males and 112 females. 227 patients—191 men and 36 women were admitted during the year. 141 were discharged as cured, 28 were handed over to relatives after improvement, 7 were discharged otherwise and 3 discharged as normal. The percentage of cured to total admission for the year was 29.7 as against 27.8 in the previous year.

*Criminal Patients.*—There were 32 males and 3 females at the beginning of the year and 14 males and 2 females were admitted during the year making the total number 51.

3 under-trial prisoners were sent by Courts for observation. Their mental condition was normal during their stay in the Hospital and they were discharged as normal. 15 males and 2 females were discharged as cured and 2 male criminals died.

The comparative statement of admissions and discharges for 1345 Fasli and 1346 Fasli is tabulated below :—

Year	Remained on 1st Azur	Admitted during the year	Total	DISCHARGED					Died	Remained at the end of year
				Cured	Handed over to relatives	Discharged otherwise	Discharged as normal	Total		
1345 F.	354	223	577	133	26	7	..	166	41	370
1346 F.	370	227	597	141	28	7	3	179	31	387

*Health of Patients.*—Beri-Beri broke out towards the end of last year and continued for three months. There were 12 attacks and 5 deaths. Immediate measures were taken to prevent further occurrence of cases and the disease was brought under control. During the remaining months the general health of patients was satisfactory. The daily average of patients requiring treatment for physical illness was 3.94 against 3.37 last year.

*Accidents and Injuries.*—Cases of minor injuries occurred which were inevitable in congested wards. But there were no serious accidents though many of the patients admitted were violent and dangerous.

*Deaths.*—31 patients died as against 41 in the previous year. The percentage of deaths to total population was 5.19 against 7.1 last year. 3 patients who were admitted in a moribund condition died within 5 days of admission. 5 patients succumbed to Beri-Beri. The following table shows the number and causes of deaths.

Serial No.	Diseases	During 1345 F.	During 1346 F.
1	Pneumonia	4	5
2	Tuberculous disease hip-joint	1	..
3	Tuberculous disease of intestine	1	1
4	Bacillary Dysentery	1	..
5	Amœbic Dysentery chronic	2	1
6	Diseases of blood	6	5

9	Psychoneurosis .. ..	2	2	4
10	Observation (Normal) ..	3	..	3
	Total ..	191	36	227

*Treatment.*—As in the previous year sedatives, hypnotics and tonics were largely used. In Maniacal excitement, mental and physical restlessness was well controlled by morphia and Hyocene injections, Sulphonal and Hydrotherapy. Selected cases of Schizophrenia were given a course of sulphur injections (1 per cent. sulphur in olive oil). The results obtained in 4 cases were satisfactory and they were discharged as cured. 10 patients showed slight improvement which was only temporary.

*Parole.*—No undue restrictions were imposed on the patients and they were allowed entire freedom to move about within the enclosures. Excited and dangerous patients were confined in single rooms. A few selected patients were allowed to go out accompanied by ward attendants.

*Leprosy.*—Dr. Donald P. Dow continued as Superintendent of the Leper Home and Hospital, Dichpalli. Dr. Speight joined the staff in Farwardi and took charge of the Pathological Laboratory. He is earnestly concentrating on its improvement. Captain C. St. John Ives' honorary assistance was appreciated. One additional Nurse joined during the year.

671 new patients were admitted during the year and 567 patients were discharged. The latter figure includes not only those discharged symptom-free but also those who left without permission or were unfit for further institutional treatment. During the year the number of patients in residence reached the record figure of 830 but despite the increased accommodation which made the housing of so large a number possible no less than 1,065 patients had to be refused who would have been benefited by treatment in the Hospital. These figures convey something of the immensity of the leprosy problem in India and particularly in Hyderabad State. Cutaneous cases are admitted, because they are sources of infection and a danger to the community; but contrary to the practice in other institutions Dichpalli discharges them soon after they become negative. This is done in view of the large waiting list and because there is a Government Medical Officer in every district who has undergone training in leprosy, to whom the patients are instructed to report themselves in case of any recrudescence of the disease. Ex-patients are also advised to report at the Hospital every six months for re-examination.

Two courses of instructions, one Under-Graduate and one Post-Graduate, were held during the year. The Under-Graduate class consisted of the Final year students of the Osmania Medical College for whom the class is now compulsory for the M.B. The Post-Graduate course consisted of Medical Officers from the State Medical Department.

The year under report saw the completion of most of the building programme. The new women's hospital got completed. The old men's ward was re-conditioned and is the centre for X-Ray, Diathermy, Ultra-violet light, etc. The houses for the subordinates have been re-conditioned and the ladies bungalow has been provided with an extra room, and a bungalow has been built for the Pathologist. A water-tank capable of storing 12,000 gallons of water has been installed and all the wells have been fitted with electric pumps. A second cattle shed, a grain store and cart shed have been erected at the Farm. The new Men's Hospital which was ready for occupation at the beginning of the year was formally declared open by H. E. the President of the Council, the Right Hon'ble Sir Akbar Hydari.

An Outpatients Clinic is conducted at the Hospital twice weekly and another bi-weekly Clinic is conducted at Secunderabad under the auspices of the British Empire Leprosy Relief Association. At the Clinic a local Medical Practitioner gives his services free and weekly visits to the Clinic are paid by Members of Dichpalli Medical Staff.

In addition to the grant of Rs. 42,197-12-10 provided by H.E.H. the Nizam's Government a handsome donation of Rs. 6,000 was made by the Rani of Wanparti as a gift for Women's Ward.

*Karwan Leprosy Clinic.*—Dr. Doraiswamy remained in charge of the Karwan Dispensary. This Outpatient Clinic continued to render Medical Relief to patients of the locality in addition to treating cases of Leprosy. There has been a steady progress. The number of new cases rose from 341 to 401 and the treatment days numbered 15,087 against 12,055 recorded last year. The increase in the attendance made it necessary to appoint an additional Medical Officer.

*The Leper Clinic, Narayanpet.*—The Jubilee Leper Clinic at Narayanpet in Mahboobnagar was constructed during the year by public subscription. The Clinic is in charge of a Sub-Assistant Surgeon and is rendering satisfactory service. The work is increasing enormously especially so after the construction of the Clinic. The staff as well as the funds are inadequate to meet the demand; a woman Sub-Assistant Surgeon a male Sub-Assistant Surgeon and some more menial staff are needed. The want of funds is a serious handicap. The lepers are disowned by their relations and it is very difficult to arrange for their food when they are in the Clinic. Two gentlemen Mr. Ramchander Naik Bhagoji and Mr. Narayan Rao have taken the responsibility of feeding 2 patients a year. Donations were collected for completing the Clinic amounting to Rs. 507.

*Other Leprosy Clinics.*—A special Leprosy Clinic is conducted by the Department in the Hyderabad and the District Hospitals and Dispensaries too afford treatment to lepers. The Sultan Bazar Leprosy Clinic and the Secunderabad Clinic render relief under the auspices of the British Empire Leprosy Relief Association and several Mission Hospitals too provide treatment for leprosy.

Work for lepers has expanded and is still growing. The field is enormous but without neglecting other crying needs it is difficult to move as rapidly as the department desires.

## PART II.

## PUBLIC HEALTH.

## INTRODUCTION.

1. *Area and Population.*—The area of His Exalted Highness the Nizam's Dominions, excluding Berar, is 82,698 square miles. The population given in the 1931 census is 14,436,148 showing an increase of 15.8 per cent. over the census of 1921. The registration of births and deaths is defective and figures for immigration and emigration are not maintained. All rates in this report are calculated on the 1931 population.

2. *Meteorological Conditions.*—The average rainfall for the Dominions was 33.24" as against a normal of 30.28". The shortage of rainfall in the South-West monsoon in the months of Amerdad and Mehir (June and July) was compensated to some extent by heavier rainfall during the months of Shahrewar (July) and Aban (September). The North-East monsoon gave a heavier amount of rainfall throughout the Dominions but was more marked in the districts of Aurangabad, Bir, Osmanabad, Raichur and Bidar. The average rainfall during this North-East monsoon was 5.03" as against a normal of 2.64". Telingana districts received more rainfall than the Marathwada districts. The following table gives the figures of actual rainfall, compared with the normal during different parts of the year.

TABLE I-(a).

*Rainfall in inches during the year 1346 F. in H.E.H. the Nizam's Dominions.*

Area	N.E. MONSOON AZAR TO BAHMAN		INTERMEDIATE PERIOD		S.E. MONSOON AMERDAD TO ABAN	
	Average	Normal	Average	Normal	Average	Normal
Whole Dominions ..	5.03	2.64	6.08	2.68	22.13	24.96

[Statement.]

The following table shows the actual rainfall for each district during the year, compared with the normal (average of 40 years).

TABLE I-(b).

District	TOTAL RAINFALL FOR THE YEAR		Excess or in defect of Normal
	Average	Normal	
	Inches	Inches	Inches
Warangal .. .. .	38.94	35.38	3.56
Karimnagar .. .. .	42.11	33.09	9.02
Adilabad .. .. .	49.44	39.25	10.19
Medak .. .. .	33.93	33.05	0.88
Nizamabad .. .. .	42.42	36.17	6.25
Baghat .. .. .	32.89	29.30	3.59
Mahboobnagar .. .. .	25.87	26.24	0.37
Nalgonda .. .. .	35.49	26.50	8.99
Aurangabad .. .. .	33.82	26.87	6.95
Bir .. .. .	24.11	26.91	2.80
Nanded .. .. .	36.38	32.63	4.75
Parbhani .. .. .	29.41	32.20	2.79
Gulbarga .. .. .	21.21	26.96	5.75
Osmanabad .. .. .	28.89	28.20	0.69
Raichur .. .. .	22.72	22.21	0.51
Bidar .. .. .	34.26	29.58	4.68
Total for the State .. .. .	33.24	30.28	2.96

The distribution was fairly satisfactory except in Gulbarga, Parbhani and Bir districts.

3. *Economic Conditions.*—It is generally accepted that the health of the population varies directly with economic conditions. It is doubtful if such epidemics as cholera, small-pox and plague can be reduced merely by improved economic conditions. Each of these diseases requires specific action by the Government combined with co-operation from the people. On the other hand diseases such as malaria, tuberculosis and leprosy are very directly encouraged by a meagre diet and poor living conditions. No preventive campaign against these diseases is likely to achieve full success unless simultaneous attempt is made to raise the economic status and the standard of living of the general population. The comparison of prevailing prices of foodstuffs with average income is one of the methods (though not a completely satisfactory one) of judging the general economic conditions.

The following table gives the retail prices of the staple food grains prevailing in the State during the year under report as compared to that of the preceding two years.

TABLE II.

Articles	1344 FASLI		1345 FASLI		1346 FASLI	
	Seers	Chat-taks	Seers	Chat-taks	Seers	Chat-taks
Coarse rice ..	7	10	7	11	7	5
Paddy 1st quality ..	15	5	15	11	14	9
Paddy 2nd quality ..	16	14	16	14	15	13
Wheat ..	9	5	9	10	6	15
Jawar ..	13	1	14	2	13	4
Bajra ..	12	3	12	1	12	4
Ragi ..	14	4	15	2	15	3
Maize ..	12	10	12	15	13	5
Gram (Chana) ..	10	11	11	1	8	5
Tuvar ..	11	10	12	4	10	10

The general economic condition as judged from these prices of the staple food grains appears to be far from satisfactory. Prices are higher in Telingana than in Marathwada districts. Much depends upon the purchasing power of the ryot. This does not appear to be very different from that of the immediately preceding years.

The dietetic habits of the people as well as the economic condition is closely wedded to the subject of nutrition. It is well known that malnutrition lowers the resistance to infection and renders people susceptible to malaria and intestinal diseases. Evidence of malnutrition rapidly appears during times of scarcity or famine. No regular general health surveys or diet surveys have so far been made in the Dominions, but there is little doubt that investigation when carried out in these connections will show diverse conditions of malnutritions in the population due to grave defects both in quantity and in quality of the daily diets. It is proposed to depute an officer of this department for training in the Nutrition Institute at Conoor and on his return nutrition surveys will be undertaken.

4. *Vital Statistics.*—Registration of births and deaths in the rural areas is undertaken by the village officials and is not reliable. Inspections are regularly made to check these figures. An Act for the deaths and births registration has been submitted to Government. When this Act is passed and its provisions enforced, a great improvement is expected. In the City of Hyderabad, the Municipal Corporation is responsible for the

collection of vital statistics. The results obtained show that the organisation and supervision of this work by the Municipal Department has not progressed. Unless several Sub-Registrars are appointed in different Wards of the City and the Sections concerned of the Hyderabad Municipal Act in this connection are strictly enforced, the results are not likely to be satisfactory. Under the circumstances it is not advisable to base conclusions on the Municipal figures.

Prompt attention has however been paid to the reporting of epidemic diseases. The Revenue and Police Departments usually co-operate with the Health authorities and the epidemic figures reported may be taken as nearly accurate, though sometimes delayed owing to the remote situations. In Paigahs and Jagirdars areas the reporting of epidemic disease is unsatisfactory.

In the City of Hyderabad the Birth-rate per mille was returned as 15.8 and the Death-rate as 17.3 compared with 18.9 and 15.4 respectively last year. The Birth-rate for Hyderabad City is too low when compared with the accepted average Birth-rate of 35 in British India. The Public Health Department have no control over the Municipal Registration Department.

The figures of Births and Deaths as now reported are given in the usual form in Statements Nos. P.H. 7, 8 and 9 and are of no statistical value.

5. *General Sanitary Condition of the State.*—Executive authority regarding public health, in the district towns and villages, is in the hands of District Boards. The Officers of the Public Health Department are represented on each Board. Inspecting Officers of the Department have the privilege of addressing the District Boards on sanitary matters, but the Health Department's functions are purely advisory.

In the larger towns there is considerable sanitary progress. Many of the district towns have been provided with a pure water-supply and efficient surface drainage under the orders of the Water Board. All such schemes are only considered by the Board with the written opinion of the Director of Public Health.

The provision of model markets, slaughter houses and improvement in conservancy in all the larger towns has produced definite benefits.

Apart from the staff of the Public Health Department each District Board employs a qualified Health Inspector who reports to the Board through the District Health Officer, and there is excellent co-operation between the Revenue and Public Health Departments.

In the villages, improved conditions are not so marked, but in a considerable number of villages modern ideas of sanitation have been introduced and the co-operation of the people secured. Each such village becomes a stimulus and an example to other villages and there are signs that health consciousness is gradually awakening.

There is a "Village Improvement Association" which has produced good results in the villages of the Medak district. The Association works in co-operation with the Government Development Centre, and with the Public Health Department.

All candidates for the Hyderabad Civil Service are during their training given a course of lectures on sanitation and on the causes and control of epidemic diseases. This has resulted in a steady stream of capable young officers joining the executive whose sympathies have been aroused and who realise the best methods in which help can be given in improving sanitation and checking epidemics. The result of this policy is already evident in the towns and many of the villages.

The schemes of water-supply and surface drainage under the Water Board are nearing completion in Nanded and Warangal. Schemes for every important town have been prepared and are being taken up in the order of urgency.

All new buildings constructed in towns are carefully scrutinized by the Revenue Department in accordance with the Building Regulations which were sanctioned by Government on the recommendation of the Health Department.

All town planning schemes are now sent to the Public Health Department for technical opinion and advice before adoption. Several town improvement schemes and labour colonies are being taken up by the Revenue Department.

The reorganization and enlargement of the Public Health Service which came into force 3 years ago gives a larger personnel for the management of each district. Any area threatened by a serious outbreak of epidemic disease can be assisted by drafting personnel from other districts, but a larger staff is still absolutely necessary.

Two special departments one for Plague and one for Malaria have been working with marked success in Hyderabad City under the Public Health Department.

Full use is made of all ordinary forms of propaganda. The Cinema Car travels throughout the Dominions showing films on plague, cholera, malaria and leprosy. A Loud Speaker is provided and each film is explained by a lecture in the local language. Active propaganda has definitely stimulated public interest in the prevention of diseases and created a demand for assistance which strains the resources of the Public Health Department.

In Hyderabad City general sanitation and conservancy remained under the control of the Municipal Corporation. There is evidence that expert advice is required in these matters.

The City Improvement Board have done wonderful work in improving the City up to the limits of the funds available. Unfortunately fresh slum areas grow up as rapidly as old areas are cleared. Suggestions to overcome these difficulties have been made. Strong action to induce landlords to recognize their responsibilities seems to be indicated.

6. *City Improvement Board.*—There is a very strong committee known as the "City Improvement Board" with Walashan Major-General, Sahebzada Nawab Moazam Jah Bahadur as President. On this Board are represented the Finance Department, the Revenue Department, the Medical and Public Health Department and others. The Board includes non-officials and has special relationship with Government which facilitates the disposal of business.

Progress with the hygienic and æsthetic improvement of the City is going on. The City Improvement Board is active, clearing congested and unhealthy areas, building model dwellings, making roads, and providing other civic amenities. This laudable work has definitely improved the health of the Hyderabad City.

By a recent decision of the Board every model dwelling built is to be provided with a water connection and a flush system of sanitation connected to the town sewers.

But a large part of the City still remains to be attended to. It is therefore of vital importance that the rehousing campaign should be accelerated to the greatest possible extent and the question of slum clearance and slum prevention should be taken in hand. A definite policy based on scientific principles should be adopted, and enforced rigidly. If every model house built by the City Improvement Board were sold outright and the proceeds used to build another, active and continuous progress could be made. The present system of dependence on sporadic Government grants and on income from a hire purchase system is too slow to meet the urgent demand for improvement in housing conditions.

7. *Sanitary Control of the Air Traffic.*—An aerodrome has been established in Hyderabad with direct communications with Madras and Bombay. Other aerodromes are proposed to be established in the Mofussil and the traffic by air is increasing. So far no Public Health Staff has been appointed for the aerodrome, no aeroplanes coming from the continents of Africa or America call at this aerodrome at present and the risk of yellow fever being introduced into this state by means of air traffic is not great. The appointment of a Medical Officer of Health with special knowledge of anti-malarial and anti-mosquito work with sufficient staff is urgently needed. This has been brought to the attention of Government.

8. *Railways.*—The major part of the line is worked by the Nizam's State Railway. The Medical and Public Health administration being under the management of a Chief Medical Officer.

9. *Water-Supply in Hyderabad City.*—The undermentioned Major works were receiving the attention of the Hyderabad Water Works Department during the year :—

- (1) Improving distribution system in the Chanchelguda High-level zone.
- (2) Providing pumping station and elevated tank for the above.
- (3) Changing media in Mir Alam Filter Beds.
- (4) Connecting public standposts with Drainage Sewers.

- (5) Special Survey work of remodelling the City area.
- (6) Constructing Road boxes on cement roads.
- (7) Land was acquired for the proposed New Red Hills Reservoir.
- (8) Remodelling Water-supply scheme at a cost of 15.5 lakhs.

The additional filters of the Candys' type at Asafnagar have been completed and are functioning satisfactorily.

10. *District Water-Supply and Drainage.*—The District Water Works Department continue to manage the following completed systems of protected water-supplies :—

1. Jalna Water Works.
2. Aurangabad Water Works.
3. Latur Water Works.
4. Raichur Water Works.
5. Gulbarga Water Works.
6. Nanded Water Works.

All the above Water-supply schemes were running in perfect order except Gulbarga. The source of water-supply for this town is Bhosga tank which dried up owing to failure of the South-West monsoon. As a temporary measure water had to be pumped to the Distribution System from some of the wells in the town. A comprehensive scheme of taking water from the River Bheema has been sanctioned.

The Manvi Water Works completed last year is under the management of the District Board, Raichur.

The following works were under construction during the year.

(a) *Warangal Water Works.*—Water is to be supplied to the town by gravity from Dharmasagar tank situated about 7 miles from the town. The water from the tank is led through a pressure conduit in the purification plant. After filtration and sterilization by means of Mechanical Filters and chlorination, water is led to the two Service Reservoirs in Hanamkonda and Mutwada and then distributed to the town through Cast Iron Pipes.

The work is progressing satisfactorily.

(b) *Warangal Surface Drainage Scheme.*—The construction of drains in Hanamkonda locality is complete and Mutwada will be taken up shortly. Side by side with the construction of the drains, the surfacing of roads and gullies is being improved.

(c) *Sedam Water Works.*—The scheme aims at utilising the water of the river Kamalavaty (a tributary of Kanga) which runs close to the town, by sinking an Infiltration Gallery in the river-bed. The water from the gallery after chlorination is pumped into a balancing tank and distributed in Cast-iron Pipes.

The scheme is mainly a standpost system. But 150 private connections are to be given.

This is the second scheme of this type constructed for a minor town by the District Water Works Department, the first being at Manvi in the Raichur district.

11. *Public Health and Sanitation.*—In 1913 a scheme for the establishment of the Public Health Department as a separate service was sanctioned by H.E.H. the Nizam's Government.

Before the inauguration of the Public Health Service the sanitary condition of the districts was anything but satisfactory.

In 1934 the Public Health Service was completely reorganized with the main object of improving the general sanitary conditions not only of the towns, but of the rural areas, and special attention was devoted to the prevention and control of epidemic disease. The reorganization and increase of staff has rendered the Health Service readily available in areas threatened by outbreaks of epidemic disease. Valuable results have been achieved. It is reasonable to hope that Government will make this scheme permanent and extend it. At present the sanction is only for a temporary scheme.

12. *Health and Medical Services.*—The Public Health organization is in the hands of the Director, Medical and Public Department, who is also the Plague Commissioner for the City and Suburbs of Hyderabad and adviser to the Government in all major schemes connected with sanitation and rural uplift. He is also adviser to the District Water Board, Ex-Officio Member of the City Improvement Board, Inspecting Officer regarding Urban and Rural sanitation, and General Secretary, Hyderabad Central Ambulance Board. He is assisted by the Deputy Director of Public Health in the Public Health Section, and by a Deputy Director of Medical Services on the Medical side.

In the 15 districts he is assisted by 15 Civil Surgeons who are also the District Health Officers. Each District Health Officer is assisted on the Public Health side by an Assistant Health Officer of the rank of Assistant Surgeon, generally with a qualification in Public Health and by a staff entirely devoted to Public Health as distinct from curative medicine.

The activities of the health organization include :—

1. Prevention and control of epidemic diseases, surveys and control of Malaria, Leprosy, Yaws, Guinea-Worm and Filariasis.
2. Constant observation of the health of the population and reports of prevalence of sickness.
3. Inspection and advice regarding sanitary conditions in Urban and Rural areas.
4. The preparation of Codes and Rules adopted to the special sanitary requirements.
5. The enforcement of sanitary rules and regulations.
6. The submission to Government of schemes for carrying on and improving the sanitary administration.
7. Technical advice regarding Town Planning, Buildings, Drainage and Water-supplies.
8. Infant Welfare Work.

9. Medical Inspection of School Children.
10. Activities under the Children Protection Act.
11. Propaganda.

The Health Department's duty is general supervision and control of the sanitary services throughout the Dominions. The administration is left in the hands of the Revenue Officials (Taluqdars and Tahsildars). These officers are assisted by District and Taluq Boards which consist of nominated members by the public with the District Health Officer (Civil Surgeon), the Executive Engineer, and the Superintendent of Police as official members. Each District Board employs a qualified Health Inspector who reports to the Board through the District Health Officer.

13. *Personnel.*—In the Public Health Department under the Director the staff consists of a Deputy Director of Public Health, 15 District Health Officers, 16 Assistant Health Officers, 17 Health Inspectors, 58 Health Sub-Inspectors, 15 Deputy Inspectors of Vaccination, 131 Vaccinators, one Special Plague Officer with 3 Assistant Surgeons and 3 Sub-Assistant Surgeons, 8 Health Inspectors and 15 Sub-Inspectors and Health Camp Staff consisting 1 Overseer and 2 Sub-Overseers; one Chief Malaria Officer with one Assistant Surgeon, 2 Sub-Assistant Surgeons and 10 Health Sub-Inspectors. The 15 District Health Officers are also District Civil Surgeons; all the remainder are employed in Public Health Duties only. 4 Infant Welfare Centres are at work and 3 more are sanctioned, each is under a fully trained Health Visitor. One or more Government Dai is employed in every Taluq.

The staff is small in proportion to the population. Gradual expansion is in progress. At present the available grants do not permit expansion. With careful distribution and supervision excellent results are being obtained. The strain on the existing personnel is heavy and should be relieved.

14. *Health, Curative and Preventive Activities.*—Steps are taken to penetrate all areas on medical, surgical and prophylactic work. In the district there is a District Central Hospital with a chain of dependent dispensaries in rural areas. In the Public Health Service, the District Health Officer is in charge of the whole district; his Assistant Health Officer is a qualified man, holding a diploma of D.P.H., or D.T.M., who tours constantly and checks the work of the subordinate staff. The whole is supervised by the District Health Officer, who is ordered to tour regularly throughout his district controlling and inspecting the work of the health staff, making proposals for the improvement of water-supply, drainage and sanitation. He is responsible for the control of epidemic diseases and measures of prevention including vaccination.

The whole work of the Dominions is checked and inspected by the Deputy Director of Public Health. He tours freely and regularly throughout the Dominions with a view to co-ordinate activities and keep in personal touch with officials of other departments. He gives advice on sanitary schemes, inspecting the work actually in progress and generally giving practical

effect to knowledge and experience acquired in different districts. He submits his reports to the Director, Medical and Public Health Department and works under his guidance and orders.

15. *Frontier Village Public Health Committee*.—A "Frontier Village Public Health Committee" has been inaugurated to administer health matters in the areas around Hyderabad City, to improve the sanitary administration and prevent epidemics, and specially to protect Hyderabad and Secunderabad from infection. For want of funds regular work could not be started. But preventive work against epidemic diseases has been undertaken with good results.

16. *Guinea-Worm*.—The number of cases treated in the different districts by various hospitals and dispensaries is as follows :—

Hyderabad City and Suburbs	..	..	42
Gulbarga	..	..	583
Osmanabad	..	..	470
Parbhani	..	..	301
Bir	..	..	274
Aurangabad	..	..	158
Nanded	..	..	214
Bidar	..	..	130
Raichur	..	..	92
Mahboobnagar	..	..	89
Nalgonda	..	..	48
Nizamabad	..	..	61
Medak	..	..	10
Warangal	..	..	4
Karimnagar	..	..	4
Asifabad	..	..	4
			<hr/>
		Total	.. 2,484
			<hr/>

The number of cases treated in a hospital does neither give the extent of the prevalence of the disease nor its severity as compared between districts. The disease may be prevalent where there is no dispensary, also the habit of resorting for treatment of guinea-worm to the village barber is hard to eradicate.

Guinea-worm surveys of Osmanabad, Bir and Gulbarga districts were carried out by the department. All the three surveys showed that these districts are heavily infected, the case rate ranging in some place as high as 155 per mille. The changing of the existing step-wells into draw-wells and the sinking of new draw-wells has reduced the incidence of the guinea-worm disease in the district of Raichur and in a few taluqs of the district of Gulbarga. The work has been started in the district of Osmanabad. The amount of suffering and disability entailed by this crippling disease fully justifies considerable expenditure in adopting preventive measures.

The work of replacement of all step-wells and other unsatisfactory sources of drinking water by standard design draw-wells can only be effective gradually. These permanent measures are essential if the disease is to be completely eradicated. In the meanwhile temporary measures are being adopted by this department to eradicate cyclops from all wells in the infected area by regular monthly disinfection with lime (60 grs. per gallon). Such a proceeding produces immediate effects and can be continued until good draw-wells have been supplied.

The Guinea-worm survey reports of the three districts mentioned have been forwarded to the Revenue Department for consideration when deciding the programme of the Well Sinking Department.

17. *Filariasis*.—This infection is chiefly present in the districts of Mahboobnagar, Medak, Nizamabad and Asifabad. With the exception of the town of Narayanpet, Dubak and Yellareddi and its neighbourhood, no regular surveys have been indicated. Anti-mosquito work in the town of Narayanpet and Dubak is being continued with great advantage. In the district of Nizamabad, Kamareddi and Armoor Taluqs are infected. *Culex* mosquitoes, the intermediate hosts of this disease, appear to have a short range of flight, as the infection persists in certain villages, while the neighbouring villages remain free.

18. *Chief Causes of Mortality*.—Deaths from all diseases recorded during the year were 126,089. Strange to say, this number is exactly the same as that of the last year. The death-rate works out as 8.9 per mille. This indicates that not more than one death in every three is recorded by the village officials. Defective as they are the recorded mortality figures may in a limited field be used for arriving at certain conclusions. Assuming that the percentage of error is fairly constant for a number of years, the figures can be compared and show an epidemiological picture of important diseases such as plague, cholera and small-pox without much distortion.

The following table shows that the year has been a comparatively quiescent period with regard to two of the three principal diseases, plague and small-pox. Cholera, however, is still taking a heavy toll, the cause may safely be attributed to increasing water scarcity in many districts.

*Table showing mortality from plague, cholera and small-pox in H.E.H. the Nizam's Dominions for the last 5 years (1342 F. to 1346 F.).*

Year	Deaths from *plague	Deaths from *cholera	Deaths from small-pox	Total
1342 F. .. ..	8,749	4,291	1,041	14,081
1343 F. .. ..	14,671	4,260	8,712	27,643
1344 F. .. ..	4,160	8,622	8,825	21,607
1345 F. .. ..	2,397	11,095	1,166	14,658
1346 F. .. ..	2,145	9,548	245	11,938
Total .. ..	32,122	37,816	19,989	89,927

\*These figures have been submitted after careful scrutiny by the District Health Officers and can be taken as fairly accurate.

(a) *Plague*.—1346 F. opened with plague epidemics in the district of Osmanabad, Bidar, Atraf-e-balda and Medak. A few cases were also occurring in the City of Hyderabad and its Suburbs. All these were in continuation of the previous year's epidemic.

The deaths registered from this cause during the year were 2,145 against 2,397 in the previous year.

The attached table gives the deaths recorded as due to plague in each district compared with the previous ten-year average.

Intensive anti-plague propaganda has been beneficial. Plague in villages usually commences in the monsoon when evacuation into huts is particularly difficult and uncomfortable. However evacuation of the infected houses is now more readily agreed to; sometimes the poverty of the people and insufficiency of hutting materials locally are real difficulties and assistance from the Revenue and Local Fund officials is necessary.

Anti-plague inoculation is definitely popular. 245,550 inoculations were performed against 201,425 during 1345 F. Table below shows the reduction of plague incidence throughout the Dominions within the last 10 years. There is still great difficulty in convincing the people of the real danger of entertaining their friends and relatives from infected areas. The main cause of the maintenance of plague is to the number of "jagir" and "paigah" villages, over which the Public Health Department has no control. There is little or no Public Health Staff appointed by the authorities in these villages and if employed the staff is unqualified, meagre, inefficient and not well supervised. Cases are not wanting where the Government Health Staff visiting these villages for prevention and control of epidemics, meet active opposition from the local jagir officials. Until this is remedied and the Public Health Administration of all areas is placed directly under the Public Health Department, it will remain impossible to prevent epidemics occurring and spreading from these uncontrolled villages neighbouring Diwani areas.

Details about the plague epidemic in the City of Hyderabad and the anti-plague measures carried out are given elsewhere in this report.

Special anti-plague campaigns have been undertaken in the following endemic areas :—

1. Kallam in Osmanabad district.
2. Osmanabad District Headquarters.
3. Latur.
4. Sadasivpet.
5. Pargi.
6. Bidar.

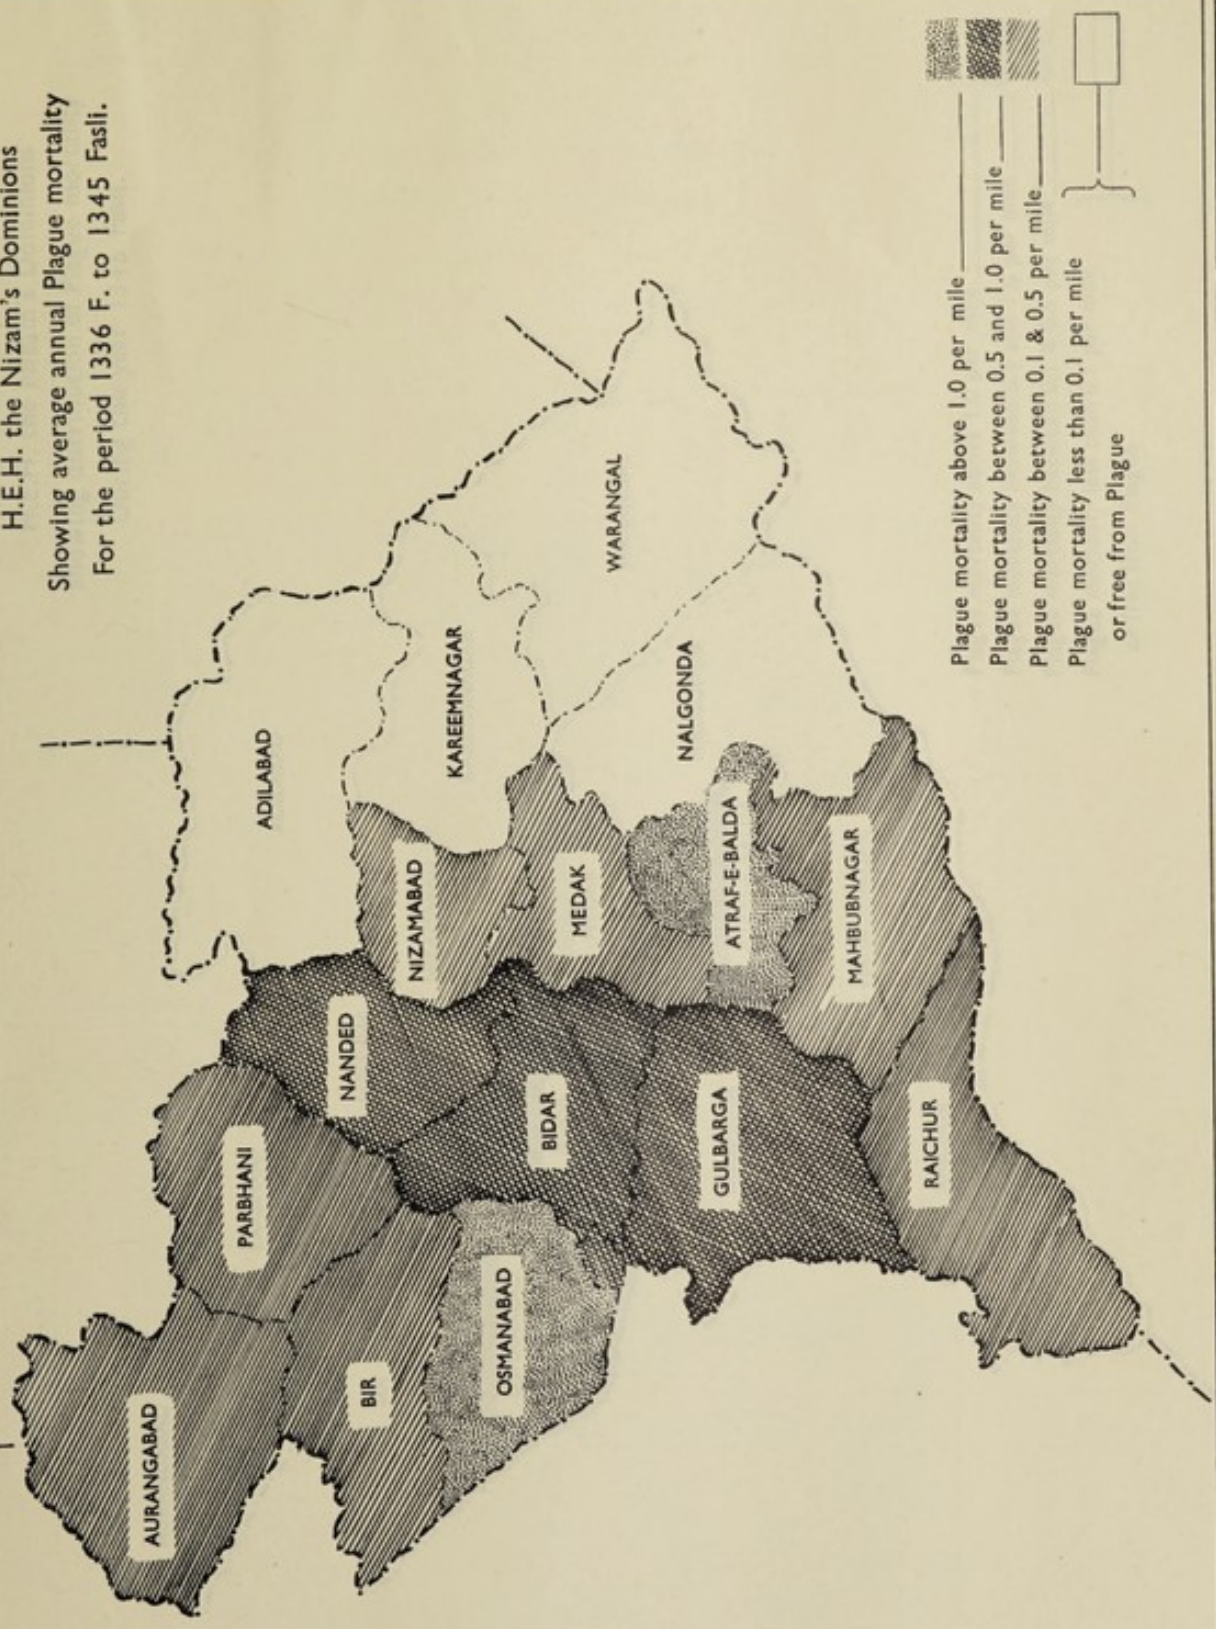

[Statement.]

(b) *Cholera*.—The cause of cholera is always a polluted water-supply. With a protected and ample supply of water, epidemics of cholera do not occur. Once an epidemic has broken out, the proportion of cases will increase by insufficient isolation of patients, contamination of foodstuff by flies and the most important of all by delay in the disinfection of the infected wells and rivers. Cholera has been well controlled, whenever reports have reached the District Health Officer promptly.

Cholera outbreaks of a severe nature occur periodically in relationship with periods of deficient rainfall. After the year 1339 F., when more than 15,000 deaths from cholera were recorded, 1345 F. and 1346 F. were epidemic years. These two years have accounted for 11,095 and 9,548 deaths. The cholera mortality rate ranged from 1.2 per mille in Gulbarga district to 0.1 in Medak district. Hyderabad City and Suburbs as usual remained free from any indigenous infection.

As seen from the map and the statement below, no district has remained free from cholera, though the brunt of infection was borne by the Western districts. These are the districts through which the river Godavari and some of its important tributaries flow. Important religious fairs are held at Tuljapur, Patan and Malegaon in these districts. Some of the biggest Hindu pilgrimages (Palkies) to and from Pandharpur also pass through these districts. These factors along with the shortage of water-supply produce conditions favourable for the spread of cholera epidemics.

Table showing cholera mortality in 1346 Fasli in H.E.H. the Nizam's Dominions.

District.	Number of deaths from cholera.	Rate per mille.
Atraf-e-balda including		
Hyderabad City ..	230	0.2
Warangal ..	609	0.5
Karimnagar ..	365	0.3
Asifabad ..	189	0.2
Medak ..	68	0.1
Nizamabad ..	510	0.8
Mahboobnagar ..	840	0.9
Nalgonda ..	765	0.7
Aurangabad ..	727	0.8
Bir ..	414	0.6
Nanded ..	632	0.9
Parbhani ..	563	0.6
Gulbarga ..	1,481	1.2
Osmanabad ..	688	1.0
Raichur ..	886	0.9
Bidar ..	581	0.7
Total ..	9,548	0.7

Attendance of people from infected villages at religious festivals and migration from infected to non-infected places generally leads to pollution of wells, rivers and canals over a wide area. It is at places where jattras and uruses are held, without the knowledge or the sanction of this department, and consequently where no proper arrangements could be made, that outbreaks occurred and spread widely.

The disinfection of wells by potassium permanganate is appreciated and in many villages cholera is promptly arrested by this measure alone. The method of disinfecting rivers and canals against cholera infection by copper sulphate has been fully tried out and has proved efficient in the field.

Prompt co-operation of the Revenue officials with the Public Health Department can readily arrest an epidemic of cholera. This has been well instanced this year in Warangal town. Here a sudden outbreak causing a hundred deaths in three days in the month of Amerdad 1346 Fasli, was immediately brought under control by the District Health Officer with the active help and co-operation of the First Taluqdar, Mr. Rahmatullah Shareef.

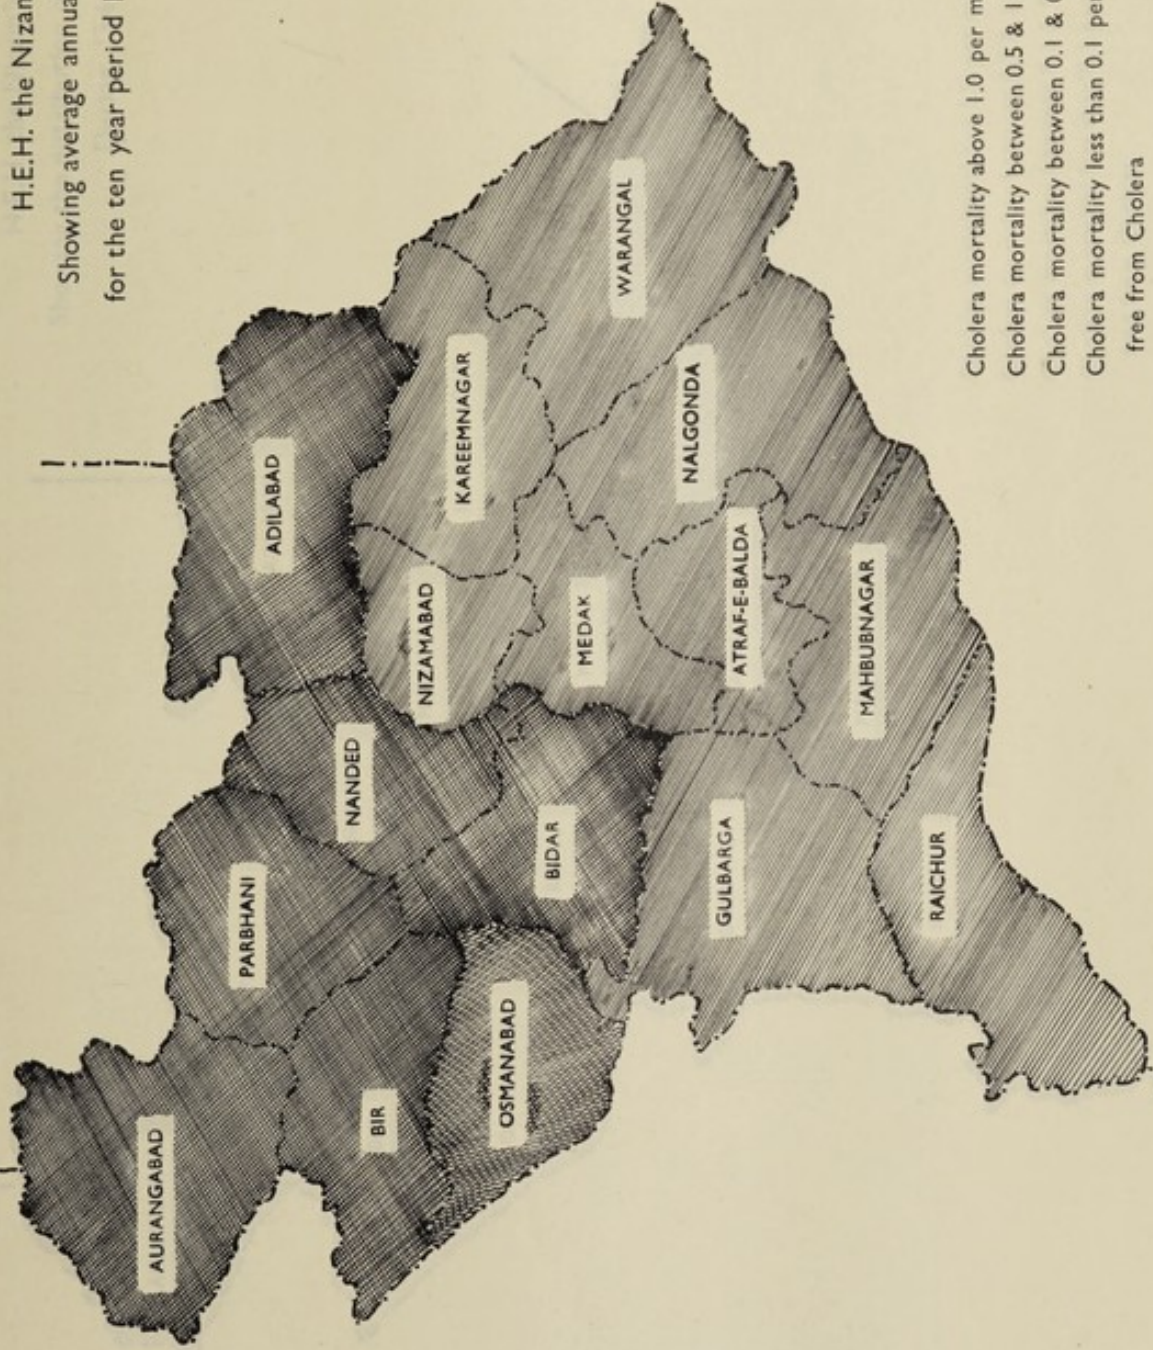

Inoculation against cholera is used for individual protection with good results. 153,977 anti-cholera inoculations were performed this year as against 86,654 during 1345 Fasli. This year the Bombay Public Health Department were unable to bear expenditure on inoculating intending pilgrims against cholera. Centres were established during the month of Shehrewar at Latur in Osmanabad, Parli in Bir and Koregaon in Parbhani districts, and all pilgrims passing these Centres were inoculated free of cost.

Rate per mille	Number of deaths from cholera	District
2.0	282	Hyderabad City
3.0	608	Warangal

During 1946 P.

(c) *Small-pox*.—After the severe epidemics during 1343 F. and 1344 F. the last two have been years of comparative quiescence. In 1346 F. there were 245 deaths reported from small-pox against 1,166 in the preceding year. Osmanabad again leads in this respect with 344 attacks and 83 deaths. The largest number of attacks occurred during the months of Isfandar, Farwardi, Ardibehisht with a recrudescence in the month of Thir. (See tables and charts below). Most of the cases occurred among the unprotected persons. The number of vaccinations carried out this year was, 377,084 see part VI of this report. Vaccinators work is supervised by all the Public Health Staff, and Health Sub-Inspectors also vaccinate correcting any omissions by regular vaccinators. The Deputy Inspectors of Vaccination's work in general has not been very satisfactory. It is proposed to merge this class into that of Health Inspectors.

The arm to arm vaccination from small-pox cases is still reported to occur in jungle areas in Warangal district. It is very difficult to detect these inoculators and the existing rules and regulations regarding vaccination do not give powers to prevent this dangerous practice. A draft act giving powers to check this small-pox inoculation and to make vaccination compulsory up to 12 years of age has been submitted to Government.

Table showing small-pox mortality during 1346 F. as compared to the annual average small-pox mortality for the last ten years (1336 F. to 1345 F.).

Total ..	24,459	2,446	0.2	245	0.0

(d) *Fevers*.—The number of deaths reported as being caused by fevers in 1346 F. was 83,896. As stated before the number is a gross underestimate. "Fevers" account for nearly 66 per cent. of the total deaths reported. The rate was high in the districts of Bir, Nizamabad, Asifabad, Atraf-e-balda, Medak, Aurangabad, Nanded and Gulbarga. It was lowest in Hyderabad City and Suburbs (3.8 per mille) and in Bidar district. In the term "Fevers" village police patels include such diseases as malaria, enteric fever, pneumonia, remittent fevers, influenza and even phthisis. Assuming that even  $\frac{1}{3}$  of these deaths are due to malaria, the havoc caused by malaria may be roughly gauged in rural areas. It is interesting to note that where large irrigation projects have been undertaken, the Death-rate from "Fevers" is high. This indicates the high incidence of malaria in irrigated areas. Anti-malaria operations on a large scale have on the other hand been followed by the reporting of a very low figure of "Deaths from fevers" in the City of Hyderabad.

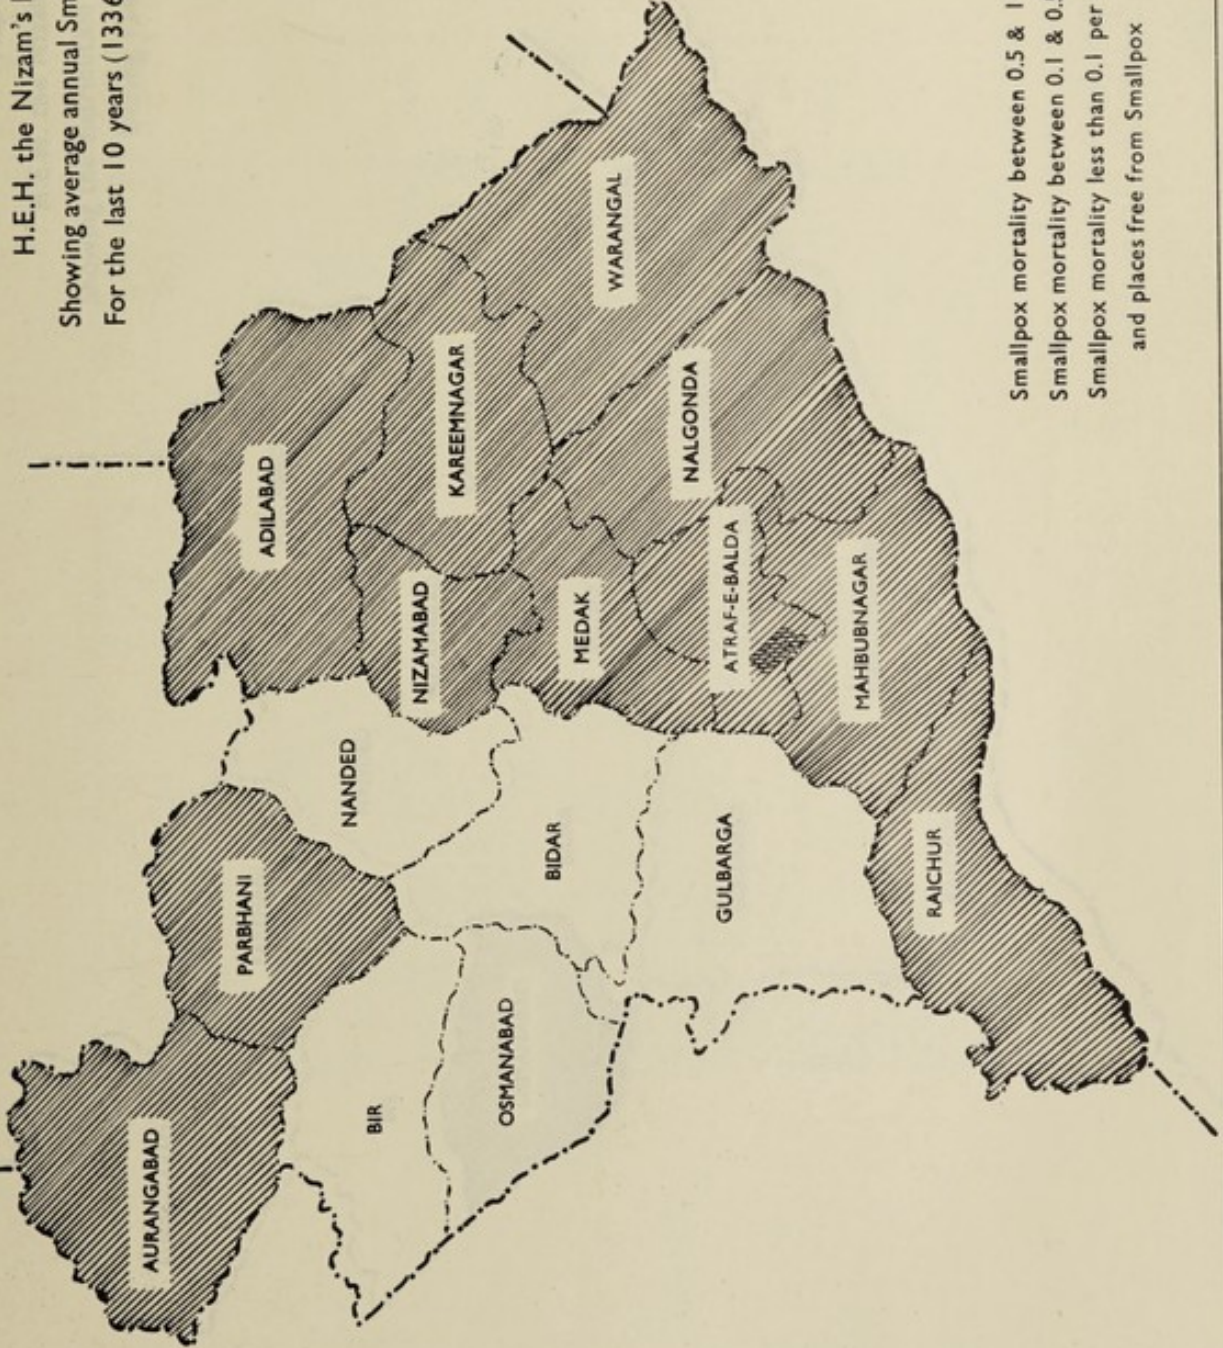

The following table shows the comparative statement of cases treated as "Malaria" in the various Hospitals and Dispensaries during the years 1345 and 1346 Fasli.

Districts.	Cases treated as "Malaria"	
	1345 F.	1346 F.
Warangal ..	17,388	16,892
Karimnagar ..	9,651	9,522
Asifabad ..	14,325	17,465
Medak ..	5,716	4,745

Total ..	<u>240,322</u>	<u>193,194</u>

In spite of an increase in general attendance there has been an appreciable reduction in the number of cases treated as malaria in the various hospitals and dispensaries in the State. The only exception to this is the Asifabad district where there has been a rise in the "Fever" cases. The reduction is very appreciable in the Hyderabad City, and the districts of Raichur, Gulbarga, and Mahboobnagar. It is not possible to compute the proportion of the "Fever" cases that are really due to "Malaria."

Anti-malarial work in Hyderabad City is described in a special section of this Report.

 During 1946 F.

## MALARIA SURVEYS AND ANTI-MALARIA CAMPAIGNS.

1. *Nizamabad*.—A malaria survey was carried out along Nizamsagar canal and its distributaries. The survey lasted for nearly six months and brought out the fact that the main breeding places are the irrigation canals, tanks, wells and rice fields. Sugar-cane fields were found to be free from mosquito breeding. Important carrier species found were *A. culicifacies*, *A. stephensi* and *A. minimus*. Splenic index varied from 1.4 to 39.4 in different villages. The presence of dangerous species of carriers in the district and the high splenic index make it probable that unless suitable action is taken immediately, malaria of a serious nature might spread throughout the district. A permanent scheme of anti-malarial operations is before the Government for sanction.

2. *Mahboobnagar*.—The anti-malaria campaign started previously in Lingal and Narayanpet has been continued this year. As a result the incidence of malaria has been reduced to one-half in Narayanpet. The local dispensary treated 2,027 as against 5,048 in the preceding year. The campaign started in Lingal towards the close of 1345 F. continued with full vigour with the co-operation of the Settlement officials and was combined with free distribution of quinine to school children. The splenic index has been reduced from 43.6 to 12.3. In the sub-settlements where this distribution of quinine could not be arranged the improvement was not satisfactory.

3. *Warangal*.—An anti-malarial campaign was carried out in the village of Salvoy with the help of the villagers, under a Sub-Assistant Surgeon.

4. *Bidar*.—The work is still under observation in Khanapur. The results of permanent drainage has been very satisfactory.

5. *Medak*.—Anti-mosquito work started last year in Dubak, where both malaria and filariasis are common, is still continuing. Suitable drains have been constructed in Dubak village and all cess pits have been closed. The surrounding villages also are being drained. This scheme sanctioned for only one year was extended for another year. It will be necessary to continue regular work for at least another five years if the whole area is to be brought under control both with regard to malaria and filariasis.

6. *Raichur District*.—(a) In Raichur town an anti-malaria campaign was started from 29th Farwardi 1346 F., with a small staff of five Local Fund kamaties under the supervision of the Raichur vaccinator, who was specially trained by the District Health Officer for this work. A small sum of Rs. 200 was sanctioned for purchase of larvacides. A small increase in staff and money has been sanctioned for next year from the epidemic grant, the Local Fund Department continuing their contribution. The result of this work is a marked reduction of malaria in Raichur town.

(b) A small scheme costing Rs. 804 per annum has been sanctioned for Anagundi Samasthan. The Compounder of the

Samasthan was trained in anti-malaria field work and the work is to commence from Azur 1347 F.

7. *Asifabad District*.—During the year anti-malaria campaigns were started in the taluqs of Rajura, Manickgarh and Utnoor. In both these places schemes are working fairly satisfactorily. With regard to Utnoor and the surrounding hamlets it is advisable that the following steps should be taken.

1. The inhabitants of seven hamlets be made to construct a new village to the East of the village of Utnoor on the highland on the road to Bapsaipet.
2. That at least half a mile of the forest area around the village of Utnoor should be cleared.
3. The tanks, Gopayya, Narsayya and Saraswati should be breached.

(e) *Respiratory Diseases*.—According to the registered reports 1,215 deaths were caused from these diseases as against 203 in the previous year.

(f) *Dysentery and Diarrhoea*.—2,692 deaths are reported against 2,438 during the previous year.

(g) *Injuries*.—2,685 deaths were reported from injuries during the year against 3,564 in the year 1345 Fasli.

(h) *Cerebro-spinal Fever*.—There were only six cases of cerebro-spinal fever with five deaths reported during the year. All these were from Hyderabad City.

Causes other than those mentioned above accounted for 20,598 deaths as against 18,944 in the preceding year.

19. *Yaws*.—This disease, commonly known to be present in the hill tracts of Burma and Assam and also in parts of Ceylon, was first suspected to be present in the Warangal district six years ago by the then Assistant Health Officer of that district. However his opinion could not be confirmed till the Deputy Director of Public Health visited these areas during the early part of this year and succeeded in finding *Sp. pertenuis* in smears taken from the non-suppurating cases. Further investigations revealed the fact that this disease not only exists but is fairly widespread in the Eastern parts of Warangal district. Special surveys carried out by the Assistant Health Officers of Karimnagar and Asifabad districts under the direct supervision of the Deputy Director of Public Health, revealed that the disease was also widely prevalent in all taluqs of Asifabad district, and the Manthani taluq in Karimnagar district. The disease was chiefly prevalent among aboriginal tribes such as Koyas, Gonds and Mannepores. The disease, accordingly, is known locally as Koya rogum, Gondi rogum, or Manne rogum. On account of the wide prevalence of this disease together with Malaria, the Revenue Department has been advised to postpone the colonization scheme of Utnoor for some time. Many cases were treated with advantage by the Assistant Health Officers of the districts and some by the Medical Officer in charge of the Taluq Dispensaries. A scheme has been submitted to the Government for carrying on an intensive treatment campaign in the affected areas and as soon as the sanction is obtained the campaign will commence. It

is hoped that when the existing cases are cured, the spread of infection will be stopped. Investigations have shown that this disease is spread by direct contagion. Some authorities have supposed that infection may be carried by eye-flies. The local people accuse red-ants. Laboratory and field investigations leave us convinced that infection is only by direct contagion.

The results of surveys and investigation originally carried out by the Deputy Director and two Assistant Health Officers showing the various clinical and the epidemiological features of Yaws observed in the Dominions have been published in the Indian Medical Gazette Vol. LXXI, No. 6th June 1936, page 322.

The life history of a local species of eye-fly has been worked out and recorded by the Chief Malaria Officer. His paper on the subject has been published in the Indian Medical Gazette. This is a valuable piece of original work.

#### 20. MEASURES FOR COMBATING CERTAIN DISEASES IN RURAL AREAS.

(i) *Malaria*.—The work done in Hyderabad City is dealt with separately. The aim is to break the cycle of infection in two ways by the destruction of mosquito larvae and by attacks on the parasites in man. Both methods are used extensively, the former being preferred as giving more certain results. The conditions and causes underlying the prevalence of malaria vary in different parts of the Dominions and no one anti-malarial measure is suitable for all.

In anti-larval operations, it may be almost impossible to abolish all breeding grounds. A marked improvement in health follows when the more important breeding grounds of malaria carrying mosquitoes are controlled.

Careful surveys are of the utmost importance and reveal important factors, on which anti-larvae operations are organized. House to house distribution of Plasmoquin was tried in an attempt to sterilize the carriers the results were disappointing. The incidence of malaria showed no great reduction and the curative effect was negligible. Better results are to be expected in dealing with the inmates of an institution under discipline but the method is unsatisfactory among the general population. Efforts are made to educate the public in the use of quinine, and the sale of quinine by Post Offices and Thanas in districts is encouraged. Free quinine is given at the dispensaries and hospitals and also by touring officers and during anti-malaria campaigns.

Permanent clearing of waterways is important; activities in this direction include training and straightening of banks, clearing of hyacinth and water weeds and stocking with larvaecidal fish.

(ii) *Plague*.—Hyderabad City and many of the districts have been subject to recurring epidemics of plague. Each epidemic lasts about 9 months disappearing with the onset of the hot dry season. A Special Plague Department was inaugurated some six years ago to combat the epidemic in the City of Hyderabad. The work done in Hyderabad City is dealt with separately. Surveys have been made in the districts and it was found that

several "Endemic Centres" existed where plague persisted throughout the year. It was from these centres that recrudescence occurred in the rains and rapidly spread over wide areas. Well directed efforts in rat destruction in the endemic areas have effected a marked reduction of plague.

The methods of rat destruction in use are as follows, and these procedures should be continuous throughout the year.

- (a) the systematic use of poison baits.
- (b) fumigation of all rat-holes with calcid and closing the rat-holes.
- (c) trapping.
- (d) examination of rats for evidence of plague.

During epidemics in addition to these measures evacuation, inoculation and disinfection are carried out, and human migration to non-infected areas is as far as possible controlled.

The conclusions of many years experience are (1) that plague is almost invariably carried from place to place by human agency, that is to say, by infected fleas carried in the personal effects of migrants; and (2) that inoculation is the most important measure of personal protection.

(iii) *Tuberculosis*.—Tuberculosis is very prevalent in Hyderabad City and the larger towns in the Dominions. A very large proportion are cases of Tuberculosis of the lung. The mortality is considerable though no accurate figures are yet available. A survey of tubercular disease in the Dominions is essential.

The main cause of the disease is bad housing that is to say, want of light and ventilation in congested areas. For poor people who adopt the purdah system it is particularly difficult to avoid these fundamental causes of disease. A house once infected becomes a danger to the whole family.

Indian cattle are not commonly infected with tuberculosis and very few Indians drink milk unboiled.

At present the organization to combat tuberculosis is only gradually developing. So far two special outpatient clinics, separate accommodation at the Osmania Hospital and a special section of the Isolation Hospital are used for tuberculosis cases—all supported by Government. The Medical Department has submitted a scheme against Tuberculosis which is being brought into effect. The proposals include an up-to-date sanatorium, a modern Clinic which is a centre for domicillary visiting and propaganda, and a special Tuberculosis Hospital.

There is no separate Tuberculosis service in the Medical and Public Health Administration of Hyderabad State. Doctors have been trained in Great Britain, at Madanpalli Sanatorium in South India, and at the All-India Institute of Public Health and Hygiene.

(iv) *Yaws (Koya disease)* is essentially a tropical disease common in nomadic and aboriginal tribes in many countries. It is found in the jungles of Assam and Ceylon, but was

practically unknown in India. This disease has been found by the Public Health Department to be prevalent in Warangal and part of Mahboobnagar districts, and there is evidence that it has been present for 200 years, though neither recognized nor reported. Investigations are continuing in the Karimnagar and Asifabad districts. Regular treatment is given to patients by the department with most excellent results.

(v) *Guinea-Worm Disease* is widely prevalent in several districts of the Dominions. Experiments were carried out in the laboratory and in the field in the hope of finding some simple measure by which cyclops could be eradicated from wells and "Bowlies." As a result of experiments the use of quicklime which presents many difficulties, has been given up in favour of slaked lime. This has been found to be efficacious in temporarily controlling cyclops in wells, but must be repeated monthly. Medical Officers are instructed to treat systematically infected wells with ordinary bazar lime. Directly cyclops reappear disinfection is repeated and a detailed record is maintained. It is necessary to treat each infected bowli (step-well) once a month until the well can be converted into a draw-well and the people prevented from entering the water. The improvements in some areas has been marked. The Well Sinking Department and in many cases the District Boards are steadily at work transforming dangerous step-wells into draw-wells.

(vi) *Leprosy*.—There is a Mission Leper Home and Hospital at Dichpalli where only applicants amenable to treatment are admitted. The daily average of in-patients is now over 700. There is a small attendance of outpatients. Dichpalli affords an excellent field for the study of early leprosy. A small Grant-in-aid is paid by District Boards and very generous grants are given by the Government.

Courses of instructions in leprosy and its treatment are given at Dichpalli to students and Doctors. Most of the Doctors of the Medical Department have received this special training and in all districts outpatient Leper Clinics are now at work.

#### 21. VILLAGE WELFARE ASSOCIATION, DORNAKAL.

A grant of 500 rupees a year has been given towards this experimental work.

Cholera Relief Work was undertaken in Mahbubabad, Khammameth and Yellandu Taluqs. Twenty-three Medicine Distributors trained by the Association worked in these areas. Wells were disinfected, village streets and houses were cleaned and the public were instructed in the protection of drinking water. The District Health Officer, Warangal supplied a Medical Officer, Health Inspectors and the vaccine needed and 4,522 people were inoculated. In co-operation these health workers with the local Patels and Medicine Distributors of the Association have done preventive and propaganda work during the epidemic. The Association also printed and circulated a song on "Cholera" on coloured papers which has become very popular with the village children.

Health days were celebrated in a Lambadi Thanda and in Mulukalapalli in Singareni Areas.

Twice during the year a doctor has camped in the forest villages of the Yellandu taluq treating patients suffering from Yaws. 73 received treatment by injection.

A set of 11 men were trained during the year as Medicine Distributors. Altogether there are 42 workers trained by the Association selling medicine and doing Health propoganda and Preventive work in the villages. During the year these workers sold simple medicines worth Rs. 105-10-6.

Under the auspices of the Association, a Welfare Centre for women and children was started in Pullur two miles from Dornakal.

## 22. MEDICAL EXAMINATION OF SCHOOL CHILDREN.

(a) *District*.—117 schools were visited in 1346 Fasli by the Civil Surgeons and Taluq Medical Officers, inspecting 41,286 boys and 1,114 girls. The figures include subsequent examinations also.

The abnormalities noticed during Medical Inspections include enlarged tonsils and adenoids, pyorrhœa, scabies, ring-worm, heart-disease, rickets, jaundice and secondary anæmia. Parents of pupils suffering from ordinary ailments received written advice to seek treatment from private practitioners or Government Hospitals. Parents are now realizing the real value of Medical Inspection of schools and are bringing their children to the hospitals for treatment.

The physical condition of the boys is reported to be generally poor and underweight children are noticed in many schools. Sufficient attention must be paid to physical culture.

Many pupils show no enthusiasm for physical exercise. It is hoped that steps will be taken by the Educational Department to encourage well-regulated physical exercises and to organize games. This is vitally important for development, and in order to keep scholars mentally alert and physically fit.

School buildings in most places are still reported to be unsatisfactory being either small or overcrowded. Many schools are still housed in rented and unsuitable buildings.

Nutrition is an important matter which needs the special attention of the authorities concerned.

(b) *City Schools*.—The staff for Medical Inspection of schools remained the same as in the previous year. Two new schools, the Model Primary School for boys and girls and the Normal Training School for women, Kachiguda, were added to the list of schools. Thus bringing 27 institutions under inspection.

19,038 boys and girls were examined during the year as detailed below :—

	First examination	Subsequent examination	RECOMMENDED FOR MEDICAL TREATMENT	
			No.	Percentage
Boys .. ..	4,067	11,811	2,355	14.83
Girls .. ..	649	2,511	321	10.15

The number of boys and girls recommended for correction of eyesight was 552 of whom 52 poor pupils were supplied with spectacles free of cost at the Osmania Hospital.

Three new cases of early leprosy were detected during the year of report among the boys examined and all the three are now under treatment. It is gratifying to note that the student of the Chanchalguda High School who was re-admitted as non-infective last year has improved considerably. He is still continuing treatment at the Karwan Clinic.

One girl and three boys have showed signs of tuberculosis of the lungs and have been advised to consult the T. B. Specialist.

Quite a good number of pupils had undergone operative treatment for enlarged tonsils and have improved in health.

The following percentage of important diseases noticed amongst the boys and girls is of interest:—

Name of diseases.	Percentage	
	Boys.	Girls.
Malnutrition .. ..	8.2	3.1
Undernourished .. ..	18.2	9.8
Enlarged Tonsils and Adenoids .	19.3	12.3
Defective Vision .. ..	10.00	8.8
Other Eye Troubles .. ..	3.2	1.3
Nasal Trouble .. ..	3.42	2.8
Ear Trouble .. ..	5.00	3.2
Teeth and Gums .. ..	25.8	3.9
Pyorrhœa .. ..	2.00	.2
Spinal and Orthopædics .. ..	1.5	Nil.
Skin .. ..	13.00	2.5
Valvular Diseases .. ..	0.5	0.02
Spleen .. ..	0.59	0.03
General Diseases .. ..	4.00	2.00

During the routine Medical Inspections, the Medical Inspector collected statistics of pupils who go without any midday meal and found this number to be 15 per cent. Of these, a few who come from distant places find it inconvenient to bring their own food and find no suitable hotel close by. The majority are actually too poor to afford a midday meal. The Education Authorities should consider ways and means for rectifying this defect.

Of the boys and girls 3 per cent. were found to be unprotected against small-pox and 15 to 20 per cent. were not inoculated against plague.

It is gratifying that pupils are impressed by the advice of the Medical Inspectors; many of them, in accordance with instruction had attended to their clothing, teeth and nails when they returned for Medical Inspection.

A boy pupil at the Kachiguda High School was found to be a Dextracardiac.

The question of malnutrition is engaging the attention of the Department. Real cases of malnutrition were few compared with undernourishment.

Many thin skinny pupils who came up for examination with poor physique were the products of an "Ill-balanced" dietary. Excess of starchy food and want of animal proteins and other protective food factors in their daily meal are the chief defects. Even pupils belonging to the well-to-do class are not free from this condition. The Medical Inspector gave impressive talks to such pupils and recommended a suitable dietary. In this connection, it is pleasing to note that at the Educational Officers' Conference, the Medical Inspector spoke about malnourishment and suggested that some satisfactory provision should be made to give a free milk issue to undernourished pupils. On the recommendation of the Public Health Department, the Director of Public Instruction, asked Government to sanction a suitable grant for supplying milk in two of the City schools, as an experimental measure. In the meantime, an experiment was made at the Urdu Shariff Middle School by supplying skimmed milk powder for a batch of 32 undernourished boys by the Public Health Department. The result is satisfactory in that a gain of weight has been recorded which is in excess of that observed in a similar number of boys as control. The experiment is continuing and definite results will be reported after longer experience.

Improvements have been made in the Darushafa Government High School during the year and a block of new building has been provided for the High School classes. The rest of the Middle Schools and High Schools remain in the same private buildings with poor light and ventilation as pointed out in the last year's Report.

Playgrounds for younger boys is an important matter that needs the special consideration of the Educational Department. Excepting a few, all the High Schools and Middle Schools, are provided with playgrounds situated far away from the respective schools. This arrangement is defective in that such distant playgrounds are not accessible to the younger boys. It is hoped that this will receive the attention of the authorities concerned.

### 23. TRAVELLING DISPENSARIES.

(Statement No. P.H. 10).

There were sixteen Itinerant Dispensaries, in-charge of Assistant Health Officers, one in each district. The number of villages visited aggregated 2,157 compared with 2,121 in the previous year. They were out on tour for 3,384 days. The number of patients treated was 36,436 compared with 39,609 in 1345 Fasli. The number of operations performed was 1,137 of which 159 were Major against 438 operations including 9 Major operations last year. The numbers inoculated were 33,379 against plague, 43,418 against cholera and 685 were vaccinated, compared with 20,564; 33,835 and 994 respectively in the previous year. They disinfected 19,818 wells with potassium permanganate and gave 1,552 health lectures. The total cost of these dispensaries amounted to 81,281-3-10 compared with Rs. 80,174-6-0 in 1345 Fasli.

The details of expenditure were as follows :—

	1346 Fasli.			1345 Fasli.		
Pay of Medical Officers and Staff	61,400	12	7	58,821	15	10
Contingencies .. .. .	2,432	9	10	2,243	6	11
Supplies and Services .. .. .	4,755	7	7	3,840	7	4
Travelling Allowance and Bhatta	12,692	5	10	15,268	7	11
<b>Total .. .. .</b>	<b>81,281</b>	<b>3</b>	<b>10</b>	<b>80,174</b>	<b>6</b>	<b>0</b>

The Assistant Health Officers with their Travelling Dispensaries were on special cholera duty for long periods owing to a virulent and widespread epidemic of cholera during 1346 Fasli. They attended 68 Uruses and Jatras and made effective sanitary arrangements. They have done good work during the cholera season in spite of the great inconvenience caused by inclement weather. They had to be away from headquarters for long periods.

The Assistant Health Officers at Warangal, Asifabad, Karimnagar and Mahboobnagar continued the work of investigation of "Yaws" and treatment of patients in forest areas.

During their tours, Assistant Health Officers inspected the work of the vaccinators in villages and accompanied "Palkies" proceeding to Pandharpur, and did everything possible to safeguard the health of the pilgrims.

#### 24. FAIRS AND FESTIVALS.

(a) *General.*—Necessary sanitary arrangements were made for the comfort and safety of the pilgrims in all Uruses and Jatras by Health Officers in their respective districts. The Revenue and Police Officials co-operated wholeheartedly with the Public Health Department and rendered every possible assistance. Special attention was paid to providing an ample and protected water-supply, to conservancy and the prevention of epidemic diseases. Temporary Sanitary menial staff was appointed for the quick disposal of refuse and the cleaning of the Jatra area regularly twice a day. Separate temporary latrines were provided for males and females. Lighting arrangements were made at important centres. Food in shops, hotels and sweetmeat stalls were examined and articles of diet adulterated or found unfit for human consumption, were either destroyed or prohibited from being sold. Distribution of medicines and treatment was provided for the sick. Lectures and magic lantern shows and talks on Health matters were given by the Assistant Health Officers and Health Inspectors in important fairs and festivals. Isolation sheds were erected outside the Major fair areas for emergency purposes. Cholera outbreak was reported in Deshagiri Sahib Urus and Mailapur Jatra in the Gulbarga district, during the year in spite of all precautions taken by the Public Health Department. But owing to prompt and efficient action taken by the District Health Officer the epidemic was controlled.

(b) *Pattan Jatra*.—One of the most important Jatras in the Dominion is held at Pattan in Aurangabad district where nearly a lakh of people collect from all Central India. Elaborate arrangements were made and purified water was supplied by fixing Centrifugal pumps in the bed of the Godavary river which forms the main source of water-supply. In spite of these arrangements, cholera broke out during the Pattan Jatra and spread over a large portion of the Aurangabad district but prompt and continuous action minimised the outbreak. The reasons attributed by the Health Officer for this outbreak were the untimely rains on the day of the Jatra, too late flooding of the Godavary river and imported infection. The other defects in the general management experienced by the Health Officer during the year were

1. Difficulty of preventing the public from living in and polluting the bed of the river due to want of sufficient police force.
2. Insufficient Revenue Staff.
3. Insufficient grant for essential arrangements.
4. The constant arrival and departure of pilgrims for short periods puts an extra strain on the staff which must be increased in future.

(c) *Bhadrachalam Jatra*.—For the comfort and safety of pilgrims, as usual, five Health Camps were organized by the District Health Officer, between the Railway Station and the river Godavary, at Kothagudam, Paloncha, Kinnersani, Banjar and Gummoor. A well-protected water-supply was provided and the conservancy arrangements were satisfactory. Two Assistant Health Officers, assisted by two Health Inspectors and five Health Sub-Inspectors and other Health Staff, were made responsible for all sanitary arrangements. Public Health lectures were given daily to pilgrims with the help of cinema films. No epidemic was reported during the Jatra.

(d) *Palkies*.—Six palkies pass through the State to Pandharpur in the Bombay Presidency. They return by different routes. These peripatetic palkies are accompanied by thousands of pilgrims. A special Assistant Health Officer was deputed to accompany each palky. He was assisted by the Health Staff of each district through which the palkies pass. A Tahsil peon and police constable from the district followed each palky to assist the Health Staff in carrying out their onerous duties. The Local Revenue and Police Officials assisted the Public Health Staff in controlling the pilgrims. A Health Sub-Inspector was sent ahead to disinfect wells with potassium permanganate along the route of each palky. All persons following palkies were persuaded to get themselves inoculated against cholera. Inoculation Centres were established at the following places :—

1. Kannargaon and Parli in the Parbhani district.
2. Vagrole, Bamboorni and Galla Borgaon in the Aurangabad district.
3. Latur in the Osmanabad district.

The pilgrims were encouraged, wherever possible, to stay outside villages and their feeding arrangements were also effectively supervised. The palkies passed without any epidemic during the year of report.

25. *Health Inspectors*.—There are 17 Health Inspectors, one of each district. There are also three Health Sub-Inspectors for each district, with a leave reserve of 5 at headquarters.

The Health Inspectors visited 1,670 villages and were on tour for 188 days each, on an average during the year. They performed 26,443 inoculations against plague, 23,376 inoculations against cholera and disinfected 16,374 wells. They also gave 1,130 lectures on health subjects and attended 44 fairs and festivals. Other details are given in statement No. P.H. 11.

26. *Health Propaganda*.—No effort is spared to educate the public in health matters.

The Cinema car toured in the districts throughout the Dominions for a period of 123 days and in all 79 shows were given. Besides these, 34 shows were given in Hyderabad City and the frontier villages when the car could not proceed to the districts during the monsoon. The car also could not be sent out during the months from Isfandar to Amerdad 1346 Fasli and after five years work the engine was worn out; a new and powerful chassis has now been purchased and the old body repaired and refitted. The car is now able to tour throughout the year.

The number of persons who attended these lectures is more than three lakhs. Apart from the annual tours, special cinema shows were arranged at Conferences, Health Weeks, Uruses, Jatras, and Fairs. Shows were also given at the Educational Conference at Karimnagar, Rural Mission Conference at Laxetipet, Health Week at Aurangabad, Rural Health Week at Pattancheroo and Andhra Peoples Conference at Shadnagar.

A new film on leprosy has been added to the already existing films on malaria, plague, cholera and small-pox.

The great interest taken by the rural public in attending these shows has compelled the department to purchase two loud-speakers which add much to the value of the lectures.

Besides these cinema shows, now many of the districts are provided with magic lanterns and slides on common diseases such as plague, cholera, small-pox, tuberculosis, etc. District Health Officers and Assistant Health Officers while on tour invariably give lectures accompanied with magic lantern slides.

Health Weeks were held during the course of the year in Aurangabad, Nizamabad, Medak and Warangal. Co-operation of the officials of the other departments as well as the general public made these periodical exhibitions and Health Weeks a great success.

A set of charts and models prepared specially to be used during these shows is available for issue from the Special Plague Office, Hyderabad.

Posters and propaganda materials are prepared, from time to time, by the department and issued to the districts either for free distribution or for use during Health Weeks.

The following table gives the number of lectures, Health Weeks, etc., held in different districts during the course of the year.

With the increase of staff, trained in Public Health work, in the districts, this work is likely to increase in volume in the near future requiring the establishment of a separate Health Propaganda Section.

Table showing the number of Health lectures given, cinema shows and Health Weeks held in different districts during the year 1346 Fasli.

District	Number of health lectures given	Cinema shows	Health weeks and Baby shows held
Aurangabad .. .. .	107	6	1

27. *British Military Manœuvres.*—The Military authorities arranged the usual annual manœuvres and practice camps at various centres in the Dominions during the year of report. The Public Health Staff, in consultation with the Military Medical Officers, concentrated on the manœuvre areas and took all precautions from the Public Health point of view for the safe conduct of Military operations. The protection of the troops against epidemic diseases was very satisfactory, and the concentration in the Military camping area proved a very useful training ground for the Public Health Officials of H.E.H. the Nizam's Government.

28. *Hyderabad Central Ambulance Board.*—During the year 28 "First Aid" classes were held representing 833 candidates, 486 of whom were successful at the examination, 353 certificates were issued by the Hyderabad Central Ambulance Board. 123 candidates were trained in "Minor Sanitation" and all obtained certificates of proficiency.

Classes were held for College and High School Students, Police Constables, Boy Scouts and Girl Guides, Ward Boys, Compounders and Vaccinators. There is now a Branch Centre working at the Headquarters of each district under the Hyderabad Central Ambulance Board. Compared with last year progress has been more satisfactory during the year under report, further progress is expected.

29. The following are the names of Educational Institutions where First Aid lectures were given during the year under report :—

1. Police Training School, Hyderabad.
2. Teachers Training School, Hanamkonda.
3. College of Physical Education, Hyderabad.
4. Government High Schools at Bhir, Parbhani, Nander, Bidar, Nalgonda and Mahboobnagar.
5. Osmania Intermediate College, Aurangabad.
6. Government Middle Schools at Nizamabad and Hanamkonda.
7. University College for Women, Nampalli, Hyderabad.
8. Mahubia Girls High School, Hyderabad.

Rs. 1,473-2-2 were spent by the Hyderabad Central Ambulance Board.

Certificates were issued to all the successful candidates, free of cost, by the Central Ambulance Board and in accordance with the recent orders issued by the Board, "First Aid" books are distributed free to all successful candidates.

30. *Infant Welfare Centres.*—In Hyderabad City, three Infant Welfare Centres were at work, one in Sultan Bazaar, one in Begum Bazaar, and one in Darulshafa. A small subsidiary Centre is working in Bogalkunta. A fifth Centre in Kazipura is recently sanctioned by the Municipal Corporation. Experience has proved the work to be of great value. Sixty-five indigenous Dais are employed under the Centres and receive continuous and careful tuition; they conduct labour cases in the Patients' homes and their work is regularly supervised by the Health Visitors.

Mothers are encouraged to bring their children to the Centres and learn mother-craft including many details in the rearing of healthy and happy children.

Expectant attend the Centre for advice by a qualified Woman Doctor. Anything which might militate against safe delivery is dealt with and they can, if they wish, be introduced to one of the trained Dais or secure admission to one of the special hospitals for maternity.

Sickly children are given simple home remedies where this is likely to be efficient and the parents of those showing serious illness are encouraged to take them to a hospital for treatment.

Magic Lantern lectures are given on domestic duties of women as well as maternity and child welfare.

Milk and nourishing food is given to infants and to expectant and nursing mothers who are under-nourished.

Three similar Infant Welfare Centres will be opened next year in the district towns of Raichur, Gulbarga and Nizamabad. Building is in rapid progress from H.E.H. the Nizam's Silver Jubilee Funds.

Sixty-five Dais were on the rolls of the Infant Welfare Centres undergoing tuition. They conducted during the year 1859 labour cases in the patients' houses and their work was regularly supervised by qualified Health Visitors. Of these only three maternal and twenty-three infantile deaths took place. Twenty-five were reported as still-born. Every Dai on the Centre list is provided free with a fresh sterilized midwifery outfit for each case attended. The soiled outfit is returned to the Centre for refilling and sterilization before re-issue.

*Creche.*—The creche attached to the Sultan Bazaars Centre is a great convenience to mothers who are out at work during the day. Free milk is issued to such of the under-nourished children and the very poor are also assisted with clothing. The daily average of infants in the creche was 17 during 1346 Fasli.

The following details of work at the four Centres during 1346 Fasli are of interest :—

1. <i>Number of clinics held</i> :—			
(a) Ante-natal	..	..	103
(b) Post-natal	..	..	40
(c) Children	..	..	109
2. Ante-natal cases	..	..	1,883
3. Post-natal cases	..	..	948
4. <i>Number of children</i> :—			
(a) Attended	..	..	79,077
(b) Weighed	..	..	39,467
(c) Bathed	..	..	62,026
(d) Given milk	..	..	49,021
(e) Given home treatment	..	..	17,099
(f) Referred to Hospitals	..	..	6,958

5. Number of house visits made .. ..	15,348
6. (a) Number of births conducted under Centre arrangements .. ..	1,859
(b) Number of infantile deaths .. ..	23
(c) Number of Maternal deaths within ten days	3
(d) Still Births .. ..	25
7. Number of classes conducted for training of Dais	177
8. Number of Dais trained .. ..	65
9. Number of lectures given .. ..	153
10. Number of visits paid by the Ladies Committee, jointly and severally .. ..	214

The figures for the previous year were as follows :—

1. Attendance of children .. ..	65,177
2. House visits .. ..	12,147
3. Ante-natal cases .. ..	2,023
4. Births conducted under Centre arrangements ..	1,701
5. Dais trained .. ..	58

A recommendation to increase the annual grants of the Centres from Rs. 12,250 to Rs. 14,100 was under the consideration of the Hyderabad Municipal Corporation when the year ended. The work of these Centres is very valuable; this year's record fully justifies the increased grant.

The members of the Ladies Committee paid 214 visits jointly and severally during the year of report. The special thanks of Government are due to these Ladies, for their devoted zeal, personal attention and absorbing interest which contributed so much to the success of the three Centres.

The recurring expenses for the Infant Welfare Centre for the year under review amounted to Rs. 12,893-13-9 against Rs. 12,087-6-3 last year.

There is a Nursery class attached to the Bogulkunta Centre. This was started at the close of the year. The attendance at the class was reported to be satisfactory.

Her Highness Princess Niloufer graced the three Centres with her august presence and presented toys for the children which they and the public very much appreciated. The children were also treated to sumptuous sweets on the occasion of the Silver Jubilee of H.E.H. the Nizam.

Other notable visitors to the Centres during 1346 Fasli were Dr. W. P. Jacocks of the Rockefeller Foundation of the U.S.A., and Dr. Orkney, W.M.S., Secretary of the Red Cross Society, New Delhi. Both these experts gave valuable information with regard to the recent development of Child Welfare work.

31. *Sanitary Inspections.*—During the year the Deputy Director of Public Health toured in nearly every district; he inspected the work of the departmental officers, organized efforts against epidemic diseases including campaigns against cholera; and against plague, particularly in endemic Centres, yaws and malaria. He paid special attention to the work of the Vaccination Staff.

He advised District Boards regarding Town and Village planning, Sanitation and Conservancy and Sanitary buildings. His control over Military manœuvre area was thorough and practical.

He also inspected the Town planning schemes in Rajura, Parli, Bodhan, Rudroor, Adilabad, Ashti, Mulug and Laknawaram.

District Health Officers controlled the Public Health and Vaccination work in their respective districts. They were responsible for all epidemic arrangements, Medical and Sanitary arrangements made for Uruses and Jatras, Medical inspection of schools, mills and factories and also police and Jail lock-ups. The District Health Officer is the adviser to the President of the District Board on questions of Public Health.

32. *Rural Hygiene Conference of the League of Nations at Java.*—Dr. C. F. Chenoy, Deputy Director of Public Health, attended this conference, which was held at *Bandeong*, Java from 3rd to 13th August 1937. Besides the delegates from the Government of India, the States of Mysore, Baroda, Travancore sent delegates to the conference. The conference discussed Public Health problems facing the Governments in the East. The subjects included Health and Medical services, Rural reconstruction and collaboration of the population, Sanitation and Sanitary Engineering, Nutrition, measures for combating certain diseases such as plague, malaria, ankylostomiasis, tuberculosis, pneumonia, yaws, leprosy and mental disease. The resolutions passed by this conference together with Dr. C. F. Chenoy's note and the departmental recommendations are before the Government for consideration. The resolutions contain much useful information, perhaps the most important have reference to malaria in connection with large irrigation projects.

33. *Isolation Hospital.*—(i) This institution is intended for the isolation and treatment of infectious diseases. Construction of a separate Tuberculosis Hospital has been commenced. For several years tuberculosis cases have been treated in a part of the hospital and are included in the hospital returns. This unsatisfactory arrangement is to be discontinued.

(ii) *(In-patients).*—44 in-patients remained under treatment at the close of 1345 Fasli. The number of new admissions during the year of report was 1,865 against 1,393 last year. The daily average attendance of in-patients was 92.42. The results of treatment were as follows :—

Cured	..	..	..	461
Relieved	..	..	..	222
Discharged otherwise	..	..	..	769
Died	..	..	..	389
Remaining under treatment	..	..	..	68

(iii) *Plague.*—The number of plague cases treated during the year was 366 with 176 deaths against 233 with 137 deaths in the previous year. The percentage of mortality was 48 compared with 58.8 in 1345 Fasli. As usual many of the cases were admitted in a moribund condition.

*Experimental Work.*—This year Convalescent Human Serum was tried in 48 cases. The results obtained in these cases were very favourable. The following statement shows the results among the treated and control cases.

Sex	TREATED WITH CONVALESCENT SERUM			CONTROL CASES UNDER ROUTINE HOSPITAL TREATMENT		
	Cases	Deaths	Mortality per cent.	Cases	Deaths	Mortality per cent.
Male .. ..	26	3	11.5	26	14	53.8
Female .. ..	22	5	22.5	22	9	40.9
Total .. ..	48	8	16.7	48	23	47.9

(b) *Small-pox.*—Only one case of small-pox was admitted to the hospital and was discharged cured.

(c) *Cerebro-Spinal Fever.*—6 cases were admitted of whom all unfortunately died. There were 15 cases with 11 deaths in the previous year. Patients were as usual strictly isolated, intrathecal and intravenous medication was carried out energetically, and contacts were safeguarded as far as possible.

(d) *Diphtheria.*—Two sporadic cases were admitted; they were successfully treated and discharged cured.

(e) *Tuberculosis.*—439 tubercular patients were admitted this year, of these 101 died. The percentage of mortality was 23.35 were discharged as much improved, 189 as improved and 77 were discharged otherwise. Tubercular patients are reluctant to remain in an Infectious Diseases Hospital admitting acute plague cases. The Tuberculosis patients treated during the year by sex and racial groups are given below :—

	Male.	Female
Muslims .. ..	131	114
Hindus .. ..	128	40
Christians .. ..	14	12
Total .. ..	273	166

(f) *Cholera.*—31 cases were admitted; of these 14 died.

(iv) *Outpatients.*—The number of outpatients treated was 12,415 against 11,112 last year. The daily average attendance was 34.5 compared with 30.4 in 1345 Fasli.

The Medical Officer, Dr. Mohammad Abdur Rahman, was absent for six months during the year while under training at the Madanapalli Tuberculosis Sanatorium.

(v) *Finance.*—A sum of Rs. 197-9-0 from the sale of un-serviceable articles was realized and was credited to Government.

The allotment for this hospital is Rs. 22,820 with an expenditure of Rs. 24,913-10-11 exclusive of the cost of drugs. The excess was met by the Department from other allotments and is entirely due to the admission of tuberculosis patients.

34. *Industrial Hygiene.*—All mills and factories were inspected by the District Health Officers or the Local Medical Officers. Sanitary condition of the smaller mills and factories (oil and flour mills, etc.), is generally unsatisfactory. In the larger mills and factories the conditions are better, though improvements in several directions are still needed. In Raichur many of the mills and factories have no latrines provided for the labour and surrounding tanks and fields are invariably contaminated. Leather factories in the vicinity of Hyderabad City, in the districts of Baghat and Atraf-e-Balda are in a deplorable condition. In the district of Bir, Flour and ground-nut mills are reported to be insanitary. The existing Factory Act and the rules and regulations made under this Act require amendments and alterations to enforce improved conditions in the mills and factories, particularly of the smaller type; in controlling the hours of work in these factories; to provide proper Medical aid and facilities to the employees; to provide suitable houses, clean water, good and nutritious food for the labourer with a reasonable distance. Industrial diseases must be made notifiable. At present there is no authority for the officials of the Public Health Department to enter and inspect mines. Sanitary Boards have not been appointed for any of the mines, though this is permissible under the existing Act.

35. *Famine Relief.*—The threatened famine conditions in Gangapur and Vajjapur Taluqs in Aurangabad District were to a great extent relieved by belated rain, but a condition of scarcity prevailed through the major part of the year in these areas. Work on feeder roads, sinking of new wells and remodelling of old wells was started as a relief measure. Conditions in Shorapur Taluq in Gulbarga District were bordering on famine. On an average 500 labourers were employed on road construction as a relief measure throughout the year. Medical help was given whenever necessary and twice cholera preventive measures had to be adopted in the labour camp. There was a failure of monsoon in Bir District during the year 1345 Fasli as a result famine conditions existed throughout the year 1346 Fasli in the taluqs of Ashti and Patoda and a few villages in Gevrai taluqa. As a relief measure the Roti Project in Ashti Taluqa has been started. Many are also employed on the construction of a road connecting the Bir Taluq with Mominabad. The new Famine Code recently prepared by the Revenue Authorities in consultation with this department, is likely to be of help in the early detection of scarcity and famine conditions, in the provision of quick relief, and in controlling the labour population on relief works.

36. *Nutrition Surveys.*—No regular Nutrition surveys have been carried out in the State during the year, but from general observation it can be stated that malnutrition is found particularly amongst children of low paid labourers, and that this is commoner in towns than in rural areas. Here the question is generally bound up with economic conditions but the factor of

an ill-balanced diet is of at least equal importance. It is probable that the majority of families have sufficient food but the diet is not well selected. The economic survey of certain parts of the State has been carried out by the Commerce and Industries Department and much is being done by the Co-operative Department, Rural Reconstruction Board and other organizations to improve the general, social and economic conditions of the people. Instruction regarding selection of articles of diet, and the gradual correction of hereditary customs by Health propaganda, are necessary along with improvement of economic conditions.

No nutrition committee or similar organization has been arranged by the State as yet. The work carried out and the results obtained in the Central Nutrition Laboratories established at Coonnoor and Calcutta are being made use of for suggesting diet tables and for recommending and carrying out practical work in connection with nutrition.

Dr. C. R. Naidu, (District Health Officer, Karimnagar) has been deputed to undergo a course of training in the Central Nutrition Institute at Coonnoor, and on his return, his services will be made use of in carrying out nutrition surveys and field investigations in the State. Action will be taken on his findings but correction of dietetic habits in India will always be difficult. These habits are often bound up with the rigid rules of caste.

Close co-operation exists between the Public Health, the Agriculture, the Revenue and the Co-operative Departments. The collaboration of these departments will be found not only to the mutual advantage of the departments concerned but also to the public at large.

The staple diet of more than half of the State is rice, most of which is produced locally. The majority of the people in the rural areas only use hand-pounded rice. Rice mills are however slowly increasing in number and the people are using more and more polished rice. This replacement of hand-pounded by polished rice raises a problem which is receiving the attention of the department. Propaganda in this connection is being taken up gradually and is likely to prove useful in the long run. The present interest on the part of the Government and the public in re-establishing cottage industries, may lead to a return to the more wholesome hand-pounded rice.

37. *Housing Schemes.*—While many schemes for Town improvement and extensions are being carried out or are under consideration there is no special scheme limited to Industrial Housing. Some mills and other Industrial Firms provide reasonable houses for the staff.

There is a Housing Society in the City of Hyderabad, assisted by Government, but so far only 3 houses have been built and 28 are contemplated.

In Hyderabad City, the housing condition of the middle and poor classes has vastly improved owing to the activities of the City Improvement Board. "Model dwellings" are built by the City Improvement Board in 4 classes, A, B, C and D.

The model dwellings are gradually relieving the labour and middle class housing problems. Congested areas are selected and cleared for construction of standard houses.

It is interesting to report that in spite of recurring epidemics of plague in the city, no rat-fall or human case has occurred in any of the model houses.

In the districts, on the recommendation of the Public Health Department, the Revenue Department have issued official circulars regards Town and Village planning and improvement. Building Regulations are now being enforced in all towns with a population of over 5,000 inhabitants. These buildings are inspected and reported on by the District Health Officer and the Deputy Director of Public Health on their tours.

Planning and Improvement of any village or town is first prepared by the Architect of the Local Fund Department and the area is inspected and the plans approved by the Public Health Department. No plan is accepted until it has been noted on by the Public Health Department.

There are labour colonies under consideration and plans have been approved by the Public Health Department. In other areas Industrial Firms are providing quarters for their staff. The Public Health Department only gives advice whenever called upon to do so. No powers exist in the "Factory Act" except that Civil Surgeons and District Health Officers as Certifying Surgeons have powers of entering and examining the premises. They report on sanitation, ventilation, lighting, latrines and water-supply. Government is being approached to give the Public Health Officers special powers to attend to industrial housing, to health, hygiene and industrial diseases, as suggested in the "Whitely Report." On receipt of authority recommendations regarding industrial areas will be made in accordance with Report of the "Royal Commission," and the "Mining Act."

In one important Colliery, the supervision of sanitation is under the control of the Director, Medical and Public Health Department. The condition of the housing here is fairly satisfactory and general sanitation is receiving adequate attention.

32 schemes for rural reconstruction were examined and noted on by the Public Health Department. In every case the recommendations of the Public Health Department have been accepted. Details of actual progress made are awaited from the Revenue and Local Fund Departments.

38. *Food Adulteration.*—In Hyderabad City there are certain provisions for preventing the sale of adulterated food materials in the Hyderabad Municipal Act. However these are seldom enforced. In the districts there are no regulations to control the sale of food materials, though the newly passed Act (or regulation) provides that bye-laws may be made by the local bodies with the previous sanction of the Government.

A comprehensive Act has been prepared and submitted to the Government for promulgation. This will enable the department

to lay down standards of purity for various food stuffs and enable the Local bodies to form rules and bye-laws to carry out the provisions of the Act.

The purchasing power of the poorer citizen is very low and the temptation to sell, and to purchase, adulterated and consequently cheap articles of diet is difficult to combat. Milk is often diluted, and ghee is often grossly adulterated, to bring the price down to the level demanded by the purchasers.

The prejudice against vegetable ghee is unfortunate as this is often purer and more wholesome than the so-called milk ghee available in the bazaars.

### 39. REFORMS AND CHANGES EFFECTED DURING THE YEAR OF REPORT.

#### *Medical.*

1. Medical inspection of children under the "Children Protection Act" has now been commenced.

2. The plans for a Mental Hospital are now ready and building operations are to commence shortly.

3. The Medical College has been raised to a high standard and provides all the Medical Officers required for the service.

4. Post-Graduate instruction of Medical men, both Government and private practitioners has been undertaken.

5. Clinics for the outpatient treatment of leprosy have been opened in all centres of Medical activity throughout the Dominions.

#### *Public Health.*

6. A new T.B. Clinic and a new Tuberculosis Hospital in Hyderabad City are now in course of construction. A site has been secured for a Tuberculosis Sanatorium in a carefully selected area 50 miles from Hyderabad. Plans and preliminary arrangements regarding water supply are now in course of preparation and building will be commenced almost immediately.

7. The Public Health service is hardly able to cope efficiently with all general questions of Hygiene but has a better control of epidemic diseases. The staff is distributed as a net work covering as far as possible all areas in the Dominions, but must be enlarged to secure efficiency.

8. Courses of instruction are given to those employed in the Health service.

9. There is excellent co-operation with the Civil and Police Authorities in all districts.

10. Special surveys for plague have been made in Kallam and Kohir. These have been followed up by preventive measures which have had a very beneficial effect upon plague previously wide-spread.

11. Detailed surveys regarding Malaria have been made in Nizamsagar, Doulatabad and other infected centres. Anti-malarial campaigns are in progress with excellent results in nine different areas.

12. A scheme for opening a fifth Infant Welfare Centre in Kazipura locality of Hyderabad City has been sanctioned and a sum of Rs. 22,000 has been provided for the building. In the districts one has been completed at Nizamabad and others at Gulbarga and Raichur are in course of preparation from Silver Jubilee Funds.

13. Almost all District Boards have now provided magic lanterns and lectures are given by the Health staff over wide areas.

The under-mentioned schemes submitted to Government for sanction were under consideration when the year ended :—

1. A scheme for correct registration of Births and Deaths in H.E.H. the Nizam's Dominions.

2. A scheme for registration of Medical Practitioners.

3. Creation of a post of Woman Doctor of Civil Surgeon rank for two Subas.

4. Creation of wholetime appointment of a Pathologist for the Osmania Hospital.

5. A scheme for bringing all Local Fund employees in the Medical Department on the scales of pay sanctioned for Government employees.

6. A scheme for constructing a Children's Hospital.

#### 40. FINANCIAL (PUBLIC HEALTH).

(a) *Income*.—The income from various sources to Government as given below during 1346 Fasli amounted to Rs. 6,546-12-3 against Rs. 4,436-1-2.

	Rs.	A.	P.
1. Sale of Vaccine lymph and calves, etc.,..	4,707	6	9
2. Sale of grass at the Isolation Hospital . .	197	9	0
3. Sale of Anti-plague Vaccine to Paigahs, rent of Malgies, sale of grass and miscellaneous .. ..	1,641	12	6
	<hr/>		
	6,546	12	3
	<hr/>		

(b) *Expenditure*.—The expenditure of the Public Health Department was Rs. 6,21,520-12-2 during the year compared with Rs. 6,01,434-4-4 in the year before. The increase was due to extra expenditure under "Epidemics" and annual increments. The main heads of expenditure for the year of report are tabulated in the following statement :—

[Statement.

Statement of the Board of Health and Sanitation of the City of New York

The cost of vaccination paid by the Hyderabad Municipal Corporation during 1346 Fasli including staff totalled Rs. 5,298-10-6. The Sarf-i-Khas Mubarak Department met also an expenditure amounting to Rs. 3,565-7-6 for the vaccination staff under the control of the Public Health Department.

14. *Public Health.*—In the early days of the development of modern medicine, preventive medicine received little attention except as regards vaccination against small-pox. Money and efforts were concentrated on the provision of medical treatment and on the establishment of hospitals and dispensaries. Prevention of disease is now universally recognised as the chief aim of medical work.

Prior to 1338 F. there was no separate public health staff in the State; recently the Public Health Department has been reorganised and is able to deal with public health matters more efficiently. Reporting of the outbreaks of epidemics, though not yet completely satisfactory, is improved and a considerable measure of control has been secured. In the Director's Office, the Public Health Section has been separated and a Deputy Director manages the section under the general supervision of the Director. District Civil Surgeons remain the District Health Officers, assisted in their public health work by Assistant Health Officers. Out of 16 Assistant Health Officers, one possesses an English Diploma in Public Health and five others Public Health Diplomas granted by Indian Universities or other Examining Boards. Arrangements have been made for two officers yearly to obtain Diplomas from the Calcutta University. In a few years' time the whole of the Public Health Staff will be specially qualified for their work.

The cadre of the vaccinators and Health Sub-Inspectors has been increased and now each district possesses a Health Inspector, three Sub-Health Inspectors, a number of vaccinators and a Deputy Inspector of Vaccination.

Perhaps the most important matter of public health is the steadily increasing interest of all departments in improving water-supplies. The Water Board is rapidly providing all District Headquarter Towns with excellent water works. The Board is devoting thought to village water-supplies, and with the help of other departments ample and protected water-supplies are being provided. The amount of work to be done in this direction is enormous and its value incalculable.

Two organized campaigns, one against plague and the other against malaria, for Hyderabad City have been working with remarkable success. The incidence of malaria has been lessened considerably and it is no exaggeration to say that plague has ceased to exist in an epidemic form.

The table below will show the incidence of malaria and plague in the City of Hyderabad at present compared with the conditions a decade ago.

Cases of fever treated in the City hospitals and dispensaries in 1338 F.	.. .. .	126,825
Cases of fever treated in the City hospitals and dispensaries in 1346 F.	.. .. .	21,567

Average annual incidence of plague in the City of Hyderabad for the period 1334 to 1338 Fasli . .	3,346
Average annual incidence of plague in the City of Hyderabad for the period 1342 to 1346 Fasli . .	403

The vaccine depot has been completely reorganized. The old and obsolete methods of preparation of vaccine lymph have given place to new and up-to-date scientific methods. The depot is now in a position to meet any demand that may be made on it.

The Chemical Examiner's Laboratory has been thoroughly overhauled and the equipment improved. The laboratory is now in a position to conduct all investigations including serological tests, that may be required by the Government departments.

Very little was known of the actual extent of diseases such as plague, malaria, guinea-worm, filariasis and Yaws in the various districts and in particular about the nature of the endemic foci which are permanent reservoirs of infection. Systematic and scientific surveys have been carried out in connection with plague, and anti-rat and other anti-plague campaigns were regularly carried out in the endemic areas brought to light by these surveys. Not a little of the reduction in the incidence of plague in the Dominions is due to these measures.

Detailed surveys regarding malaria have been made in 23 dangerously infected centres; of these seven have been selected and anti-malarial campaigns are now in progress with good results. Many Medical Officers have been trained in the Malaria Department and are now in a position to carry out independently, survey work, and also to adopt anti-malarial measures where necessary and where funds are available.

A survey undertaken for the purpose has revealed the widespread presence of Yaws among the aborigines in the forest areas of Warangal, Karimnagar, Mahboobnagar and Asifabad districts. Field investigations were carried out to study the epidemiological features of this disease and a scheme for carrying out an intensive treatment campaign has been brought into force recently.

A systematic survey for guinea-worm disease has been made in the districts of Osmanabad, Gulbarga and Bir. The reports have been submitted to the Government for the guidance of the Well Sinking Department.

Ante-natal and Infant Welfare work has been started and is making rapid progress.

The department is now responsible for the guidance and the administration of five Infant Welfare Centres. Three more Centres are proposed to be opened in the districts in the near future.

The systematic Medical Inspection of school children has been inaugurated for both the City of Hyderabad and the districts.

With the idea of improving the sanitary condition of the mofussil towns and villages, standard designs for vegetable and meat markets, slaughter-houses, wells and latrines have been prepared. These have been introduced by several District and

Taluq Boards. A new type of latrine known as "aqua privy" has been devised; over a hundred of these have been constructed and have proved efficient.

A great impetus has been given to town planning schemes and more than 50 town planning schemes have been scrutinized and are being worked out by the District and Taluq Boards.

All candidates for the Hyderabad Civil Service are, during their training, given a course of lectures on sanitation and epidemics. These officers understand the causes of various epidemic diseases and are able intelligently to co-operate with the Health Officials both in controlling epidemic diseases and in improving the sanitary condition of the towns and villages administered by them. District Health Officers are instructing the Patels and Patwaries during "Jamabandi" time in the simple work of disinfecting wells during cholera epidemics and in the prompt and correct registration of Births and Deaths.

As the pay of the Health staff (Inspectors, Sub-Inspectors and Vaccinators) has been improved, better qualified men are applying for the posts of Inspectors and Sub-Inspectors and consequently the efficiency of the department has improved.

The duties, functions and responsibilities of different officials in the Public Health Department have been clearly defined and the work standardized throughout the Dominions.

A Public Health Manual as well as the Medical Manual have been prepared for use of Members of the Health Department and others associated with it. This has been submitted to Government and sanction is awaited.

Formerly with the exception of circulars, regulations and rules passed by the Government from time to time (of which many had already become obsolete on account of advance in the knowledge of disease and the methods of prevention) no separate Acts existed for the control and regulation of Public Health activities in the Dominions. The following Acts have been framed and are under the consideration of the Government.

Medical Registration Act.

Epidemic Diseases Act.

Vaccination Act.

Food Adulteration Act.

Births and Deaths Registration Act.

On the recommendation of the Public Health Department a District Municipalities' Sanitary Powers Act has been framed by the Revenue Department.

A scheme has been submitted to Government for the proper administration of health matters in the areas around Hyderabad City, which is at present under the administrative control of different authorities, such as, Sarf-i-Khas, Paigahs, Jagirs, Diwani and British administered areas. A representative Frontier Village Public Health Committee has been nominated and their deliberations are at the disposal of Government.

*Health Propaganda.*—A booklet in English and the local vernaculars on "Common Infectious Diseases" has been published and is being used by Government Officials and schools. The Plague and Malaria Departments have been responsible for the issue of a large number of posters and pamphlets on their respective subjects for free distribution. Health Weeks and Health Exhibitions have been organized periodically in several districts and Health stalls are always arranged in Exhibitions organized by the departments of Agriculture and Commerce and Industries.

A travelling Cinema Car with interesting cinema films on plague, cholera, small-pox, malaria, tuberculosis, filariasis and leprosy has been touring for the last six years throughout the Dominions. It has achieved remarkable success in educating the public with regard to the causes of these diseases and has done much to popularize the preventive measures adopted by this department. The car invariably attends important fairs and festivals held within the Dominions and is present at almost all Health Weeks and Health Exhibitions. The demand for the car is so great that provision of at least one more is being seriously considered.

*Research Work.*—As far as heavy routine duties allow, a certain amount of research work is carried out in the plague, malaria, Chemical Examiner's and Vaccine Laboratories. The work was directed chiefly towards problems met within Public Health Administration. Some of the subjects on which research was carried out are as follows :—

- Comparative efficiency of various materials used for fumigation work such as Calcid, Sulphur, Cynogas, etc.
- Disinfection of plague infected houses with various materials.
- Identification of various species of flees found on local rodents and their susceptibility to plague infection.
- Comparative efficiency of various poisonous baits used for killing rats.
- Efficiency of various types of traps used for catching rats and improvising one that would give the best results locally.
- Identification of various species of malaria carrying mosquitoes in the State.
- Efficiency of various anti-larvel drugs used.
- Comparative efficiency of various anti-malarial drugs, both preventive and curative.
- Efficiency of various types of fishes with regard to their larvicidal habits.
- Efficiency of various methods of disinfecting wells against cyclops.
- Finding some suitable method of disinfecting running water in rivers, nalas, streams, etc., against cholera infection.
- Study of the life history of the eye-fly.

Following is the list of the Scientific papers already published and also in the course of publication by the Members of the Medical and Public Health Department within the last few years.

1. Norman Walker, J., Chenoy, C. F., and Rao, S. R. (1931) Rat-flea Survey of the City of Hyderabad-Deccan. Indian Journal of Medical Research, Vol. XIX. No. 2. October 1931, pp. 657-673.
2. Abraham A. C. (1932), The Anopheline Mosquitoes of Hyderabad-Deccan and their Control. Records of the Malaria Survey of India, Vol. III. No. 2. December 1932, pp. 179-196.
3. Chenoy, C. F., Siddiqui, M. A., and Abraham, A. C. (1936) Investigation of Yaws (Koya Disease). Indian Medical Gazette, Vol. LXXI, No. 6, June 1936. page 322.

There is little doubt that continuous propaganda has created an interest in Health matters not previously noticed among either officials or the public.

Hyderabad Dominions no longer stands alone as an area regarding which epidemiological facts were unknown and unrecorded. Co-operation with neighbouring provinces has developed. All records bearing on public health are freely and very promptly exchanged and any outbreak or even any threat of epidemic disease is immediately notified to neighbouring districts and neighbouring provinces with marked mutual benefit. Through the Information Bureau arranged by the Advisory Board of Health at Delhi information regarding the activities of all Provinces and States is available.

Within the State other departments are learning to seek the assistance and advice of the Public Health Department more freely when the health of an institution or the general public is involved.

Hyderabad is now represented by a member on the reconstituted Central Advisory Board of Health, Delhi. In June 1937 (Amerdad 1346 F.) this Board dealt with the question of the organization of Public Health Departments in the various States and Provinces, the sale, purchases and distribution of quinine, and with Nutrition surveys. The Hyderabad suggestion that the Board should be a clearing-house for Provinces and States in regard to type designs, bye-laws, etc., in use locally was accepted by the Board.

The Deputy Director, Public Health Department, attended the Rural Hygiene Conference held in Java in 1937 under the auspices of the League of Nations. The conference made several useful recommendations and wherever feasible, these recommendations are being given effect to by this department. The delegate from this State was able to place before the conference the results achieved by the anti-plague work here and was responsible for the passing of a resolution by the conference that control of the land traffic for the prevention of the spread of epidemics is as essential as the control of sea-borne traffic. Useful resolutions based on the Hyderabad delegate's proposals were framed on the vital question of improving village water-supplies. A note on the resolutions of the conference together with departmental recommendations is before the Government.

The Public Health Department still remains a 'temporary' department, the justification for better reorganization is overwhelming. The department could spend more generous grants to the benefit of the State. The time cannot be far off when there will be a demand for a separate Health Minister to give undivided attention to public health problems of the State and to co-ordinate and guide the activities of all local bodies responsible for the health of the people. Given the right type of men to direct the movement under the sympathetic control of one with an informed imagination, a great future can be confidently expected for the Public Health Department.

## PART III.

*Chemical and Bacteriological Laboratory.*

Dr. M. Farooq was in charge throughout the year assisted by Assistant Surgeon S. Bhoomannah and a Sub-Assistant Surgeon. An Assistant Surgeon was put in charge of the Anti-Rabic Centre.

One Sub-Assistant Surgeon from Secunderabad attended the Laboratory for training.

*Nature of Work conducted during 1346 Fasli.*

During the year 3,230 cases were investigated against 1,980 cases in the previous year, an increase of 1,250 cases; the total number of articles examined was 5,146 against 4,065.

The following five comparative statements show details of the work.

*Blood Stains for Murder.*—179 cases with 1,085 articles (as against 169 cases with 1,276 articles for 1345 Fasli) were examined for the detection of Human Blood Stains; of these, Human Blood was found in 171 cases showing a p.c. of 95.5 positive cases.

[Statement.]

*Details of Work conducted under various Sections.*

1. *Medico-Legal Section.*—Under this main and important section, the nature of work conducted during the year is as follows :—

Sub-Sections	1346 Fasli.			1345 Fasli.		
	Cases	Percentage of Positive cases	Articles	Cases	Percentage of Positive cases	Articles
A. Abortion ..	3	66.6	18	2	100	13
B. Blood Stains ..	179	95.5	1,085	169	96.4	1,276
C. Human Poisoning.	237	69.6	514	264	67.0	609
D. Cattle ,, ..	12	83.3	38	18	44.4	88
E. Seminal Stains ..	76	86.6	558	61	44.2	414
Total ..	507	81.4	2,213	514	37.5	2,400

The average number of articles received for examination per case investigated during the year was 4.36 (4.67 last year).

Statement No. VI shows the districts from which these 507 cases were received. The cases are arranged according to the crime, those proved positive and the number of articles examined, compared with those of last year.

Statement VII gives details of cases investigated for *Human Blood*.

Statement VIII gives details of cases of *Human Poisoning* examined.

The relative frequency of poisons used and detected in 237 cases of Human Poisoning during 1346 Fasli is shown in Statement No. XI arranged according to nature of poison detected and the district concerned.

From this statement, it will be seen that the most commonly used poisons were Opium, Datura, Arsenic, Copper Sulphate and Alcohol, which form 27.2, 18.7, 7.2, 4.8 and 3 p.c., respectively of the total positive cases, the remaining 39.1 per cent. include the less commonly used poisons.

[Statement.]

From the Statistics of Medico-Legal investigations for Human Poisoning cases compiled in the manner suggested by the Director of Statistics, H.E.H. the Nizam's Government, Hyderabad, the following data have been tabulated.

—	1346 F.			1345 F.

*General Analysis.*—Under this heading 16 specimens were analysed and tested as against 32 examined last year. The details of analysis conducted are as follows :—

1. *Aluminium Sulphate.*—Three samples of alum were received from the Hyderabad Water Works. All the samples proved to be of fairly good quality.

2. *Bleaching Powder.*—One sample was sent for analysis by the Executive Engineer, Hyderabad Water Works and was found to contain 8.8 p.c. of available Chlorine.

3. *Phenyl.*—One sample was received from the Principal Medical Officer, Regular Forces; on examination it was found to be of fairly good quality giving a Rideal Walker No. 3.

4. *'Finol'.*—Two samples of 'Finol' were received. One from the Principal Medical Officer, Regular Forces and the other from the Proprietor, Hyderabad National Industries. The first gave a Rideal Walker No. 0.5 and the second sample Rideal Walker No. 1.

5. *Alcoholic Beverages.*—Three samples were received for analysis, one from the Magistrate, Mahboobabad and two from the Superintendent, Victoria Zenana Hospital, and were found to contain 37 per cent., 19.2 per cent. and 9.7 per cent. of alcohol by volume respectively.

6. *Quick-lime.*—Three samples of Quick-lime were received from the Special Plague Officer and found to contain 42.2 per cent., 28.2 per cent. and 17.19 per cent. of Calcium Oxide.

7. *'Kruchan Salt'.*—One sample was received for analysis for the presence of poisonous substances. On examination no poison was detected.

8. *Arsenical Solution.*—One sample was received from the Vaccine Depot Cattle Dip, on analysis was found to contain 1 in 2,500 of Arsenic.

9. *Currency Note.*—One ten-rupee currency note was received from the Assistant Accountant-General for the examination of stains on the note. No chemical was detected.

II. *Bacteriological and Pathological Section.*—Under this section there has been a great increase of work during the year; 438 cases with 646 specimens were examined against 178 cases with 238 specimens last year.

[Statement.]

The following statement shows the details under this section as compared with the previous year.

	1346 FASLI		1345 FASLI	
	Cases	Specimens	Cases	Specimens
Animal (P. M. Organs) .. ..	1	4	1	1
Blood smears Human .. ..	52	111	27	54
"    "    Animal .. ..	..	..	2	6
Excretions .. ..	90	95	26	26
Secretions & Scrapings .. ..	69	144	58	86
Sputum .. ..	38	55	36	37
Cerebro-Spinal Fluid .. ..	2	2	1	1
Auto-Vaccine prepared .. ..	10	10	6	6
Focuss and Vomit for Cholera Vibrios ..	39	39	..	..
Miscellaneous .. ..	137	186	21	21
Total .. ..	438	646	178	238

III. *Histological Section*.—27 specimens were examined under this section against 21 specimens last year. The specimens examined were as follows :—

	1346 Fasli.	1345 Fasli.
Dog's Brains for Negri Bodies ..	10	7
Tumour and Section-cutting ..	17	14
Total ..	27	21

*Dog's Brains*.—Out of the 10 specimens examined none showed the presence of Negri Bodies.

Specimens of Tumour and Section-cutting were as below :—

Fibromas .. ..	5
Normal Testicular Tissue .. ..	1
Adenoma .. ..	1
Granulation Tissue .. ..	2
Sarcoma .. ..	1
Normal Utrine Tissue .. ..	4
Carcinoma .. ..	1
Fibro-Sarcoma .. ..	1
Normal Breast Tissue .. ..	1
Total ..	17

IV. *Serological Section*.—The number of specimens examined under this section was 1,274 against 702 last year. The number includes :—

	1346 Fasli.	1345 Fasli.
Anti-Sera for Precipitin Test prepared ..	45	56
Widal's Test .. ..	98	109
Kahn's and Wasserman Test .. ..	1,131	553
Total ..	1,274	702

V. *Urological Section*.—Under this section 218 samples of urine were examined as against 109 last year.

	1346 Fasli.	1345 Fasli.
Chemical Examination .. ..	190	94
Bacteriological Examination .. ..	28	15
<b>Total .. ..</b>	<b>218</b>	<b>109</b>

*Water Analysis*.—During the year under record 203 specimens of water samples were analysed as against 211 last year.

	1346 Fasli.	1345 Fasli.
Chemical Examination .. ..	101	104
Bacteriological Examination .. ..	102	107
<b>Total .. ..</b>	<b>203</b>	<b>211</b>

43 Samples were found to be pure and wholesome.

62 do do doubtful in nature.

98 do do polluted and unfit for Human Consumption.

Statement XIII gives details.

*Statement XIII showing Abstract of Water Analysis conducted during 1346 F., with details of the Source of Water and their Results.*

The following summary is drawn up to show from which department samples of water were received for analysis during the year :—

From whom received	Total number
<i>Hyderabad.</i>	
1. P.W. Department, Hyderabad Water Works :—	
(a) Asaf Nagar Filter Beds .. .. .	56
(b) Mir Alam Water-supply .. .. .	74
Total P.W.D. .. .. .	130
2. Divisional Engineer, C.I.B. .. .. .	2
3. Military Department .. .. .	10
4. Special Plague Officer .. .. .	3
5. Superintendent, Central Jail .. .. .	2
6. Municipality .. .. .	22
7. Isolation Hospital .. .. .	2
8. Osmania University .. .. .	8
9. Mr. Askri Hussain .. .. .	1
10. G. Allahuddin, (Sample of Ice) .. .. .	1
Total for Hyderabad .. .. .	51
<i>Districts.</i>	
1. Civil Surgeon Nizamabad .. .. .	4
2. Do Gulbarga Sheriff .. .. .	16
3. Medical Officer, Manvi .. .. .	2
Total for districts .. .. .	22
Grand Total of water samples analysed .. .. .	203

*Food Analysis.*—Chemical analysis of 549 food samples was done during the year against 282 samples last year.

*Milk.*—Of the 47 samples of milk examined only two were found to be adulterated. In the absence of any recognised standard of purity, cow milk with 3.5 per cent. Fat and 8.5 per cent. Solids-non-fat; and buffalo milk with 6 per cent. Fat, and 9 per cent. Solids-non-Fat; is declared unadulterated.

*Butter and Ghee.*—Of the 308 samples examined (against 162 last year) 207 were found to be adulterated. Samples giving a Reichert—Meissle Value of 20 and a Butyro-refractive index of 40-43 at 40°C., are declared 100 per cent. genuine.

Statement XIV and XV give further details of the food samples examined during the year.

	Total .. .. .	181	788 0 0

## PART IV.

*Plague Department.*

The year 1346 Fasli opened with cases of plague in the City. The eighteenth epidemic having commenced in the middle of Mehir 1345 Fasli (August 1936) 34 attacks had occurred with 22 deaths before the year came to a close.

The first infection was due to importation from Budihal village in Koppal Jagir in the Raichur district.

In spite of all precautions families continued to move from infected to non-infected areas and a small number of plague cases occurred. The City was declared to be infected with plague on the 9th of Bahman 1346 Fasli (12th December 1936) as ten indigenous cases had occurred in one week. A few cases continued to occur and the epidemic ceased with the last reported case on the 3rd of Thir 1346 Fasli (8th May 1937).

The City remained free from plague until the commencement of the nineteenth epidemic, when plague broke out in the districts, several villages of Atrah-i-Balda, Medak and Bidar being infected.

The first imported case was brought into the City of Hyderabad from Dhobipet in Atrah-i-Balda district on the 13th of Shehrewar 1346 Fasli (19th July 1937) and died on the 14th of Shehrewar 1346 Fasli (20th July 1937). This patient was under the treatment of a local qualified medical practitioner who visited the patient three times, but did not report the case to the Plague Department.

The first infected rat was found on the 26th of Shehrewar 1346 Fasli, the infection being traced to Siddipet in the Medak district, a school master from that infected town having come to stay with his relatives in Mir Alum Mundi. Subsequently more rat-falls occurred. Fortunately the measures adopted by the Plague Department prevented the occurrence of human cases in this locality.

A serious outbreak of rat-plague occurred in Shamshabad Frontier village which was not promptly reported until human cases of plague had occurred. As Shamshabad is close to Municipal limits, it was difficult to prevent infection being brought into the City. With energetic measures the disease was successfully localized, but during Aban owing to migration of people from previously infected localities rat-falls occurred in several localities. Again local precautions were successful and no single human case occurred in these localities, and in spite of widespread infection only 4 deaths occurred in Mehir and 7 in Aban.

[Statement.

The following table shows the incidence of human plague and deaths month by month during the year 1346 Fasli :—

Months					Total Attacks	Total Deaths
Azur	1346 F.	..	..	..	26	14
Dai	1346 F.	..	..	..	25	9
Bahman	1346 F.	..	..	..	75	43
Isfandar	1346 F.	..	..	..	126	53
Farwardi	1346 F.	..	..	..	148	73
Ardibehisht	1346 F.	..	..	..	68'	35
Khurdad	1346 F.	..	..	..	31	19
Thir	1346 F.	..	..	..	2	2
Amerdad	1346 F.	..	..	..	..	..
Shehrewar	1346 F.	..	..	..	..	..
Mehir	1346 F.	..	..	..	8	4
Aban	1346 F.	..	..	..	11	7
Total ..					520	259

The following table shows the incidence of plague in different areas in the City and Frontier Villages during the year :—

Division					Total Attacks	Total Deaths
Municipal Limits						
(a)	Chaderghat.	..	..	..	185	90
(b)	City.	..	..	..	241	125
Frontier Villages.					58	30
Private huts.					12	3
Military Areas.					12	4
Imported					12	7
Total ..					520	259

The City for Plague Administration is divided into Chaderghat and the City Sections. In Chaderghat 26 areas were infected, the highest number of deaths in any one area was 8, and the average below 3.5. In the City Section 38 areas were infected, the highest number of deaths in any one area being 13, and the average deaths in each area were below 3.3; *i.e.*, there was no single area out of the 64 infected areas where the disease was not kept under control.

[Statement.

The following table shows the incidence of plague per mille for the year among the different communities :—

Community			Population	Attacks	Incidence per mille
Hindus	..	..	1,67,349	300	1.7
Mohammadans	..	..	1,70,191	216	1.2
Christians	..	..	4,560	4	0.8

The following table shows the incidence of plague according to age groups. It is interesting to note that the highest incidence of plague year by year is in people between 11 and 30 years of age.

*Incidence of Plague according to ages.*

Years	1 to 5		6 to 10		11 to 20		21 to 30		31 to 40		41 to 50		51 to 60		61 and onwards	
	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.

1346 Fasli .. ..	30	14	82	36	147	69	137	78	65	26	37	21	11	8	11	7
Total .. ..	214	123	450	263	1039	603	912	562	486	281	267	181	109	77	49	31

It is always during the latter part of the month of Shehrewar and during the month of Mehir that plague recurs in endemic areas in the districts. It is particularly unfortunate that this should occur at a season when camping in huts outside villages is very uncomfortable owing to the rains. Naturally at this season there is a great tendency for people to forsake infected villages and to move into other villages or into Hyderabad City. Year by year plague in the City has started owing to this migration.

This year the first outbreak was due to importation of infection from Siddipet in the Medak district. Careful research during eight years has failed to show any evidence of indigenous infection in the City. It has also been demonstrated that once infection is admitted the spread of plague from one locality to another is by human agency. Carefully recorded experience proves the importance of human movement and the transport of infected fleas in the personal effects of migrants. No evidence is forthcoming in support of the old theory that movement of grain, cotton or other merchandise is responsible for outbreaks of plague, nor is there any evidence of rat migration.

The spread and maintenance of plague in an infected locality however is in proportion to the rat population. The very great and continuous destruction of rats in Hyderabad City has reduced the rat population to a low figure. This is the chief safeguard against the rapid spread of plague.

The Plague Department continues to do its utmost in combating plague by all known and recognized methods, details of which have been recorded in many recent reports. These measures include inoculation, evacuation, disinfection and fumigation and the continuous campaign against rats.

After eight years of vigorous and continuous work plague has been brought under control and in spite of the conditions in the City being highly favourable for widespread epidemics, it is now possible to prevent plague from assuming epidemic proportions, as it did repeatedly before the adoption of the present system.

This is all the Plague Department can ever achieve. The work of eradication of plague will remain incomplete until vigorous steps are taken to strike at the very root of the rat population by constructing rat-proof houses. The conditions under which people are housed and the manner in which they live encourage plague and constitute a menace to health. Overcrowding is widespread and there is much congestion of buildings. The sanitary condition of some localities is deplorable. Slums and huts without solid foundations abound everywhere in the City, and are still being constructed in spite of Municipal laws and bye-laws. Such living conditions encourage the breeding of rats and constantly recurring epidemics of plague.

The City Improvement Board has carried out a number of clearing and reconstruction schemes with excellent results, but a large portion of the City still remains to be attended to. It is of vital importance that the City Improvement Board should accelerate the rehousing campaign as far as possible and continue to build hygienic dwellings in which shops, godowns and stables should be separated from human habitation. Not only are old houses allowed to remain in a dilapidated condition, encouraging close contact between man and rat, but new buildings are constructed, almost one might say, with the object of providing ideal conditions for the nesting and breeding of rats.

The Municipal Corporation must rigidly apply the rule that all houses which are newly built or reconstructed must be made rat-proof. All that is necessary is to insist on solid foundations, masonry walls, concrete or stone floors on stone plinths and roofs of solid construction. Such buildings offer no facility for rat runs or nests.

Along with this building programme it is advisable to improve general sanitation with special reference to those conditions which lead to rat infestation. Close attention should be given to the proper disposal of refuse, protection of food supplies, and the supervising of godowns.

A very important point which has not yet received proper attention is the development of a complete system of surface drainage. Until housing, drainage and sanitation are taken up with a definite policy based on scientific principles rigidly enforced, the complete eradication of plague from Hyderabad is extremely improbable.

The Plague Department in its operations have to record with sincere appreciation the very great assistance given by the Police and the large proportion of the public who willingly co-operated in measures devised for their benefit.

There are of course a number of people who either frankly disbelieve in the efficacy of our measures, or resent the enforcement of any change in their established customs.

The department have to record with gratitude the assistance received from Government in the granting of powers to deal with active obstruction and are glad to report that it is only very rarely that the department have to take advantage of these powers. At the same time without these powers it would be impossible for any Health authority to keep control of constantly recurring centres of infection.

The greatest difficulty is experienced in preventing people from infected areas in the City from migrating into non-infected areas. The department has to constantly appeal to public opinion to prevent this migration and to individuals to refuse to entertain their friends and relations from infected areas.

On the whole doctors, hakims and vaidas have reported suspicious cases to the Plague Department promptly. Without this assistance it is very difficult to obtain information regarding fresh outbreaks or either human or rat mortality.

The efficacy of the measures which we have adopted is well proved by the fact that in 43 localities where rat-falls were reported during this year, the adoption of anti-plague measures prevented the occurrence of a single case amongst human beings.

In preventing the spread of plague the value of the control of migration is well illustrated by the success achieved by the Secunderabad Health Authorities. The Secunderabad authorities placed barriers and only people coming from non-infected localities were permitted entrance. The result has been that for two years in spite of the infection in the neighbouring City of Hyderabad there have been no cases of plague in Secunderabad.

*Inoculation.*—In face of a threatened epidemic of plague and during the epidemic inoculation has proved the most valuable method of prophylaxis. Inoculation by the vaccine issued by Government affords a very high degree of protection against plague. It is perfectly safe to be inoculated during an epidemic. There are now fortunately only a few fanatical and ignorant people who object to inoculation.

During the year under report, 156,827 persons were inoculated.

Inoculation is done free at all Government hospitals and dispensaries, at the Special Plague Office and in all infected

localities. A Woman Doctor is provided for purdah ladies. During the year she performed 17,151 inoculations.

The following table gives the number of inoculations performed by the various agencies during the year 1346 Fasli :—

Inoculating Agency.	Total inoculations.
Officers of the Plague Department .. ..	1,17,596
Military Department .. ..	18,202
Municipality .. ..	1,630
Osmania Hospital .. ..	4,734
City Dispensaries .. ..	11,043
Private Practitioners .. ..	3,622
<b>Total .. ..</b>	<b>156,827</b>

*Evacuation.*—Evacuation of the inhabitants of infected areas is obviously essential. Accommodation is always available in the Health Camps and on the whole people have learnt the value of this measure, but it is to be regretted that complete evacuation of an area can rarely be achieved before human cases have occurred.

Thirteen Health Camps were available with accommodation for 16,000 people. Of these 13 Health Camps were occupied as shown in the accompanying table.

Serial No.	Name of the camp	Sheds occupied	Temporary huts erected	Total persons accommodated	Duration of the camp opened
1	Mushirabad ..	98	..	371	125 days

	<b>Total ..</b>	<b>1,332</b>	<b>485</b>	<b>8,615</b>	

*Fumigation.*—For fumigation of rat-holes calcid has now been substituted for sulphur and cyano gas, and has proved extremely efficient. Like the rat campaign by baits and traps, fumigation is carried on continuously throughout the year and is of great value in reducing the rat population and the flea index.

The following table gives the number of houses fumigated and rat-holes closed by Calcid each month during the year 1346 Fasli :—

Month.	Number of houses fumigated.	Number of rat-holes closed.
Azoor 1346 Fasli	.. 7,533	113,14
Dai "	.. 7,669	101,443
Bahman "	.. 7,304	99,436
Isfandar "	.. 8,039	104,181
Farwardi "	.. 8,761	84,329
Ardibehiht "	.. 7,419	100,640
Khurdad "	.. 8,287	112,490
Thir "	.. 4,620	47,729
Amardad "	.. 5,350	58,151
Shehrewar "	.. 7,616	97,494
Mehir "	.. 5,902	167,317
Aban "	.. 5,341	72,365
Total ..	83,841	1,158,721

*Disinfection.*—As in previous years kerosene oil emulsion (1 in 10) has been found efficient for the disinfection of houses. The destruction of fleas in clothing and bedding and other infected articles is achieved by exposing these to the direct rays of the sun for three hours.

Tiled and thatched roofs of houses are opened up so that direct sunlight may have access to any rat nests in the tiles and also to kill fleas in the roof and in the rooms.

*Treatment of Cases.*—Experience has shown that there is great advantage in immediate admission of plague cases to the Special Hospital provided for the purpose. The open-air wards provided and the treatment given by the trained staff assisted by specially trained Nurses gives a proportion of recovery which is greater than that among the patients treated in their own homes. The treatment of plague or any other disease in dark and ill-ventilated rooms is extremely dangerous.

Secondly, by the admission of cases to the Special Hospital the danger of spread of infection is minimised.

The public have realised the value of the Isolation Hospital and out of 520 reported cases of plague during the year 366 were admitted to the hospital.

No specific drug has yet been discovered for the cure of plague, but the department have introduced a form of treatment which has so far given surprisingly good results. The details of this treatment have been published in the Indian Medical Gazette.

48 cases of plague were given this new treatment with a mortality of 16.7 per cent. 48 similar cases treated by routine hospital methods showed a mortality of 47.9 per cent. This is very encouraging and the treatment will be applied to further cases. The difficulty is to get sufficient patients to fully confirm the results so far achieved.

*Anti-rat Campaign.*—Rat destruction remains the most valuable permanent anti-plague measure. The reproductive powers of rats bewilder imagination, and the possibility of total extermination in a City is probably impossible. Fortunately experience shows that total elimination of rats is not necessary for the eradication of plague. As long as the population can be kept at a low figure plague does not occur.

A continuous and organized rat campaign is carried on throughout the year. The routine consists of baiting each house for three days, subsequently trapping the same house for two days and finally fumigation and closing of all rat-holes. To complete the circuit of the City takes six weeks, so every house in the City is thus treated eight times every year. Barium carbonate is the poison used for destroying rats which has the advantage of being practically harmless to domestic animals and human beings. Each bait consists of 1.9 grs. of barium carbonate with 8 grains of wheat flour.

The number of baits used during the year was 124 lakhs of which 31 lakhs were recovered, so that 93 lakhs of baits were consumed presumably by rats. Each bait contains a lethal dose for an adult rat. Even supposing that one rat is killed for every two baits consumed, it is possible to compute that 46 lakhs of rats were destroyed by this means.

The following gives the comparative results of baiting and trapping for the last seven years :—

Year	Houses baited	Baits set	Rats assumed to be dead	Rats trapped and killed	Rats destroyed
1840 F. ..	209,383	2,502,293	583,706	236,063	818,768
1841 F. ..	730,862	9,328,242	2,911,640	496,387	34,07,977
1842 F. ..	1,112,428	11,938,770	4,189,185	340,950	4,530,135
1843 F. ..	1,533,827	9,980,387	3,476,982	518,319	3,995,301
1844 F. ..	1,706,773	10,480,141	3,773,590	504,801	4,278,391
1845 F. ..	2,017,742	17,372,790	6,535,918	403,457	6,939,375
1846 F. ..	1,678,545	12,415,911	4,646,719	549,512	5,196,231

*Laboratory.*—The laboratory work as reported in previous years has been continued and all results are carefully tabulated and recorded. The work includes the examination of rats, their classification, dissection and examination for plague infection, the examination of fleas and the recording of the flea index. Meteoriological findings are carefully recorded and their relationship to epidemics noted.

[Statement.

The following table shows the monthly number of rodents dissected, and those found infected during the year under report.

*Classification and examination of rats during the year 1346 Fasli.*

Total ..	1,460	520

*Propaganda.*—Incessant educational propaganda is undertaken and has on the whole been successful in gaining the confidence of the public. 34 lectures were given with the Cinema Car and 36 public Magic Lantern lectures were given, special attention being paid to schools and institutions. Regular radio talks were given. Pamphlets, posters and circulars in different local languages were printed and distributed.

We have to thank the vernacular press for useful press notifications which were issued without cost.

The personal talks given by all members of the plague staff have done much to remove objections and superstitions.

*Frontier Villages.*—The usual anti-plague measures were carried out in the 216 Frontier Villages on the same lines as mentioned in the last annual report.

The routine baiting and trapping campaigns in these villages for the last eight years have resulted in enormous rat destruction and it has been possible to isolate and arrest all outbreaks in these villages.

During the year under report only 14 villages were infected and in all 58 cases and 30 deaths occurred as follows :—

Name of Village.	Total attacks.	Total deaths.
Mallepalli .. ..	7	6

## PART V.

*Special Malaria Department.*

The City Improvement Board have slowly been effecting improvements in the old-walled city but still there remains a definitely lower standard of sanitation here than in the recent extensions of the town.

The Special Malaria Department started its work eight years ago. At that time the preliminary survey indicated a serious state of affairs. Anopheline infestation was severe and the splenic index high. In one area 87 per cent. of the children were found to have enlarged spleens. At that time there were about 6,000 wells present in the old-walled city and all were breeding anopheline mosquitoes known to be dangerous carriers of malaria. Besides wells there was plentiful breeding in the bed of the River Musi, in the Musheerabad channel and in areas of wet cultivation. To a smaller extent breeding was also going on in casual and permanent collections of water. Unfortunately wet cultivation is still permitted within the City limits.

The mosquitoes responsible for malaria in Hyderabad City are:—*A. stephensi*, *A. culicifacies*, *A. fuliginosus*, *A. hyrcanus* and *A. barbirostris*.

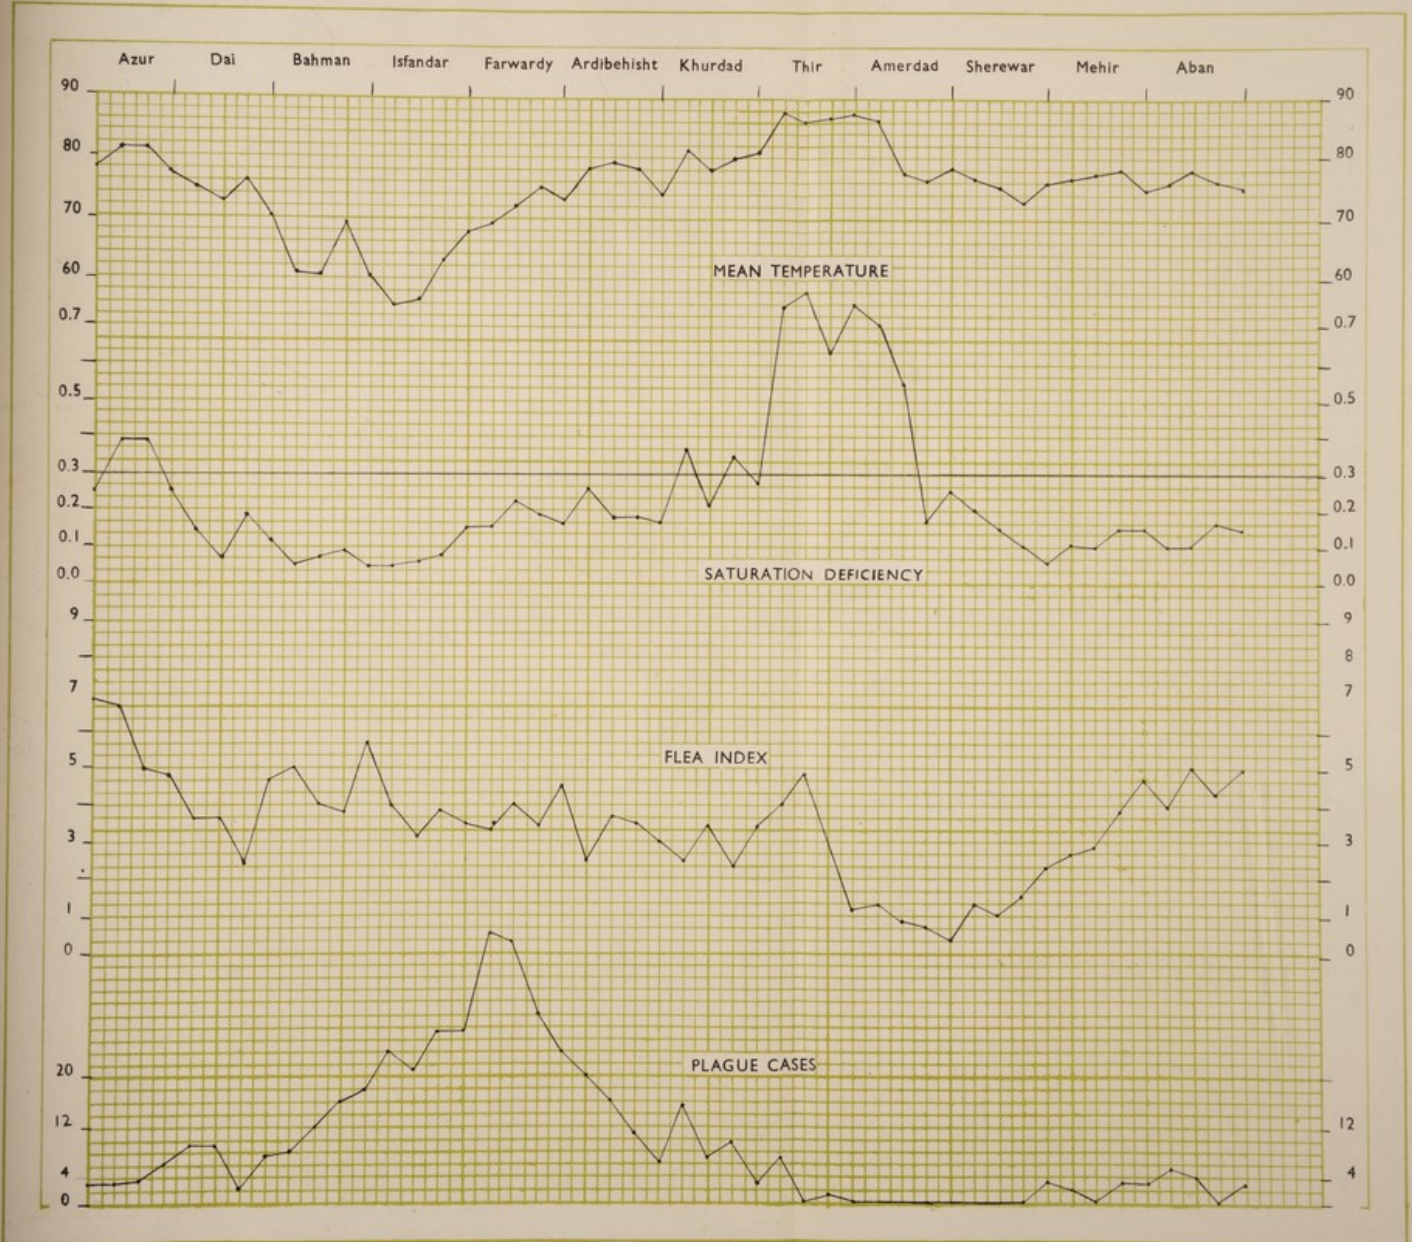

The common sources of culex nuisance are the incomplete and broken down system of town surface drains, partially filled "bowlies," masonry cisterns outside private houses (these are now rapidly disappearing); to some extent the margins of large collections of water, rice fields and pits in the Musi River-bed, all these breeding grounds of culex mosquitoes receive as much attention as more urgent work against anopheles allows but much has been achieved. Culex also breed freely in broken toddy cups and bottles, in ant-excluders and in vessels containing water in private houses. These domestic sources of culex are out of our control. If people would accept our constant recommendation to empty all water vessels in their houses once a week the nuisance would rapidly disappear.

The Municipal Corporation are very gradually taking up different parts of the City section by section and providing new good surface drains. When completed this should help immensely in the reduction of culex mosquitoes. The Municipality is gradually filling up some of the bigger wells also.

The routine activities of the Malaria Department have been dealt with in some detail in the annual reports that have been issued year after year. Careful inspection and regular treatment of breeding grounds with special attention to wells and water-ways has produced very satisfactory results.

Practically no permanent works except filling in of pits were taken in hand this year on account of paucity of funds. Out of 6,000 wells 1,316 have been permanently closed but none this

Weekly Chart Showing Mean Temperature, Saturation Deficiency, Flea Index  
& Plague Cases 1346 F.

Weekly Chart Showing the Temperature, Heart Rate, Saturation, Flea Index, and Plaque Count in a Pique Case 1346

year. It is earnestly hoped that funds will be soon available to extend the pipe line and to enable the Malaria Department to complete the work of well closing. In the meantime wells are regularly treated with larvicides except on premises to which the Malaria staff are forbidden admission. In the face of great reduction in malaria, it is surprising how many people through prejudice or ignorance refuse treatment of their wells. Unfortunately this resistance on the part of the public is only very gradually being overcome.

The Malaria Department concerns itself chiefly with controlling breeding grounds of anopheline mosquitoes, but a partial attack is made on the breeding places of the culex mosquitoes also.

The activities of the Malaria Department may be summarised as follows :—

(1) Systematic use of larvicides.

'Malariol' (a product of Messrs. Burmah Shell Company) and Paris Green in one and two per cent. strengths mixed with fine dust are the two larvicides in use. Details about their composition and method of use were given in the last year's report.

(2) Destruction of water hyacinth and other aquatic plants which shelter larvæ and interfere with efficient treatment. The River Musi, Musheerabad channel and other water-ways have been kept clear of hyacinth.

(3) Pools and collections of water are filled in where possible otherwise an attempt is made to connect them up and provide an ultimate outfall into one of the permanent water-courses.

(4) Use of larvicidal fish has been tried but has proved of little value in Hyderabad City.

(5) *Propaganda*.—Public lectures with the aid of magic lantern slides are given regularly in the city and are well attended.

A speech on "Malaria" was broadcast by the Chief Malaria Officer, Hyderabad.

The cause of malaria, its mode of spread and the methods of protection against it, are constantly explained to the public during routine work.

The public is invited to visit the Malaria Laboratory where demonstrations are given.

Posters and leaflets in Urdu, English, Telugu and Mahrathi entitled "How can you assist the Malaria Department in protecting yourself and your neighbours from Malaria" were distributed.

(6) *Laboratory Experience*.—Very large number of larvæ are collected, identified and bred out in the laboratory. Adults are caught with specially devised traps from houses and dissected for evidence of infection. Blood smears are examined.

8,108 larvæ were collected and identified. *A. subpictus* 7,117; *A. stephensi* 367; *A. hyrcanus* 239; *A. culicifacies* 184; *A. barbirostris* 173; *A. fuliginosus* 26 and *A. pallidus* 2.

A. stephensi and A. culicifacies are dangerous carriers.

356 adults were bred out in the laboratory. A. subpictus 252; A. stephensi 42; A. hyrcanus 34; A. barbirostris 18; A. culicifacies 5 and A. fuliginosus 5.

For various local reasons work on larvicidal fish has not been extensive. Larvicidal fish, however, were placed in several wells not regularly available to the Malaria Department. The results in such cases were satisfactory.

The life history of the Eye-fly (*Siphunculina funicola*) has been successfully worked out. Work on other flies in the same genus existing in Hyderabad City is in progress.

It was suggested that scorpion might be useful as treatment in guinea-worm infections. Experiments with scorpion poison on earthworms were tried. 1/10th of the poison available from one ordinary brown scorpion (*Buthus*) was enough to kill an earthworm in about half a minute. No experiments have yet been made on guinea-worms in human cases.

"Pyroicide 20" and "Pyretol 19:1" two insecticides (Extracts of *Pyrethrum* flowers) have been placed on the market. These were tried on mosquitoes, ordinary house-flies and bed bugs in a closed room. The experiments are encouraging.

Experiments with copper-sulphate to gauge its utility as a disinfectant in cholera affecting running and large collections of water were carried out in the Nizamabad district. A report was prepared and submitted.

On the request of the Agricultural Authorities a report was submitted on the effect of the Paris Green on paddy cultivation. Experiments by mixing Paris Green mixture (one and two per cent.) with the soil from which very young rice plants were growing were carried out. No untoward effects were observed.

*Training of District Health Staff.*—One Assistant Health Officer, two Assistant Surgeons, two Sub-Assistant Surgeons, one Sanitary Sub-Inspector of Singareni Collieries and four Health Sub-Inspectors were given special training in anti-malarial work.

*Surveys.*—A detailed survey of the Nizamabad district with a view to gauge the extent of malaria present and any likelihood of its increase from extensive wet cultivation now possible with the Nizamsagar canal system was carried out. A report was prepared and submitted which was approved.

Anti-malarial measures were introduced in the Military area last year. The results of a year's work have been quite satisfactory.

The Chief Malaria Officer visits dispensaries in the Municipal area to check the numbers of patients diagnosed as malaria and to see that efficient treatment is given and accurate records maintained. The results of the campaign are measured by the records over many years of these dispensaries. These returns (see Statement III) show a steady reduction in cases treated as malaria.

Attendance for all diseases and for malaria at Osmania, Victoria Zenana Hospitals and Doodbowli, Kamatipura and Yacootpoora dispensaries.

	Before Malaria Camp- aign	1339 F.	1340 F.	1341 F.	1342 F.	1343 F.	1344 F.	1345 F.	1346 F.

The Splenic Index is taken yearly in the month of Mehir (August) and shows a steady decrease. (See Map).

The reduction in malaria this year has been marked. There is a corresponding improvement in the general health of the people. The cost of the work this year is H. S. Rs. 48,702 or B.G. Rs. 40,585. (See Statement II).

STATEMENT I.—SHOWING WORK DONE IN 1346 FASLI.

During the year 81,043 wells were treated with "Malarial" and 24,703 with "Paris Green."

Very large numbers of cisterns, drains, pools, etc., were similarly treated.

Treatment of wells and cisterns was not possible on over 7,000 occasions during the year mostly owing to evacuation on account of plague, but in some cases to obstruction which is lessening only very gradually.

[Statement.

## STATEMENT II.

Showing the Annual Budget and Expenditure of the Malaria Department for the year 1346 F.

## PART VI.

*Tuberculosis.*

In the year of report I paid a visit to the Tuberculosis Sanatorium at Madanapalli to consult the Superintendent Dr. Frimodt Moller on technical matters connected with the proposed Anantagiri Sanatorium. The site selected at Anantagiri, measuring 142 acres 19 guntas, for the Sanatorium was acquired from the Sarf-i-Khas Department on payment of a compensation of Rs. 20,000. A sum of 3 lakhs has been provided from the Silver Jubilee Funds for the Tuberculosis Sanatorium. The site is very attractive and at an altitude of about 2,230 ft., above the sea-level. Only a moderate expenditure will be required on scrub clearance, road-making and drainage. The site is well elevated above the surrounding country and is free from liability to malaria and epidemic diseases. Malaria is not found in the few villages which exist within three miles of the site of the Sanatorium. The air is fresh and free from dust. An Engineer from the Public Works Department was deputed to the Madanapalli Sanatorium to make a technical survey of the institution and see the arrangements, etc. The Public Works Department have been asked to expedite the preparation of final plans and estimates of the various Sanatorium buildings and are making proposals for increasing the water-supply.

The Sanatorium is to provide accommodation in various classes of wards at Anantagiri for 120 cases selected for Sanatorium treatment. The selection will be made by the Special Tuberculosis Officer who will be in charge of all activities devised to combat the disease. All up-to-date equipment and facilities for the modern treatment of Tuberculosis will be available. Electric light and Power and ample water-supply and dust-proof roadways will be provided at the Sanatorium. Adequate arrangements will be made for provision of good milk and all articles of food.

The donation of Rs. 1,63,000 received last year from His late Majesty King Emperor's Silver Jubilee Funds has been deposited with the Imperial Bank of India for Tuberculosis relief work in Hyderabad. The plans and estimates for a clinic to be constructed behind the suburban dispensary were received and sent up to Government for sanction. Plans and estimate for the creation of a Special Tuberculosis Hospital at Lingumpalli with quarters for the staff were under preparation by the Public Works Department at the close of the year. Construction of both institutions is to be commenced at once.

Meanwhile the Tuberculosis relief work in Hyderabad has not been neglected. A Tuberculosis Clinic has been functioning, in existing buildings, at the suburban dispensary where patients are treated and receive advice on home treatment. Suitable cases are recommended for admission to the Osmania Hospital where a limited accommodation is provided for T. B. patients of both sexes.

Chronic and highly infectious cases are admitted to special open-air wards in the Isolation Hospital.

Pulmonary Tuberculosis is definitely more common and will persist until people learn to live in clean, well-ventilated houses and are educated to realise the alarmingly infectious nature of the disease, the importance of isolation of the sick and the significance of the so-called "Open Window Campaign." Purdah arrangements must be so arranged that privacy does not mean polluted air and the exclusion of sun-light.

(a) *Beyroon-Balda Dispensary*.—The suburban dispensary Tuberculosis clinic continued to work daily from 8 a.m. to 10 a.m.

The number of outpatients is steadily increasing from year to year which is a gratifying sign of the increasing popularity of the clinic, but a depressing proof of the wide prevalence of Tuberculosis. The outpatients attendance during the year of report as compared with the last year's figures was as follows :—

	1346 Fasli.	1345 Fasli.
New Patients .. ..	1,408	1,345
Old Patients .. ..	18,993	10,718

The daily average was 55.9 as against 33.5 in 1345 Fasli.

*New Patients* :—

	1346 Fasli.	1345 Fasli.
Men .. ..	747	747
Women .. ..	524	496
Male Children .. ..	68	56
Female Children .. ..	69	46
Total .. ..	1,408	1,345

	1346 Fasli.	1345 Fasli.
<i>Communities</i> :—		
Hindus .. ..	266	278
Muhammedans .. ..	1,090	1,002
Christians .. ..	50	65
Others .. ..	2	..
Total .. ..	1,408	1,345

(b) *Osmania Hospital*.—The total number of patients treated during the year was 198. The number of patients discharged was 173 and 25 patients were under treatment when the year closed.

The discharge results were as follows :—

Much improved .. ..	60
Improved .. ..	69
Stationary .. ..	10
Worse .. ..	4
Discharged otherwise .. ..	19
Transferred to Isolation Hospital .. ..	9
Died .. ..	2

*Communities :—*

	Men.	Women.
Christians .. ..	13	11
Hindus .. ..	28	27
Muhammedans .. ..	53	41
Total .. ..	94	79

The majority of the patients came from the town. A few came from the districts; notably from Nalgonda, Mahboobnagar, Warangal, Medak, Bidar and Gulbarga.

The majority of cases were in the advanced stage.

*Artificial Pneumothorax.*—Of the 173 patients discharged 84 were found to be suitable for this treatment but among 5 it was not possible to induce artificial Pneumothorax due to adhesions.

*Sanocrysin.*—94 out of the 173 patients discharged were treated with Sanocrysin. Many of them had good results.

*Ultra Violet Light Treatment.*—11 patients suffering from intestinal Tuberculosis were given this treatment with very satisfactory results.

*Age Incidence.*—The majority of patients were in the ages between 15-35. Children are not usually admitted. The accommodation in the Hospital being very limited it is not possible to take in many patients.

*Complications.*—Besides complications due to Tuberculosis such as Hæmoptysis, Intestinal ulceration, Pneumothorax and Empyema, several patients had intercurrent disease due to Malaria, Syphilis and Diabetes.

(c) *Isolation Hospital.*—439 cases of pulmonary Tuberculosis were admitted into the hospital during the year as against 392 of the last year.

The results of the cases discharged were as follows :—

Much improved .. ..	35
Improved .. ..	189
Discharged otherwise .. ..	77
Died .. ..	101
Remained under treatment at the close of the year .. ..	37

The following figures show classification into sex and communities.

	Males.	Females.
Muhammedans .. ..	131	114
Hindus .. ..	128	40
Christians .. ..	14	12

Almost all the cases in this institution were admitted in the last stage. Many of them were in a moribund condition.

## PART VII.

1. *Vaccination.*—The undermentioned table shows the number of vaccinations performed during the year compared with the last year (Annual Statement No. I).

Year	Primary vaccinations	Revaccinations	Total
1346 F. .. ..	359,690	17,394	377,084
1345 F. .. ..	340,448	15,108	355,556
Plus .. ..	19,242	2,286	21,528

There was an increase of 21,528 in the number of vaccinations performed during the year, when compared with last year. Owing to defective registration, Police Patels do not enter all Births in the register provided for the purpose and in many places the Birth registers are blank. Unless and until details of Births are given by Police Patels to the Vaccinators, there will be difficulty in increasing the number of vaccinations and waste of time in the work.

2. *Vaccination in Districts.*—The number of vaccinations in rural areas was 328,009 primary with 12,223 revaccinations, a total of 340,232. Warangal held the first place with 26,089 and Aurangabad next with 25,495 operations. The number of children under one year of age successfully vaccinated was 89,875 against 91,186 in 1345 Fasli.

3. *Vaccination in Hyderabad Municipality.*—The number of vaccinations in the Hyderabad Municipality was 22,020 consisting of 17,430 primary and 4,590 revaccinations. The corresponding figures for last year, were 23,047; 16,505 and 6,542 respectively. 7,089 children under one year of age were successfully vaccinated against 7,361 last year. The rate of successful vaccinations per thousand of population was 60.2. Thirteen vaccinators were employed by the Hyderabad Municipality. The post of Woman Vaccinator was not filled during the year of report. For a population of nearly four lakhs, the vaccination work is unsatisfactory. The attention of the Municipal Corporation will be drawn to this. The Public Health Department has no control over the Municipal Vaccinators.

[Statement.

11

4. *General.*—The successful vaccinations performed in the Dominions during 1346 Fasli by various agencies are shown in the table below :—

Agencies	NO. OF SUCCESSFUL VACCINATIONS		PERCENTAGE OF SUCCESSFUL CASES IN WHICH THE RESULTS WERE KNOWN	
	Primary	Reavvaccinations	Primary	Revaccinations
Shahi Vaccinators.. ..	286,984	6,395	96.2	66.5
Municipal Vaccinators ..	16,952	3,882	97.7	88.4
Sarf-i-Khas Mubarak Vaccinators	11,971	290	96.8	52.7
Other Agencies .. ..	13,309	418	98.5	81.2
Total ..	329,216	10,985	96.4	71.6

5. *Mortality from Small-pox.*—The number of deaths registered from small-pox in 1346 Fasli is 245 against 1,166 last year.

6. *Establishment.*—The strength of the Vaccination Staff employed in the Dominions was 146 during the year of report against 147 last year. The temporary post of a Local Fund Vaccinator for Banswada ceased to exist.

The average number vaccinated by each vaccinator was 2,481 against 2,292 in the year before. The increase was due to vigilance on the part of Inspecting Officers. Health Officers took greater interest, in organizing and augmenting the work in the districts.

7. *Cost of Vaccination.*—

Establishment	TOTAL EXPENDITURE		AVERAGE COST OF EACH SUCCESSFUL CASE	
	1346 F.	1345 F.	1346 F.	1345 F.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Shahi Vaccinators ..	89,005 11 11	72,929 9 1	0 4 10	0 3 7
Municipal Vaccinators..	5,298 10 6	4,410 12 8	0 4 1	0 3 4
Sarf-i-Khas Mubarak Vaccinators ..	3,565 7 6	3,265 10 3	0 4 7	0 4 2
Total ..	97,869 13 11	80,606 0 0	0 4 9	0 4 3

This expenditure does not include the cost of manufacture and other expenses of the Vaccine Depot which are given later in this report.

Annual statement No. IV, shows the total number primarily vaccinated for each year in the decennium ending 1346 Fasli.

The steady increase from 142,775 to 359,690 is fairly satisfactory. If this progress is continued, and revaccination more readily accepted, the fear of widespread epidemics of small-pox will disappear.

8. *Inspection of Vaccinated Cases.*—The Health Officers of the 17 districts inspected 4,083 cases of which 3,637 were successful. They visited 332 villages and were on tour for 239 days during the year.

The Assistant Health Officers were fully occupied with outbreaks of cholera but were able to inspect vaccination work in 2,157 villages, seeing 14,275 vaccinations of which 12,712 were successful. They also performed 685 vaccinations.

In rural areas, the 16 Deputy Inspectors of Vaccination inspected 63,664 vaccinated children in 2,449 villages and spent 2,423 days on tour. The percentage of inspection to total vaccinated cases amounted to 17.5 per cent. against 13.1 per cent. in the previous year.

The inspection work done during 1346 Fasli was not satisfactory taking into consideration the total number of vaccinations performed namely, 377,084. Health Officers of districts have been instructed to interest themselves in this important work and to see that they, the Assistant Health Officers and the Deputy Inspectors of Vaccination inspect more efficiently in future.

The work done by the Deputy Inspectors of Vaccination was poor indeed. Only 16.9 per cent. of vaccinations were inspected against an accepted rate of 60 per cent. in British India. More satisfactory inspection must be obtained next year. The department is seriously contemplating the retirement of these promoted vaccinators and replacing them by qualified Health Inspectors.

The difficulties met with by vaccinators are common to all communities. Apathy, ignorance and superstition are common enough and vaccination only becomes easy in face of an epidemic. The Police Patels are neither accurate in their registers nor helpful when vaccination is in progress. The Revenue Departmental Officers have assisted by punishing Patels in some cases, but lenient punishments have had little effect. Until the Patels realize that the Revenue Officers are interested it is difficult to make real progress. District and Taluq Boards must be prepared to appoint extra vaccinators when recommended by the District Medical Officer.

The small number of secondary vaccinations performed, (11,157) indicates that the public at large have not yet realized how essential is revaccination to maintain immunity from small-pox. The District Health Officers have been instructed to push on revaccination by active health propaganda.

9. *Vaccination in Jagirs.*—Special difficulty is often experienced by Government vaccinators in getting children in Jagir villages for vaccination purposes. The Patels and Patwaries are not helpful and much time is wasted. There is naturally a general tendency among the vaccinators to avoid Jagir areas. District Health Officers have been asked to take special care that

such villages are not totally neglected and to arrange effective Health lectures and intensive propaganda and to give the vaccinators all reasonable support.

*Vaccine Depot.*—Dr. M. Farooq remained in charge of the Vaccine Depot throughout the year.

*Calves.*—Calves were purchased through a contractor. 177 cow-calves and 11 buffalo-calves (total 188 calves) were purchased as against 105 cow-calves and 21 buffalo-calves (total 126 calves) purchased last year.

Out of 166 cow and 13 buffalo-calves vaccinated, 158 cow and 11 buffalo-calves gave successful results, giving a 'success rate' in calves of 94.14 per cent. against 95.13 per cent. for 1345 Fasli.

Inspector from the Veterinary Department regularly inspected the calves in the Depot and treated 7 calves during the year for minor ailments.

No infectious disease occurred among the calves. One cow-calf died before vaccination.

*Yield of Pulp.*—The yield of lymph pulp from 158 cow-calves was 1909.9 drachms giving an average of 12.08 drachms per cow-calf as against 11.53 drachms per calf obtained last year.

The yield of lymph pulp from 11 buffalo-calves, for seed lymph, was 158.5 drachms with an average of 14.36 drachms per buffalo-calf against 13.61 drachms last year.

For the Nejlant's cycle of rejuvenating the seed lymph 5 rabbits were vaccinated successfully during the year. The total yield of lymph pulp was 6 drachms giving an average of 1.2 drachms per rabbit, against an average yield of 0.91 drachm per rabbit last year.

*Statement I.*—Comparative statement showing number of calves vaccinated, amount of lymph manufactured and yield per calf from 1342 Fasli to 1346 Fasli.

Year	Calves			Lymph pulp		Doses Manufacture	
	Number Vaccinated	Number Successful	Percentage successful calves	Total yield drachms	Average yield per calf drachms	Total	Average No. of doses per calf
1342 F.	195	180	92.31	1,955.0	10.86	374,680	2,081.55
1343 F.	194	181	93.30	1,713.0	9.46	403,844	2,231.18
1344 F.	208	200	96.15	2,118.34	10.59	523,050	2,615.25
1345 F.	123	117	95.13	1,155.6	11.53	423,843	3,622.59
1346 F.	179	169	94.14	1,909.9	12.08	602,890	3815.78

The total number of Lymph doses manufactured during the year was 602,890 as against 423,843 last year. This number together with 131,154 doses remaining in cold storage at the beginning of the year, gave a total stock of 734,044 doses available for distribution and for use as seed-lymph during the year.

*Statement II.*—Shows details of the quantity of Lymph doses manufactured and distributed during the year under report.

*Statement showing Quantity of Lymph Doses manufactured during the year 1346 F.*

*"Case Success" Rate of Primary Vaccinations.*—Lymph statements received from the Vaccinating Units show the case success rate to be 96.7 as against 97.4 for 1345 Fasli.

[Statement

The following shows the percentage of successful primary vaccination reported from districts during the year.

No.	Vaccinating Units.	Percentage success.
1.	Hyderabad City and Suburbs ..	97.6 per cent.
2.	Secunderabad and Bolarum ..	99.0 "
3.	Lallaguda ..	92.5 "
4.	Atraf-e-Balda ..	96.3 "
5.	Aurangabad District ..	98.4 "
6.	Bhir ..	98.5 "
7.	Nander ..	96.3 "
8.	Parbhani ..	95.6 "
9.	Gulbarga ..	97.5 "
10.	Bidar ..	96.5 "
11.	Osmanabad ..	99.0 "
12.	Raichur ..	98.2 "
13.	Medak ..	93.6 "
14.	Nizamabad ..	96.2 "
15.	Mahboobnagar ..	96.4 "
16.	Nalgonda ..	95.6 "

*Sale of Lymph to non-Government Departments and Private Persons.*

During the year 28,551 doses against 25,375 doses last year were sold at varying rates of 2 annas 6 pies and B.G. 1 anna 1 pie (*i.e.*, equivalent to O.S. 1 anna 3 pies) the latter rate being specially sanctioned by Government to meet the wishes of Secunderabad Cantonment Authorities who have, since Shehrewar 1341 Fasli, been purchasing vaccine lymph from the Vaccine Depot.

*Statement IV*—shows the details of sale proceeds of vaccine lymph supplied to non-Government departments and private individuals in 1346 Fasli and 1345 Fasli of which the following is a synopsis :—

	1346 Fasli.			1345 Fasli.

*Financial Aspect.*

The Budget Grant sanctioned for 1346 Fasli was O.S. Rs. 22,893 against O.S. Rs. 22,486 last year.

The expenditure involved during the year was O.S. Rs. 18,693-2-10 against O.S. Rs. 14,473-11-2 for 1345 Fasli.

The increase in the expenditure during the year is due to purchase of more calves and the manufacture of more lymph to meet the increased demand from districts. During the year 188 calves were purchased against 126 last year and 602,890 doses of lymph were manufactured against 428,843 last year.

A Doring's lymph grinding machine with accessories was purchased for O.S. Rs. 766-14-3 during the year.

The amount realised from the sale of Vaccine Lymph to private bodies was O.S. Rs. 4,010-14-4. The sale proceeds from vaccinated calves and miscellaneous articles during the year was O.S. Rs. 820-9-0. Thus a total sum of O.S. Rs. 4,831-7-4 was realised during the year against O.S. Rs. 4,009-2-6, last year.

The net expenditure after deducting the sale proceeds was O.S. Rs. 13,861-11-4 as against O.S. Rs. 10,464-8-8 last year.

*Average cost of Lymph per dose.*—The average cost of lymph per dose manufactured at the depot works out as under:—

	During	
	1346 F.	1345 F.
(a) On total expenditure ..	5.9 pies.	6.5 pies.
(b) On net expenditure ..	4.41 „	4.7 „

*Purity and Potency of Vaccine Lymph.*

During the exposure of the Vaccine Lymph to the action of glycerine under suitable conditions of temperature, the number and nature of the living Bacteria present are periodically determined, the results being recorded. This treatment and examination of, the Vaccine Lymph continues until the total number of living Bacteria has been reduced to not more than 5 in 1 Milligram or 5,000 in 1 c.c. of the Vaccine Lymph, and no Vaccine Lymph is issued until this reduction has been effected.

Each batch of Vaccine Lymph is further submitted to tests for the presence of living-gas-producing Anærobic organism and for the presence of Hæmolytic Streptococci. Their complete absence is ensured before issue.

Each batch, after all the procedures required for preparing it for issue have been completed, is tested for potency so as to ensure its activity at the time of issue.

*Bacteria Free Vaccinia Virus.*

As stated last year in the Annual Report it has been recognized for sometime that the standard methods of producing vaccinia virus might be improved upon. Great care and labour are needed to produce a safe lymph. Many investigators have

been conducting experiments. Here experiments are in progress. Fertile eggs are inoculated and it has been found possible to produce lymph which is bacteriologically sterile. Tests of potency showed a good strong Vaccine Lymph. It remains to complete immunity experiments and these are in progress.

TRAINING OF VACCINATORS, PROBATIONERS AND HEALTH  
SUB-INSPECTORS.

*Vaccinators.*—One class for training candidates in Vaccination, lasting for a period of 6 months, was conducted during 1346 Fasli.

	During the year.	
	1346 Fasli.	1345 Fasli.
Total number of candidates admitted for training ..	13	10
<i>Results :—</i>		
1. Passed during the year .	9	8
2. Candidates discontinued training during the year .. ..	0	2
3. Candidates failed ..	3	0
4. Candidates did not appear for Examination ..	1	0
Total ..	13	10

Refresher courses in Vaccination were given to Vaccinators from districts for a period of four weeks during the year. They all passed the examination held at the end of the course.

Probationer Compounders from Osmania General Hospital were trained in vaccination work, in 3 batches for a period of one month each. Out of the total of 19 candidates trained during the year one failed and one did not appear for the examination.

During the year, the second course of 6 months training in Vaccination (from Khurdad to Aban) was limited to Health Sub-Inspectors from districts.

Four Health Sub-Inspectors were sent for training in the Depot. They were detailed for training in the Plague and Malaria Departments for a period of one month in each department. All the four passed the examination in vaccination at the end of their training.

As in previous years, Haj Pilgrims proceeding from Hyderabad to holy places of pilgrimage were revaccinated against small-pox and inoculated against cholera at the Vaccine Depot.

The number of certificates issued was 295 as against 348 last year.

## PERSONAL.

No one who cares to study the figures of attendance at the Government Hospitals can fail to notice the steadily growing popularity of these institutions.

The total number of in-patients in the last ten years has increased from 13,447 to 37,782 and outpatients from 3,038,959 to 7,124,643.

This great extension of the benefits of modern treatment could not have been made available, but for the generous support in every way, including increased financial grants generously given by Government. The department is very grateful to the Hon'ble Member and the Army Secretary for unfailing and sympathetic support.

In the department itself it is my pleasant duty to call the attention of Government to the arduous and skilful work of all the Medical Officers. I would particularly mention the younger generation who are well qualified professionally and inspired by a real spirit of service to the public.

The Medical Officers received every year as new recruits from the Osmania Medical College are a credit to their University and to the department.

I have much pleasure in mentioning Dr. V. S. Mohalker, the Second Surgeon, Dr. V. G. Borgaonker the Gynæcologist, Dr. Bankat Chandra the Second Physician, and Dr. Abdul Ali Khan the Anæsthetist, all of the Osmania Hospital and Dr. Venkat Rao, the Ear, Nose and Throat Specialist.

Dr. Mohammed Farooq, the Chemical Examiner has done valuable work for Government.

The Chief Malaria Officer Dr. Mian Mohammed Siddiq and the Special Plague Officer Captain C. L. Ahluwalia have worked untiringly and successfully for the benefit of Hyderabad City.

Among Assistant Surgeons the following have done valuable work :—

V. M. Joshi at Jalna, Govind Trimbak Rao at Osmanabad; N. S. Ganesh as Medical Inspector of Schools; S. Raghvendra Rao and A. C. Abraham in the Public Health Department; Hakeem Abdul Rahman at the Isolation Hospital and Mohammed Riasat Ali Khan in the Child Protection Scheme.

Yeshwant Rao Bhide one of the best of the Assistant Surgeons was invalidated from the service for serious illness. This is a severe loss to the department.

Finally in thanking the Officers of the department for loyal support I would mention the constant assistance in administrative matters I have received from Dr. C. F. Chenoy, the Deputy Director of Public Health and from Syed Lutf Ahmed, the Personal Assistant.

## ABSTRACT.

### SOME OBSERVATIONS WITH THE 'ENTORAY' MACHINE\*.

BY

M. M. SYDDIQ, M.B., B.S., L.R.C.P., M.R.C.S., D.O.M.S., D.P.H., D.T.M. & H.,  
*Chief Malaria Officer, Hyderabad-Deccan.*

[6th August, 1938.]

THE author gives an account of certain experiments carried out with the 'Entoray' machine in various localities in Hyderabad State, Deccan, during the year 1935.

His conclusions are in the main in agreement with those arrived at by Wats and Bilderbeck (1936)† and by Senior White *et al.* (1936)‡, namely that whilst the machine undoubtedly catches mosquitoes it is not likely to prove of practical value as a measure of malaria control.

The following summary is given by the author at the end of the paper :—

1. The machine catches mosquitoes and other disease-carrying insects.
2. Its cost compared with the results obtained is high, particularly the initial cost.
3. It cannot replace the anti-malarial measures in use at present.
4. It is a machine and therefore has the drawbacks inherent in a machine, namely, it may get out of order or be damaged, or the mercury tube might be broken, or its function impaired by deposition of mercury on the electrodes and general wear and tear.
5. It is useless during rains or winds. In bright moonlight nights its efficiency is impaired.
6. It might have undesirable effects on human beings and plants.
7. It requires a special voltage to work it.

G. C.

ABSTRACT

STUDY OF THE EFFECTS OF THE TREATMENT OF

THE DISEASE OF THE LIVER IN THE

OF THE

The object of this study was to determine the effect of the treatment of the disease of the liver in the

1. The first group of patients was treated with the following regimen:
2. The second group of patients was treated with the following regimen:
3. The third group of patients was treated with the following regimen:
4. The fourth group of patients was treated with the following regimen:
5. The fifth group of patients was treated with the following regimen:
6. The sixth group of patients was treated with the following regimen:
7. The seventh group of patients was treated with the following regimen:
8. The eighth group of patients was treated with the following regimen:
9. The ninth group of patients was treated with the following regimen:
10. The tenth group of patients was treated with the following regimen:

The results of the study are as follows:

The first group of patients showed a marked improvement in their condition after treatment.

'ENTO-RAY' MACHINE.

It has been held upto this time that mosquito must  
light, but experiments with this machine oblige us to correct  
our views about the photo-taxis of mosquitoes. The inventor  
is very loquacious about the execution of his machine but is  
equally reticent about the type of the lamp he uses and the  
composition of the rays it emits. Before describing the  
the machine. It is a hollow metallic tower eleven feet tall.  
At the top is adjusted the mercury-vapour tube. In  
the main column of the machine is a wire gauze basket  
of thin mesh which acts as the trap. Insects are  
sucked into this trap by a powerful electric fan  
at the base. The machine is fitted with a glass  
window through which the catch in the trap can be  
seen while the apparatus is in action. The machine  
can be worked on A.C. or D.C. supply or by generators  
supplied by the company. The base which contains  
the electric turbine can be detached when necessary.  
There is a regulator at the base which if opened is  
very likely to alter the combinations essential  
for the working of the machine.

===000===

what is known as radiant energy. The waves travel at the  
same speed but vary greatly in length. Each wave-length has  
its own degree of refrangibility and the rays can be  
separated out by means of a prism into a series of  
beams each of a definite wavelength.

In determining the physical nature of light the  
wavelengths of the part of the spectrum under consideration  
is the main factor of importance. The unit of measurement  
employed when dealing with wavelengths is called the  
Angstrom Unit (A.U.). This equal to one ten millionth

'EINTO-RAY' MACHINE.

It is a hollow metallic tower eleven feet tall. At the top is adjusted the mercury-vapour tube. In the main column of the machine is a wire gauze basket of thin mesh which acts as the trap. Insects are sucked into this trap by a powerful electric fan at the base. The machine is fitted with a glass window through which the catch in the trap can be seen while the apparatus is in action. The machine can be worked on A.C. or D.C. supply or by generators supplied by the company. The base which contains the electric turbine can be detached when necessary. There is a regulator at the base which if opened is very likely to alter the combination essential for the working of the machine.

of a millimetre, i.e., tenth metre or 10<sup>-4</sup> m.

It has been held upto this time that mosquito shun light, but experiments with this machine oblige us to change our views about the photo-trophy of mosquitoes. The inventor is very loquacious about the execution of his machine but is equally reticent about the type of the lamp he uses and the composition of the rays it emits. Before discussing the merits or demerits of the invention it would be advisable to say a few words about this lamp and the ray.

\* "An atom consists of two essential parts a nucleus or proton which is a positively charged body and revolving round this central body are negative electrical charges called electrons. These electrons are kept in their respective positions by the attraction of the nucleus. The Chemical properties of the atoms are due to these electrons. Normally the atomic system is in a state of equilibrium neither absorbing nor radiating energy, but when a body is rendered incandescent the equilibrium of its atomic system is upset and the complex disturbance results in the production of energy in the form of electro-magnetic waves. These waves are electro-magnetic disturbances of ether. They travel out in all directions with the velocity of light and constitute what is known as radiant energy. The waves travel at the same speed but vary greatly in length. Each wave-length has its own degree of refrangibility and the waves can be separated out by means of a prism into an orderly array of beams each of a definite wavelength known as spectrum."

In determining the physical action of rays the wavelengths of the part of the spectrum under consideration is the main factor of importance. The unit of measurement employed when dealing with wavelengths is called the Angstrom Unit (A.U.). This equal to one ten millionth

between 2800-1800 A.U. As to the amount of Ultra Violet

\* Physiology by Starling.

It has been held up to this time that mesotropy shows  
light, but experiments with this machine oblige us to change  
our views about the photo-tropy of mesotropy. The invention  
is very judicious about the execution of his machine but  
equally reticent about the type of the lamp he uses and the  
composition of the rays it emits. Before discussing the

the merits or demerits of the invention it would be advised  
to say a few words about the lamp and the ray.

\* "An atom consists of two essential parts a nucleus  
or proton which is a positively charged body and revolving  
round this central body are negative electrical charges

called electrons. These electrons are kept in their respec-  
tive positions by the attraction of the nucleus. The chemical  
properties of the atoms are due to these electrons. Normal-  
ly the atomic system is in a state of equilibrium neither  
absorbing nor radiating energy, but when a body is rendered  
incandescent the equilibrium of its atomic system is upset

and the complex disturbance results in the production of  
energy in the form of electro-magnetic waves. These waves  
are electro-magnetic disturbances of ether. They travel out  
in all directions with the velocity of light and constitute  
what is known as radiant energy. The waves travel at the

same speed but vary greatly in length. Each wave-length has  
its own degree of refrangibility and the waves can be  
separated out by means of a prism into an orderly array of  
beams each of a definite wavelength known as spectrum."

In determining the physical action of rays the  
wavelengths of the part of the spectrum under consideration  
is the main factor of importance. The unit of measurement  
employed when dealing with wavelengths is called the  
Angstrom Unit (A.U.). This equals to one ten millionth

rays emitted, I do not think it is very much for if one  
of a millimetre, ie., tenth metro <sup>10</sup> metre or 10 U U.

The visible portion of the spectrum lies near the middle of the total range of the electro-magnetic spectrum and consists of wavelengths extending from 8,000 -4,000 A.U. The shorter waves are at the violet end and the longer waves at the red end of the visible spectrum, Rays with greater wavelengths than the red are the Infrared or Heat rays and beyond this the Wireless rays. On this side of the violet end are the Ultra violet rays and further still the X rays and Gamma rays.

The visible spectrum consists of the following colours with their respective wavelengths :-

<u>Red.</u>	<u>Orange</u>	<u>Yellow.</u>	<u>Green.</u>
8000-6500	6500-6000	6000-5500	5500-5000
<u>Blue-green.</u>	<u>Blue.</u>	<u>Violet.</u>	<u>Ultra-violet.</u>
5000-4500	4500-4000	4000-3800	3800-200.

After 1850 A.U., Ultra Violet rays are very readily absorbed by atmosphere, by moisture and by dust. At the extreme ends there is an overlap between the Ultra Violet and X rays and X rays and Gamma rays of the radium.

The lamp used in the 'Entoray' machine is a mercury vapour lamp. There are several types of Mercury Vapour lamps varying in intensities. The one used in this machine is 2,000 candle power. The rays emitted by it are greenish-yellow in colour, i.e., between 6000-4500 A.U. approximately. The mercury is put in a quartz container I am not very sure about the electrodes used but I think they are white light carbon impregnated with metal or tungsten. With such a lamp there is bound to be generated Ultra Violet Rays besides the ordinary luminous rays.

Since after 1800 A.U. the Ultra Violet rays lose their power of penetration so the wavelength of the Ultra Violet rays emitted by this machine is bound to be between 3800-1800 A.U. As to the amount of Ultra Violet

of a millimetre, i.e., tenth metre or 10 U.U.  
 The visible portion of the spectrum lies near  
 the middle of the total range of the electro-magnetic  
 spectrum and consists of wavelengths extending from  
 8,000-4,000 A.U. The shorter waves are at the violet end  
 and the longer waves at the red end of the visible  
 spectrum. Rays with greater wavelengths than the red are  
 the Infrared or Heat rays and beyond this the Wireless  
 rays. On this side of the violet end are the Ultra violet  
 rays and further still the X rays and Gamma rays.

The visible spectrum consists of the following  
 colours with their respective wavelengths :-

Red.	Orange	Yellow	Green
8000-6500	6500-6000	6000-5500	5500-5000
Blue-green	Blue	Violet	Ultra-violet
5000-4500	4500-4000	4000-3800	3800-300

After 1850 A.U., Ultra Violet rays are very  
 readily absorbed by atmosphere, by moisture and by dust.  
 At the extreme ends there is an overlap between the Ultra  
 Violet and X rays and Gamma rays of the radiations.

The lamp used in the 'Entony' machine is a  
 mercury vapour lamp. There are several types of mercury  
 vapour lamps varying in intensities. The one used in this  
 machine is 2,000 candle power. The rays emitted by it are  
 greenish-yellow in colour, i.e., between 6000-4500 A.U.  
 approximately. The mercury is put in a quartz container  
 I am not very sure about the electrodes used but I think  
 they are white light carbon impregnated with metal or  
 tungsten. With such a lamp there is bound to be generation  
 of Ultra Violet rays besides the ordinary luminous rays.  
 Since after 1800 A.U. the Ultra Violet rays  
 lose their power of penetration so the wavelength of the  
 Ultra Violet rays emitted by this machine is bound to  
 be between 3800-1800 A.U. As to the amount of Ultra Violet

rays emitted, I do not think it is very much for if one looks at a Carbon or Mercury Arc lamp used in ordinary Ultra Violet Clinics for 15 minutes with naked eyes one is bound to get severe Conjunctivitis. But with this machine in action people have been looking at the light for much longer periods with no untoward results at least none have been reported. However, the Engineer who works the machine developed a severe burn of his face and hands and on enquiry I found that it was not the first time that he got it. He did not develop any conjunctivitis.

The lamp is very fragile and great care has to be taken to prevent damage, also after some time mercury deposits on the electrodes and the function is impaired. There is an insurance scheme against breakage for the mercury vapour tubes. Manipulations have to be very delicate, for I have noticed that after rough handling the machine goes out of order. After transfer from one place to another it always required few hours for readjustments. I wonder if the machine would work when the car is in motion. I have had no such demonstration. I have noticed that even a slight jolt when the machine is in action puts the lamp out of gear.

The following were the places visited during this tour:-

- (1). Medak.
- (2). Nizamsagar.
- (3). Bhodan.
- (4). Banswara.
- (5). Nizamabad.

The whole thing was done in such haste that there was not much time for a complete survey. However as many breeding places as was possible were visited and the larvae collected. Also blood smears of suspected cases were taken. A short description of all the places visited

The following were the places visited during this tour :-

- (1) . Madak.
- (2) . Misamis.
- (3) . Bohol.
- (4) . Zamboanga.
- (5) . Misamis.

The whole thing was done in such haste that there was not much time for a complete survey. However as many breeding places as was possible were visited and the larvae collected. Also blood smears of suspected cases were taken. A short description of all the places visited

with the type of mosquitoes caught with the machine and the larvae collected and identified from each place is given below. All the catches contained culex and staegomyia, so that in the descriptions that follow no further mention shall be made of them.

M E D A K.

It is a small town situated at the foot of a hill with a population of about 11,000. The inhabited area is triangular in shape with big sheets of water on two sides and a pond on the third side absolutely adjoining the houses. Paddy fields are distributed all round. A part of the town is walled off by the missionary people. Sanitary conditions in this part of the town are very good. The rest of the town requires a lot of improvement. Drainage system is practically absent and consequences of such an omission are apparent everywhere. In the missionary area there is a swimming pool, also water channel passes through it, but in neither of these places breeding was found. In other breeding grounds anopheline and culex larvae were found in abundance, particularly in the pond which adjoins the town. The 'Entoray' machine was fixed in the same locality. A search for adult mosquitoes was made but not many could be found.

The machine was worked for one hour. The catch was not heavy and neither was the number of mosquitoes caught very great. As a rough average they were about 400 - 600. It is interesting to note that two culex mosquitoes caught by the machine were full of blood.

The following species were identified:-

(a) Fuliginosus and (b) Subpictus.

Unfortunately all the larvae and eggs collected were destroyed during transport. Some drowned and some eaten up by the bigger members.

 Unfortunately all the larvae and eggs collected were destroyed during transport. Some drowned and some eaten up by the bigger weevils.

## NIZAMSGAR.

It is a small village with a population of about 1000. As elsewhere no drainage exists here. The village adjoins paddy fields and some ponds and ditches all of them breeding heavily. There is a Canal Dispensary here run by a compounder. This compounder is an energetic fellow and very helpful. He collected quite a large number of patients for me and it was remarkable that all the cases presented to me had enlarged spleens and one woman seemed to have nothing else in her abdomen. I was told that malaria had appeared in an epidemic form here in August 1935, practically every body being down with it. Blood smears of all the cases were taken and in spite of the fact that they were taking 25 grs of Quinine Hydrochloride every day (this according to the compounder) still fifty percent smears were positive. Seventy-five per cent of the positive slides showed B.T. infection, the rest M.T.

The larvae were collected from practically all the breeding places, i.e., from the dam and from its tributaries, paddy fields, ditches and ponds. A search for the adult mosquitoes was made but not many could be found.

The 'Entoray' machine was worked for half an hour behind the village. The catch was more numerous and so were the mosquitoes. The average was from 500 - 800. The species found were Culicifacies, Subpictus, Fuliginosus & Barbirostris.

The other two places visited, namely, Bodhan and Banswara have no peculiar features of their own. These are two small places with the same faulty drainage, pits and ponds and paddy cultivation as

There is one thing certain that beside

NIZAMGARH.

It is a small village with a population of about 1000. As elsewhere no drainage exists here. The village adjoins paddy fields and some ponds and ditches all of them breeding heavily. There is a Canal Dispensary here run by a compounder. This compounder is an energetic fellow and very helpful. He collected quite a large number of patients for me and it was remarkable that all the cases presented to me had enlarged spleens and one woman seemed to have nothing else in her abdomen. I was told that malaria had appeared in an epidemic form here in August 1935, practically everybody being down with it. Blood smears of all the cases were taken and in spite of the fact that they were taking 25 grs of Quinine Hydrochloride every day (this according to the compounder) still fifty percent smears were positive. The larvae were collected from practically all the breeding places, i.e., from the dam and from pits, tributaries, paddy fields, ditches and ponds. A search for the adult mosquitoes was made but not many could be found.

The 'Entory' machine was worked for half an hour behind the village. The catch was more numerous and no were the mosquitoes. The average was from 500 - 800. The species found were *Culiseta*, *Anopheles*, *Wiedemanni* & *Barbrosia*.

The other two places visited, namely, Boda and Banawra have no peculiar features of their own. These are two small places with the same family drainage, pits and ponds and paddy cultivation as

elsewhere. The insect catch at Banswara was very numerous and mosquitoes constituted quite a fair amount. Unfortunately ants got into the box containing mosquitoes from these two places and left nothing but pins on which these mosquitoes were mounted.

The larvae collected showed :-

BODHAN. Pallidus and Subpictus.

Banswara. Barbirostris and Subpictus

and the few blood smears obtained were negative.

NIZAMABAD.

It is a town with a population of about 25,000. There is a newly built area to the east of the jail. On both sides of the road leading to the jail there are pits probably excavated for road and building construction. On one side of the road there is also a small canal where women-folk wash clothes etc. The water from this canal and rain collects into these pits and they were found breeding some of them heavily. The Civil Surgeon told me that a proposal was afoot to fill these up - a highly desirable thing and a recommendation for the same should be made to the authorities.

The blood smears obtained were negative.

The adult mosquitoes caught were not many. The catch contained subpictus and Fuliginosus and the larvae collected showed Subpictus only.

I do not think there is much malaria at Nizamabad and there are not many breeding places present. Filling up of pits mentioned is very desirable and in future precautions should be taken not to create more of them.

GENERAL REMARKS.

There is one thing certain that beside

elsewhere. The insect catch at Banawara was very numerous and mosquitoes constituted quite a fair amount. Unfortunately ants got into the box containing mosquitoes from these two places and left nothing but pins on which these mosquitoes were mounted.

The larvae collected showed :-

BOBANA. Pallidus and Subpictus.

BANAWARA. Barbrostris and Subpictus

and the few blood smears obtained were negative.

WIZAMBAD.

It is a town with a population of about

25,000. There is a newly built area to the east of

the jail. On both sides of the road leading to the

jail there are pits probably excavated for road

and building construction. On one side of the road

there is also a small canal where women-folk wash

clothes etc. The water from this canal and rain

collects into these pits and they were found breeding

some of them heavily. The Civil Surgeon told me that

a proposal was also to fill these up - a highly

desirable thing and a recommendation for the same

should be made to the authorities.

The blood smears obtained were negative.

The adult mosquitoes caught were not many. The catch

contained subpictus and P. nigropennis and the larvae

collected showed subpictus only.

I do not think there is much malaria at

Wizambad and there are not many breeding places

present. Filling up of pits mentioned is very

desirable and in future precautions should be

taken not to create more of them.

GENERAL REMARKS.

There is one thing certain that beside

insects the machine does catch mosquitoes. The number caught however is not constant. I think this variation is due mainly to the number of mosquitoes about. It is quite reasonable to presume that the amount of catch would be directly proportional to the number of mosquitoes present at a particular time when the machine is worked. In this connection the time of the year, the time when the machine is worked and how long worked, the type of the place worked, presence of moon and atmospheric conditions have to be taken into consideration.

TIME WHEN THE MACHINE IS WORKED.

The mosquitoes keep hiding in dark cool places during the day and come out towards the dusk. So that if the machine is worked soon after sunset the catch would be greater. Similarly towards latter part of the night some time before the day dawns the mosquitoes begin to retire to the places where they have to spend the day. This time is also suitable for better results.

THE LENGTH OF TIME THAT IT IS WORKED.

If the machine is worked when the sun is setting the brightness of the mercury lamp is not so perceptible, the light of the sun drowning the light of the lamp. But as it grows darker it appears more brilliant by contrast and the range of perceptibility increases. Now at the start insects round about are the first to reach the lamp, the insects which are further off take some time to reach the lamp. I have noticed that the number is maximum after the machine has been in action for about 15 minutes. It continues to remain so far

#### TIME WHEN THE MACHINE IS WORKED.

The mosquitoes keep hiding in dark cool places during the day and come out towards the dusk. So that if the machine is worked soon after sunset the catch would be greater. Similarly towards latter part of the night some time before the dawn the mosquitoes begin to retire to the places where they have to spend the day. This time is also suitable for better results.

#### THE LENGTH OF TIME THAT IT IS WORKED.

If the machine is worked when the sun is setting the brightness of the mercury lamp is not so perceptible, the light of the sun drowning the light of the lamp. But as it grows darker it appears more brilliant by contrast and the rays of perceptibility increase. Now at the start insects round about are the first to reach the lamp, the insects which are further off take some time to reach the lamp. I have noticed that the number is maximum after the machine has been in action for about 15 minutes. It continues to remain so far

the catch is small. Also on moonlit night number about an hour, if insect life is very numerous no diminution is felt; if the things however are the other way about the decline is quite perceptible. I think if the machine is worked for several hours the difference in any circumstances would be fruitful, obvious. I have never seen the machine work more than one hour. This decline is quite consistent with the fact that the machine has a certain definite range of attraction. Insects from this area or those moving into this area from round about would only be attracted. When the majority of them have been trapped pari passu the catch would begin to diminish. In order to have a large catch of mosquitoes the best time would be two hours after sunset and two hours before sun-rise.

THE TYPE OF PLACE WHERE IT IS WORKED.

Direct If the machine is installed in a dry, hilly place with no or few breeding places the catch naturally would be small. On the other hand if the place is marshy or studded with pools and puddles or habitations with large number of superficial wells, bad drainage, surrounded by sheets of water big and small, wet paddy cultivation, conditions prevailing per excellence at places visited by me the catch would be proportionally high. Mr. Menasche certainly selected good time and good places to show the execution of his machine to its best advantage.

THE MOON.

On well moonlit nights the brightness of the mercury lamp is very much diluted by the moon light. It appears dim; the range is curtailed, so

about an hour, if insect life is very numerous no  
diminution is felt; if the things however are the  
other way about the decline is quite perceptible.  
I think if the machine is worked for several hours  
the difference in any circumstances would be  
obvious. I have never seen the machine work more  
than one hour. This decline is quite consistent  
with the fact that the machine has a certain  
definite range of attraction. Insects from this  
area or those moving into this area from round  
about would only be attracted. When the majority of  
them have been trapped past the catch would  
begin to diminish. In order to have a large catch  
of mosquitoes the best time would be two hours  
after sunset and two hours before sunrise.  
THE TYPE OF PLACE WHERE IT IS WORKED.  
If the machine is installed in a very  
hilly place with no or few breeding places the catch  
naturally would be small. On the other hand if the  
place is marshy or studded with pools and puddles  
or habitations with large number of superficial  
wells, bad drainage, surrounded by sheets of water  
big and small, wet badly cultivated, conditions  
prevailing for excellence at places visited by me  
the catch would be proportionally high. Mr. Menasche  
certainly selected good time and good places to  
show the execution of his machine to the best  
advantage.  
THE MOON.  
On well moonlit nights the brightness of  
the mercury lamp is very much inhibited by the moon  
light. It appears dim; the range is curtailed, so  
about in general. It continues to remain so

the catch is small. Also on moonlit night number of mosquitoes about is small. They preferring to remain in darkness. So that this also contributes to the smallness of the catch. Therefore for two weeks after the moon is four days old the working of the machine after sunset would not be so fruitful, neither would it be so useful before day dawn for about the same period before the moon disappears. I have seen the machine work in moonlit night. The insects did come but were not so numerous as on dark nights.

#### ATMOSPHERIC CONDITIONS.

When it is raining or the wind is strong it is quite obvious that the working of the machine would be futile. I have not seen it work in strong or mild wind, but the inventor told me that once he did work it in high wind in the presence of the Director, Agriculture Department, Hyderabad-Deccan, and the latter went away quite disappointed with the machine.

#### R A N G E.

The inventor says that insects from a distance of half a mile around are attracted to the machine. I suggested to him to take his machine to a small island in Nizamsagar dam from which land was at least half a mile all round, If the insects continued to come after the machine had been working for an hour particularly when they practically ceased to come and then came along in large numbers it could be presumed that they were coming from the main land. This the range of attraction could be determined. No conveyance however being available the proposal had to be dropped. Whether the

the catch is small. Also on moonlit night number of mosquitoes about is small. They prefer to remain in darkness. So that this also contributes to the smallness of the catch. Therefore for two weeks after the moon is four days old the working of the machine after sunset would not be so fruitful, neither would it be so useful before day dawn for about the same period before the moon disappears. I have seen the machine work in moonlit night. The insects did come but were not so numerous as on dark nights.

ATMOSPHERIC CONDITIONS.

When it is raining or the wind is strong it is quite obvious that the working of the machine would be futile. I have not seen it work in strong or mild wind, but the inventor told me that once he did work it in high wind in the presence of the Director, Agriculture Department, Hyderabad-Deccan, and the latter went away quite disappointed with the machine.

R A N G E.

The inventor says that insects from a distance of half a mile around are attracted to the machine. I suggested to him to take his machine to a small island in Hussainagar dam from which land was at least half a mile all round. If the insects continued to come after the machine had been working for an hour particularly when they practically ceased to come and then came along in large numbers it could be presumed that they were coming from the main land. Thus the range of attraction could be determined. No conveyance however being available the proposal had to be dropped. Whether the

mosquitoes would come out of dwellings depends upon whether the light would reach them. If the doors and windows are quite open this is quite possible. At Medak two mosquitoes were separated from the collection full of blood; both were Culex. Whether they were attracted from the houses by the 'Entoray' machine or had already quitted the house after the feed and then came to the machine is a moot question.

#### DO THE RAYS POSSESS ANY DIRECT ANY LETHAL AFFECT ON THE INSECTS.

The inventor claims that a large number of insects die far way without coming in contact with the machine. As a proof one can see large numbers of dead insects in the lorry conveying the 'Entoray' machine after the demonstration is over. The question arises as to whether the burner gets hot when the machine is working. It should for the lamp, as far as I know, is not a watercooled one. If it did get hot then there is an explanation of the insecticidal action of the rays. But then this action would be indirect and not direct. I could not feel it for myself partly owing to the crowds, partly due to the machine being 12 feet high I could not reach it. During one demonstration however I saw a big grasshopper sitting on the mercury tube and seemed quite happy. However what might not be very inconvenient for a grasshopper might be lethal for a tiny insect. On one occasion I recovered a dead female anopheline mosquito stuck up to the mercury tube after a demonstration.

#### SELECTIVE SEX ATTRACTION.

The inventor claims that 80 to 90 per cent

mosquitoes would come out of bewellings depends upon whether the light would reach them. If the doors and windows are quite open this is quite possible. At Malak two mosquitoes were separated from the coil section full of blood; both were Gulex. Whether they were attracted from the houses by the 'Entory', machine or had already quitted the houses after the feed and then came to the machine is a moot question.

DO THE RAYS POSSESS ANY DIRECT OR INDIRECT EFFECT ON THE INSECTS.

The inventor claims that a large number of insects die far way without coming in contact with the machine. As a proof one can see large numbers of dead insects in the forty conveying the 'Entory' machine after the demonstration is over. The question arises as to whether the burner gets hot when the machine is working. It should for the lamp as far as I know, is not a watercooled one. If it did get hot then there is an explanation of the insecticidal action of the rays. But then this action would be indirect and not direct. I could not feel it for myself partly owing to the crowds, partly due to the machine being 12 feet high I could not reach it. During one demonstration however I saw a big grasshopper sitting on the mercury tube and seemed quite happy. However what might not be very inconvenient for a grasshopper might be fatal for a tiny insect. On one occasion I recovered a dead female anopheline mosquito stuck up to the mercury tube after a demonstration.

SELECTIVE SEX ATTRACTION.

The inventor claims that 80 to 90 per cent

of the mosquitoes trapped are females. In my opinion this is more apparent than real. There is no doubt that in nature males preponderate to a great extent. In our laboratory mosquitoes bred out from haphazard larval catches from different localities show an approximate proportion of five to six males to one female. But the males are very delicate and short lived as compared with the females. After their function in life is over they rapidly die out. The suction of the machine is very powerful. Besides all types of insects small and big are present. The smaller insects are killed by the suction outright but the larger ones do not die and keep on jumping and fluttering about, crushing and disorganizing the smaller insects still further. Some of the insects actually bite and cut up the other insects which impedes their way in their struggle for freedom. The insects in the trap are exposed to a continuous suction over and above the primary powerful impact. The insects are killed by calcium cyanide before they can be sorted out. The catch when emptied out is one big wet conglomerate mass. The smaller insects are all smashed up and caught between the wings and claws of the bigger ones. It is really a job this sorting out. It is impossible to tackle the whole mass. We separated 1/20 - 1/30th part and distributed it between five or six of us and had to work till one every night to finish our task. Thus roughly we were enabled to make our statistics. Now as I have said before the male with its bushy palps and antennae and small thin abdomen is far more easily smashed up face, neck and arm pulled off.

of the mosquitoes trapped are females. In my opinion this is more apparent than real. There is no doubt that in nature males predominate to a great extent. In our laboratory mosquitoes bred out from haphazard larval catches from different localities show an approximate proportion of five to six males to one female. But the males are very delicate and

short lived as compared with the females. After their function in life is over they rapidly die out. The suction of the machine is very powerful. Besides all types of insects small and big are present. The smaller insects are killed by the suction current but the larger ones do not die and keep on jumping and fluttering about, crashing and disorganizing

the smaller insects still further. Some of the insects actually bite and cut up the other insects which impedes their way in their struggle for

freedom. The insects in the trap are exposed to a continuous suction over and above the primary powerful impact. The insects are killed by calcium

cyanide before they can be sorted out. The catch when emptied out is one big wet conglomerate mass. The smaller insects are all smashed up and caught between the wings and claws of the bigger ones.

It is really a job this sorting out. It is impossible to tackle the whole mass. We separated 150 - 150th part and distributed it between five or six of us and had to work till one every night to finish our task. Thus roughly we were enabled

to make our statistics. Now as I have said before the cells with the brushy palps and antennae and small thin abdomen is far more easily smashed up

as compared with the female. So it is very difficult to indentify the males. The females are also broken down and very fifficult to find. It is due to this reason that the catch shows up at the end more females than males. At Nizamasagar we worked only for half an hour and killed the insects immediately afterwards. In this catch males and females were nearly equal, males slightly predominating.

DETRIMENTAL EFFECTS OF LONG EXPOSURE ON  
HUMAN BEINGS.

So far no complaints have been made to that effect. Looking at the naked light with unprotected eyes might very well give conjunctivitis, absence of complaint might mean people attributing sore eyes to some other cause. The conjunctivitis appears nearly 8 hours after an exposure above the thresh-hold limit and lasts 24 - 36 hours. Afterwards the eyes become supersensitive and conjunctigitis appears even after exposure to a light below the thresh-hold value. There is not much danger to the ordinary Indian skin, but exposure of a fair skin might result in pigmentation and even skin burn. The Belgian Engineer of the inventor has had several such attacks. The one he had at Nizamsagar was very severe. His face was bloated and he could hardly open his eyes. There was sleeplessness and he was so uncomfortable that we were thinking of resorting to a morphia injection. However ice compresses relieved him to a great extent and he went off to sleep. He was much better next morning and was quite normal after three days. Skin from his face, neck and arm peeled off.

as compared with the female. So it is very difficult to identify the males. The females are also broken down and very difficult to find. It is due to this reason that the catch shows up at the end more females than males. At Hissnagar we worked only for half an hour and killed the insects immediately afterwards. In this catch males and females were nearly equal, males slightly predominating.

DETRIMENTAL EFFECTS OF LONG EXPOSURE ON HUMAN BEINGS.

So far no complaints have been made to that effect. Looking at the naked light with unprotected eyes might very well give conjunctivitis, absence of complaint might mean people attributing sore eyes to some other cause. The conjunctivitis appears nearly 8 hours after an exposure above the threshold limit and lasts 24 - 36 hours. Afterwards the eyes become supersensitive and conjunctivitis appears even after exposure to a light below the threshold value. There is not much danger to the ordinary Indian skin, but exposure of a fair skin might result in prurition and even skin burn. The Belgian inventor of the invention has had several such attacks. The one he had at Hissnagar was very severe. His face was distorted and he could hardly open his eyes. There was sleeplessness and he was so uncomfortable that we were thinking of resorting to a morphine injection. However ice compresses relieved him to a great extent and he went off to sleep. He was much better next morning and was quite normal after three days. Skin from his face, neck and arms peeled off.

## POLLINATION.

Cross pollination is mainly affected through insects, so if we instal such a machine which causes wholesale destruction of insects in a garden or in cultivated areas, the question arises as to whether it would prove in the long run detrimental to the plant life. Only large experience can settle this question. The suggestion that the machine only catches night insects is quite absurd. Ordinary houseflies, butterflies, etc. are day insects and they are found in quite large numbers in the catch. Winged insects to which the light reaches seems to be attracted. Therefore I would reiterate that any definite statement on the subject with the meagre experience at our disposal would be too premature; however, the question is of economical importance and must be kept in mind.

## THERAPEUTIC EFFECTS.

The inventor claims that his machine besides being a powerful means of prophylaxis against insect-borne diseases can also be used as a curative agent. He claims having cured a case of long standing adenitis by exposure to his light. It has also similar effects on arthritis. It is quite possible, for ultra-violet therapy is being used for varied conditions, and the diseases mentioned are amongst those treated in this way. However, the inventor is only a layman and naturally very enthusiastic about the varied utility of his machine. All that an interested percent would constitute quite a high proportion.

POLLINATION.

Cross pollination is mainly effected through

insects, so if we install such a machine which

causes wholesale destruction of insects in a

garden or in cultivated areas, the question arises

as to whether it would prove in the long run

detrimental to the plant life. Only large

experience can settle this question. The suggestion

that the machine only catches night insects is

quite absurd. Ordinary houseflies, butterflies,

etc. are day insects and they are found in quite

large numbers in the catch. Winged insects to

which the light reaches seems to be attracted.

Therefore I would reiterate that any definite

statement on the subject with the machine

The inventor claims that his machine

besides being a powerful means of prophylaxis

against insect-borne diseases can also be used

as a curative agent. He claims having cured a

case of long standing adenitis by exposure to

his light. It has also similar effects on arthritis

It is quite possible, for ultra-violet therapy

is being used for varied conditions, and the

diseases mentioned are amongst those treated in

this way. However, the inventor is only a layman

and naturally very enthusiastic about the varied

utility of his machine. All that an interested

in nature. Again every female that is born does man says has to be believed with a grain of salt. The efficacy of any particular therapeutic agent in the treatment of any ailment is fraught with so much falacy that a sweeping statement about the remedial perfections of any therapeutic measure always smacks of quackery. However, there is no harm in saying that claims made may be true to some extent.

#### PRACTICAL VALUE.

Entorays attract winged insects which include mosquitoes, sand flies, house flies, blue bottles, &c. I do not know but would very likely attract Tsetse flies as well. Therefore the prophylactic value of the invention in the prevention of diseases conveyed by these insects is quite certain. The inventor claims that the rays when the tube is placed in water also attract larvae. This experiment has not been shown to me. As a rough working average the machine catches from 500 to 800 adult mosquitoes per first hour of which about half are anophelines. Whether the number would decline in the succeeding hours I am not absolutely certain, but I think it would. The hypothesis that destruction of one adult female means prevention of laying of two hundred eggs and prevention of development of 200 mosquitoes later on exaggerates the situation very much. Every egg that is laid does not in nature develop into a mosquito. Given the best conditions of development, I think ten percent would constitute quite a high proportion.

 Rs.115/- nearly.

man says has to be believed with a grain of salt. The efficacy of any particular therapeutic agent in the treatment of any ailment is fraught with so much fallacy that any statement about the remedial properties of any therapeutic measure always smacks of quackery. However, there is no harm in saying that claims made may be true to some extent.

#### PRactical VALUE.

Entomologists attract winged insects which include mosquitoes, sand flies, house flies, blue bottles, etc. I do not know but would very likely attract Tsetse flies as well. Therefore the prophylactic value of the invention in the prevention of diseases conveyed by these insects is quite certain. The inventor claims that the rays when the tube is placed in water also attract larvae. This experiment has not been shown to me. As a rough working average the machine catches from 500 to 800 adult mosquitoes per first hour of which about half are anophelines. Whether the number would decline in the succeeding hours I am not absolutely certain, but I think it would. The hypothesis that destruction of one adult female means prevention of laying of two hundred eggs and prevention of development of 200 mosquitoes later on exaggerates the situation very much. Every egg that is laid does not in nature develop into a mosquito. Given the best conditions of development, I think ten percent would constitute quite a high proportion.

in nature. Again every female that is born does not live long enough to lay eggs. Those that survive long enough, all of them cannot get a feed of blood and, therefore, cannot lay eggs. Therefore destruction of one adult female amounting to destruction of 200 mosquitoes of the coming generation is gross exaggeration. The cost of the machine, I think, is B.G. Rs. 3,000/- you want 400 volts to work the machine which necessitates the purchase of a generator costing about B.G. Rs. 1,000/- . Again to convey it from place to place you want a motor lorry which means another B.G. Rs. 3,000/-. That means a net cost of B.G. Rs. 7,000/- for one machine. One lorry, however, can be used to convey the machines to different places according to the needs. Then one would require a motor driver who should also be a good electrical machanic. That would cost Rs. 50/- per month. Besides two kamaties @ Rs. 12/- a month are also necessary. This means Rs. 72/- per month. The running cost I do not know. It is said it comes to one anna an hour. Then there must be some budget allotment for breakages, repairs, etc. For a successful control in a city like Hyderabad, we would require about 24 machines. For experimental purposes one machine mounted on a lorry and moved about at a slow speed, say half a mile per hour, would be advisable. I do not know if such thing is possible, the inventor says it is, but I have noticed this during his demonstrations that a jolt puts the

the lamp out of gear. For small villages and cultivated areas the big machine with lorry &c is practically useless. The inventor says that he has small machines made of aluminium weighing about 80 lbs. and also generators weighting about the same. Each article can be carried on the head of a coolie. This is a practicable scheme for small villages and irrigated areas. How far this would succeed I have no idea. I have not been given such a demonstration, neither have I been shown smaller machines or generators.

#### SUMMARY.

- (1) The machine catches mosquitoes and other disease-carrying insects.
- (2) Cost compared with the results obtained is high, particularly the initial cost.
- (3) It cannot replace the anti-malarial measures in use.
- (4) It is a machine, so has the drawbacks inherent in a machine, namely, may get out of order, be damaged or the mercury tube might be broken, function impaired by deposition of mercury on electrodes and general wear and tear.
- (5) It is useless during rains or winds. In bright moonlit nights efficiency is impaired.
- (6) Might have undesirable effects on human beings and plants.
- (7) Requires a special voltage to work it.

PERSONAL

No one who cares to study the progress of attendance in our Government Hospitals can fail to notice the steadily growing popularity of these institutions.

The total number of in-patients in the last two years has increased from 16,117 to 27,728 and outpatients from 8,200 to 17,244.

The great extension of the benefits of modern medical and surgical treatment has been made possible in large measure by the generous support in every way, including increased financial grants, given by Government. The Department is very grateful to the Hon'ble Member and the Army Secretary for providing and expediting support.

In the department itself it is my pleasant duty to call the attention of Government to the vigorous and skilful work of all the Medical Officers. I would particularly mention the various specialists who are well qualified professionally and inspired by a real spirit of service to the public.

The Medical Officers received every year as new recruits from the Calcutta Medical College are a credit to their University and to the department.

I have much pleasure in mentioning the names of the Hon'ble Surgeon Major V. K. M. Chatterjee, the Hon'ble Surgeon Major Dr. Rajnarayan Chatterjee, the Hon'ble Surgeon Major Dr. Khair-ud-Din, all of the Calcutta Hospital and Dr. Vinod Rao, the Hon'ble Surgeon and Throat Specialist.

STATEMENTS

Dr. Mohammed Farooq, the Chemical Examiner has done valuable work for Government.

The Chief Malariologist, Dr. Hina Mohammed Siddiq and the Special Fingerprint Officer, Captain G. L. Dhillon have worked diligently and successfully for the benefit of Hyderabad City.

As the Assistant Surgeons the following have done valuable work:

V. M. Jadhav at Jales, General Tribunal Rao at Gungahat, N. S. Ghosh as Medical Inspector of Schools, S. Rajendran, Rao and A. C. Abraham in the Public Health Department; Hakim Abdul Rahman at the Isolation Hospital and Mohammed Ehsan Ali Khan in the Child Protection Scheme.

Yashwant Rao Bhide one of the best of the Assistant Surgeons was invalided from the service for serious illness. This is a severe loss to the department.

Finally in thanking the Officers of the department for their support, I would mention the constant assistance in administrative matters I have received from Dr. C. P. Chetty, the Deputy Director of Public Health and from Syed Ishtiaq Ahmad, the Personal Assistant.

(34) J. NORMAN WALKER,

CHIEF, S.M.S. (M.A.),

Director, Medical and Public Health Dept.,

Hyderabad.
