Proceedings of His Honour the Lieutenant-Governor of the Punjab in the Home (Medical and Sanitary) Department, No. 83-Sanitary-1, dated 5th July 1916.

READ—

The Report on the Sanitary Administration of the Punjab for the year 1915 by Colonel H. Hendley, I.M.S., Officiating Sanitary Commissioner, Punjab.

REMARKS.—The character of the seasons during the year had a marked effect on the health of the province. Unusually heavy rain in March and the beginning of April retarded the development of normal hot weather actions, thus prolonging and accentuating the severity of the worst epidemic of plague since 1907. On the other hand, the practical failure of the monsoon and consequent abnormally dry weather during the remainder of the year resulted in the disappearance of plague in June and its reappearance later in the year only on a very small scale. To the same cause was due the almost entire absence of malaria in epidemic form. The price of food grains remained unusually high throughout the year.

2. There was a fall in the general birth-rate of 2·7 *per mille* as compared with the previous year. The birth-rate in 1914 was, however, exceptional, and a much larger decrease was to be expected than actually occurred. Compared with the average of the previous five years the rate was only 1·3 in defect, while in five districts it was actually higher than in 1914. The decrease was greatest in the Gujrat and Multán districts, amounting to over 5 *per mille* compared with the quinquennial average and to 7·8 and 6·8, respectively, compared with the previous year. The fall is attributed partly to the effect of plague and partly to the absence on military service of so many young men and men in the prime of life. In Rohtak and Gurgaon, however, the rates were over 50 *per mille*,—an excess of 26 *per mille* over the death-rates. As the former is one of the best recruiting districts in the Province too much stress cannot obviously be laid on the second of the reasons given for the reduction in the number of births.

3. There was a considerable rise in the death-rate, from 32 to 36·3 *per mille*. This was chiefly due to plague, but cholera and respiratory diseases were contributory causes. The figures with regard to infant mortality, however, show a very marked improvement. Calculated on the number of births during the year the mortality among male infants works out at 188·02 and among female infants at 189·17 as compared with 208·98 and 211·38, respectively, in 1914—figures which themselves were better than those of the previous year. March, April and May were the unhealthiest months, plague being then at its height, while the months from September to December, usually marked by an epidemic of malaria, were healthier than any other period of four months in the year. The death-rate was highest in the Rawalpindi District, and was above the provincial rate in eleven other districts. It was less than 20 *per mille* in the Dera Gházi Khan and Simla districts and less than 30 *per mille* in ten other districts.

4. The general death-rate in towns was practically the same as that in rural circles, but there were considerable differences in respect of the various causes of death, the rural rate for plague being 6·03 in excess of the urban rate, while respiratory diseases accounted for 3·24 *per mille* more deaths in towns than in country circles. In the smaller towns of the province the variations in the rates were very marked, ranging from 2·40 in Gojra to 68·96 in Gohána. Sixteen other towns had rates of over 50 *per mille*, the high mortality in most cases being due to plague. Of the three principal towns in the province, Amritsar was the most unhealthy with a death-rate of 43·5 as compared with 33·59 in Lahore and 33·14 in Multán. The chief cause of this difference is to be found in the high mortality from respiratory diseases which amounted to 14·44 in Amritsar as compared with 4·97 in Lahore and 6·27 in Multán.

5. Inspection of birth and death registers revealed the normal percentage of omissions. In the Government of India resolution on scientific sanitation which was published in 1914 stress was laid on the want of complete and accurate vital statistics as constituting an impediment in the way of sanitary reform. The remarks of the Government of India in this connection were brought to the notice of local bodies, and a project has been approved for obtaining accurate registration in a selected area by means of a special staff. The realization of this project, however, awaits the return of normal financial conditions.

6. The number of deaths registered as due to cholera was 13,196, the largest number in any year since 1903. Deaths were reported from every district in the province, 69 towns and 1,678 villages being infected. The Ferozepore and Lahore districts with 2,890 and 2,657 deaths, respectively, were the worst sufferers, while among towns the number of deaths was highest in Kasúr, Gohána, Amritsar, Lahore and Kunjah. As in 1903 the chief cause of the outbreak is to be found in the infection spread by pilgrims returning from the great Hardwar Kumb fair, but a further centre of diffusion was the Ghariafa fair in the Kasúr Tahsil, while in the Gujrat District the epidemic started from local causes in two villages, in one case being due to the eating of the flesh of a diseased ox, and in the other to the drinking of water from a polluted well in a graveyard. The experience of the year has thus still further emphasised the importance of controlling the sanitary arrangements at all large fairs, and in this direction good work is being accomplished. Special arrangements are made at the larger fairs under the supervision of the Additional Deputy Sanitary Commissioner, and during the year schemes for the supply of pure water to the fair areas at Gullu Shah and at Núrpur in the Ráwalpindi District have been approved and assisted by grants-in-aid from the Sanitary Board.

7. Only 1,694 deaths were due to small-pox, the lowest number recorded since registration of deaths was introduced. Eleven districts of the province were practically free from the disease. The death-rate from fevers was, however, again very high, amounting to 14.73 *per mille*, though this figure represents an improvement on the previous year which is accounted for by the almost entire absence of malaria in epidemic form. The rate was proportionately highest in the Multan Division, where 56,752 deaths out of a total of 82,268 were attributed to this cause. No satisfactory explanation is afforded of the very large increase from 9.55 to 30.12 recorded in Murree which had a higher rate than any other town. On the whole, the towns shared in the general decrease but the rate remained high in Khángarh, Karor, Bhakkar, Shujabad, Kamalia and Alipur.

8. It has already been observed that the epidemic of plague with which the Province was afflicted in 1915 was the worst since 1907. Twelve districts suffered severely, and a total of 244,104 deaths was recorded. The epidemic had commenced in the latter portion of 1914 and the full effects were felt in the first half of 1915. There was, however, but little recrudescence in the latter half of the year owing to the abnormally hot weather and the efforts of the plague staff in treating the worst infected areas. His Honour is glad to observe that despite the severity of the epidemic the special staff were able to afford general medical relief to a large number of persons. He is convinced that no better means exist of gaining the confidence of the people and thus facilitating the introduction of the various measures by which plague can be effectively controlled if not overcome. It is also gratifying to find that some local bodies entertained paid agents to assist in the work, and that much valuable voluntary help was forthcoming.

9. The increase in the recorded number of deaths from respiratory diseases is a disquieting feature of the year, but is no doubt very largely due to improved diagnosis. At the same time the heavy toll that is taken by tuberculosis of the lungs especially in towns cannot be disregarded, and His Honour

trusts that the question will receive the fullest consideration from local bodies. Much indeed depends on the personal habits of residents in towns, but it is one of the foremost duties of the authorities responsible for the health of towns to see that the conditions so favourable to this disease, crowded houses, narrow and sunless lanes, and generally the want of air and light which are such conspicuous features of the larger towns in the province, shall not be perpetuated or reproduced in future extensions or alterations.

10. Eight lakhs were originally allotted to the Sanitary Board for distribution among local bodies, but it was subsequently found necessary, for financial reasons, to withdraw more than half this sum. Over 3½ lakhs were, however, distributed by the Board in aid of urban drainage and water-supply schemes and about Rs. 15,400 for rural sanitation.

One of the main obstacles in the way of utilising the allotments for rural sanitation has been the rule that a grant-in-aid of a sanitary scheme shall only be made when half the cost of the work is provided from local sources. The subject of rural sanitation has been engaging the close attention of Government, and the question of passing a special Act on the lines of the United Provinces Village Sanitation Act has been carefully examined. It has, however, been decided that for the present such an Act is not required, and that the Punjab District Boards Act provides all the administrative machinery necessary. In several districts the adoption of simple regulations under this Act to promote the sanitation of villages has been approved, and in a number of cases villages have agreed to the imposition of taxation in order to meet the cost of elementary measures of conservancy. In such cases when there is an evident desire on the part of the inhabitants for sanitary progress His Honour considers that the strict requirements of the rule may be waived and that grants in aid of sanitary works may be given, provided the principle of self-help is not disregarded, even when half the cost of such works cannot be raised by local contributions. With regard to urban sanitation there are no fresh developments to record, but drainage and water-supply schemes figure prominently in the activities of most municipalities. An experiment in the administration of quinine to school children, which was made in Amritsar in the autumn of 1914, met with considerable success. The results achieved are being brought to the notice of selected municipalities which are being recommended to adopt a similar scheme modified in the light of the experience gained at Amritsar. The acknowledgments of Government are due to the many individuals mentioned in paragraph 39 of the report who have constructed works of public utility; the public spirit shown by the Jats and Mahajans of the Ambala Division in this matter merits special mention.

11. The post of Sanitary Engineer to Government was held by Mr. A. S. Montgomery up to the end of September and by Mr. V. Stainton for the rest of the year. Mr. Stainton's report gives an interesting account of the various sanitary works in progress throughout the province and a summary of the many schemes which have been prepared but have not yet been put in hand. It is, however, distressing to learn that many completed sanitary schemes were found to be in a very neglected and deplorable condition through lack of proper maintenance and supervision. His Honour trusts that the instructions recently issued to local bodies regarding the regular inspection of machinery and plant by expert firms will be carefully followed.

Colonel C. J. Bamber held charge of the post of Sanitary Commissioner in addition to his own duties until the middle of July when he was succeeded by Colonel Hendley. His Honour's acknowledgments are due to both these officers for the readiness with which they undertook the additional responsibilities involved in this charge and to Colonel Hendley for an interesting report. The posts of Deputy Sanitary Commissioner and Additional Deputy Sanitary Commissioner were held throughout the year by Major W. C. H. Forster, I.M.S., and Dr. Khwaja Abdurrahman, respectively, and His Honour desires to express his appreciation of their services.

ORDER.—Ordered that a copy of the foregoing remarks be circulated with the report and be furnished, with the usual number of copies of the report, to the Government of India; also that the review be published in the *Punjab Government Gazette*.

Ordered, also, that a copy be furnished to the Sanitary Commissioner, Punjab, for information.

By order of His Honour the Lieutenant-Governor of the Punjab,

O. F. LUMSDEN,

Financial Secretary to Government, Punjab.

Section I.

MR. GILBERT T. WALKER, C.S.I., M.A., Sc.D., F.R.S., Director-General of Observatories, has kindly furnished the following brief summary of the chief meteorological features of the Punjab during the year 1915 :—

During January rainfall occurred mainly on the 16th, 17th, 23rd and 24th, and was confined almost entirely to the eastern and northern parts of the province, but even there the recorded amounts were generally short of the small normal for the month. During February wide-spread rain fell on the 3rd, 4th, 7th and 8th, but dry weather set in and continued up to the 8th March when a winter storm from Persia introduced general rainfall lasting for four days. This disturbance was followed at intervals by three or four others of the same type, and the last two of the series caused good rainfall over the east and north Punjab during the second week of April. In the Simla Hills snowfall occurred down to unusually low levels as late as April 7th. The rainfall of both March and April was distinctly heavier than usual and one of its important effects was to retard materially the development of the normal hot weather actions. In May accordingly there were fewer duststorms and thunderstorms than usual and the rainfall was upwards of 50 per cent. in defect. Marked hot weather conditions prevailed in June and frequent showers were recorded, but as there were no incursions of damp sea winds, such as ordinarily occur, the month's rainfall although normal in the south-west of the province was as much as 44 per cent. below the average in the north and east Punjab. The monsoon currents were exceedingly weak and fitful from July to about the middle of September and the rainfall due to them was light and occurred sporadically. Between September 12th and the 4th October the monsoon was very active and good rain fell in the northern and eastern parts of the province, but it failed to extend into the south-west Punjab. During the rest of the year save for light rainfall in December 1915 the weather was drier even than usual.

In brief the weather was more open than usual in January and February, abnormally wet in March and the first half of April and unusually dry during the rest of the year with the exception of the interval between September 12th and the 4th October when a much-needed burst of rainfall occurred. Normally the final cessation of the summer rains in the Punjab takes place about the middle of September.

In January, July, August and November, the months of abnormally dry weather, cloud amount was in decided defect. Humidity was high in the first four months and low in July and August when a marked drought prevailed over the province. The maximum temperature departed to no great extent from the normal except in May, July and August when it was 4° or more in excess; the minimum was higher than usual by 5° in May and by 3° in July and September, and fairly normal in the rest of the year.

2. The usual return furnished by Mr. L. French, C.I.E., I.C.S., Director of Land Records, Punjab, shows that the average retail price of wheat was 8½ seers per rupee at Ambala, 8¾ at Lahore, 8⅞ at Rawalpindi and 9¼ at Multan during the year 1915.

The average rates of barley were 13 seers at Ambala, 14¼ at Lahore, 14½ at Rawalpindi and 12¾ at Multan, and that of jowar 10⅓, 11⅓, 11½ and 12½, respectively. As regards bajra, the average rates varied from 9½ to 10½ seers at the principal markets of Ambala, Lahore, Rawalpindi and Multan, that of maize 10½ to 11½ and that of gram 11½ to 12½ seers per rupee.

Except in the case of gram, there was a general rise in the price of food-grains as compared with the preceding year, which is due to the war and the failure of the monsoon. The fall in the price of gram is due to less exports to the United Provinces and the bumper crop of 1915.

3. The first survey on wages taken in December 1912 will stand until the next survey which will be held in 1917.

Section V.—Vital Statistics.

4. Though the question of basing our statistics on an estimated population throughout the Report has been deferred for the present, yet for comparison an estimated population has been prepared and a few ratios worked out to show the difference made in the ratios calculated on this population and that of the previous census. The birth rate on the estimated population is 41·0 *per mille*, this is 2·6 less than the rate calculated on the census figures. The difference in individual districts varies and is as high as 4·9 in Lyallpur and as low as 0·6 in Rawalpindi, while in Simla the rates are the same. In the case of deaths, the rate for which is 34·1, there is a decrease of 2·2 over the rate calculated on the census figures and here also the rates in individual districts varied but not to the extent that they did in the case of births. The decrease was greatest in Ferozepore 3·0 and least in Rawalpindi 0·8, while in Simla there has been an increase of 0·1. The population in all the districts except Simla has increased since the census of 1911 and now amounts to 20,573,733 instead of 19,337,146, i.e., an increase of 6 per cent. The population in Lyallpur has increased by 12 per cent., Ferozepore and Montgomery 10 per cent., Hissar, Jhang and Multan 9 per cent., Rohtak, Lahore and Mianwali 8 per cent., Ludhiana and Shahpur 7 per cent. and Gurgaon, Sialkot and Muzaffargarh 6 per cent. In the others it varied between 2 per cent. in Rawalpindi and 5 per cent. in Karnal, Jullundur, Amritsar, Gurdaspur, Gujranwala, Gujrat, Attock and Dera Ghazi Khan, Simla being the only district with a reduction of 68 or 0·2 per cent. The population of Simla however is so small that this slight decrease in it need not be considered.

5. But for plague which caused a death rate of 11·48 *per mille* the year 1915 was an exceptionally healthy one and excluding plague deaths the death rate is lower than it has ever been since 1877. With the exception of cholera and respiratory diseases which accounted for more deaths than in recent years no other cause of mortality except plague showed an increase while the reduction in the death rate from fevers compared with the two previous years and the quinquennium is most satisfactory and is due, no doubt, to the partial failure of the monsoon. The birth rate is not so satisfactory but compares favourably with the average for the previous five years and is only a little less than it was in 1911, 1912 and 1913. The birth rate in the previous year 1914 was exceptionally high and as in 1899 has been followed by a year in which the birth rate is much less, though in the year under report the decrease has not been nearly so great as it was in 1900.

6. **Births.**—The total number of births this year was 843,012 of which 440,955 were males and 402,057 females, the respective rates being 43·6, 22·8 and 20·8. Compared with the previous year there is a total decrease of 2·7 *per mille* though the quinquennial average is only 1·3 in excess. The birth rate this year has presumably been affected by plague and perhaps partly by the absence of young men and those in the prime of their life at the war. Last year's birth rate was exceptional and the rates for the two years previous to it were also high, so the quinquennial average was higher than it usually is; the birth rate for this year showing a decrease therefore when compared with these rates does not mean that it was exceptionally low, on the contrary it may be regarded as a fairly average rate. A remarkable fact about the birth rate is that after a year in which it is exceptionally high it is usually followed by one in which the rate is either very low or lower than that for the previous five years, e.g., 1883, when it was 39·00 followed by 20·01 in 1884, in 1899 48·4 followed by 38·8 the following year. I do not quote 1909 for there were special reasons for the great decrease which was explained at the time in the report for that year.

7. The Central Provinces again shows the highest birth-rate 47·95 and the Punjab comes next with 43·60. The other provinces recorded rates in the following order:—United Provinces 43·48, Bihar and Orissa 40·4, Bombay 37·10,

Burma 35.13, Assam 33.60, Bengal 31.80, North-West Frontier Province 31.73 and Madras 31.2.

8. The provincial birth-rate shows a decrease of 1.3 *per mille* compared with the quinquennial average; this decrease was shared by all the districts in the province except Hissar, Rohtak, Gurgaon, Simla, Kangra, Mianwali, Jhang and Dera Ghazi Khan. Compared with the previous year the decrease is greater and amounts to 2.7, while individually only 5 districts have a higher birth-rate than in the year preceding, namely, Simla, Kangra, Rawalpindi, Mianwali and Jhang, and it is satisfactory to note that among these districts Simla, Kangra, Mianwali and Jhang have a higher birth-rate than their respective quinquennial averages and the rates for the year preceding. The decrease was greatest in Gujrat, Multan, Ferozepore, Amritsar, Montgomery, Ludhiana and Lyallpur, where it was 5.4, 5.3, 2.3, 2.2, 2.5, 1.0 and 2.3, respectively, compared with the quinquennial average, and 7.8, 6.8, 5.7, 4.9, 4.8, 4.8 and 4.1 with that of the previous year. In the remaining districts the increase or decrease did not exceed 3.9 and was as low as 0.1.

9. In the principal towns of the province, *i.e.*, those with a population of 10,000 or upwards, 38 in number, the same as last year, the rate amounted to 43.4 as compared with 45.4 the previous year and 43.7 the average for the previous five years. Of the three largest of these Amritsar accounted for the highest rate 44 *per mille*, Multan coming next with 41 and Lahore 38. With the exception of Lahore, in which the rate is the same as in the previous year, the other two have lower rates than in the quinquennium and the year preceding.

10. The highest birth-rate, 51.3 was recorded in Rohtak, Gurgaon closely following with 50.2, Hissar 49.1 and Amritsar 48.1. The lowest rate was registered in Simla 21.3, next to this comes Dera Ghazi Khan with 31.1, Muzaffargarh 34.6, Jhelum 35.6, Attock 37.0 and Multan 37.1. In the others it varied from 38.7 in Kangra to 47.9 in Karnal. The provincial rate of 43.6 was exceeded in 12 districts out of the 28 in the Province.

11. The natural increase of population, *i.e.*, excess of births over deaths amounted to 7.3 *per mille* in the year under report. Among those districts which had an excess of births Rohtak and Gurgaon, both districts, which have a high birth-rate headed the list, the excess amounting to no less than 26.5 and 26.0, respectively, Lyallpur had an excess of 21.4 and Hissar 20.9. In the others it ranged from 19.9 in Jhang to 0.1 in Sialkot. This increase was observed in all but 6 districts, namely, Jullundur, Amritsar, Gujrat, Jhelum, Rawalpindi and Attock. The excess of deaths over births was greatest in Rawalpindi 18.3, Gujrat 15.6 and Jhelum 13.2, in the other three districts it varied between 3.7 and 4.2.

12. **Deaths.**—The death-rate during the year under report which amounted to 36.3 *per mille*, accounted for 702,550 deaths, 359,821 males and 342,729 females, and was 4.3 *per mille* in excess of that for the previous year and 5.0 in excess of the average for the previous 5 years. The high death-rate is due to plague, but cholera and respiratory diseases also accounted for more deaths than in the previous year. With these exceptions, however, the rates have been lower than in the previous year and the quinquennium except in the case of dysentery and diarrhoea which have a slightly higher rate than in the quinquennium. The reduction in the fever death-rate is most satisfactory and with the exception of the rate in 1912 is the lowest on record since 1877.

13. The highest provincial death-rate was recorded in the Punjab 36.33, the Central Provinces coming next with 35.91 and the remaining provinces as follows:—Bengal 32.83, Bihar and Orissa 32.2, Assam 30.86, United Provinces 30.04, Burma 27.99, Bombay 26.12, North-West Frontier Province 23.61 and Madras 22.0.

14. The highest death-rate was registered in Rawalpindi 57.4, the others were as follows:—Gujrat 55.8, Amritsar 52.3, Jhelum 48.8, Jullundur

Deaths by districts.—Annual Form No. II.

47.0, Gurdaspur 46.1, Sialkot 46.0, Gujranwala 43.0, Ludhiana 41.4, Attock 40.9, Hoshiarpur 39.3 and Lahore 38.7, all these districts had rates higher than the provincial rate and in all of them their high rates are due to plague. On the other hand in those districts in which there was either no plague or very little low death-rates were recorded, e.g., Dera Ghazi Khan 19.0, Simla 19.7, Muzaffargarh 23.4, Multan 23.8, Montgomery and Gurgaon 24.2, Rohtak 24.8, Lyallpur 25.2, Jhang 25.5 and Mianwali 25.8, in fact the total death-rates in these districts are not as high as the plague rates in Gujrat, Rawalpindi and Jhelum where they were 36.0, 28.6 and 27.4, respectively. In the 6 districts not already mentioned the rates varied between 28.2 in Hissar and 34.5 in Ferozepore. All the districts in the Jullundur Division have a death-rate higher than the mean for the previous 5 years and last year's rate and the same is the case in the Lahore and Rawalpindi divisions with one exception in each case, i.e., in Gujranwala in the Lahore Division and Mianwali in the Rawalpindi Division the rate is less than it was last year. Ambala is the only Division which shows a reduction in both while Multan has only two districts with a higher rate than in the previous year and in the quinquennium, namely, Montgomery and Lyallpur; the increase in these two districts is due partly to plague and cholera in Montgomery and to plague in Lyallpur.

15. The healthiest month in the year was September, the death-rate being only 1.75, this was closely followed by October 1.84, August 1.87, July 2.06

Death-rate by months.—Annual Form No. III.

and November 2.12, the low rates from September to November are due to the practical absence of Malaria in epidemic form. The only months in which a high death-rate was recorded were April 6.04, May 4.81 and March 4.53 the cause being the severe outbreak of plague in these months. Owing to plague in the first half of the year the total deaths practically doubled that of the latter half for the reason that fevers accounted for much fewer deaths than usual. The Malarial season, i.e., September to December, was healthier than any four-month period during the year.

16. Infants under one year of age again accounted for the highest death-rates, 195.24 for males and 188.06 for females, but these rates are much below those for the previous year which

Death-rates according to different diseases under specified age periods.—Annual Form No. IV.

were 230.43 and 223.05. The decrease is due chiefly to a reduction in the death-rate from fevers, respiratory diseases and all other causes, but all heads of mortality except cholera, plague and injuries accounted for a lower death-rate in this age group than in the year preceding. The infant mortality calculated on the number of births during the year works out at 188.02 for males and 189.17 for females as compared with 208.98 and 211.38 in the previous year. Last year's figures were an improvement on those for the previous year and the improvement this year is even more marked. The next highest rates were recorded among those above 60 years of age and were 78.03 in the case of males and 84.47 in that of females, these figures are in excess of those for the previous year and are due principally to an increase in the deaths from plague which was more prevalent in the year under report than in the previous year. Children between one and five years of age accounted for rates of 48.48 and 50.79, those between 50 and 60 for rates of 36.43 and 40.84, those between 40 and 50 for rates of 26.44 and 28.98, in the other age groups it varied between 16.06 the male rate in the group between 20 and 30 and 25.31 the female rate in the group 10 and 15. The total female rate exceeded the male rate under every age group except in the case of infants under one year of age.

17. The districts of Gujranwala and Attock are again offenders in respect of a higher death-rate being recorded among "other classes" than

Deaths by classes.—Annual Form No. V.

the general population, while the districts of Jhang, Sialkot, Muzaffargarh, Dera Ghazi Khan, Gujrat, Montgomery and Amritsar recorded very high death-

rates under this heading ranging from 65.90 in Amritsar to 416.6 in Jhang, the total rate for the province being 51.26.

The rates for the others was as follows :—

Native Christians 40.21, Muhammadans 38.72 and Hindus 33.19.

Practically no improvement has been effected in rectifying the classification of deaths by classes, notwithstanding all efforts made by this department, and it is feared that no change for the better can be expected until the next census when it is hoped that the population for this class will be more accurately recorded.

18. The rural rate which was 36.35 exceeded the urban rate 36.17 under the heads of mortality of cholera, plague and fevers, the excess being greatest under plague amounting to 6.03. Under all the other heads of mortality the urban rate was in excess but to no marked extent except in the case of all other causes and respiratory diseases, the excess amounting to 2.86 and 3.24, respectively.

Amritsar again accounted for the highest death-rate among the three most important towns of the province, the rate being 43.50 as compared with 45.44 last year and 39.26, the average for the previous five years. Multan and Lahore had rates of 33.14 and 33.59, both rates were in excess of their quinquennial average and in the latter above the rate for the previous year also. The increase in Amritsar is due to plague and respiratory diseases, the death-rates from which were 4.78 and 14.44, respectively, compared with a quinquennial average of 1.24 and 9.23. The increase in Lahore and Multan compared with the quinquennial average calls for no remarks except perhaps that in the latter plague accounted for a death-rate of 2.01 against an average of 0.02. The increase in Lahore compared with last year is very slight 0.38, while Multan shows a decrease of 2.03.

Among the smaller towns in the province the lowest rate was recorded in Gojra 2.40, Lyallpur coming next with 9.30 and the following in all of which the rate was below 20.0 *per mille*. Sargodha (14.13), Akalgarh (14.71), Fattahabad (15.79), Dera Ghazi Khan (17.27), Simla (17.59), Khangah Dogran (18.15), Sambrial (18.46), Hafizabad (19.33), Daud (19.82) and Shahkot (19.92). These low rates are due to either the entire absence of plague or to a very small death-rate from it and also partly to the low rate from fevers. The highest rates were recorded in Gohana 68.96, Mitranwali 65.03, Murree 64.63, Sharakpur 61.13, Panipat 54.63, Raekot 54.19, Eminabad 53.75, Nurmahal 53.08, Khushab 51.78, Pakpattan 51.69, Khem-Karan 51.47, Dinga 51.02, Jagraon 50.87, Chawinda 50.69, Jagadhri 50.64, Dasuya 50.04 and Jandiala 50.01. With the exception of Murree, the high death-rate in which is due to fevers (30.12) and dysentery and diarrhoea (17.63), the high rates in all the others are the result of the excessive plague rate recorded in them.

19. There were 620,460 entries checked in the birth registers and 475,230 in the death registers. This shows a decrease compared with both last year and the average for the previous five years. This decrease is due to the fact that the Vaccination Staff were employed to a very large extent on cholera and plague duty during the off season.

The percentage of omissions discovered to number of entries checked worked out to 1.81 and 1.84 for male and female births and 0.89 and 0.95 for deaths for inspections by Divisional Inspector; the rates for Superintendents of Vaccination and Vaccinators are 1.11 and 1.33 for male and female births and 0.45 and 0.52 for deaths. The Revenue Staff found omissions at the rate of 1.07 and 0.89 among births and 0.80 and 0.73 among deaths.

There were 110 Chowkidars fined for neglecting to report births and deaths during the year, the fines amounting to Rs. 65. In municipal towns 151 persons were fined for failing to register births and 91 to register deaths, the total fines amounting to Rs. 202.

20. At railway stations outside municipal limits 119 births and 91 deaths were registered, the corresponding figures for the previous year were 152 and 116, respectively. Of these deaths 2 were due to cholera, 5 to plague, 44 to fevers, 4 to dysentery and diarrhoea, 1 to respiratory diseases, 3 to injuries and 32 to all other causes. No death was registered from small-pox.

21. There were 239 births and 130 deaths among Europeans and Anglo-Indians as against 394 and 206, respectively, in the previous year. The total number of deaths are distributed as follows:—Cholera 4, plague 1, fevers 6, dysentery and diarrhoea 7, respiratory diseases 21, injuries 2 and all other causes 89. No death was registered from small-pox.

22. Among the non-military population of cantonments there were 3,558 births at a rate of 17 *per mille* and 3,352 deaths at a rate of 16 *per mille*, the corresponding figures for the previous year being 3,863 and 3,577 at rates of 18 and 17, respectively. The deaths were classified as follows:—1,516 fevers, 461 respiratory diseases, 122 dysentery and diarrhoea, 114 plague, 42 each cholera and injuries, 1 small-pox and 1,054 all other causes.

Section VI.—Chief Diseases.

23. Cholera.—The total number of deaths from cholera registered in 1915, the great Hardwar Kumb Fair year, amounted to 13,196, the largest annual number since 1903, the year in which the last Kumb Fair was held when 14,688 deaths were recorded. The only other year in which deaths almost equalled this figure was 1908 when 12,297 were reported, the result of a severe outbreak of the disease at Kitas Fair in the Jhelum District. The ratio of mortality from this cause was 0·68 *per mille* of population or double the rate in the previous year and 0·50 more than the quinquennial average. Deaths were reported from all the districts in the province and out of a total of 139 towns and 33,110 villages, no less than 69 towns and 1,678 villages were infected. The largest number of deaths was registered in the districts of Ferozepore and Lahore being 2,890 and 2,657, respectively, Gujrat came next with 1,251. Hissar 785, Amritsar 782, Kangra 775, Karnal 624, Montgomery 587, Rohtak 556, Gujranwala 542, and Ludhiana 502, while in Lyallpur, Shahpur, Rawalpindi, Gurgaon, Ambala, Hoshiarpur, Gurdaspur, Sialkot and Jhelum the number of deaths varied between 316 and 50. In the 8 remaining districts the mortality did not exceed 20.

Except for 3 deaths from cholera registered in the Kangra District during the month of January (a continuation of the outbreak during the latter part of the previous year) the province was free from the disease for practically the first two and a half months of the year. During the latter half of the month of March 10 deaths were registered of which 4 occurred in Kangra, 5 in Lahore and 1 in the Amritsar district.

The first case of cholera occurred at Nurpur in the Kangra District on the 19th March; the inquiry made elicited the fact that the patient had been to Amritsar where cholera was said to be present but on enquiry the Health Officer, Amritsar, reported that he had not heard of the prevalence of the disease there at that time. At Nurpur all preventive measures were adopted and the disease kept well under control. There were only 7 cases with 4 deaths.

On the 23rd March an imported case of cholera occurred at Jawalamukhi Naurata Fair, also in the Kangra District. The patient was a pilgrim from Gharwal District in the United Provinces and developed symptoms of the disease 36 hours after his arrival at Jawalamukhi; another case also occurred in the same locality on 28th. The patients were isolated and every possible precaution taken, but this fair has been held responsible for the partial dissemination of the disease and along with infections imported from Kumb Fair, Hardwar, led to the epidemic which continued in April, May and June.

It was towards the end of March that the disease broke out in epidemic form amongst the people returning from the Ghariala Fair in the Kasur Tahsil from where the infection was spread gradually to other parts of the district and led to a severe epidemic. The source of infection at Ghariala could not be definitely traced. The first (fatal) case, in the Amritsar District, occurred on the 30th March in the Amritsar city, in the person of one who had returned from the Ghariala Fair.

On receipt of telegraphic intimation from the Sanitary Commissioner, United Provinces, that cholera was present at Hardwar and pilgrims were dispersing, Civil Surgeons and Health Officers were warned to take necessary precautions against the disease, but notwithstanding this precaution cholera broke out at once in 23 districts and caused 877 deaths during April, the victims being in most places those who had just returned from the great Hardwar Kumb Fair. It may be noted here that no less than 2,017 cases with 1,085 deaths were due to infection introduced from Hardwar from the middle of April to the 3rd week of May. In May the number of deaths amounted to 4,390 when the disease assumed a virulent form; from the month of June the disease declined and the number of deaths fell to 3,607, in July and August

there was a still further reduction to 2,145 and 1,796 while in September and October the number fell to 331 and 29, respectively, the number of infected districts decreasing accordingly. In November, Ferozepore and Gurdaspur were the only districts in which deaths occurred, only 1 in the former and 7 in the latter. No death was registered during the month of December. The district of Ferozepore headed the list with 4,407 cases and 2,890 deaths. From the cholera enquiry reports it was ascertained that no less than 61 persons were infected at Hardwar in the Kumb Fair and were the chief agents of importing infection into the district. The Civil Surgeon and the medical subordinates did all that was possible to stamp out the disease and to mitigate its effects. Eighty infected villages were frequently visited by the Civil Surgeon who personally conducted operations. The Additional Deputy Sanitary Commissioner, Punjab, was also in this district from 8th to 28th June supervising anti-cholera operations in the infected villages of Moga and Zira Tahsils which were the worst affected. The Lahore District came next with 2,657 deaths. The Ghariala Fair in the Kasur Tahsil was considered to be a diffusion centre as from the cholera enquiry reports the source of infection was traced from this fair to at least 36 villages, many of which helped again in the further spread of the disease. It is a noteworthy fact that with the exception of the Kangra District the disease was not prevalent in any part of the province at that time and as far as could be ascertained it was not imported from the Kangra District or from outside the province, it may therefore be concluded that the real origin of the disease was from "Chronic carriers." It would also be interesting to note that the first few cases noticed in Algan, which was the first village infected from Ghariala on 29th March, were very similar to severe ptomaine poisoning, only those who attended the Fair being attacked. The course of the epidemic was much protracted, lasting from 29th March to nearly the end of September. The largest number of deaths in this district occurred in May and June (1,018 and 673, respectively) the reason assigned was that a large number of marriages took place during these months, the Jats being comparatively free from work in the fields. In Lahore Municipality 86 deaths occurred, the first four cases being among those who had just returned from Hardwar between the 16th and 25th April with the exception of a sporadic case which occurred on April 7th. Besides these 10 cases with 7 deaths occurred in a part of the city known as Wachhohali on the 2nd May and the Health Officer reported that although he could not say with certainty yet from the history given to him, it seemed as if infection had been brought from Hardwar. Prompt measures for disinfection were adopted in all cases reported, by the Health Officer, Lahore, and the spread of the disease was kept well under control. About 430 wells were permanganated in the City. Gujrat is the third district in which cholera has been bad this year. The disease was first perceived in Pindi-Hasna and Chilianwala villages in the Gujrat and Dinga Police Stations on 14th May. After that 3 towns and 210 villages were infected from one another and from the adjacent districts. At Pindi-Hasna the cause of the disease was reported to be due to the eating of the flesh of a diseased ox by some 30 persons, all of whom were seized with vomiting and purging and that then the disease spread through contaminated food and drink in the village. At Chilianwala it was reported that the people had evacuated their houses on account of plague and were living at different wells outside in temporary constructed huts. The two camps in which the first persons were attacked were side by side. They drank water from a well situated to the east of the village on the roadside and in the Muhammadan graveyards of the Sayyads which had been closed for the last four months. The water contained a lot of decomposed matter which lent it a whitish colour and an offensive smell. Next day after drinking the water 4 cases of vomiting and purging occurred in both these camps. Two of them ended fatally, while the others recovered. When the people assembled in the same graveyard to bury the first Muhammadan case and offer prayers several of them drank water from the same well and all were seized with vomiting and purging in the evening. The disease went on slowly in June, but with the approach of the Ramzan (15th July) it began to increase, but subsided again after the "Id" festival (15th August). There can be no doubt that the

Ramzan is a great predisposing cause and Gujrat being a district which is mostly populated by Muhammadans suffered considerably. In the Kunjah town all those attacked with one exception were Muhammadans, they fell sick mostly during the fasting month.

There was an outbreak of epidemic diarrhoea in Murree during the month of Ramzan. The Civil Surgeon and the Additional Deputy Sanitary Commissioner, Punjab, who were sent to investigate the disease, examined excreta of 4 cases, with the result that no cholera germs were found in the stools.

The chief cause of the severe epidemic of cholera this year, except in Lahore and Gujrat districts which were badly infected, was the great Kumb Fair at Hardwar, though later on disseminating centres were formed in the infected districts. Every possible effort was made to check the spread of the disease and the Additional Deputy Sanitary Commissioner, Punjab, inspected the severely infected districts, personally supervising the disinfection of all sources of water supplies and other anti-cholera precautions. While not on cholera duty all the returns were checked by him and in addition to pointing out irregularities to the Civil Surgeons concerned, he also instructed them as to further precautions to be observed. It was a drawback that the prevalence of the disease was not reported to the authorities in several cases till the disease had been firmly established, it is hoped that in future, now that the Lam-bardars and Chaukidars have been made definitely responsible for the prompt report of such outbreaks, there will be no more trouble of this nature and if so, that the district authorities will take severe notice of any delinquency in future.

In April at several principal railway stations segregation sheds were erected and passengers found sick in trains were removed and treated in them. As cholera was also prevalent in Kashmir an inspection post was established at Kohala to prevent the introduction of the disease from that side.

The Civil Surgeon of Amritsar reported that valuable services were rendered in connection with cholera by Honorary Sanitary Inspectors, Bhai Sahib Singh, son of Sirdar Budh Singh, Subedar-Major, and Lala Jaishi Ram, grandson of late Lala Lal Chand Rai Bahadur, Honorary Magistrate and Sirpanch of Amritsar city. The public spirit shown by the gentlemen was most praiseworthy. They distributed medicines gratuitously and made frequent visits in order to get the drains and lanes situated within their circle thoroughly cleaned; besides they rendered much assistance in the disinfection of wells and houses in the city. The Civil Surgeon considered that they deserved high commendations and exceptional notice for these services.

The Civil Surgeon, Gurgaon, reported that the services of Rao Bahadur Balbir Singh, Honorary Magistrate of Rewari, were also worthy of special recognition. Lalas Sri Ram and Maya Das, Civil Surgeons of Ludhiana and Gurdaspur, Chawdhri Mela Ram and Sayed Nasir Hussain, officiating Civil Surgeons of Kangra and Ferozepore districts, did good work in controlling the disease, and Assistant Surgeons, Pandit Chandar Shikar, Lala Piarey Lal Tandan and Lala Jagat Ram Kochar also rendered valuable services. The following Sub-Assistant Surgeons Abdul Rahim, Bhawani Sahai, Lala Diwan Chand of Zira, Munshi Jan Mohammad, Lala Fakir Chand, and Pandit Amin Chand of Dehlon are also worthy of mention for their valuable services in this connection.

24. Small-pox.—There were as few as 1,694 deaths in all recorded under the head of small-pox yielding a rate of 0.09 *per mille* of population. The

Annual Form No. VIII.

number of deaths among children under one year of age was 379 as against 765 in the previous year whilst the number for over one and under 10 years of age was 911 as against 1,569. It is satisfactory to note that the death rate is 0.06 less than the figures for the previous year when the ratio of mortality from this disease was the lowest recorded since the introduction of the system of registration of deaths. It is also 0.73 below that of the quinquennial average. The decrease is no doubt due to the fact that there were very few persons susceptible to the disease for the reasons stated in paragraph 24 of the report for the year 1914.

During the month of January 64 deaths were registered and in February the number of deaths fell to 59 which is the lowest number of deaths ever recorded in any one month since 1867. In March and April, however, the number of deaths rose to 101 and 131, respectively, and to 306 in the month of May in which it was the highest. From this month onwards, however, the disease declined and the number of deaths fell to 282 in June, 244 in July, 144 in August, 105 in September and 96 in October; the months of November and December accounted for only 77 and 85 deaths, respectively, and with the exception of the month of December of the previous year, when there were only 76 deaths recorded, these figures are the lowest on record for this season since the commencement of the registration of deaths in the province.

The districts of Ferozepore and Lahore recorded the highest death-rate from small-pox as was the case last year being 0.42 and 0.33, respectively, per 1,000 of population, but these rates were lower than the figures for the previous year and that for the average for the previous 5 years. Ludhiana comes next with a rate of 0.25 compared with 0.34 in the year preceding. In Amritsar, Hissar, Lyallpur, Multan and Montgomery the rates varied between 0.19 and 0.09.

It is very gratifying to observe that the districts of Simla, Kangra, Jhelum, Gujranwala, Rawalpindi, Attock, Dera Ghazi Khan, Jhang, Gujrat, Mianwali and Sialkot were practically free from the disease as no death was registered in the Simla district and in the others the number of deaths was between 1 and 8 only. In the 9 remaining districts of the province the death rate was also below the provincial rate.

The average death-rate from small-pox in towns was 0.12 *per mille* or 0.4 greater than in rural circles while for towns in which the compulsory Vaccination Act is in force it was 0.10 as compared with 0.15 for those in which the provisions of the Act have not been extended. Vaccination is better attended to in towns where it is compulsory, but a stricter application of the Act would effect greater improvement. Among the largest towns of the province, Multan headed the list with a death-rate from small-pox of 0.38, Amritsar being next with 0.21, while in Lahore the rate was as low as 0.03. In the smaller towns the highest rates were registered in Ballabgarh, Khudian and Batala and were respectively 1.73, 1.34 and 1.21, and it may be noted that the provisions of the Act have not been extended to any of them. In 36 towns the death-rate varied between 0.03 in Gujranwala and 0.93 in Phillaur and in the remaining 97 towns there was not a single death from small-pox.

The rate of mortality from small-pox was, as usual, greatest, among infants under one year of age being 0.49 *per mille* in the case of males and 0.42 in that of females as compared with 1.00 and 0.84, respectively, in the previous year. Among children from one to five years of age the rate fell to 0.31 and 0.27, while in the next age period of 5—10 years it was further reduced to 0.13 and 0.12; over 10 years of age the death-rate never exceeded 0.03 *per mille* in either sex and gradually fell with increasing age. The female death-rate was greater than the male rate in age periods from 10—50 years due to the reason given in last year's report, namely, the reluctance with which females are presented for re-vaccination.

25. Plague.—The following plague report has been furnished by the Inspector-General of Civil Hospitals, Punjab.

Mortality.—There were 244,104 deaths from Plague in the year under report in the Punjab. This is the worst epidemic since that of 1907, though

the years 1910 and 1911 were not by any means light years as will be seen from the following figures:—

1907	...	...	...	...	666,501
1908	...	...	...	...	40,106
1909	...	...	...	...	45,064
1910	...	...	...	...	169,867
1911	...	...	...	...	198,669
1912	...	...	...	...	35,123
1913	...	...	...	...	20,231
1914	...	...	...	...	73,627
1915	...	...	...	...	244,104

The severity of the epidemic was mainly due to the large legacy of infected areas left over from the latter half of the year 1914.

Area of distribution.—The Jullundur, Lahore and Rawalpindi Divisions were attacked very severely, the Multan Division escaped comparatively lightly. In the Ambala Division the districts of Gurgaon and Rohtak which are annually rather badly affected were not so this year, but the Karnal and Ambala districts suffered more heavily than usual. Two districts, Mianwali and Dera Ghazi Khan, practically escaped. Out of the 28 districts in the province, altogether 12 were severely visited, *viz.*, Hoshiarpur, Jullundur, Gurdaspur, Ludhiana, Amritsar, Lahore, Gujranwala, Gujrat, Jhelum, Shahpur, Rawalpindi and Attock.

Seasonal variation.—Starting with a death roll in January twice as heavy as that of the corresponding month of 1911, the worst year within the preceding seven years, the mortality went up by leaps and bounds until it reached its highest in April, when the humidity and the temperature factors were most favourable to the spread of the disease; and it began to drop in May, practically disappearing in June, and during the last 6 months of the year owing to the abnormally dry weather and unusually high temperature a number of districts remained absolutely free. A comparison of the figures for the first and the last 6 months, January to June 1915, 243,299, July to December 1915, 805, together with the mortality for the last 6 months of 1914, which was 13,833, shows what has been the effect of the legacy transmitted to this year, while at the same time it enabled us to foretell more or less correctly what sort of a year 1916 would be.

Measures.—(1) *Education.*—In addition to instruction afforded to the people on the causes, prevention and treatment of Plague, large numbers of Lady O'Dwyer's Appeal to the Women of the Punjab were very widely distributed.

(2) *Disinfection*—

- (a) By Solar Heat. People seem to understand the value of this quite well, and they would quite willingly practise it if only they could rid themselves of their accustomed inertia.
- (b) Dessication by means of dried cowdung cakes and Nim leaves burned on the floor is in use, and people like it.

(3) *Rat Destruction.*—Has been carried out throughout the year. In the hot weather particularly the worst later infected villages were repeatedly visited, and in only a very few instances has there been any outbreak in them; where there has been any it has been of a very mild type. This rat-destruction campaign has been carried out by means of—

- (i) trapping.
- (ii) baiting.
- (iii) smoking with Nim Battis.
- (iv) smoking with stoves.

The general idea has been to reduce the rat population in —

- (a) places which were infected late in the preceding year.
- (b) places where the epidemic generally appears early and annually.
- (c) places which reported unusual rat mortality or human cases at any time.

The good effects of these operations were well illustrated by the work of the municipalities of Rawalpindi and Lahore. In the former case operations were commenced very late, but the result was satisfactory in that the disease was kept well in check. In Lahore over 2 lakhs of rats were killed.

Owing to Chlorate of Potassium for Nim Battis not being obtainable in the market, smoking with Bhusa and sulphur was carried out by means of stoves with a bellows attachment with a very good result.

(4) *Cresol Fumigation*.—This was done fairly extensively and its utility seemingly succeeded in aborting out breaks or in preventing their getting out of control.

(5) *Evacuation*.—This measure the people know to be effectual, but it is difficult to get them to practise it so as to be of real use in cutting short an outbreak. During active infection people will fly away in panic, evacuating houses and even whole Mohallas, but with the exception of rare instances where all possible help has been given by the District authorities, they will not evacuate whole villages. The unintelligent employment of this measure together with the little use made of their power to refuse access to people from infected places are largely responsible for the spread of the disease from one place to another.

(6) *Inoculation*.—Although it must be admitted that there are certain districts where this measure is becoming to be appreciated at its proper value there is no doubt that there is little willingness shewn in accepting it except where the danger of contracting the disease is imminent. Consequently we have been practising limited inoculation, i.e., inoculating mainly of persons actually exposed to infection. This has been found to work very satisfactorily and we have this year done as many as 161,313 inoculations in British districts, with another in the 4,844 in the Native States, as compared with 49,468 in 1914, and 26,419 in 1913, and 51,570 in 1912.

Reporting.—Though there have been instances here and there of villages trying to hide an outbreak and though there have been undoubtedly some tahsils which have shown a disinclination to give early intimation of fresh outbreaks, yet on the whole, the reporting has been more satisfactory.

Attitude of the People.—On the whole the attitude of the people generally to plague measures has, it is thought, improved. The medical staff has been frequently admonished on the necessity of remaining in contact with villages and providing medical relief to such as require it. There is no doubt there is too great a tendency for Assistant Plague Medical Officers to look upon themselves as inspecting officers and to pay only flying visits to infected areas.

General Relief.—47,849 persons were treated during the year by the special staff in the way of medical relief, as compared with 55,915 in 1914, 84,530 in 1913 and 36,940 in 1912. Considering that the staff had a very severe epidemic to control this may be considered satisfactory.

Protection of Simla.—The usual arrangements for the protection of Simla were carried out throughout the year.

Special Staff.—There was an average of thirty Assistant Surgeons and seven Sub-Assistant Surgeons on Plague work. On account of the reversion to the Military Department of all I.M.S. officers on Plague duty it was found necessary to have an Assistant to the Chief Plague Medical Officer, and Dr. T. Sinha was selected for the appointment, and he took up his duties from the beginning of September. About the end of September, Lieutenant-Colonel D. T. Lane, I.M.S., the Chief Plague Medical Officer, reverted to his substantive appointment and since then I have carried on the duties of Chief Plague Medical Officer.

Sanction was obtained from the Local Government to place the district Vaccinators on Plague duty during the hot weather to help in rat extermination under the supervision of the Special Staff.

Auxiliary Staff.—All Assistant Surgeons and Sub-Assistant Surgeons in charge of dispensaries are now required to attend to outbreaks in towns and villages pending the arrival of the special staff.

Paid lay Agents.—Some district boards and municipalities employed paid agents during active infection to carry on ratting operations and to help the special staff with satisfactory results, and many people rendered most helpful voluntary assistance which, as far as possible, has been acknowledged.

26. **Fevers.**—Fevers this year accounted for 284,784 deaths at a rate of 14·73 *per mille* as against 17·87 last year and 16·31, the average for the previous five years. This rate is lower than that in the previous 2 years and only slightly higher than that recorded in 1912.

Annual Form No. IX.

As in the previous year, the fever death rates of fourteen districts were lower and of fourteen higher than the provincial rate of 14·73. This rate was exceeded in the districts of Muzaffargarh and Mianwali where it was 20·34 and 20·10, respectively, Amritsar 18·18, Attock 18·13, Rawalpindi 17·95, Kangra 17·41, Multan 17·31, Hoshiarpur, 16·93, Gujranwala 16·89, Dera Ghazi Khan 16·19, Lahore 15·95, Montgomery 15·77, Karnal 15·14 and Hissar 14·85. But all these districts except Lahore, Amritsar, Mianwali and Montgomery have lower rates than their quinquennial average.

It is gratifying to note that the fever death rate showed a decrease in all the districts in the Punjab as compared with that of the previous year except Kangra, Ferozepore and Montgomery which showed a slight increase, which calls for no remark. Compared with their quinquennial average all the districts show a decrease except Ferozepore, Lahore, Amritsar, Mianwali, Montgomery and Lyallpur.

The lowest death rates were recorded in the districts of Simla, Gurgaon, Gujrat and Shahpur where they were 7·69, 9·49, 10·76 and 10·95, respectively.

As usual the rate for females was higher than that for males.

The fever death rate for towns and rural circles was 13·32 and 14·87 as against 15·64 and 18·80, respectively, in the previous year. The three largest towns had the following fever death rates, Lahore 18·59, Amritsar 15·59 and Multan 15·38. The first named town recorded a higher and the other two a lower rate than in the previous year. In the minor towns rates as high as 30·12 were recorded in Murree, 27·77 in Khangarh, 26·83 in Karor, 24·13 in Bhakkar, 23·37 in Shujabad, 22·63 in Dina Nagar, and 22·34 in Kamalia and Alipur, while the lowest rates were recorded in Rewari 0·40, Gojra 0·74, Dalhousie 4·26, Kalaswala 4·46, Sargodha 4·75, Raekot 4·79 and Dharmkot 4·95.

Although the fever death rate recorded in Khangarh and Kamalia towns during the year under report is high, yet these rates are lower than their respective rates for the previous year. The highest fever death rate 30·12 was recorded in Murree as against 9·55 in the previous year. No satisfactory explanation has been furnished for this high rate, but the Civil Surgeon reports that on enquiry it appears there was an outbreak of enteric fever and that some of the deaths may be due to this outbreak. It is probable, however, that some deaths due to diarrhoea during the epidemic were misclassified and recorded under the head of fevers.

As usual infants under one year of age and old people above sixty suffered most from fever during the year, the death rates being 81·59 for males and 81·64 for females in the former and 42·80 and 44·60 in the latter groups. Next to these come those between one and five, the rates being 22·00 and 23·67, all these rates were lower than those recorded in the previous year.

Fevers in municipal towns and rural circles. Annual Form No. VI A. & B. and specified age periods, A. F. No. VI.

The rates for the others varied from 5.09 to 10.01. The largest number of deaths from fevers among infants under one year of age were registered in the Kangra, Amritsar, Hissar and Lyallpur districts.

There was an outbreak of typhoid fever in village Uddafattah in the Sialkot District where 19 cases and 5 deaths occurred between the last week of May and the 1st August. On enquiry it was found that the first case was a Christian boy aged 9 years who had not been away from the village and died on the 5th June. Other cases followed rapidly chiefly among children or young persons between the ages of 4 and 14 except in two cases, men of 21 and 25 years of age. The cause of the infection could not be traced. The Civil Surgeon, Sialkot, reported that an attempt was made to take blood in capsules for examination but this was not permitted by the relatives of the patients.

27. Dysentery and Diarrhoea.—There was a total number of 12,558 deaths from this cause at a rate

Annual Form No. X.

of 0.65 *per mille*, this is 0.04 less than in the previous year and 0.08 in excess of the average for the quinquennial period. Rawalpindi again accounts for the highest death rate 3.91, and Hoshiarpur the lowest 0.03, and with the exception of Montgomery and Attock where the rates were 0.06 and 0.07, the rates in the others varied but slightly, *i.e.*, from 0.14 in Muzaffargarh to 1.62 in Kangra.

The urban and rural rates were 1.91 and 0.52, respectively, the corresponding rates for the previous year being 2.11 and 0.55.

28. Respiratory Diseases.—Diseases of the respiratory organs accounted for 47,193 deaths at a rate of

Annual Form No. XI.

2.44 *per mille*. This rate which is in excess of the average for the previous 5 years (2.26), and last year (2.42), is the highest on record since 1908, when it was 3.22. The highest rate as usual was recorded in Gurdaspur (10.22) and the lowest in Multan 0.002, fairly high rates were recorded in Ambala 5.33, Amritsar 4.56, Jullundur 4.45 and Sialkot 4.18, while very low rates were recorded in the Multan Division. Jhang District being the only one in which the death rate was 1.29.

29. Injuries.—Of the 6,893 deaths recorded under the head injuries which caused a death rate of 0.36, 253

Annual Form No. II.

(102 males and 151 females) were due to suicide, 463 (351 males and 112 females) to wounds, 4,673 (2,681 males and 1,992 females) to accidents, 1,134 to snake bite, 272 to injuries inflicted by wild beasts and 98 to rabies.

30. All other causes.—114,266 deaths were recorded under the head "All Other Causes" at a rate 5.91

Annual Form No. II.

per mille, the corresponding figures for the previous year being 131,688 at a rate of 6.81, and the rate for the quinquennium 6.37. The highest death rate under this head was recorded in Gurgaon 10.0, and this was closely followed by 9.9 in Ferozepore, 9.6 in Ludhiana, and 9.0 in Karnal. The lowest rate was as usual in Gurdaspur 0.9, the following districts also returning low rates, Dera Ghazi Khan 1.4, Muzaffargarh 2.0, Rawalpindi 3.7, Attock 3.8 and Gujrat 3.9, in the others it varied between 4.1 in Mianwali and 8.3 in Rohtak.

31. Rabies.—There were 5,050 patients during the year, who underwent anti-rabic treatment at the Pasteur Institute of India at Kasauli, as compared with 4,589 in the previous year. Out of this number 322 were Europeans and 4,728 Indians. There were 60 deaths and 30 failures all among Indians. The number of cases who were advised that treatment was not necessary, was 441 as against 297 in the previous year.

Section IX.—Sanitary Work.

32. The Report on Sanitary Works during 1915 furnished by the Sanitary Engineer to Government, Punjab, is contained in appendix B to this report.

33. Only three village sanitary note-books were supplied to villages in the Multan District and 50 books to the Civil Surgeon, Montgomery, during the year 1915.

34. The sum of Rs. 500, which was provided in the budget of the Gurgaon District for rewards on account of sanitary improvement, was not utilized as no village was reported to be deserving of a reward.

35. The number of wells cleaned and parapets constructed during the year fell from 13,120 to 9,537, and from 1,700 to 1,489, respectively. The amount spent for the purpose was Rs. 59,323 as against Rs. 75,132 last year.

In the Ferozepore District 148 wells were cleaned by private persons at their own expense, while in the Gohana Tahsil (Rohtak District) certain private individuals spent a sum of Rs. 996 in this direction.

Three springs of water were improved by the district board, Mianwali, by providing iron pipes; estimates for Rs. 2,378 for the construction of a water reservoir and filter bed at Musakhel, and improvements to the spring water between Trutta and Sukesar are also in hand.

36. An income of Rs. 1,28,286 was derived from the sale of street sweepings in municipal towns during the year as against Rs. 1,40,520 last year. The largest sums were realized in Lahore, Amritsar and Sialkot.

37. There were 1,842.60 acres of land under sewage irrigation in the principal towns and Rs. 34,333 were realized for its use during the year showing an increase of 94.22 acres in land thus irrigated and Rs. 845 in the amount realized.

38. Very few attempts have been made to improve village sanitation. It is extremely difficult to get the villagers to change their customs or habits, it would therefore seem almost hopeless to do very much to help them until some wish for improvement is shown by the people themselves. Instruction in schools, experience of the benefits of good water, etc., in their visits to towns, fairs, etc., where good sanitary arrangements have been made, will, it is hoped, at least tend to remove prejudices against steps taken to assist them and lead in time to the growth of a genuine desire to help themselves.

In the course of my inspections nothing has struck me more than the need there is for a better appreciation of the benefits of good sanitation amongst the municipal authorities of our towns, even where under their own direction a system of drainage has been introduced, from neglect has led to its becoming a source of danger rather than a benefit to the population committed to their care. In the Hissar and Amritsar districts efforts are being made to teach the people the elementary principles of sanitation through the agency of the plague establishment when they are on itinerating duties.

It is gratifying to note that a punchayat of 7 men is being appointed to supervise sanitation in villages in the Gurgaon District.

39. A list of works of public utility constructed during the year 1914-15 by private individuals at their own expense is given below :—

AMBALA DIVISION.—*Ambala District*.—A pucca well on the road to Ambala at a cost of Rs. 600 by Buhloo Mal, son of Parabh Dyal, Bania, of Daugdehri. A ghât of a tank at a cost of Rs. 1,000 by Mussammat Partapi, widow of Kalyan Singh, Jat of Kumbara. A well

at a cost of Rs. 900 by Mussammat Karmen, widow of Hira Singh, Jat of Mullanpur. A pucca well at Mankheri, tahsil Rupar, at a cost of Rs. 600 by Mussammat Partapi, widow of Kirpa, carpenter, of Bharaoli Tahsil, Sirhind, in Patiala State.

Hissar District.—A pucca well at Satrod Kalan at a cost of Rs. 4,000 by Badri, son of Kanhi Ram, Mahajan of Satrod Kalan. A Dharamsala with a well on Hansi-Jind Road at a cost of Rs. 3,500 by Nathu Ram, son of Jai Ram, of village Narnand. A pucca well with a Dharamsala at village Dhanana at a cost of Rs. 3,000 by Radha Kishen, adopted son of Lekh Ram, of village Dhanana. A pucca well with platform near village Haluwas Mazra Deosar on Bhiwani-Kairo Road at a cost of Rs. 3,500 by Jankhe Ram, Mahajan, of Bhiwani Halu Janpal. A pucca well with ghât, etc., in village Deosar at a cost of Rs. 3,900 by Lala Het Ram, son of Lala Kala Ram, Mahajan of village Deosar. A pucca well in village Kasumbi on Bhiwani-Kairo Road at a cost of Rs. 3,000 by Jali Ram, son of Muthra Dass, Mahajan, of Bhiwani Janpal.

Rohtak District.—A Dharamsala with a well at Bahadurgarh at a cost of Rs. 5,000 by Lala Ajudhia Parshad, son of Kishori Lal, Mahajan, of Bahadurgarh. A pucca well at Jharli at a cost of Rs. 3,500 by Chaudhri Dhani Ram, Zaildar, Jharli. A pucca well on Rohtak Bohar road near Bohar at a cost of Rs. 2,000 by the wife of Indraj, son of Teja, Jat, of Bohar. A pucca well at Kiloi at a cost of Rs. 2,000 by Jiwan Ram, son of Fateh Chand, Mahajan, Lath. A pucca well at Bidhal on the way to Joli at a cost of Rs. 900 by Amar Singh, son of Harnamond, Pujare, Mahajan, of Bidhal. A pucca well at Bhainswal Kalan on the way to Anwali at a cost of Rs. 1,200 by Baldewa, son of Pokhar, Mahajan, Bhainswal Kalan. A pucca well at Dhanana, Alladadpur, on the way to Chiri and Nandal, at a cost of Rs. 1,000 by Sukh Lal, Brimchhari of Dhanana. A pucca well at Khandrai at a cost of Rs. 450 by Hari Singh, Rati Ram and Nathoo, Jats, of Khandrai. A pucca well within the compound of Veterinary dispensary, Gohana, at a cost of Rs. 650 by Jiwan Ram, son of Fateh Chand, Mahajan of Lath. A pucca well on tank at Bhaini Chandarpal, at a cost of Rs. 1,000 by Nanak Nath, Jogi of Bhaini Chandarpal. A pucca well on the tank at Seman at a cost of Rs. 4,000 by Mat Ram, Mahajan, of Seman.

Gurgaon District.—A Dharamsala, well and garden on the Bahadurgarh-Majhaoli Road at a cost of Rs. 600, Rs. 400 and Rs. 500, respectively, by Baldev, son of Gutti, Mahajan of Tigaon. A pucca well, Dharamsala and Piao on Nuh-Ujina Road, at a cost of Rs. 1,800 by Tota and Nanga, son of Mukh Ram, Mahajan of Nuh. A well and Dalan on Jhajjar road at a cost of Rs. 1,200 by Bansi, son of Mansa, Jat, of Khandeola. A pucca Dharamsala, Piao and well at Badha at a cost of Rs. 90, Rs. 35 and Rs. 700, respectively, by Tej Singh and Bahala, son of Ram Parshad and Ram Saran, son of Harpal, Jat, of Badha.

Karnal District.—A pucca well at Sheikhpura for drinking purposes at a cost of Rs. 300 by Chaudhri Raja Ram, son of Prem Sukh, Jat, of Sheikhpura. A pucca bathing ghât at Tiraon built from contributions at a cost of Rs. 976 by Pandit Ajudhia Parshad and Baij Nath, sons of Mangal Sen, Brahmin of Tiraon. A pucca well at Naraina village for drinking purposes at a cost of Rs. 400 by Mussammat Bhuro, widow of Bhartu, Gujar, of Naraina. A pucca well at Bhalang for drinking purposes at a cost of Rs. 1,050 by Chaudhri Sukh Ram, son of Sahej Ram, Jat, of Bhalang.

LAHORE DIVISION.—*Lahore District.*—A drinking well and a shed for travellers on the Lahore-Multan Road near village Kakki Zai, tahsil Lahore, at a cost of Rs. 1,000 by Lala Har Bhaj Ram of Lahore. A drinking well on circular road near Zailghar, Chunian, at a cost of Rs. 600 by Mussammat Matab Kaur, widow of Magi Ram of Chunian. A drinking well in the town at a cost of Rs. 625 by Pandit Ram Nath of Chunian.

Gujranwala District.—The sinking of a well and constructing a hut in the compound of the District Court, Gujranwala, for the convenience of the public and litigants, at a cost of Rs. 1,404 by Lala Mohan Lal, Arora, caste Ghamir, Municipal Commissioner, Gujranwala.

RAWALPINDI DIVISION.—*Mianwali District.*—A tobha (Kacha tank) at a cost of Rs. 120 by Mussammat Khatun of Shadia (Mianwali). A well at a cost of Rs. 320 by Mussammat Khando of Shadia. A tobha at a cost of Rs. 275 by Jhangi Ram of Watta Kbel (Mianwali).

Section X.

40. Colonel C. J. Bamber, I.M.S., held additional charge of the post of Sanitary Commissioner, Punjab, from the commencement of the year till the forenoon of the 12th July 1915, when I relieved him and held additional charge till the end of the year.

The post of Deputy Sanitary Commissioner was held throughout the year by Major W. C. H. Forster, I.M.S., in addition to his duties of Professor of Pathology at the Lahore Medical College.

Dr. Khawaja Abdul Rahman, M.B., Ch. B. (Edin.), D. P. H. (London), held charge of the appointment of Additional Deputy Sanitary Commissioner throughout the year. He was confirmed in his appointment on 20th November 1915.

41. In January Colonel Bamber inspected Montgomery, Multan, Muzaffargarh and Dera Ghazi Khan, and in February Lahore, Lyallpur and Gojra, in April Simla and Jullundur, and afterwards conducted the examination of the Sanitary Inspectors' class. In May he inspected Amritsar and accompanied the Local Government to Simla. No inspections were done in the summer, but I inspected Simla and Gurgaon in October, and in the following month Ferozepore, Rohtak and Ambala. In company with the Sanitary Engineer, I visited the Nankana Sahib fair ground on the 20th November and advised the Deputy Commissioner in regard to the preparation of the rough project for a model fair ground in connection with the drainage and water works there. A combined note by the Sanitary Engineer and myself was also prepared and sent to the Deputy Commissioner for necessary action.

42. Major Forster was not able to devote as much time as he desired to the proper sanitary surveys of towns, as he was almost entirely occupied at the Medical College, Lahore, and in the supervision of the working of the Punjab Vaccine Institute. Nevertheless during the college recess (from the middle of June to the end of September) he toured, chiefly for the purpose of inspecting Vaccination and Birth and Death Registration, in 88 towns and villages of the following localities:—

British Districts—(1) Simla, (2) Ambala.

Native States— (1) Keonthal,
 (2) Theog,
 (3) Kumharsain,
 (4) Rampur Bashahr,
 (5) Jubbal,
 (6) Baghat, and
 (7) Ghund.

During these tours, as far as possible, every opportunity was taken to bring home to the people generally, and the officials particularly the advantages to be derived from the observance of general sanitary measures.

43. In the beginning of January Dr. K. A. Rahman inspected some of the local schools at Lahore, and examined 3,957 children in connection with the immunity produced by glycerinated calf lymph. On the 14th of that month he started his first tour of Sanitary and Vaccination inspections, returning to head-quarters on the 28th February. During these seven weeks he visited and reported on the sanitary condition of the towns of Hafizabad, Ramnagar, Akalgarh, Gojra, Chak Jhumra, Khangarh, Leiah, Karor and Bhakkar, at the same time inspecting vaccination and registration of births and deaths in the above-mentioned towns and 304 villages of

the Gujranwala, Lyallpur, Muzaffargarh and Mianwali districts. In March he was deputed to supervise the Medical and Sanitary arrangements at the Pehowa fair in the Karnal District. On the termination of the fair he visited the Jullundur District and reported on the sanitary condition of the towns of Nakodar, Nurmahal, Rahon and Banga, inspecting vaccination and registration of births and deaths in those towns, and also of Phillaur and Nawashahr and 104 villages in the district.

In April he supervised the Medical and Sanitary arrangements made at Choa Saidan Shah and Katas fairs in the Jhelum District, after which he made a sanitary and vaccination inspection of the town of Pind Dadan Khan. On his return to head-quarters he was ordered to investigate an outbreak of cholera in the Kasur Tahsil of the Lahore District, which appeared there in epidemic form. In May he was detailed to supervise cholera operations in the towns of Panipat, Dharamsala, and in several villages of the Kangra and Palampur tahsils of the Kangra District. Early in the month of June he inspected the Punjab Vaccine Depôt at Murree, after which he remained on cholera duty in the Ferozepore District till the end of that month.

By the middle of July he was in Simla, where he worked in my office, dealing with the cholera enquiry reports and returns of the province besides his own office work.

On August 13th, he left Simla for Murree where diarrhoea was reported in an epidemic form. From there he went to Gujrat, Shahpur and Lahore districts, investigating the outbreaks of cholera in the infected parts of those districts, returning from there to head-quarters on the 23rd September. In October he visited and reported on the sanitary condition of the towns of Sonapat, Bahadurgarh and Gohana in the Rohtak District. In November he supervised the Medical and Sanitary arrangements of the Nankana Sahib and Baba Farid fairs in the Gujranwala and Montgomery districts, respectively, and in December he made a sanitary inspection of the towns of Panipat and Kaithal, at the same time inspecting vaccination and registration of births and deaths of these towns and 46 villages in the Karnal District.

44. Civil Surgeons made one hundred and eighty-four inspections of towns and 2,238 of smaller towns and villages during the year as against 158 of towns and 2,743 of villages in 1914. The number of towns inspected by Assistant Surgeons remained the same as in the previous year, viz., 43, and of villages 1,191 as compared with 1,116 in the previous year.

45. Owing to scanty rain during the year under report there was no undue prevalence of malaria in the province, notwithstanding this, however, a good deal of quinine was distributed free of cost in most of the districts.

In Fazilka town Mr. S. Chandu Lal, Assistant Surgeon, took special interest in carrying out anti-malarial measures by destroying mosquito larvæ with kerosine oil, filling up and draining depressions, quininisation of school children and free distribution of quinine. A pamphlet on malaria written by him was also freely distributed.

Special precautions were taken by the municipal committee of Palwal to check the spread of malaria by filling up depressions and kerosining pools of water for the destruction of mosquitoes and removal of an objectionable cactus hedge through a special malaria gang under the supervision of Revd. F. W. Hale, a member of the Committee, and Kanwar Raghbir Singh, the Sub-Divisional Officer.

In the Ambala District short leaflets giving the necessary information and the precautions to be observed in avoiding malaria, etc., were distributed.

46. Many borrow-pits in the Civil Lines, Ambala, were filled up on the recommendation of the Civil Surgeon, while 37 notices were issued by the Lahore Municipality for the filling in of depressions, 26 of which have been

complied with, and action is being taken to have the remaining depressions filled in. A "chappar" (pond) near the village Padhana was drained during the year at a cost of Rs. 700.

A pucca floor and a drain were constructed at Jhelum under Railway crossing bridge on the Civil lines road leading to the Cantonment to do away with the accumulation of the rainy water, and in order to check the spread of malaria at Pind Dadan Khan tanks were cleaned during the year.

47. The Deputy Sanitary Commissioner, Punjab, remained *ex-officio* Professor of Hygiene at the Medical College, Lahore, throughout the year and delivered the prescribed course of lectures.

48. The Agent, North-Western Railway, reports that no new towns were formed in the vicinity of the North-Western Railway during the year ending the 31st December 1915.

49. The Multan, Sialkot and Rawalpindi municipalities have secured the services of qualified men, but the municipality of Ludhiana has not yet been able to replace their Health Officer who died shortly after his appointment.

The usual class and examination for Sanitary Inspectors was held during the year, and there are now all told 66 men who have qualified in the Punjab. Some of them have already secured employment, and it is hoped that most of the others will secure appointments shortly.

50. The Choa Saidan Shah and Kaitas fairs were held in the Jhelum District on 8th and 13th April, respectively, the prevalence of plague in and round Choa Saidan Shah, which was widely made known to the people under the orders of the Deputy Commissioner, Jhelum, resulted in the gathering at these fairs being very small, not more than 4,000 as compared with about 34,000 in previous years. In fact there was practically no fair at the former place and only a very small number of persons attended the latter. The usual sanitary arrangements were made and the Additional Deputy Sanitary Commissioner, Punjab, was directed to supervise, remaining there from 6th to 14th April 1915.

Owing to heavy rains the gathering at the Pehowa fair (Karnal District) was much less than was expected, and only about 40,000 people came in from the adjacent districts and Native States. The wells in and round the fair area were disinfected with permanganate of potash, and no other persons, except special Jhewars, were allowed to draw water from the wells. The custom here is for a large number of persons to draw the sacred water themselves, but only those whose vessels and ropes had been disinfected by boiling water for which arrangements were made and passes given, were allowed to do so. The fair lasted from 12th to 15th March and owing to the excellent arrangements made no infectious or contagious diseases were introduced. The medical and sanitary arrangements at this fair were supervised by the Additional Deputy Sanitary Commissioner.

As usual the supervision of the sanitary arrangements at the Baba Farid fair held at Pakpattan on the 14th and 15th November 1915, was left entirely to the Additional Deputy Sanitary Commissioner, Punjab, who arrived at the place on the 8th. Adequate sanitary arrangements were made, and there was no case of contagious or infectious disease. The number of persons who passed through the Bahishti Gate amounted to 47,214, but as many persons pass twice or even oftener it is doubtful if more than 30,000 persons can be considered to have been actually present at the fair.

The number of pilgrims who attended the Nankana Sahib fair held on 21st November 1915 was between 60,000 and 70,000. Most of the pilgrims arrived on the 19th and 20th, and a great majority had left by the evening of the 22nd. The sanitary arrangements were made according to the rules for the management of large fairs, and the supervision was entrusted to the Additional

Deputy Sanitary Commissioner, Punjab, who took this opportunity to make further suggestions for the improvement of the sanitary arrangements for future fairs. His report was sent to the district authorities for necessary action.

It might also be mentioned that a meeting was held on 22nd November 1915 to raise subscriptions for a hospital at Nankana Sahib, and promises of over Rs. 6,000 were made at the spot. I suggested that in the compound of the proposed hospital small shelters, consisting of a pucca platform and a roof supported on disused rails, should be erected for infectious cases to relieve the district board from the recurring expenses of temporary chappar hospitals which are erected every year.

51. As the Provincial Laboratory of the Punjab, the Pasteur Institute at Kasauli reported on the specimens noted below—

Offg. Sanitary Commissioner, Punjab.

APPENDIX A.

PROCEEDINGS OF THE SANITARY BOARD, PUNJAB.

The constitution of the Board was the same as in 1914, except that Colonel C. J. Bamber, I.M.S., held additional charge of the post of Secretary to the Board from the commencement of the year till the forenoon of the 12th July 1915, when he was relieved by me. I held additional charge till the end of the year.

The Board met three times during the year.

Out of the balance of Rs. 82,209 of the grant of 3 lakhs placed at the disposal of the Board for distribution to municipalities as grants-in-aid during the year 1914-15, the following grants were sanctioned between 1st January and 31st March 1915 and the amount remaining, Rs. 48,037 withdrawn by Government owing to financial stringency due to the war :—

	Rs.
Gojra drainage scheme	3,719
Sambrial drainage and pavement	100
Daska drainage and payment	250
Amritsar combined slaughter-house (additional grant)	1,388
Rupar drainage	15,825
Tandlianwala drainage scheme	12,490
Total	34,172

Out of the balance of Rs. 2,40,436 of the grant of 2 lakhs-and-a-half placed at the disposal of the Board for distribution to district boards as grants-in-aid for Sanitary works during 1914-15, the following grants were made between 1st January and 31st March 1915, and the remainder Rs. 2,04,156 withdrawn by Government owing to financial stringency :—

	Rs.
Sultau Wind paving and drainage	10,000
Gullu Shah fair area water-supply scheme	5,000
Nurpur (Rawalpindi District) fair area water-supply scheme... ..	21,280
Total	36,280

The annual grant this year was enhanced from 7½ lakhs to 8 lakhs and the Sanitary Board would have been able to dispose of the entire grant, but for circumstances which rendered a reduction in this amount necessary and a subsequent withdrawal of Rs. 4,26,564.

The grant of 8 lakhs consisted of the following :—

	Rs.
Urban grant	3,00,000
Additional urban grant	2,00,000
Rural grant	1,00,000
Additional grant (reserved with Government)... ..	2,00,000
Total	8,00,000

Out of the urban grant of 5 lakhs, the following grants were made up to 31st October leaving a balance of Rs. 1,43,463 which was withdrawn by Government :—

	Rs.
Sialkot water-supply scheme	50,000
Hazro drainage scheme	1,231
Repairs to Kalka water-supply scheme	1,180
Lala Musa drainage scheme	7,489
Kalka drainage scheme	21,045
Moga drainage scheme	10,560
Improvement to Rawalpindi Intra-mural drainage	42,360
Rewari water-supply	70,000
Dera Ghazi Khan water-supply extension scheme	1,15,617
Experimental and printing purposes	1,200
Gurdaspur intra-mural drainage	8,723
Sargodha filling pits	1,291
Tandlianwala water-supply extension scheme	23,000
Kalka drainage scheme	2,841
Total	3,56,537

The grant of 2 lakhs for the Montgomery water-supply scheme was sanctioned by the Board on the condition that the remainder is provided by Government but as Government could not in the present state of affairs afford Rs. 74,029 the remainder of the cost, the grant-in-aid was not allotted.

A sum of Rs. 50,000 was sanctioned for the Sargodha water-supply scheme but was not allotted as the scheme had not been administratively sanctioned by Government, this being the condition on which the grant-in-aid was sanctioned. Administrative sanction was refused as the balance of the cost (Rs. 70,000) could not be provided locally.

Out of the grant of one lakh for rural sanitation placed at the disposal of the Board during the year 1915-16, the following grants-in-aid were sanctioned up to 31st October 1915, leaving a balance of Rs. 84,601 which was withdrawn by Government:—

	Rs.
Kotli Loharan drainage scheme	3,500
Rural scheme of the Gujrat District	7,100
Pipe at Chitti dill bungalow	804
Nurpur (Rawalpindi District) fair area water-supply scheme	3,995
Total	15,399

The additional grant of two lakhs reserved at first with the Government was finally placed at the disposal of the Board but was also withdrawn along with the other remaining grants.

The schemes noted below were approved by the Sanitary Board and submitted to the Local Government in the civil department for administrative sanction which was accorded in each case—

	Rs.
Gujranwala water-supply scheme	5,04,918
Amritsar city improvement scheme	1,63,650

Revised administrative sanction was also accorded to the Sialkot water-supply and Nurpur (Rawalpindi District) fair area water-supply scheme at a revised estimated cost of Rs. 5,09,403 and Rs. 25,275, respectively.

The scheme relating to the sanitation of Murree-Kohala Road was postponed by Government as no funds were available for the project.

In accordance with the powers delegated to the Sanitary Board by Government to accord administrative sanction to sanitary schemes, the cost of which does not exceed one lakh, the board approved of the following schemes and administrative sanction was accorded in each case:—

	Rs.
Eminabad drainage scheme	25,054
Rupar drainage scheme	31,650
Kalka drainage scheme	21,045
Kotli Loharan drainage scheme	10,500
Moga drainage scheme	21,121
Improvement to Rawalpindi drainage scheme	92,360
Gurdaspur intra-mural drainage scheme	17,446
Tandlianwala water-supply scheme	46,007

The Board accorded revised administrative sanction to the Lala Musa drainage scheme at a revised estimated cost of Rs. 20,889.

Government in the Public Works Department accorded technical sanction to the schemes noted below which had previously received the approval of the Board—

	Rs.
Dera Ghazi Khan water-supply extension scheme	1,65,617
Dalhousie water-supply extension scheme	15,903
Lahore northern storm water drainage scheme	33,210
Lala Musa drainage scheme	20,889
Improvement to Rawalpindi District drainage scheme	92,318
Shujahabad drainage scheme	15,302
Bherra drainage scheme	78,682
Nurpur (Rawalpindi District) fair area water-supply scheme	25,275

Revised technical sanction was accorded to the Sialkot water-supply scheme and boring at Pasrur in connection with the water-supply scheme at a revised estimated cost of Rs. 5,09,403 and Rs. 7,731, respectively.

The work of the Board was to a very great extent suspended for the latter part of the year owing to the withdrawal of funds by Government.

APPENDIX B.

ANNUAL REPORT OF THE SANITARY ENGINEER TO GOVERNMENT,
PUNJAB, FOR THE YEAR 1915.

The post of the Sanitary Engineer to Government, Punjab, was held by Mr. A. S. Montgomery, up to the 28th September and by Mr. V. Stainton from the 29th of that month to the close of the year.

2. *Simla*.—The important sanitary scheme of the Chair water supply extension (estimated cost Rs. 5,75,587, which was completed in 1914 and handed over for maintenance to the municipal committee, continued to be maintained by that body during the year under report on the same conditions as were previously laid down by the Local Government in connection with the operation and maintenance of pumps and mains. Orders do not seem to have yet been passed for the subsidiary works enumerated in the report for the year 1914, which were discussed and reported on by the Fenton Committee of 1913 and further considered by the Porter Committee of 1914.

The miscellaneous small sub-head estimate of the scheme which had necessarily been kept open, was closed and a comprehensive completion report amounting to Rs. 5,67,721 against the main estimate for the scheme submitted during the year.

The usual half-yearly inspections of the water supply and sanitary arrangements of the Viceregal Lodge Estates were made during the year.

3. *Amritsar*.—The work on the under-ground sewerage scheme of a part (Sant Singh and Dhab Khatikan area) of the city (estimated cost Rs. 2,36,008) which was entrusted for execution to Messrs. Lane Brown and Hewlett, Consulting Engineers of Lucknow, was completed during the year. This underground system commands an area of over 76 acres with a population of 15,530. The work has been carried out in a most satisfactory manner and if the system is properly looked after and regularly flushed it should prove a great boon to the inhabitants and at the same time afford an excellent example of a model up-to-date sanitary scheme for other municipalities. The Sanitary Engineer had advised the committee to have this system extended to the entire area of the city and to have the project for the remaining portion of the city drawn up and work carried out by the same expert firm.

The work of renewal of the conservancy tramway lines for the renewal of city refuse and the substitution of locomotive traction in place of horse traction (estimated cost Rs. 55,000) was completed by the Municipal Committees' own Engineer and the completed scheme brought into operation. It is now contemplated to still further extend the track and increase the number of engines and wagons which will greatly benefit the city.

The work of filling in the dhabs round the city (estimated cost Rs. 1½ lakh) which was originally computed at 61½ lakhs cubic feet of filling and since revised at 81½ lakhs cubic feet is being completed. This 33 per cent. extra work necessitated the revision of the original estimate.

4. *Lahore*.—Messrs. Lane Brown and Hewlett, Consulting Engineers of Lucknow, who were, on the advice of the Sanitary Engineer, engaged for the preparation of a complete detailed project for an underground water borne sewerage system for Lahore city and civil station, which was administratively sanctioned for Rs. 15½ lakhs in 1913 have submitted the detailed project to the Municipal Committee. It is now under scrutiny by the Municipal Engineer, in consultation with the Sanitary Engineer.

The work of constructing the northern storm water outfall drain (estimated cost Rs. 33,210) is in progress.

In the Borstal Central Jail, 2 tube wells are being put down for the supply of water and a reservoir built for its storage. This work is combined with that of a watch tower. The original estimate which amounted to Rs. 18,050 had to be revised to cover the cost of extra work subsequently found necessary and the revised estimate which awaits sanction amounts to Rs. 28,889. The total expenditure up to the close of the year was Rs. 12,326.

5. *Sialkot*.—The water supply scheme was completed, opened by His Honour the Lieutenant-Governor and handed over for maintenance to Municipal Committee during the year. Including Rs. 37,400 still payable for the pumping machinery, the total expenditure on the scheme comes to Rs. 4,66,839 against the revised sanctioned estimate of Rs. 5,09,403. The difference between these two sums, out of which a few extra items necessary for the efficient and successful working of the scheme have yet to be paid for, will represent a good saving.

The recuperative tests made on these tube wells to date shew that the actual amount of water pumped closely corresponds to the anticipated quantity so that the yield has so far been very satisfactory.

6. *Ambala*.—Work on an extension to the *intra-mural* drainage system, the estimate for which amounted to Rs. 8,921 is in hand and has been carried out to the extent of more than one half.

7. *Mullan*.—The tests of the experimental tube well which was sunk in advance of the construction of the water supply scheme; in order to be quite certain of the yield expected from the sub-soil and its suitability for such wells, were carried out with satisfactory results. There now seems to be no fear in relying on tube wells for the supply of drinking water for this city. The original project which was sanctioned for Rs. 3,52,173 in the year preceding that under report had to be revised in the light of experience gained from the actual construction of tube wells in the Sialkot water supply scheme. The amount of the amended estimate is Rs. 4,10,506 and it awaits sanction.

The city *intra-mural* and suburban drainage scheme amounting to Rs. 3,82,565 has been sanctioned. The Municipal Committee propose on the advice of the Sanitary Engineer, after obtaining requisite sanction, to spend at once on this work the sum of Rs. 3 lakhs which they have available and to put in hand at once those urgent portions of the drainage scheme which are not dependent on the new water supply scheme. Subsequently, as funds become available, those portions of both the drainage and water supply schemes will be put in hand in order of urgency with due regard to their inter-dependency. It might here be noted that of the sum of Rs. 3 lakhs which the committee have now at their disposal 2½ lakhs represent grants-in-aid namely 1 lakh for this scheme and 1½ lakh for the water supply scheme.

8. *Jullundur*.—The Municipal Committee are anxious to have a complete water supply scheme provided for this city and bastis and also to have their drainage system brought up to date. In connection with the former, an experimental boring tube, for which an estimate amounting to Rs. 2,220 had been sanctioned, was sunk, but the results though fairly satisfactory were not good enough to justify our reliance on the results without further experiments with strainers. It is now proposed to put down a 5 inches strainer in the above mentioned well or a new one, with a view to correctly gauging the yield of the sub-soil. If the results of these experiments are satisfactory, a project for the scheme will be worked out for this source of supply and submitted for administrative sanction.

With regard to the drainage scheme, the detailed project is under preparation in this office.

9. *Perozepore*.—The intramural drainage scheme (estimated cost Rs. 24,016) work on which was commenced in 1914 made good progress under the supervision of the local body and is expected to be completed shortly.

10. *Lyallpur*.—The new pumping plant and the two new filter beds forming a part of the main extension to the water supply scheme estimated to cost Rs. 1,55,530 and which is yet under sanction, were completed during the year.

11. *Jhang*.—The work of regarding the Gaur Nallah with a view to preventing stagnation of water round the city is practically complete. The total expense up to the close of the year is Rs. 12,302 against the sanctioned estimate of Rs. 14,884.

12. *Dera Ghazi Khan*.—Work on the extension of water supply scheme (estimated cost Rs. 1,65,617) was put in hand and good progress has been made. The tube well sumps for head works were sunk and plugged and the brick work of storage tanks finished up to floor level (i.e. 16 feet above ground) and almost all the pipes purchased Rs. 59,759 being the total expenditure up to the close of the year.

The rough project for Rs. 4,13,982 for the drainage of the town which was prepared in the year preceding that under report also the project for the storm water drainage prepared last year amounting to Rs. 26,648 still await administrative sanction. The latter will need amendment as it can be reduced in cost, now that the Irrigation Department have agreed to allow us to discharge storm water direct into the canal instead of syphoning under the canal and discharging it beyond the canal.

13. *Skujabad in the Multan District*.—An estimate for a drainage scheme was sanctioned for Rs. 15,302. Manufacture of special bricks is in hand and work will now be started.

14. *Mianwali*.—The experimental borings which were reported to be in hand in the last report in connection with the proposed water supply scheme were completed during the year and a detailed project worked out, but it had to be returned to the Executive Engineer for modification.

The modified project is now under consideration in this office.

15. *Pasrur in Sialkot District*.—To determine the suitability of subsoil for putting down tube wells for water-supply, an experimental tube well, which will subsequently form part of the Head Works and the estimated cost of which with that of the boring plant is Rs. 12,931 is in hand. The sump well 6 feet in diameter has been sunk to a depth of 58½ feet and the strainer tubes and piping have been purchased. Another trial boring close to this well has since been found necessary before further proceedings with the tube well as great difficulty has been experienced with thick bands of hard clay.

16. *Wasirabad in Gujranwala District.*—Work on the Drainage Scheme (estimated cost Rs. 64,251 was commenced and good progress has been made. The total expenditure upto the end of the year is Rs. 31,500.

17. *Jandiala in Amritsar District.*—The work of filling up certain depressions and constructing an extra mural drain with a collecting tank for the east side of the town, the estimated cost of which is Rs. 21,883 has progressed satisfactorily. The filling work has been completed and the rest is well in hand. A project for draining the west side of the town has been prepared.

18. *Majitha in the Amritsar District.*—The work on the drainage scheme for which an estimate amounting to Rs. 12,064 was sanctioned during the year 1914 was well in hand. It could not be pushed on to completion owing to work having to be stopped pending approval to the re-design of the outfall and other modifications suggested by the Deputy Commissioner. The total expenditure upto the close of the year was Rs. 3,154 and the work is about to be started again on revised lines.

19. *Tandlianwala in Lyallpur District.*—The drainage scheme for which a revised estimate amounting to Rs. 75,189 was sanctioned during the year 1914 is now complete except a little work required to be done on the sillage tanks.

20. *Isa Khel in Mianwali District.*—The water-supply scheme for this town, which was initiated as far back as 1905 was sanctioned at an estimated cost of Rs. 45,300 and work started in 1913. After a personal inspection of the locality, Mr. Montgomery, the then Sanitary Engineer, found that further borings were necessary at different sites with a view to securing a better quality of water so work was stopped pending result of these fresh borings. After numerous borings in various localities and failing to obtain sweet water it was decided to locate the tube wells where the best available results were obtained with the least brackish water. The project revised on these lines and amounting to Rs. 71,270 has not yet been sanctioned as the local body has not yet been able to arrange for extra funds. The Civil authorities now contemplate abandoning the scheme in consequence of the proposal for transferring the Tahsil Head Quarters from Isa Khel.

21. *Bhara in Shahpur District.*—An estimate amounting to Rs. 78,682 for the extra mural drainage scheme was sanctioned during the year. Actual construction was, however, kept in abeyance pending detailed surveys to determine whether the capacity of the depression in which the outfall was to discharge was adequate and also to safeguard the local body from any subsequent suits for compensation to crops and buildings from any flood discharges. After careful investigation the project has now been returned for execution and it is hoped that work will now be pushed on vigorously.

22. The out-door survey staff attached to this office has been fully engaged during the year and has again done most useful work in carrying out surveys and working out drainage schemes for the various local bodies in the Punjab. For some months during the year they were engaged on the preparation of detailed surveys of the town and Bastis at Jullundur required for the drainage scheme project which is in hand and is expected to amount to Rs. 4½ lakhs.

The other drainage schemes, which were surveyed and levelled by the Survey Staff and which were subsequently worked out in detail in this office are:—

	Rough cost.
	Rs.
1. Gujranwala (extra mural as well as the suburban intra-mural)	2,69,510
2. Extra-mural drainage scheme for Jandiala in Amritsar District	16,395
3. Drainage scheme for Hoshiarpur and its suburbs	1,23,267
4. Jagadhri drainage scheme	88,439
5. Shujabad intra-mural drainage	32,723
6. Palwal drainage scheme	69,319
7. Gurdaspur intra-mural drainage scheme	18,324
8. Filling up depression at Palwal	23,165
9. Eminabad drainage	31,751
10. Kalka drainage	36,531
11. Sialkot drainage	3,46,410
Total	10,55,834

The total cost of the out-door establishment including the services of the draftsman who prepared the plans for these various schemes has come to Rs. 4,002 for the year which works out at about annas four per cent. on the cost of schemes prepared including that for Jullundur.

23. Various sanitary schemes completed or in progress in the province were inspected either by the Sanitary Engineer or his Personal Assistant and inspection notes were written and advice given to those concerned. It is noted with regret that in many instances completed sanitary schemes were on inspection found in a very neglected and deplorable condition owing to want of proper maintenance showing great lack of interest on the part of those concerned. This matter is, however, being taken up separately—

I.—In some cases, the pumping machinery attached to water works installations were found in a very bad state of repair. On the representation of the Sanitary Engineer and the recommendation of the Sanitary Board, the Local Government has since issued orders that all the local bodies responsible for the up-keep of these plants should have them inspected regularly each year by an expert firm of constructional engineers.

II.—It is hoped that this procedure will materially improve the up-keep of water works plant in the province besides effecting a considerable ultimate saving to the local bodies concerned.

III.—Excessive waste of water is apparent on various water works installations owing to leaky house connections, distribution mains, and hydrants, also very frequently by abuse of water for garden purposes. This waste can materially be prevented by the proper use of the district metering system and efficient night inspections by the Superintendent and his inspection staff. In several cases it has been found that local bodies have not brought into use the waste water metres on their systems which were handed over to them with the water works after construction and the result has been that great and unnecessary waste has taken place in the system and consequently more coal used for pumping and greater expenditure. Local bodies will find that it will pay them to provide an efficient night inspection staff and they should not begrudge this small expenditure.

IV.—As an instance in point, I would note the case of Mr. Jarman, the Municipal Engineer at Amritsar who has, during the last hot weather, done good work towards checking and preventing excessive waste, by overhauling and repairing his district metering system and by personal night inspections, saving thereby no less than 3 million gallons in less than 6 months.

V.—A study of this system by the officials concerned of other local bodies and a proper provision of a similar system for all water works installations, which have not yet been provided with this system, is strongly recommended.

24. The detailed estimates, which were prepared and recast in the office of the Sanitary Engineer are 10 in number, the cost of which aggregate Rs. 12,37,052. The number of the rough and detailed rough estimates prepared for administrative sanction is 15 and their total cost reached a sum of Rs. 18,41,519.

25. Both the rough and fair estimates which were scrutinized and finally approved by the Sanitary Engineer are 31 in number, the total of which amounts to Rs. 10,58,260.

26. Nine estimates aggregating Rs. 4,54,682 were technically sanctioned by the Local Government in the Public Works Department in addition to the 3 revised estimates for Rs. 5,28,459.

27. The accompanying statement shows the water pumped at the various water works in the province together with the cost of pumping.

28. Notwithstanding the curtailment of grants-in-aid in the case of local bodies owing to the present financial stringency yet the preparation and scrutiny of complex sanitary schemes out-door inspections also clerical work of this office have been as arduous and onerous as in the previous year.

29. In conclusion I would place on record my great appreciation of the excellent work and zealous energy of my Personal Assistant Rai Sahib Lala Amar Nath Nanda, who has been of the greatest help to me both in his office and out-door work also of my office staff who have loyally co-operated in disposing of the vastly increased clerical work of this office and maintained its efficiency.

V. STAINTON,

Dated 11th April 1916.

Sanitary Engineer to Government, Punjab.

STATEMENT OF WATER PUMPED AND USED IN THE WATER WORKS STATIONS,—SIMLA, LAHORE, AMBALA, AMRITSAR, SARGODHA, LYALLPUR, LUDHIANA AND DERA GHASI KHAN, AND COST OF PUMPING IN 1915.
