TOWN COUNCIL OF BENONI

---

# Annual Report

OF THE

## MEDICAL OFFICER OF HEALTH

FOR THE YEAR

1ST OF JULY, 1946 - 30TH OF JUNE, 1947

50027

To His Worship the Mayor,  
and Members of the Town Council of Benoni.

Your Worship, Councillor (Mrs.) Mc Dowell,  
and Gentlemen,

I have the honour to present to you the  
Annual Report on the work done by the Health Department  
during the year ended 30th June, 1947.

Details of the work of the department during  
the year are discussed in the main body of the report, and  
it is only necessary here to draw attention to certain  
salient features.

The birth rates for all sections of the  
community were the highest yet recorded in Benoni, whilst  
the death rates remain satisfactory. The Infantile  
Mortality rate, continues to remain eminently satisfactory.

Housing continues to remain a grave problem  
overcrowding remains rife, affecting all sections of the  
community, both European and Non-European. An attempt,  
foreshadowed in the previous annual report, to eradicate  
some of the worst slum properties in the township, has  
been partially successful, inasmuch as the demolition of  
the properties in question has been deferred pro tem as  
a consequence of the realisation that alternative housing  
is a prior necessity. And it is to be hoped that this  
alternative accommodation, in the form of a new housing  
project for Coloureds, will be realised during the coming  
year.

I wish to express my thanks and appreciation  
to your Worship and Councillors, in particular the  
Chairman and members of the Public Health Committee for  
their assistance, support and consideration on all matters  
submitted to them.

I also wish to express my appreciation to the  
Town Clerk and his staff, Heads and Sub-Heads of other  
departments, the Secretary for Health and the Superin-  
tendent of the Boksburg-Benoni Hospital for the continued  
courtesy and assistance extended this Department at all  
times.

In conclusion I desire to record my grateful  
thanks to the staff for their loyal support and eager  
activity during a difficult transitory period.

I have the honour to be,  
Lady and Gentlemen,  
Your obedient servant,

S. V. ADLER

MEDICAL OFFICER OF HEALTH

REPORT "A"

1. . VITAL STATISTICS

(i) POPULATION (Pages 17 and 18)

The population figures for European, Coloured Indian and Native residents are those estimated on previous census figures and have been supplied by the Union Department of Census and Statistics. The figures for mining natives - native males employed by and resident in mine compounds situated in the municipal area - have been checked locally during the year.

The population figures shew a small overall increase, as compared with the previous year, increases being noted in the European, coloured and Non-Mining native populations. Decreases are to be noted in the figures for the Asiatic population, whilst a further decrease is to be noted in the figures for mining natives, brought about by the further closure of mines in this area, commented upon in the previous report.

	1945-46	1946-47
Europeans	24,207	24,700
Mining Natives	20,754	19,329
Non-Mining Natives	24,468	26,871
Coloured	2,536	2,700
Asiatic	1,228	1,200
<u>Total: Non-Europeans</u>	<u>48,986</u>	<u>50,100</u>
<u>Total: All Races</u>	<u>73,193</u>	<u>74,800</u>

(ii) BIRTHS (Pages 18 and 19)

The European birth rate (29.59) is the highest yet recorded in Benoni, the previous highest being for the year 1941/1942 when the birth rate was 28.16.

The coloured and Asiatic Birth Rates, as usual, remain high, and, like the European Birth Rate, are the highest yet recorded being 46.3 and 57.5 respectively, the previous highest being 45.5 in 1938/39 and 55.45 in 1942/43 respectively.

An increase is to be noted in the masculinity rate, whilst the European Illegitimate Rate (0.56) shows a decided decrease over the preceding year (1.78).

The native Birth Rate remains fallacious owing to continued incomplete registration of native births.

(iii) DEATHS (Pages 20 to 35)

The European Death Rate (7.22) shews a /decrease.....

decrease over the preceding year (7.52) and remains eminently satisfactory. A substantial decrease, from 24.23 for the previous year to 20.6 for the current year, is to be noted in the Death Rate for Non-Mining Natives.

Decreases are also to be noted in the Death Rates for mining Natives (from 6.07 to 5.12) and for Asiatics (from 15.47 to 10.00), whilst an increase (from 18.54 to 20.39) is to be noted in the Coloured Death Rate.

Decreases are to be noted in the Death rates of various diseases, as under.

	<u>1945/46</u>	<u>1946/47</u>
Lung Diseases (Non T.B.)	4.04	3.37
Enteritis (under 2)	1.38	1.33
Violence	1.02	0.95
Enteric Fever	0.17	0.05
All Infectious Diseases	1.84	1.33

The Death Rate for T.B. (all forms) remains Static, whilst it should be noted that the Death Rate for Cancer has increased from 0.45 for the preceding year to 0.53 for the current year (in the case of Europeans it has increased from 0.7 to 0.99).

(iv) I N F A N T I L E M O R T A L I T Y

(Pages 31 and 32)

The European infantile mortality rate (31.46), though slightly higher than that for the preceding year (29.17 - this being the lowest on record) nevertheless remains eminently satisfactory, and compares very favourably indeed with the figure of 54.7 for the year 1936/7 when the Public Health Department was re-organised with the appointment of its first full time Medical Officer of Health.

The Native Infantile Mortality rate continues to be unreliable owing to the incomplete registration of native births.

2. I N F E C T I O U S D I S E A S E (Pages 36 to 40)

(1) G E N E R A L

The total number of accepted notifications decreased from 931 for the preceding year to 753 for the present year, as the result chiefly of fewer notifications received in respect of measles (460 to 261).

(11) S C A R L E T F E V E R (Page 37)

All the 50 cases notified (c.f. 88 for the previous year) were Europeans. As usual the cases were of a mild nature, with no fatalities. With few exceptions, home isolation was the rule.

(111) W H O O P I N G C O U G H (Page 37)

/ 172 notifications.....

Faint, illegible text at the top of the page, possibly a header or introductory paragraph.

Section 1

Faint text in the middle section, possibly containing a list or detailed notes.

Section 2

Faint text in the lower middle section, continuing the list or notes.

Section 3

Faint text in the bottom section, possibly concluding the list or notes.

172 notifications, with three deaths due to complications were received during the year. Most of the cases were of a mild nature and were invariably isolated at home.

(iv) MEASLES (Page 36)

261 cases of measles were notified during the year. As in fact years measles makes its appearance during the months August - November, with its peak during September - October.

Most of the cases were of a mild nature, and with few exceptions, home isolation was the invariable procedure.

(v) DIPHTHERIA (Page 38)

During the year 15 cases of Diphtheria (10 European, 4 Native and 1 Asiatic) were notified the Department. All cases of Diphtheria (as well as suspected cases) are immediately hospitalised. Two deaths (one native and one Asiatic) occurred from this disease during the year.

Anti-Diphtheria Clinics were established several years ago, but despite active propaganda both in the press and in the form of film advertisements, the response, considering the efficacy of immunisation, was poor indeed. Consequently in a further attempt to induce parents to immunise their children, a system of "Birthday Cards" was instituted during the year. A card is sent to the parents of every child in Benoni, one month before the child's first birthday, congratulating the parents and strongly advising the parents to have the child immunised, either at the clinic, where immunisation is free or by private practitioners. Thus far the results have been most encouraging and during the year 396 children (375 Europeans) were immunised, the vast majority being of the pre-school going age, in contra-distinction to previous years when school going children chiefly were immunised.

The method in vogue at the Benoni Clinic is the "3 injection" course with Formal Toxoid or Anatoxine.

(vi) SMALL POX

During November 1946, a non-European, a recent arrival in Benoni and employed by a large industrial firm was found to be suffering from Small Pox. All employees (191 European and 759 Non-Europeans) were re-vaccinated, after having been mass vaccinated the previous year, and no further cases were recorded.

During the year altogether 1869 persons (282 European and 1587 Non-Europeans) were vaccinated by the Department.

/ (vii) PUERPERAL .....

*[The page contains extremely faint, illegible text, likely bleed-through from the reverse side of the document. The text is too light to transcribe accurately.]*

(vii) PUERPERAL SEPSIS

During the year 6 cases, with 1 death, were notified.

(viii) C.S. MENINGITIS (Page 38)

39 cases (3 European, 34 Native, 1 Coloured and 1 Asiatic) of Cerebro. Spinal Meningitis were notified during the year, as compared with 16 for the preceding year.

Five deaths occurred from this disease giving a case mortality of 12.8.

(ix) TRACHOMA

Notifications in respect of two cases, both native, were received during the year.

(x) LEPROSY

No notifications were received during the year.

(xi) ANTERIOR POLIOMYELITIS

No cases of infantile paralysis occurred during the year as compared with two cases for the preceding year and 12 cases for the year 1944/45.

The very large number of cases reported in Britain during recent months leads one to consider the possibility of its appearance in epidemic form in South Africa later in the year. With this prospect in mind the department redoubled its efforts in the prevention of fly breeding as far as possible.

(xii) ENTERIC FEVER (Page 39)

The outbreak of a major epidemic of enteric fever involving in all 52 cases (all Europeans) has to be recorded during the year.

The history of this epidemic was as follows:-

On Monday 30th December, 1946, the Department was notified that five inmates, all related, and living in neighbouring houses were diagnosed to be suffering from? Enteric Fever. Immediate investigations were carried out by the department to ascertain if possible, the source, whilst investigations into these cases were being pursued, further notifications were received in respect of other cases living in widely scattered areas of the town until by that evening some sixteen notifications were received. The explosive nature of the outbreak pointed to a milk borne infection, and investigations shewed that it was localised to one dairy. This dairy, is a distributing dairy and draws its supplies from 7

/ different .....

different producers, five being in the Benoni Municipal area whilst two were from outside areas.

As the epidemic was so obviously milk borne and localised to one distributing dairy, arrangements were made for all employees of both the distributor dairy and producer dairies to be re-tested the following morning for the Enteric Fever carrier state. At this stage it is desired to emphasise that, during the past year it had been the policy of the Department to insist that all foodhandlers, no necessarily limited to the dairy industry, be bloodtested for the Enteric Fever carrier state (Vi Test). All employers of foodhandlers have repeatedly been instructed by the Department not on any account to employ personnel unless they have been medically examined and Vi Tested by the Department. Co-operation from employers is not however always readily forthcoming. All dairies (and other food handling trades) can be visited but once, possibly twice a month by the Department's health inspectorate staff. In between such inspections it has not infrequently been found that contrary to instruction natives are employed without prior examination. This unfortunately was the position in this instance as will be revealed later.

Immediately the incriminating dairy was localised the Secretary for Health was informed, and in consultation with a member of his Staff it was decided to obtain Ministerial authority, in terms of Section 116 of the Public Health Act, to close down all the producing dairies until the results of the bloodtests were known. These producer dairies were closed until 2nd January, 1947, when after the necessary adjustments had been made in regard to personnel following receipt of the reports on the blood tests, they were permitted to re-open. The distributor dairy, whose employees had all been recently examined and who were all satisfactory, was permitted to continue to supply its customers only with pasteurised milk obtained from a neighbouring town.

Consultations were also held with the principal of the distributing dairy and it appeared that the centre of the township, where the majority of the cases occurred, was supplied with milk drawn from two of the suppliers. These two suppliers, are within the municipal area, and one from a neighbouring town, were thus suspected. That this suspicion was not ill founded was subsequently confirmed by the results of the blood tests.

The bloodtests shewed that 4 native employees were Vi-positive in dilutions of 1 in 10 and 1 in 20 ( and therefore presumably Enteric Fever Carriers). According to departmental records the dairies in question were inspected by the Dairy Inspector on 26.11.1946 and by the Dairy Inspector and the Veterinary Officer on 4.12.1946. On both occasions everything at the dairies was satisfactory. Between December 8th and December 27th new staff was engaged, no report of their engagement being given the department nor were they medically examined prior to engagement, thus lending point to the earlier remarks that it is not always possible to secure that desired co-operation from employers, which is so essential to ensure that none but

/wholesome .....

Faint, illegible text, likely bleed-through from the reverse side of the page. The text is too light to transcribe accurately.

wholesome food shall reach the consumer. A public health Department anticipates wholehearted support and co-operation from employees, for it is manifestly impossible for any department to check all dairies ( and other food handling trades) in its area, daily or even weekly, and the lesson to be gained from this epidemic should not be forgotten, and that is that there exists the utmost urgency for the compulsory pasteurisation of all milk supplies. The most vociferous opponents of compulsory pasteurisation of milk are the dairymen themselves, their Unions and certain misguided civic associations. Apart from the fact that the reasons they advance against pasteurisation of milk are quite unscientific and are contrary to the considered and expert opinion of the vast majority of scientists, doctors, bacteriologists and hygienists the world over, the lesson is obvious that it is impossible to attain that Utopia where a Public Health Department could obtain 100% co-operation from 100% of its dairymen. In the absence of that 100% co-operation from 100% of its dairymen, a health department can at best but hope to limit epidemics of milk borne origin, whether such epidemics be enteric fever, scarlet fever, diphtheria, enteritis or undulant fever. In the absence of pasteurisation of its milk supply the threat of an epidemic of any of the aforementioned diseases will forever hang like the sword of Damocles over the community, on whom the responsibility must rest for not taking heed of its officials who so strenuously and assiduously advocate compulsory pasteurisation.

It is indeed fortunate that this particular epidemic was limited to Europeans, of whom 52 were infected from this one particular source. The disease in most of the cases pursued a mild course and the case mortality was "Nil", as was the number of "Return Cases". Mass immunisation of all Benoni residents was undertaken very early to limit, as far as possible the number of cases. The response from the public was most gratifying and some 4432 Europeans and 1370 Non-Europeans were immunised by the Department. Many thousands more Europeans were immunised by private practitioners.

(b) ENTERITIS (Page 33)

During the year 73 children under the age of 2 years died of Enteritis. Of these deaths, 69 were Natives, 3 Coloureds and one European.

It is again necessary to emphasise that enteritis is a dirt disease and as such is largely preventible. It again appears necessary to state that a native creche would fulfill a great need for those children left alone all day amidst dirty insanitary surroundings whilst their parents are out working.

(xiii) TUBERCULOSIS (Pages 34, 35, 40)

The death rate (0.91) for all forms of T.B. remains virtually the same as the preceding year (0.90). A disquieting feature however is the /steadily

high incidence rate amongst Non-Europeans. This continuously high incidence rate may be ascribed partly to the continuance of the insanitary, grossly overcrowded housing conditions under which this section of the community is compelled to live, and to their inability to purchase for themselves and their families the necessary protective foods. Undernourishment amongst this section is rife, with a corresponding lowering of vitality and resistance to disease. Overcrowding and undernourishment conduce to make this section ready victims to the rampage of the tuberculosis germs. And so the circle goes on and on, more victims being claimed each year, as evidenced by the ever-increasing tempo of the incidence rates for this disease from 0.97 in the year 1943/44 to 1.34 for the year 1944/45 to 1.88 for the year 1945/46 and 1.49 for the current year. Of the 79 notifications no less than 55 (or 69.6%) occurred in persons between the ages of 15 and 50.

As has been the practice in the past, the policy of isolating in hospital all cases, and suspect cases, of T.B. was continued during the year. All contacts of both proven and suspected cases of T.B. were examined at the T.B. Clinic, established the previous year. Here contacts are subjected to physical examination, T.B. Patch tested, and where necessary, subjected to radiological examination as well. Some 260 contacts were so examined at the T.B. Clinic.

### 3. VENEREAL DISEASES (Pages 45, 46)

Attendances at the Venereal Diseases Clinics continue to increase; the total attendances for the year reaching the new record high figure of 9261 (previous year, total attendances 7868).

574 new cases (of whom 13 were Europeans) were treated during the year.

244 cases (1 European male) of V.D. in an infectious and communicable form were isolated at the Rietfontein Hospital. Most of these cases (167 males and 26 females) were discovered at the routine examinations conducted by the department at the Pass Office.

At the Pass Office 14576 native males were examined during the year, thus giving an incidence rate of 1.15% for open or infectious venereal disease of all forms in the native male population, presenting themselves casually at the Pass Office for registration during their quest for employment.

Only a very infinitesimal number of natives present themselves voluntarily for treatment and/or isolation for V.D., the vast majority being "discovered" fortuitously during examinations prior to registrations. It is thus understandable that the vast majority of sufferers are left at liberty to disseminate the disease even further. The experience of Benoni is not unique and the time appears appropriate for bold legislation on the part of the central authority whereby all natives are subjected periodically to a compulsory medical examination. By this means many more

infection, thus preventing further subjects from being infested needlessly.

#### 4. M A T E R N A L A N D C H I L D W E L F A R E

(Page 44)

##### (a) ANTE-NATAL CLINICS

An all round increase is to be noted e.g. the number of new cases increased to 1048 from 874 for the previous year, and the total attendances increased from 4,255 to 4973.

The greatest increase took place amongst the European and the native sections. The native Ante-Natal Clinic is held on Wednesdays from 9 a.m. to 1 p.m., but with the larger number of new cases attending each week, it eventually became impossible to deal with all attendances during one weekly session, and it became necessary to increase the sessions to two per week.

##### (b) INFANT WELFARE CLINICS

The value and benefits to be derived from these clinics is more and more being realised amongst the European section of the community and it is pleasing to note that no fewer than 560 new cases with 5908 attendances were seen at the European Infant Welfare Clinics during the year c.f. 355 new cases with 5171 attendances for the preceding year.

A decrease is to be noted in the figures for the native section. This decrease co-incided with the temporary closing of the milk-bar owing to difficulties experienced in obtaining supplies of milk. Free issues of milk had been made to certain necessitous cases amongst natives, and it would therefore appear that this free issue was the inducement for many mothers to bring their children to the clinic. It is nevertheless hoped to re-open the milk bar in the near future when it is further hoped the the Non-European figures will again show an increase.

The practice of supplying free milk and vegetable to the necessitous European cases was continued during the year.

##### (c) DISTRICT MIDWIFERY SERVICES

These services, run by the Boksburg-Benoni Hospital on behalf of the Town Council of Benoni, continue to show great progress, no fewer than 692 cases of all races having been confined either on district (234 cases) or in hospital (458 cases), as compared with a total of 399 cases for the previous year.

The district Midwifery services though run by the Hospital on behalf of the Town Council, are operated in conjunction with Council's Ante-Natal Clinics and the figure of 692 cases referred to above were all cases attended to at the Department's Ante-Natal Clinics. A study of these figures shows conclusively that a central maternity block in Benoni has become an urgent necessity. The question of the erection of a maternity block in Benoni has been raised on several previous occasions with

/the .....

the Provincial authorities, and though these attempts have up till now been unsuccessful, there is reason to hope that further representations during the coming year will be fraught with success.

#### 5. FOODSTUFFS

Continued attention was paid to the control of foodhandling in shops, market gardens, markets, restaurants, hotels and boarding houses.

The policy, initiated the previous year, of blood testing all employees engaged in foodhandling trades of all descriptions for the Enteric Fever Carrier State (Vi tests) was vigorously pursued throughout the year. All Vi positives are excluded from the foodhandling trade as far as possible.

For list of foodstuffs condemned see Pages 51, 52 and 53)

#### 6. ABATTOIRS (Pages 57 and 58)

The set back, referred to in the previous report, and experienced by all reef abattoirs, was continued during the year. The number of animals slaughtered was again well below the numbers slaughtered prior to the inception of the government's meat scheme. Owing to the continued high loss on the abattoirs, it was found necessary to increase the slaughtering and inspection fees.

As a consequence of this increase of fees there has been a decrease in the annual loss sustained, the deficit for the year being £3594 as against £4651 for the previous year.

#### 7. DAIRIES AND MILK CONTROL (Pages 52 and 53)

Continued attention was given dairies supplying Benoni with milk. During the period of the war owing to shortages, both in personnel and material, conditions bordering on chaos had developed. Buildings and equipment of the older established dairies had been allowed to deteriorate badly. Many dairies had been licensed and many permits issued which, but for the war, should never have been granted. However most of them have by now, under pressure of the department, been re-equipped, re-built or new premises erected as the case may be.

Routine chemical and bacteriological, as well as dirt tests, were taken during the year. All dairies are regularly inspected by the Department's Dairy Inspector, Veterinary Officer as well as the Medical Officer of Health.

#### 8. WATER SUPPLY

The supply for all premises, except certain mines who have their own supply for flushing purposes only and most houses in the semi-rural areas, comes from the Rand Water Board. The supply is eminently satisfactory.

One or two flat properties, in the centre of the town, possessing private boreholes were supplied by water from these boreholes. Samples of the water taken for /analysis.....

The Provincial Government, and through their attorneys have  
on all new business, all cases in regard to land  
that further business will be done the coming year will be  
transacted with them.

PROVINCIAL GOVERNMENT

analysis were however unsatisfactory, consequently the use of this water was prohibited in favour of water drawn from Rand Water Board supplies.

#### 9. NIGHT SOIL AND REFUSE REMOVAL SERVICES

The services provided under this heading come under under the direct control of the Sanitary Department, as do the street cleansing services, the public conveniences and the municipal compound.

Water borne sewerage is still limited to the central townships area, the remaining areas being on a tri-weekly pail system, except in the areas of Westdene and Rynfield where septic tanks have been installed.

A vast new sewerage scheme, embodying extensive additions to the disposal works and new pump stations is, at present, under construction.

These improvements will enable the Industrial sites, Northmead, Farrarmore, Airfield and Westdene to be brought under the waterborne sewerage scheme.

Plans have been completed for the reticulation of the first portion of Northmead, and are being prepared for the second portion, whilst a preliminary survey has been made for Westdene.

At Dunswart a new pump Station will serve the western industrial areas and the new Industrial Township No. 12. This station will house two 650 gallon per minute pumps, and provision is being made for the installation of a third pump at a later date as this area develops.

In order to accommodate the greater sewage flow caused by Northmead and the other townships being placed under waterborne sewerage, the Tom Jones Street pump station will be enlarged from the one working pump and one emergency pump now working to two operating pumps and one spare. The present pumping capacity of the pumphouses in Tom Jones Street and Rothsay Street is approximately 900,000 gallons per day.

At the disposal works extensive enlargements are in course of construction.

The one existing detritus channel will be augmented by the erection of one further channel, whilst the existing sedimentation tank will be augmented by the erection of four more tanks, eight new trickling filters will bring their number up to 12. Four humus tanks will be added to the one already in operation and five digestion tanks, three of which are new, are already completed.

#### 10. V E R M I N C O N T R O L (Page 59)

Vigorous anti-plague measures were continued throughout the year whilst the rodent free belt around the town was maintained.

As previously reported the Asiatic section and Location abound in rodents, and owing to the general dilapidation and overcrowding of the old wood and iron structures, anti-rodents measures here, however vigorously prosecuted, are not nearly as successful as might be desired, complete eradication of rodents in this area being seemingly / impossible....

THE STATE OF TEXAS,  
COUNTY OF [illegible]

impossible of achievement. The most that would appear possible is that the rodent population is kept to a minimum.

## 11. OTHER SERVICES

### (a) EXAMINATION OF TEMPORARY EMPLOYEES (EUROPEAN)

During the year 77 European employees, were medically examined, before commencing work in a temporary capacity with the municipality.

### (b) MUNICIPAL FIRE BRIGADE

Medical attention continued to be given by the Department for members (and families) of the Fire Brigade.

### (c) NATIVE EMPLOYEES

All native employees, entering the Council's service were examined by the Department, prior to being accepted for service.

In addition all employees, reporting sick during the year, were attended by the department where necessary, patients requiring more intensive treatment, owing to the gravity of their illness, were admitted to hospital.

### (d) RACE WELFARE CLINIC (Page 47)

This clinic, the only clinic of its kind on the East Rand, continues to be well attended, supplying the needs in particular of the poorer sections of the community. The Non-European section too is gradually recognising the need for skilful spacing and limitation of families, and is beginning to make use of the clinic in ever increasing numbers.

### (e) PASS OFFICE EXAMINATIONS (Page 47)

Routine examination of all native males registering at the office of the Native Commissioner, and in search of work in Benoni, continues to be undertaken by the Department.

Facilities are also provided, though rarely used, for householders to have their domestic servants examined periodically either at the pass office or at the clinic. 167 native males (or 1.15% of all males examined) were found to be suffering from some form or another of acute infectious venereal disease, and were isolated in hospital. When it is realised that these natives have been involuntarily examined, in as much as they are compelled, prior to registering for work, to be examined, it becomes evident that the percentage of natives suffering from acute venereal disease and who do not seek treatment for their complaint must be immeasurably higher, than the 1.15% quoted above (see also remarks under "Venereal Disease").

### (f) BOKSBURG BENONI HOSPITAL OUTPATIENTS (Page 45)

Accommodation at the Public Health Offices for European, and at the Location Clinic Building for Non-European clinics held by the Boksburg-Benoni Hospital, continues to be provided.

As stated in the previous report these clinics and services, essential as they are, fulfil a fraction only of the services required in as much as the clinics are available only for a portion of the mornings. No services are available in the afternoons, at night, or on Saturdays Sundays and Public Holidays.

It is hoped that a round the clock service to cater for the needs of that section of the population, both European and Non-European, in need of such services will be brought one step nearer in the coming year by the erection or establishment of A Maternity Cum Out-Patients Blocks.

(g) DENTAL CLINIC

The department continued to provide accommodation for the dental clinic at its weekly session. The services at this Clinic, which caters for the indigent school going child, continue to be provided for gratuitously by private dental practitioners, to whom the department, on behalf of not only the Town Council of Benoni but of the community as well, records its thanks for services so willingly and cheerfully given. It does seem incredible and incongruous that the Provincial Administration should be so dilatory and so unconcerned with the dental needs of the population. Even its off-spring, the Transvaal Education Department, sits back complacently and with equanimity, and views unconcernedly the attempt by local authority assisted by private practitioners, and charitable organisations to provide dental treatment for the school going child, which provision should actually be made by the Education Department itself or it may be that the administration in its research into the needs for hospitalisation has reached the conclusion (a conclusion not shared by either the medical or dental professions) that ill-health is not dependant upon healthy mouths and teeth.

The pious wish expressed in the last report that it was hoped that a full time Dental Officer would be provided by the Benoni Dental Clinic Board, has not as yet been realised. The equipment, kindly donated by the Benoni Centre of the Red Cross Society and the Benoni Rotary Club, has been installed. It is hoped that, when the Provincial Administration can be shaken out of its lethargy and be induced to assist financially, the Dental Clinic established by the local authority, with the assistance of local charitable bodies, will be able to provide dental treatment for all sections of the community.

S T A F F

The Staff as at the 30th June, 1947, was constituted as follows:-

PUBLIC HEALTH DEPARTMENT

Medical Officer of Health (Acting): S.V. Adler M.B. Ch.B,  
D.P.H., D.T.M. and H.

Assistant Medical Officer of Health (Acting) C.B. Shapiro  
M.B., Ch.B.

Veterinary Officer: J.H. Schoeman B.Sc.,  
B.Vsc.

/Chief .....

Chief Health Inspector (Acting): N. Youens R.S.I, Meat and Other Foods Certificate in Tropical Hygiene.

Senior Health Inspectors: P.J. Howett R.S.I  
J.R. Hamilton R.S.I, Meat and Other foods.  
H.E. Theron R.S.I., Meat and Other foods.

Grade I Health Inspectors: J.D. Beal R.S.I., Meat and Other Foods.  
H.F. Smith R.S.I Meat and Other Foods.

REPORT " B "

UPON THE HOUSING OF PEOPLE

The quickening tempo of industrial expansion of Benoni has been such that the shortage of housing, despite the erection of a large number of new dwellings for Europeans (251 houses were erected privately whilst 54 houses were erected by the National Housing Commission) remains as acute as ever for all sections of the community.

Many European families particularly in the lower income group of £25 to £40 per month are accommodated in premises which are veritable slums. Furthermore many of these dwellings are overcrowded inasmuch as two, three and up to four families are accommodated therein. Overcrowding is thus rampant and segregation of the sexes in most instances virtually impossible. With the shortage of alternative housing for the displaced persons, it has not been feasible at the present juncture to deal with these dilapidated, structurally unsound dwellings in the way that is most desirable, and repairs as far as possible in the absence of total demolition have been effected in order to make them temporarily habitable.

A large coloured community, with a sprinkling of Asiatics and Natives, with a few European families living checks by jowl with them, has become established in the lower end of the town. The houses inhabited by the coloureds who appear to be the responsibility of neither the local authority nor of the province, are in shocking condition, filthy, dirty, verminous, structurally grossly defective and so hopelessly overcrowded as to form slums of the worst possible type. No amount of major repairs could convert these dwellings into habitable quarters. Consequently during the course of the year recourse was had to the Slums Act. The premises were duly declared Slums, which declaration was confirmed by the responsible Minister. In the absence of alternative housing for the evicted families however the terms of the demolition orders in respect of these properties was postponed. The Town Council of Benoni, more on humanitarian grounds than because of its responsibility towards the "unwanted" Coloureds, has resolved to erect a sufficient number of houses to accommodate these coloured families. When, and with shortages of essential building materials it appear a very big when, these dwellings have been erected the process of demolishing the slums will be proceeded with.

The housing position in regard to natives presents the same sordid picture. The industrial expansion previously referred to has attracted numerous natives to Benoni, as evidenced by the fact that the last census revealed an increase of nearly 2,500 during the year. No new houses have been erected for the residents of the location, who already overcrowded, have become further overcrowded, as the result of this large influx, which, with new industries continuously opening up shows no sign of abatement.

The location itself already over-saturated with humanity has been unable to absorb these newcomers, of whom over 2,000 (535 Adult males, 536 adult females and 998 children) have established themselves in "tent Town" This "Tent Town" may be described as the Moroka of Benoni - which epithet describes conditions here without the need for further comment or elaboration. Sanitation and water have been

/provided .....

THE HISTORY OF THE  
INDUSTRIAL REVOLUTION

The industrial revolution was a period of rapid change in the way that people worked and lived. It began in the late 1700s and continued through the 19th century. This period was characterized by the invention of the steam engine, the factory system, and the rise of the middle class. The industrial revolution led to the growth of cities and the development of modern industry. It also led to the rise of the working class and the development of labor unions. The industrial revolution was a time of great progress, but it also brought with it many challenges, such as pollution and the loss of traditional ways of life.
