TRIENNIAL REPORT

ON

VACCINATION,

BIHAR AND ORISSA,

FOR THE YEARS 1914-15, 1915-16 & 1916-17.

1. Staff.—Vaccination work in the Province is chiefly carried out by a special staff of vaccinators, the majority of whom are licensed, but a few of whom are paid. In municipalities and in the district of Sambalpur and largely in Puri the work is done by paid vaccinators and since the end of 1916 paid vaccinators have been temporarily employed in the Singhbhum district and in Angul. Elsewhere throughout the Province vaccination has been carried out under the licensing system, except for the employment of paid vaccinators for short periods to deal with outbreaks of small-pox.

The total number of vaccinators employed in the Province during the last three years have been as follows:—

inory to re		Year.			The s	Licensed.	Paid.
1914-15	No. of Lot	cap city as	is a supplied		HII	995	143
1915-16		4.1				986	184
1916-17		d	Service and	3 100		1,086	207

The increase in the number of paid vaccinators is chiefly due to their temporary employment in Singhbhum and Angul and the increase in the number of licensed vaccinators in the last year under report is due to the redistribution of elakas on a population basis which was carried out under my orders in 1916.

The inspecting staff now consists of 20 District Inspectors of Vaccination and 65 Sub-Inspectors of Vaccination (including 3 deputed for duty at the Vaccine Depôt) in addition to the three Sub-Assistant Surgeons combining vaccination inspection with other duties in Angul. During 1915-16 two additional appointments were sanctioned in order to provide Sub-Inspectors for the new Sub-division at Simdega and for the compulsory vaccination area in Patna, but otherwise the cadre has remained constant during the three years under report.

2. Operations Performed.—The average number of operations performed each year between 1915-17 was 1,227,012 as compared with an average of 1,306,556 during the previous three years. Of these operations 95.02 were primary and 4.97 were revaccinations as compared with 97.48 per cent. and 2.51 per cent., respectively, in the previous three years. The average number of operations performed annually by each vaccinator was 1,023 as compared with 1,136 in the previous three years.

The total numbers of operations performed during the last three years have been as follows:—

1	31	Year.			ZO.	Total number of operations.	Number performed by Vaccinators.
1914-15		1.5	0	T 783 1	7/ 3.	1,807,295	1,288,432
1915-16		·				1,283,308	1,250,599
1916-17						1,090,434	1,072,081

Of the total number of operations performed the majority have been primary as is shewn in the following statement:—

	Year.		Primary.	Secondary.
1914-15	 	 	1,235,571	52,861
1915-16	 	 	1,200,351	50,248
1916-17	 ***	 	1,039,575	32,506

Both primary operations and revaccinations have fallen off very considerably in numbers during the last two years. It is doubtful whether the statistics of past years can be accepted as accurate as they show a primary vaccination rate considerably in excess of the birth-rate which is an obvious impossibility over an extended period of years. As it was the custom in Bengal to expect an increase in the returns every year and to arrange promotions accordingly, I think it probable that the old returns and standards were fictitious. Nevertheless I am not satisfied with the present state of affairs which now shews a primary vaccination rate of about 31 per thousand which is well within the limits of possibility and I have accordingly increased the number of vaccinators and brought considerable pressure to bear on the inspecting staff with a view to improving the quality and increasing the quantity of vaccination work.

The percentages of successful operations out of the total number of operations performed during the last three years have been as follows:—

1914-15			98-12
1915-16			97-23
1916-17	din to dans	restriction is	97.27

3. Vaccination in Districts.—The total number of operations performed in this Division increased by \$1,491 in the three years under report as compared with the previous period. Patna District showed an increase of 47,082 and Shahabad an increase of 41,306, but in Gaya there was a decrease of 6,897.

Owing to the high rates of small-pox mortality prevailing in previous years in the districts of this Division, special efforts were made in the last two years to improve the works, and new and energetic inspecting officers have been posted to the districts of Patna and Shahabad. During the period under report Act V of 1880 and Act II of 1911 making vaccination compulsory were enforced throughout the Patna and Phulwari thanas of Patna District.

In the two districts of Saran and Muzaffarpur the number of operations during the three years under report decreased by 15,964 and 8,098, respectively.

Whilst in the two districts of Darbhanga and Champaran the numbers increased by 19,392 and 2,995 respectively. The work in this Division meets

with less opposition than in lany other Division of the Province and is carried out more thoroughly.

The Bhagalpur Division shows the worst record of the three Divisions of Bihar. In all the four districts there has been a serious decrease in the number of operations performed, the falling off amounting to 33,387 operations in the Santal Parganas, 17,382 in Monghyr, 16,971 in Bhagalpur, and 7,320 in Purnea during the three years' period.

In the Orissa Division the decrease in the number of operations performed during the last three years has been large, amounting to 138,464 in Cuttack, 78,310 in Balasore, 51,679 in Puri, and 11,617 in Sambalpur. In Angul alone has there been an increase amounting to 6,728. I have reason to believe that the returns from the Orissa Districts from 1909 up to 1911 were largely fictitious. A special campaign was being pressed during these years by the Sanitary Commissioner, Bengal, and the returns went up by leaps and bounds to figures which showed a vaccination ratio very largely in excess of the birthrates. Whilst I do not consider that there has been an actual decrease in the work to any thing like the extent which would appear from the figures quoted, nevertheless I am dissatisfied with the work of the Vaccination Department in Orissa and I have taken action against the Inspecting Officers who are chiefly responsible for bad work.

In four out of the five districts (Palamau being the exception) there were small decreases in the number of operations performed, amounting to 7,020 in Ranchi and 6,177 in Hazaribagh and to smaller numbers in other districts.

Act II of 1911 and Act V of 1880 were enforced at Sakchi and in the Mining Settlement area at Jharia during the period under review and there has been no difficulty in getting the work of compulsory vaccination efficiently carried out.

In the Orissa and Bhagalpur Divisions there has been a serious decrease in the amount of work and departmental action has already been taken to deal with the staff. In the other three Divisions of Patna, Tirhut and Chota Nagpur, the results have been fairly satisfactory during the last three years. In my opinion it is probable that the recently introduced methods of checking vaccinators' work and returns in absolute detail have had a considerable influence in reducing the numbers of reported operations. But there is no doubt but that there is still scope for a considerable increase in the amount of work actually done and I accordingly arranged to increase the number of vaccinators in the Province in September 1916, and to supply a larger quantity of vaccine than had been issued in the previous years.

If necessary, I propose to extend those measures further and I anticipate that some results should become apparent by next year.

- 4. Vaccination in towns and compulsory areas.—During the triennial period under review the Vaccination Acts were extended to the Patna and Phulwari thanas of Patna, to the Mining Settlement area of Jharia, and to Sakchi and Padma. Statement VII shows the details of Municipal vaccination from which it appears that in Bhagalpur and Darbhanga the work has been consistently bad and that it has been unsatisfactory in several of the other large towns. On the other hand, in several municipalities, noticeably in Cuttack, more children were vaccinated than were recorded as being available.
- 5. Work done in the Native States under the supervision of the Political Agent.—Vaccination work in the Orissa Feudatory States has steadily developed during recent years under the direction and encouragement of the Political Agent.

		Year.		noi lo pa	Total number of Vaccinations.	Total number of Revaccinations.

1913-14					430,720	261,225
1914-15	***************************************		The same		419,562	260,707
915-16					454,699	281,913
1916-17					* 504,948	* 311,670

^{*} Excluding the figures of the State of Rairakhol.

The figures above quoted speak for themselves and are a very satisfactory record of the work done to stamp out and prevent small-pox in these States. Both vaccination and to a large extent revaccination are practically compulsory in the majority of these States and both the record and the results of the work are eminently satisfactory.

6. Protection of infants.—During last year out of 1,052,193 the estimated number of children under one year available for vaccination 432,588 equal to 468 per thousand were successfully vaccinated as compared with 620,702 equal to 576 per thousand in the previous year.

The protection of infants in municipalities is separately shown in Statement VII and works out a ratio of 681 per mille of the surviving population. These figures are very unsatisfactory as they show that more than half the total number of operations are performed on children over one year of age. Whilst the ratio of protected children under one year of age has fallen to below 500 per thousand, the total number of operations performed is still in excess of the total number of infants available as it always has been. In previous years the excess has been very marked and as there has been a constant excess it must be inferred that the returns are to that extent on the average fictitious.

Civil Surgeons and Deputy Sanitary Commissioners are unanimous in attributing the opposition to vaccination to be concerned more with the age of the child than with the operation itself and in view of the strong popular prejudice which exists against vaccination of infants at an early age I consider that it is desirable that the Vaccination Act should be amended so as to raise the age for compulsory vaccination to one year instead of six months.

7. Incidence and Mortality of Small-pox.—During the first two years of the period under report the death-rate from small-pox increased from '11 to '22 and again to '42, but during last year it has fallen to '28.

The Patna Division has always been a hot bed of small-pox, second only to the Orissa Division in the prevalence of the disease.

During the last two years efforts have been made to extend and improve vaccination work in the Patna Division and during the last year of the period under report there has been a decrease in the death-rate from small-pox in the Patna Division amounting to over 50 per cent.

In the Tirhut Division the death-rate from small-pox has always been low and there is no doubt but that this Division is the best vaccinated Division in the Province.

In the Bhagalpur Division the mortality has always been higher than in Tirhut but has never recently exceeded the mortality in the Patna Division.

The Orissa Division has the unenviable position of returning the highest death-rate from small-pox and is headed by the Sambalpur District with a death-rate of 1.09 last year which is almost double the death-rate in Puri District (.52) and Cuttack (.46) which are the districts with the next highest death-rates in the Province.

In Chota Nagpur small-pox is not very prevalent and this Division shares with Tirhut the reputation of being well vaccinated and having a low small-pox mortality.

- 8. Prevention of Small-pox.—In last year's Annual Report I recommended that the Vaccination Act should be modified and generally enforced throughout the Province. As that proposal has not been accepted I would now suggest that it should be tried on a small scale in one Division and I would propose to choose the Orissa Division in which vaccination is in a very backward and unsatisfactory state and in which small-pox has been unduly prevalent for many years.
- 9. Inspection of work.—During the three years under report the three Deputy Sanitary Commissioners inspected a large number of children most of whom had undergone primary vaccination.

The numbers are as follows:-

1914-15				 8,781
1915-16				 133,895
1916-17	1.4	***	omaDom	 213,885

The figures for the first year were abnormal as there were only two Deputy Sanitary Commissioners and both of them were employed on special duty during most of the inspecting season. The inspection work done during the last year under report has been very extensive and thorough and has covered all the districts of the Province except Angul.

The Civil Surgeons of the Province have inspected a considerable number of operations, the numbers of which are shown in the following statement:—

	Y	ear.	Bin in	Primary.	Secondary.
		1		2	3
1914-15				78,646	7,162
1915-16				82,485	10,265
1916-17		State Control		67,096	6,263

It should be noted that the methods of inspection of Civil Surgeons and Deputy Sanitary Commissioners are different. Civil Surgeons inspect the new work which has just been done and the numbers returned by them are therefore smaller, whereas Deputy Sanitary Commissioners inspect all the children under ten years of age and look at old work as well as new work and also look for unvaccinated children and children who are marked with small-pox.

10. The Officers of the Inspecting Staff.—The Officers of the Inspecting staff have not yet attained to a satisfactory standard of efficiency. A few of them are energetic and capable and these men have been rapidly promoted and put in the most responsible positions. The majority, however, are careless and negligent and do not attempt to carry out their duties honestly and efficiently. The standing rules of the Department and recent orders have been enforced with considerable stringency in order to imbue the staff with some sense of discipline. As that does not yet appear to have been sufficiently attained the process at present continues and a large number of inspecting officers have been punished during the last year under report. At the end of the last two working seasons a list of the punishments and promotions has been circulated for general information amongst the members of the staff.

In July 1916 a class of instruction was held at Gulzarbagh for four days to which the entire staff of Inspectors and Sub-Inspectors was summoned and at which lectures and demonstrations were given on the methods of operation, the nature and scope of the duties of Inspecting Officers, the Rules and Regulations of the Department, the use of Forms and Registers and the methods of maintaining and checking them, and the standard of efficiency and work expected from the staff.

II. Supply of Vaccine.—The Vaccine Depôt at Namkum was opened during the first year of the period under report. In the first year a partial supply of vaccine was issued and during the last two years the full requirements of the Province were met and a reserve stock was established.

The following tabulated statement shows the number of doses manufactured, the number of doses issued, and the number of doses in reserve during the three years under report:—

	Year.	1	Number of doses manufactured.	Number of doses issued.	Number of doses in reserve.
	1		2	3	4
1914-15 1915-16 1916-17			771,696 3,127,290 2,84 2 ,710	541,259 1,798,239 * 2,417,730	230,437 1,559,488 1,705,174

Note:—Inaddition to the 2,017,730 doses issued, 679,000 were destroyed as they had become inert
owing to a temporary failure of the cold storage plant during the summer and 294 doses were
lost in the process of manufacture.

The following tabulated statement shows the numbers of calves purchased or hired, the numbers of doses manufactured, the average numbers of doses yielded per calf, the total gross cost and the total revenue and the average net cost per dose for the three years under report:—

	Year.		Number of enives pur- chased or hired.	Number of doses manufactured.	Average number of doses yielded per calf.	Total gross cost.	Total revenue.	Average net cost per dose.
	1	1010	2	3	4	5	6	7
	ST SE			THE REAL PROPERTY.		Rs	Rs.	l'ies.
1914-15			5,07	771,696	1522-08	19,367		4.8
915-16	303.00		1,267	3,127,590	2468-26	34,537	4,637	1.8
916-17			1,129	2,842,710	2517-90	34,936	13,518	1.4

In the first year under report the work had just begun and many difficulties were encountered. In 1915-16 the work and management were reorganized and the output was greatly increased. In 1916-17 the output required was not so great as a reserve stock had been established, and it was found advisable to close the Depôt in May and June as the vaccine previously made in these hot months had been deficient in quantity and defective in quality. Unfortunately during this year there was a loss of 679,000 doses owing to a failure of the cold storage plant and it was only by working at very full pressure during the cold weather that the reserve stock could be maintained. The defect in the quality of the vaccine was first reported when it was issued at the beginning of the working season and before the vaccine could be tested a considerable number of doses had issued and resulted in a large number of "failed" operations at the beginning of the season.

All vaccine is now tested both at the time of manufacture and at the time of issue and as a precautionary measure the dilution with glycerine has been decreased from 1 in 6 to 1 in 5. This decrease in dilution combined with the increased cost of all stores and materials owing to the war has prevented a much greater diminution in the cost of production. Nevertheless in spite of these disadvantageous circumstances the working costs of this Depôt are now very low as compared with any other Depôt in India and the vaccine now issued is giving very satisfactory results.

During the last year under report arrangements have been made to issue landlinated vaccine to the Orissa Feudatory States at the request of the Political Agent. The dilution is less and the cost to the Depôt is greater but it appears to stand long journeys better and gives general satisfaction.

Epidemics of foot and mouth disease have stopped the work of the Depôt four times in the three years, but the loss of time has been made up and the output of vaccine has been ample. The chief loss through these epidemics arises from the loss of calves and of vaccine in the making as the sick calves have to be discarded.

This loss, together with the loss of calves from accidents and other causes, greatly diminishes the apparent output per calf which has really been greatly increased by improved feeding and technique and is actually over 3,000 doses per calf kept and used.

The system of direct fortnightly issues to vaccinators has been continued. The cost to the Depôt is greater as the number of postal packages is large but the results are good. There is no loss of time or of the freshness of the vaccine and there is really a saving owing to the packages being posted only once instead of issuing to Civil Surgeons and being reposted by them.

The staff of the Depôt has worked well during the last year and special credit is due to Dr. T. Sebastian and Dr. C. N. Banarji for their good work.

12. Experimental work.—During the last two years a large number of experiments has been carried out at the Depôt with a view to determining the best dilutions and the best medium for vaccine preparations. The experiments have not yet been completed but they show that no vaccine will stand a high temperature for more than a week and that glycerine vaccine is the most stable preparation so far dealt with. Lanoline paste gets bad very quickly unless protected by the inclusion of some glycerine and the great difficulty at present is to get really neutral lanoline or glycerine for use as a medium. Either substance if even slightly acid renders the vaccine inert very rapidly and owing to the war it is almost impossible to get pure lanoline and very difficult to get good glycerine.

Experiments have also been made with a view to increasing the output per calf and have resulted in almost doubling the amount of vaccine obtained from each calf actually used.

Further experiments are being carried out in the packing and manufacture of the vaccine with a view to getting a product which will remain potent longer than ten days when issued and which will be easier to pack and handle than the

glycerine vaccine at present issued in capillary tubes. Collapsible tin tubes are desirable but a less fluid preparation is required for issue in them.

13. Cost of the Department .—The cost of the Department during the three years under report has been as follows:—

Year.			Total C	ost	
			Rs.	a.	p.
1914-15	 	 	98,421	3	6
1915-16	 	 	1,12,336	0	2
1916-17	 	 	1,09,664	10	5

The cost during the year 1916-17 is detailed in Statement II and shows a total expenditure of Rs. 1,09,664-10-5 or Rs. 2,671-5-9 less than the previous year.

The cost per successful operation rose from Re. 0-1-2 in 1914-15 to Re. 0-1-5 in 1915-16 and to Re. 0-1-8 in 1916-17. In the first year the rise in cost per operation was due to the increase in establishment, viz., one Deputy Sanitary Commissioner and his office establishment and two Sub-Inspectors of Vaccination and in the last year under report it was due to the large decrease in the number of operations performed.

14. General.—I had expected better results than have been obtained during the last year under report; but I have found the inspecting staff slow to respond to the more stringent supervision and control which have been recently exercised over them. Other factors have also operated against good results during the last year. Owing to the lateness of the rains and the occurrence of the Puja holidays in the first half of October work did not begin until nearly the end of October and when it began the results were at first bad owing to the issue of inert vaccine and apparently it proved to be too great a task to make up for the bad start which was thus obtained. I anticipate better general results next year and I propose to still further increase the issue of vaccine with a view to obtaining better results.

In conclusion, I desire to bring to the notice of Government the large amount of useful work done by the three Deputy Sanitary Commissioners during the year in inspecting vaccination work and reporting on the efficiency of the staff and work in almost all the districts of the Province.

W. C. ROSS, MAJOR, I.M.S.,

Offg. Sanitary Commissioner.
