Report of the Medical Officer of Health, Cairo City, for the Year 1923.

I.-VITAL STATISTICS.

(a) POPULATION.

The mid year population of Cairo for 1923, as estimated by the Statistical Department, was 791,000 consisting of 721,429 Egyptians and 69,571 Foreigners.

To this population should be added that of the area around Helwân proper which is administered by the inspectorate for all public health purposes, except the registration of births and deaths.

This population, which has been estimated at 30,230, added to that of Cairo, amounts to 821,230, and it is on this total that our zymotic charts are based.

The district distribution of the population is estimated as follows :---

micheore	ad		Distri	ct.	19.0	alt	line	2.0	Popu	ilation.
Mûsky									24,600	
Bâb el Sha								1000	67,500	
Ezbekîya									59,100	
Darb el Al									70,400	
Abdîn									62;200	
Saiveda Ze	inal	b							79,500	
Helwân									11,600	(41,830)*
Khalîfa									56,100	
Jamâlîya									65,700	
Shubra									86,700	
Bulâq									96,900	
Old Cairo									33,600	
Wâyli									77,100	
		1	Тотаі	. CA	IRO	City			791,000	(821,230)

* This includes the area around Helwan, i.e. 30,230.

(b) BIRTHS.

During 1923 the total number of births which occurred in Cairo was 41,309. Of this total 40,471 were Egyptian and 838 foreign births. The annual birth-rate was therefore 52.2 per thousand of population as compared with 53.5 in the previous year.

For the quinquennial period ending in 1923 the mean annual birth rate was 48.6 the highest rate being 53.5 in 1922 and the lowest in 1919 was 42.0 per thousand of population.

The highest district birth-rate was in Old Cairo where there were 66.8 births per thousand of population whilst the lowest rate occurred in Ezbekîya with 36.2.

Still-Births.—During 1923, 1,191 children were born dead : of these 1,177 were of Egyptian parentage and 14 of foreign. This gives a rate of 2.9 still-births per hundred births as compared with 3.1 in 1922 and 3.4 in 1921.

TABLE I.-DISTRICT BIRTHS AND BIRTH-RATES PER 1000 OF POPULATION.

(c) DEATHS.

During 1923, a total of 28,806 deaths occurred in Cairo. Of these however 650 were deaths of non-residents, leaving 28,156 for Cairo proper.

This gives an annual death-rate of 35.6 per thousand of population as compared with a rate of 34.3 for 1922 and 30.8 for 1921.

For the quinquennial period ending with the present year the mean annual rate was 37.5 per thousand with a maximum during the period of 41.4 in 1919 and a minimum of 30.8 in 1921. The lowest mortality occurred in Ezbekîya with a death-rate of 25.9 per thousand as against 22.7 per thousand in 1922 and 21.2 in 1921.

The highest district mortality was in Old Cairo with a death-rate of 49.0 per thousand of population as compared with 46.4 in 1922 and 36.7 in 1921.

Out of the total number of 28,156 for Cairo proper, 27,570 were deaths of Egyptians and 586 of foreigners.

TABLE II.-DISTRICT DEATHS AND DEATH-RATES PER 1000 OF POPULATION.

Chart I shows the maximum, minimum and mean weekly death-rates for the period 1918-1922 with the weekly death-rates for 1923 per thousand of population. 9,495 children under one year of age died during 1923 giving an infantile mortality of 230 per thousand births for the whole city as compared with 239 in 1922 and 220 in 1921. In addition there were 227 deaths of infants coming from outside Cairo and who died in various public institutions.

During the quinquennial period ending with the present year the mean annual infantile mortality rate was 236 per thousand births.

The highest rate during this period was 255 in 1920 and the lowest 220 in 1921.

As regards the various districts of the city the lowest infantile mortality rate occurred in Ezbekîya with 181 infantile deaths per thousand births. Of the 9,495 deaths of children under the age of one year occurring in 1923, 9,410 were deaths of Egyptian infants and 85 of foreigners.

TABLE III .- DISTRICT INFANTILE MORTALITY RATES PER THOUSAND BIRTHS.

Chart II shows the weekly infantile death-rates for 1923 as compared with the maximum, minimum and mean weekly rates for the period 1918–1922 per 100 births.

Chart III shows the principal causes of infantile deaths in 1923.

Chart IV.—This chart shows the relationshop between infantile mortality from Diarrhœa and temperature.

The temperature curves shown are two, the minimum temperature and the average maximum temperature.

There is a tendency amongst the uninformed to take the view that because hygienic conditions are not better, the health authority is almost entirely to blame for the fearful infant mortality that prevails during the summer months. It is therefore of interest to note the following extract from an Article entitled "Summer Diarrhœa in Infancy," by Dr. Pearson of the Hospital for Sick Children, Great Ormond Street, London :--

Summer Diarrhaa in Infancy.

"The points of general agreement are that bad hygiene, bottle-feeding, and heat, all have a positive influence in promoting the disease.

"Children in their first year are the chief sufferers, the highest mortality occurring in the last nine months of this period.

"Although bad hygiene and bottle-feeding exist at all times, yet diarrhœa is only prevalent in the hot months; hence we must regard a high temperature as a factor of great importance. The rise in mortality from diarrhœa occurring yearly in most cities, beginning in July and reaching its maximum in August or September, is very striking. Observations have shown that this increase occurs when the atmospheric temperature becomes sustained day and night above 60° F. (15.6°C.). An exact explanation cannot be given, but probably heat exters its effect in several ways; first by depressing vitality, thus lowering the power of resistance and lessening tolerance for food; and secondly, by favouring the growth of micro-organisms both within and without the body."

If such is the case in the cooler countries of Europe, infantile mortality in sub-tropical countries may always be expected to be very high during the hot season, however great the improvements that may be effected in hygiene.

From the chart it will be seen that from the second week of May until the last week in October, the temperature did not fall below 15.6° .

It will be noticed also that the onset of the heat is accompanied by a very sudden enormous increase in infant mortality that decreases later on although the temperature may still remain high. The most probable explanation of this is that ailing and weakly children at once fall victims and only the stronger children survive until the later summer months.

Table IV shows the comparative mid-year population and vital stastistics of Cairo from 1911-1923.

Table V shows the population and vital statistics of the various districts of Cairo for 1923.

TABLE V .- THE POPULATION AND VITAL STATISTICS OF CAIRO AND ITS QUARTERS IN 1923.

- 5 -

II.-INFECTIOUS DISEASES.

The total for all infectious diseases reported during 1923 was 4,780 which includes 106 cases coming from outside Cairo so that the total for Cairo proper was 4,674 as compared with 4,740 in 1922.

Out of this total 3,189 with a mortality of 986 were cases belonging to the eight principal diseases.

The remainder inlcude 833 cases of influenza, 97 of whooping cough, 106 of mumps, 24 of tetanus, 5 of Malta fever, 11 of encephalitis lethargica, 10 of rabies, 50 of puerperal fever and 295 of chicken pox.

The rate per thousand of population for the eight principal diseases was 3,880 as compared with 3,165 in 1922 whilst the rate of deaths to cases was 30.9 per cent as against 33.3 in the previous year. See Tables VI, VII with Fig. 1, VIII and IX.

Smallpox.—The total number of cases notified during the year was 28 as against 24 in the previous year.

The rate of cases per thousand of population was 0.034.

There were 13 deaths from this disease, 10 of which were diagnosed after death. The death-rate per thousand of population was 0.015 and the ratio of deaths to cases recorded was 46.4 All had been vaccinated with the exception of one which was only one month old. See Table X with Fig. 11 and Chart V.

TABLE X .- SMALLPOX CASES AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

Measles.—The total number of cases recorded in 1923 was 1,418; this gives a rate of 1.726 per thousand of population.

There were 452 deaths from this disease all of which were diagnosed after death with the exception of one. This is an indication that a large number of cases of this disease was never declared but recorded.

The death-rate per thousand of population was therefore 0.550 whilst the ratio of deaths to cases notified was 31.9 per cent. This latter figure obviously does not represent the true case mortality.

The highest case rate occurred in Bulâq with 3.116 per 1,000 of population.

The largest ratio of deaths to cases was in Gamâlîya being 71.1 per cent. See Table XI Fig. 3 and Chart VI.

Scarlet Fever.—There were 29 cases notified during the year as compared with 68 in 1922 whilst the number of deaths from this disease was 3.

This gives a case rate and death rate per thousand of population of 0.035 and 0.003 respectively whilst the percentage of deaths to cases recorded was 10.3 per cent.

Of the total number of cases 6 were Egyptians the other being 8 English, 2 French, 5 Syrians, 3 Jews, 3 Armenians, 1 Russian and 1 Portuguese. See Table XII, Fig. 4 and Chart VII.

TABLE XII.-SCARLET FEVER CASE AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

Diphtheria.—The total number of cases recorded in 1923 was 619 as compared with 418 in 1922 and 438 in 1921. This gives a rate of 0.753 per thousand of population.

The total number of deaths was 194 giving a death rate of 0.236 per thousand of population and a ratio of 31.3 per hundred cases notified.

Out of the total deaths 168 were found dead.

The highest case rate occurred in Wâyli being 1.180 per thousand of population. See Table XIII, Fig. 5 and Chart VIII.

TABLE XIII .- DIPHTHERIA CASE AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

Typhoid Fever.—The total number of cases notified during the year was 969 as against 859 in 1922 and 669 in 1921.

The case rate for the year was therefore 1.179 per thousand of population.

The number of deaths from this disease was 242 of which 202 were found dead.

The death rate was 0.294 per thousand of population and the ratio of deaths to cases notified was 25.0 per cent.

The highest case rate occurred in Wâyli with 2.217 per thousand of population. See Table XIV, Fig. 6 and Chart IX.

The cases were distributed as follows :---

740	Natives.	17	English.	2	Maltese.
46	Jews.	14	Armenians.	1	Belgian.
43	Greeks.	12	French.	1	German.
35	Syrians.	6	Swiss.	1	Dutch.
25	Italians.	3	Russians.	1	Spanish.
		3	Austrians.	19	Other Foreigners.

A further analysis shows that the 969 cases are divided as follows :----

909	cases	occurred	in	909	separate families.
38	,,	,,	,,	19	families (i.e. 2 in one family).
12	,,	,,	,,	4	families (i.e. 3 in one family).
4	,,	,,	,,	one	family.
6	,,	- ,, 0	,,	one	family.

That is to say that out of the 969 cases occurring in 934 families only 35 may have contracted the disease as contacts.

These figures are of importance for, on considering their significance, it will be seen that the administration of Anti-typhoid Serum to contacts as a routine measure of prophylaxis is counter indicated in Cairo. (See Table XIV.)

TABLE XIV .- TYPHOID FEVER CASE AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

Typhus Fever.—The total number of cases recorded during the year was 112 which is the lowest total during the last 10 years. The case rate per thousand of population was 0.136.

75 cases were diagnosed after death.

There were 77 deaths which gives a death-rate of 0.093 per thousand of population and a ratio of deaths to cases recorded of 68.7 per cent. This ratio is rather high.

The highest case rate was in Gamâlîya with 0.456 per thousand of population. See Table XV, Fig. 7 and Chart X.

TABLE XVI.-RELAPSING FEVER CASE AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

Cerebro-Spinal Fever.—There were 12 cases of this disease during the year as compared with 8 cases in 1922 and 14 in 1921. The number of deaths was 5. The case and death-rates therefore were 0.014 and 0.006 respectively per thousand of population. Out of the total number of cases 5 were diagnosed after death. See Table XVII, Fig. 9 and Chart XII.

TABLE XVII.-CEREBRO-SPINAL FEVER CASE AND DEATH-RATES IN CAIRO DISTRICTS IN 1923.

- 13 -

Puerperal Fever.—The total number of deaths from Puerperal fever during 1923 was 32 out of which 29 were among Egyptians and 3 among Europeans.

There were however 28 deaths which occurred within a fortnight of confinement which, if added to the others, make a total of 60.

The causes of these 28 deaths are given as : nephritis 1, eclampsia 9, hæmorrhage 4, peritonitis 3, abortion 1, enteritis 1, pneumonia 2, difficult labour 2, septicæmia 2, insanity 1.

The death-rate of puerperal fever was therefore 0.038 per thousand of population or 0.774 per thousand of births.

If the 28 deaths which occurred within a fortnight of confinement be added, the deathrate will be 0.073 per thousand of population or 1.452 per thousand births. See Table XVIII.

Puerperal Fever has now been added to the list of notifiable diseases and the rates are accordingly calculated on the population which includes the Helwân District.

Yeab	ł.	Deaths from Puerperal Fever,	Deaths within a Fortnight of Contine- ment.	Total Maternal Deaths.	Death-rate of Puerperal Fever per Thousand Births,		Death-rate of all Maternal Deaths per Thousand Births.

TABLE XVIII.-PUERPERAL FEVER, 1914-1923.

Influenza.—The total number of cases notified during the year 1923 was 833 as against 1,461 in 1922 and 1,479 in 1921. This gives a case rate of 1.014 per thousand of population as against 1.812 in 1922 and 1.862 in 1921.

The number of deaths attributed to this disease was 21 which gives a death-rate of 0.025 per thousand of population as compared with 0.101 in 1922.

The number of deaths of all respiratory diseases excluding Pulmonary Tuberculosis was 4,423 out of which 1,871 were due to pneumonia, 2,388 to bronchitis, 26 to pleurisy and 138 to other respiratory diseases.

Of the 1,871 deaths from pneumonia 1,322 were children up to 5 years of age, 154 from 5 up to 15, 166 from 15 up to 35 and 229 from 35 over.

Table XIX shows the comparison of deaths from influenza and those from pneumonia and other respiratory diseases.

The cases were distributed as follows :--

Encephalitis Lethargica.—There is reason to think that the diagnosis of most of these cases may have been suggested by the same consultant.

Plague.—Three cases of Septicæmic Plague occurred, the disease having been brought from Suez. Their history is as follows :—

(1) Boab came from Suez February 3, 1923, stayed with a friend, another boab at Bab el Bahr and died February 4. The Medical Officer who examined the body diagnosed tuberculosis.

(2) Boab, the host of No. 1, removed to Bâb el Sha'rîya Qism and died on 12th instant, the death certificate from a private practitioner giving kidney disease as the cause of death

(3) Brother of (2) died on 16th instant, the body was seen by the Medical Officer who diagnosed Typhus on the strength of a hæmorrhagic rash.

Thanks however to the careful control exercised by the Senior Medical Officer of the Epidemic Section, the Inspectorate became aware of the case and specimens were taken and sent for bacteriological examination with the result that the case was proved to be Plague

In the meantime every precaution had been taken and no further cases occurred.

There was also a case of bubonic plague imported to Cairo from Menouf Markaz, which died three hours after admission to the Fever Hospital.

III.-GOVERNMENT FEVER HOSPITAL, 'ABBASIYA.

During the year 1923 there were 1,897 admissions to the Government Fever Hospital as compared with 1,705 in 1922. Of these admissions 1,314 were males and 583 were females. Table XX.

December	147	97	50	2	10	135
TOTAL	1,897	1,314	583	61	185	1,651

The admissions consisted of 19 small-pox, 46 chicken-pox, 45 measles, 22 scarlet fever, 278 typhoid+38 paratyphoid=316, 34 typhus, 3 relapsing fever, 14 cerebro-spinal fever, 87 diphtheria, 38 mumps, 615 influenza, 6 erysipelas, and 1 bubonic plague; 274 other cases were admitted to Hospital under a mistaken diagnosis of infectious disease, 220 persons were sent in under observation in whom no disease of any sort manifested itself and 157 mothers of young children and other persons accompanying patients. Tables XX and XXII.

The 274 cases sent to Hospital under a mistaken diagnosis of infectious disease were found on examination to consist of 43 gastro-enteritis, 10 cases of malaria, 10 of pneumonia, 5 of bronchitis, 19 of tuberculosis, 5 of whooping cough, 30 of tonsilitis, 6 of dysentery, 3 of malta fever, 7 of tetanus, 15 of various skin diseases and 121 other cases of a most diverse nature consisting of kidney disease, tumours, heart disease, etc.

Of the 1,897 admissions 61 were first class, 185 second class and 1,651 third class. Table XXII.

The admissions from the eight principal notifiable diseases (small-pox, measles, scarlet fever, diphtheria, typpoid, typhus, the relapsing and cerebro-spinal fevers) were 540.

From the admissions, however, should be deducted 65 military cases.

There were 148 deaths in Hospital during 1923 or, estimated on the 1,897 admissions, 7.8 per cent of the cases admitted.

The mortality in typhoid, typhus, diphtheria and cerebro-spinal fever is high owing to the fact that some of the patients suffering from these diseases were admitted to hospital in a very advanced condition.

By deducting the number of patients who died within 2 or 3 days of their admission from the total number of deaths in each of the above-mentioned diseases, the death-rate will be as follows :---

Typhoid.—Total number of deaths 54. Of these 13 died within 2 or 3 days of their admission, remain 41, *i.e.*, a mortality of 13 per cent.

Typhus.—Total number of deaths 10. Of these 6 died within 2 or 3 days of their admission, remain 4, *i.e.*, a mortality of 11.8 per cent.

Diphtheria.-Total number of deaths 24. Of these 17 died within 2 or 3 days of their admission, remain 7, *i.e.*, a mortality of 8 per cent.

Cerebro-spinal Fever.—Total number of deaths 9. Of these 7 died within 2 or 3 days of their admission, remain 2, *i.e.*, a mortality of 14.3 per cent.

In addition there were 32 deaths amongst patients sent in under a mistaken diagnosis of various infectious diseases and whose condition did not permit of a refusal of admission.

These are: 5 phthisis, 1 dysentery, 2 senility, 3 septicæmia, 1 syphilitic laryngitis, 3 puerperal fever, 6 gastro-enteritis, 1 heart disease, 1 mumps, 1 bronchitis, 2 meningitis and 6 pneumonia.

Included amongst the 1,651 third class admissions were 59 sick convicts from Cairo Prisons. Of these 17 were suffering from typhoid, 1 from typhus, 22 from influenza, 6 from mumps, 4 from measles, 2 from enteritis, 1 from phthisis, 3 from tonsilitis, 1 from paratyphoid, 1 from erysipelas, and 1 from renal colic.

Of the convict patients 8 died, death being due to typhoid in 6 cases, typhus in 1 and phthisis in 1.

The convict mortality was therefore 13.5 per cent of the total number of cases admitted. Table XXV.

Apart from some microscopic examinations for relapsing fever and malaria no bacteriological examinations were carried out in the Hospital Laboratory since the doctor in charge was transferred from here.

TABLE XXV MONTHLY	CONVICT MORTALITY	AND CAUSES OF	DEATH IN 1923.
-------------------	-------------------	---------------	----------------

IV.—DISINFECTION SERVICE.

The total number of rooms disinfected during 1923 was 22,628, of this total 8,717 were done by the 'Abbâsîya and 13,911 by the Fum el Khalig Staff.

This makes an average of 23.9 rooms per day for 'Abbâsîya and 38.1 for Fum el Khalig. Of the total of rooms disinfected 708 were treated by Formalin, 12,229 by Sublimate

Solution, 8,306 by Izal, 1,351 by Petroleum Emulsion and 34 by Sulphur. In addition there were 109,140 articles of clothing removed to the two Stations for

disinfection by steam, of this total 31,198 were disinfected at Fum el Khalig and 77,742 at 'Abbâsîya.

Delousing.—The total number of contacts of Typhus and Relapsing Fevers who were deloused during the year was 811 of which 450 were males and 361 females.

V.—AMBULANCE SERVICE.

During 1923 there were 1,153 calls made on the Ambulance Service as against 1,226 in 1922.

Of the total 1,152 journeys were made by the motor ambulances and one by the hooded carts.

VACCINATIONS.

The total number of vaccinations carried out during 1923 by the District Medical Officers and those of the Inspectorate was 47,257. Of this total 37,804 were primary vaccinations, 37,151 of which were among natives and 653 among foreigners.

The remaining 9,453 were secondary vaccinations of contacts of Smallpox or persons voluntarily applying for this.

DEATH INQUIRIES.

The total number of uncertified deaths during 1923 which required to be investigated was 19,289 as against 17,951 in 1922.

The proportion therefore of uncertified deaths to the total Cairo deaths (*i.e.* 28,156) was 68.5 per cent as against 67.2 per cent in 1922.

Out of the 19,289 uncertified deaths 12,913 were investigated by the District Medical Officers that is 66.9 per cent, 5,168 or 26.7 per cent were inquired into by the District Qabilas, 1,132 or 5.9 per cent by the Sanitary Barbers and 76 or 0.4 per cent by the Village Dayas, therefore the daily average of inquiries was 52.8.

The average per day for the Medical Officers was 35.4, for the Qabilas 14.2, for the Village Barbers 3.1 and for the Village Dayas 0.2.

In 1923 the largest number of inquiries were made by the Medical Officer of Khalîfa who investigated 1,511 deaths whilst the Qabila of Bulâq I. had the largest record having made 1,903 inquiries. See Table XXVI.

VI.—PASSENGER AND PILGRIM CONTROL SERVICE

(a) PASSENGER SERVICE.

During 1923 the total number of passengers arriving in Cairo from infected countries was 14,214.

Out of this total 8,835 or 62.2 per cent arrived via Alexandria, 2,449 or 17.2 per cent via Port-Said and 2,930 or 20.6 per cent via Suez.

Of the 14,214 passengers 11,397 or 80.2 per cent were observed during the whole prescribed period, 2,522 or 17.7 per cent left Cairo before completing the full period of observation, and 295 or 2.1 per cent could not be traced.

The bulk of the passengers who came from Turkey were 5,109, from Greece 3,700, from Syria 1,345 and Japan 1,395, whilst 974 came from India, 935 from the Red Sea Ports and 562 from Australia. Tables XXVII and XXVIII.

Passengers via Qantara.—Besides the total passengers mentioned above, there were 9,082 passengers who arrived in Cairo by way of Qantara.

Out of this total 8,268 or 91 per cent were observed whilst 550 could not be traced. Table XXIX.

(b) PILGRIM SERVICE.

The total number of passports issued by the Governorate during 1923 was 511 as against 373 in 1922 and 118 in 1921.

Out of this number 503 returned and were put under observation for the usual period whilst 8 died during the pilgrimage.

There were also 158 Government Employees attached to the Mahmal. Of these 144 went on to Mecca and were observed on their return, 2 did not leave Cairo, 1 died in the Hedjaz, 1 could not be traced whilst 10 returned with the Mahmal. Table XXX. VII.—SANITARY CONTROL OF PUBLIC WOMEN.

- 27 -

(a) EXAMINATION ROOMS OF EGYPTIAN PROSTITUTES.

The total number of Egyptian prostitutes registered during 1923 was 1,354 as against 1,620 in the previous year.

Out of this total there were 111 new names; and 284 were struck off during the year for various reasons leaving 1,070 at the end of the year.

The total number of examinations carried out during the year was 33,891 making an average of 25 examinations per woman as compared with an average of 23.3 in 1922 and 21.4 in 1921. The list of women who absented themselves for examination is, unfortunately, still a very long one. Table XXXI.

Bab el Sha'rîya and Ezbekîa.—The total number of women on the register of these districts was 1,097 which is 243 less than in 1922. Out of these 232 were struck off leaving 865 names at the end of the year.

The total number of examinations held was 28,165 as against 30,730 in 1922, showing an average of 25.6 examinations per woman as compared with 22.9 in the previous year.

Abbasîya.—The total number of registered women was 107 as against 140 in 1922, 22 names were struck off during the year leaving only 85.

The number of examinations made was 2,782 making an average of 26 examinations per woman.

Sayeda Zeinab.—In this district 150 women were registered ; 30 were struck off during the year, leaving 120 on the registers.

The examinations made amounted to 2,953 making an average of 19.7 per woman. The number of absentees in this district was very great.

Diseases.—The total number of diseases discovered during the year was 1,892 as compared with 2,089 in 1922 and 2,536 in 1921.

The actual number of women who were diseased was 791, that is 58.4 per cent of the registered women as against 52.6 per cent in 1922 and 56.3 per cent in 1921. All the cases were sent to hospital.

These figures however are deceptive for, as explained in the report for 1922, the measures adopted by the women who are diseased to mask their symptoms are very difficult to control.

Syphilis.—The total number of cases of syphilis discovered during 1923 was 80 as against 95 in 1922 and 148 in 1921.

Of this total 12 were primary and 68 secondary.

Gonorrhæa.—The total number of cases of Gonorrhæa was 1,631 or $86\cdot 2$ per cent of the total number of diseases, as compared with 1,836 in 1922. Out of this total 19 were acute and 1,612 chronic.

Chancroids.—There were 181 cases of Chancroids this year as against 158 in 1922. Table XXXII.

Wassermann.—During the year 15 specimens of blood were examined in the Laboratories, 5 of which were found to be positive and 10 negative. Only specimens of suspected cases were sent.

Unregistered Women.—The total number of unregistered women examined at the request of the Police was 840 as against 651 in 1922 and 906 in 1921.

Out of this total 178 or 21.2 per cent were found to be diseased. There were 132 cases of gonorrhœa, 26 of syphilis (3 primary and 23 secondary) and 20 of chancroids.

(b) EUROPEAN EXAMINATION ROOMS.

The total number of European Prostitutes registered during the year was 283 as compared with 308 in 1922 and 326 in 1921.

During the year 57 names were struck off for various reasons leaving 232 at the end of the year.

The total number of examinations made was 8,763 which gives an average of 29.9 examinations per woman. Table XXXIII.

TABLE XXXIII.-RESULTS OF EXAMINATIONS OF REGISTERED EUROPEAN WOMEN.

The total number of diseases discovered was 290 which gives a percentage of 3.4 examinations revealing disease.

Syphilis.-20 cases of syphilis, or 6.9 per cent of the total diseases, were diagnosed, of which 4 were primary and 16 secondary.

Gonorrhæa.—The total number of cases of gonorrhæa was 265 or 9.1 per cent of the total diseases. 15 were acute and 250 chronic.

Chancroids .- There were 5 cases of chancroids.

The actual number of women diseased was 178 or 62.9 per cent of the registered women.

Unregistered Women.---At the request of the Police 9 unregistered women were examined, 7 of whom were found diseased and were suffering from Gonorrhœa.

Out-Patient Clinic.—In consequence of the closing of the European Hospital at Shoubra at the end of 1922, an out-patient clinic was instituted at the Examination Rooms for the treatment of women suffering from venereal disease. A special room, containing a bed, was set aside for the use of women who had an intra-venous injection. This has proved very necessary and useful.

Treatment, naturally, was entirely free and voluntary, and was available, not only to the registered women, but also to unregistered women brought up for examination by the police and to those who might come of their own accord.

Almost all the registered women elected to be treated and for the most part attended very regularly. As regards the unregistered women sent by the Police very few returned for treatment and no unregistered woman presented herself for advice or treatment. This, however, is not surprising considering the situation and object of the examination rooms.

As regards the out-patient treatment when compared with hospital treatment, the efficiency and result depend on the disease.

Gonorrhaa.—Out-patient treatment of this disease, which is the most prevalent disease, does not at all compare favourably with hospital treatment which can be carried out much more thoroughly. In hospital, rest, frequent douching and total abstinance, etc., have not only shortened the duration of the treatment but made the result more permanent. Many of those treated in the out-patient rooms and apparently cured, returned shortly with a relapse.

Some of the women recognised this by going to the hospital in Alexandria.

Syphilis.—Apart from the danger of infection the treatment of this disease can be carried out quite satisfactorily in the out-patient department. The women, for the most part, attended regularly.

Quite a large number of women who showed no outward signs of disease came to the clinic, declared themselves to have had syphilis and asked to be treated.

The treatment consisted of injections of nevarsenobenzol and mercury. Treated cases as well as doubtful ones were controlled by Wassermann's.

520 intravenous and 365 intramascular injections were done during the year.

Chancroids.-The treatment of this disease could be carried out in the out-patient clinic.

VIII.—UNHEALTHY, INCONVENIENT AND DANGEROUS ESTABLISHMENTS.

Under the law of August 28, 1904, and the Arrêté of the Ministry of Interior of August 29, of the same year, 1,995 "Saha" Establishments and 291 Zabt Establishments, concerning which we were consulted, total 2,286, were licensed during 1923, after compliance with the sanitary conditions laid down by this Inspectorate and verified by subsequent inspections. The number of 1922 was 1,990.

Of the 2,286 Establishments dealt with, 115 were establishments under Class I. of the Schedule attached to the law, as against 82 in 1922; 1,663 were establishments in Class 11. as compared with 1,515 in 1922; 508 in Class III. as compared with 393 in 1922.

Subjoined is a detailed list of the various establishments in each class licensed in 1923.

The staff dealing with the inspection of establishments was augmented in June by the appointment of an additional Egyptian Food and Nuisance Inspector holding the diploma of the British Sanitary Institute. One of the overseers however resigned during the year to take up a better post.

25,734 inspections were made during 1923. The conditions were found satisfactory in 24,929 establishments and unsatisfactory in 805, the percentage of establishments with unsatisfactory conditions being 3.12 per cent as compared with 3.46 per cent in 1922.

Table XXXV shows the relative occurrence of faulty conditions in 1922 and 1923.

From this it will be seen that nearly the improvements of 1922 were maintained in 1923, *i.e.*, the percentage of visits in which faulty conditions were found was 3.12 per cent in 1923 as compared with 3.5 per cent in 1922.

Ezbekîya 1,890, Bab el Shariya 3,177, Darb el Ahmar 3,426, Gamâlîya 856, Mouski 2,267, Abdîn 2,426, Shoubra 1,728, Abbasîya 1,367, Bulâq I, 2,997, Boulaq II, 1,325, Sayeda Zeinab 1,377, Old Cairo 806, Zeitoun 1,074, Helwân 1,108.

Table XXXVI shows the number and results of inspections of various districts of Cairo. In Table XXXVII are shown the monthly distributions and results of the inspections of the various establishments. Although there is an improvement regarding the bakeries and poulterers' shops, faults however have been found in confectionery manufactories, vegetable dealers and certain other establishments. Nevertheless there is a slight improvement and the percentage of those establishments found satisfactory was somewhat higher than the previous year. The same remarks mentioned in the last year's report regarding removal of smoke and insufficient frequency of white-washing were still the reasons of the faulty arrangements found in 1923.

The most satisfactory establishments were grocers' shops with 1.97 per cent, butchers' shops 1.60 per cent, oilmen's shops 1.36 per cent, poulterer's shops 1.83 per cent, fish shops 2.22 per cent.

Table XXXVIII shows that the number of milk samples taken was 860. Of these 199 were found adulterated and 661 genuine as compared with 954 taken in 1922 of which 180 were found adulterated and 774 were genuine.

Table XXXIX shows that the number of samples of ærated waters taken was 556 as compared with 621 in 1922. In 7 cases the number of lactose fermentation organisms in 10 c.c. was below 5 c.c. as compared with 40 cases in 1922, in 3 cases the number of lactose organisms in 10 c.c. was between 5 and 10 against 2 cases in 1922 and in 5 cases only did they exceed 10 c.c. as compared with 13 cases in 1922. The remainder 556 were found to be uncontaminated.

These results show a great improvement and are highly satisfactory.

TABLE XXXIX.—RESULT OF THE CHEMICAL AND BACTERIOLOGICAL EXAMINATION OF SAMPLES OF AERATED WATERS DURING 1923.

A VERY SATISFACTORY RESULT.

The annual report for 1923 submitted by the Chief Sanitary Inspector (Food and Nuisance Inspector) is as follows :---

Results during 1923.—Generally speaking the results obtained have been satisfactory and considerable improvements have been effected in spite of the inadequacy of the Staff. It is a generally acknowledged fact that unless proprietors of establishments are being kept up to the mark by continuous supervision, they are very apt to get lax and fall back into their old habits of disregarding ordinary principles of sanitation. The inadequacy of the Staff, however, hinders continuous supervision as it is found necessary to move them from one Qism to another instead of allowing them to stay in one district to consolidate and maintain the improvements effected.

The value of continuous supervision is shown by the statistics of results obtained in certain particular sections of the work where, on account of the importance of the articles manufactured, regular frequent inspections are carried out, *viz*: Mineral Water Factories and Ice Factories.

Mineral Waters.—During 1921 the percentage of samples of Mineral Waters that gave an unsatisfactory result on examination at the Bacteriological Laboratory amounted to 10 per cent of the total; in 1922 they numbered 9 per cent, whereas in 1923 the proportion was only 2.7 per cent, 15 only out of 556 proving unsatisfactory.

Several of these factories have been connected to the public sewers during the year and various improvements carried out and maintained in practically all.

Ice Factories.—Again, in regard to the samples of ice, the factories of which are periodically inspected, the number of bad results in 1922 showed a proportion of 23 per cent whereas in 1923 they worked out at 18 per cent.

The total numbers of samples taken were 94 in 1922 and 125 in 1923.

Zaribas.—In addition to consolidating the work of the previous year in connection with certain other classes of establishment, the supervision of *zaribas* was taken up. In only one or two cases could the conditions be called satisfactory. The chief defects are, want of cleanliness, insufficient ventilation, no proper receptacles or places for storing milk cans and perfunctory washing of the latter.

Unsound Food.—There appears, on the whole, to be a diminution in the amount exposed for sale especially as regards jam. This is probably attributable to the fact that the large quantity that was placed on the market two or three years ago has now been disposed of.

Refuse.—Considerable nuisance is caused by the quantity of refuse thrown out from various licensed establishments, especially greengrocers. This often occurs just after the scavengers have cleaned up the streets.

Occupiers of shops generally are being persuaded to provide receptacles for waste materials to avoid their shops and the streets being littered in this way.

The practice of pulling out of refuse from the dustbins and sorting it alongside, which is very prevalent, is also a cause of nuisance.

Flies.—During the month of November flies were exceptionally numerous considering the time of the year. This no doubt was due to the heavy rains at the end of October and damp nights and warm days experienced during November.

General Remarks.—As regards the general work carried out by this section it is satisfactory to note that occupants of factories, shops, etc., are beginning to realise more, the necessity or advantage of having their establishments in a more or less sanitary condition, and therefore are more amenable to having various improvements, which may be suggested, carried out, but at the same time they are still very much inclined to fall back into the old habits of carelessness, which shows the necessity of continual supervision being maintained.

Subjoined is a list of visits and work carried out by the Chief Sanitary Inspector and his Assistants during 1923 not shown on the ordinary monthly returns.

IX.—ANTI-MALARIAL MEASURES.

The special measures taken for the abatement of the mosquito nuisance were applied in the same selected areas and quarters as in 1922.

There were only 23 complaints received from private individuals in 1923. 7 from Abdîn, 1 from Ezbekîya, 3 from Zeitoun, 1 from Abbasîya, 8 from Saiyeda Zenab, 2 from Shubra and one from Khalîfa.

The Birkas around Cairo were stocked with larvæ-eating fish as usual.

Helwan and Gezira.—The work carried out in 1923 was the same as in 1922 and no new work was undertaken.

X.-RAT-CATCHING SERVICE.

The number of rats destroyed during 1923 was 3,580. Of these 599 were caught in January, 481 in February, 351 in March, 224 in April, 81 in May, 199 in June, 199 in July, 348 in August, 310 in September, 292 in October, 199 in November, and 297 in December.

XI.--MISCELLANEOUS.

(a) THEATRE COMMISSION.

By the Arrêté of the Ministry of the Interior of July 12, 1911, instituting the Theatre Commission, and by the Arrêté of the Ministry of the Interior of February 6, 1912, the Medical Officer of Health of the City of Cairo is appointed a member of the Theatre Commission.

During the year 1923, one new establishment, a cinema, was licensed and 28 establishments already licensed were inspected by a delegate of the Cairo City Inspectorate.

Of this number 4 were Theatres, 17 Cinemas and 8 Café-Concerts.

The sanitary conditions were found satisfactory in one theatre, 10 cinemas and 3 café concerts, and unsatisfactory in 3 theatres, 7 cinemas and 5 café-concerts. In most of the latter cases the defects were the filthy conditions of the walls and floor of the W.C.s and urinals and broken W.C.s pans.

(b) MOULID EL NABI.

The Moulid el Nabi was held at Abbâsîya on 14, 15, 16, 17, 18, 19, 20, 21 September 1923, on a larger scale than in 1922. It lasted 8 days.

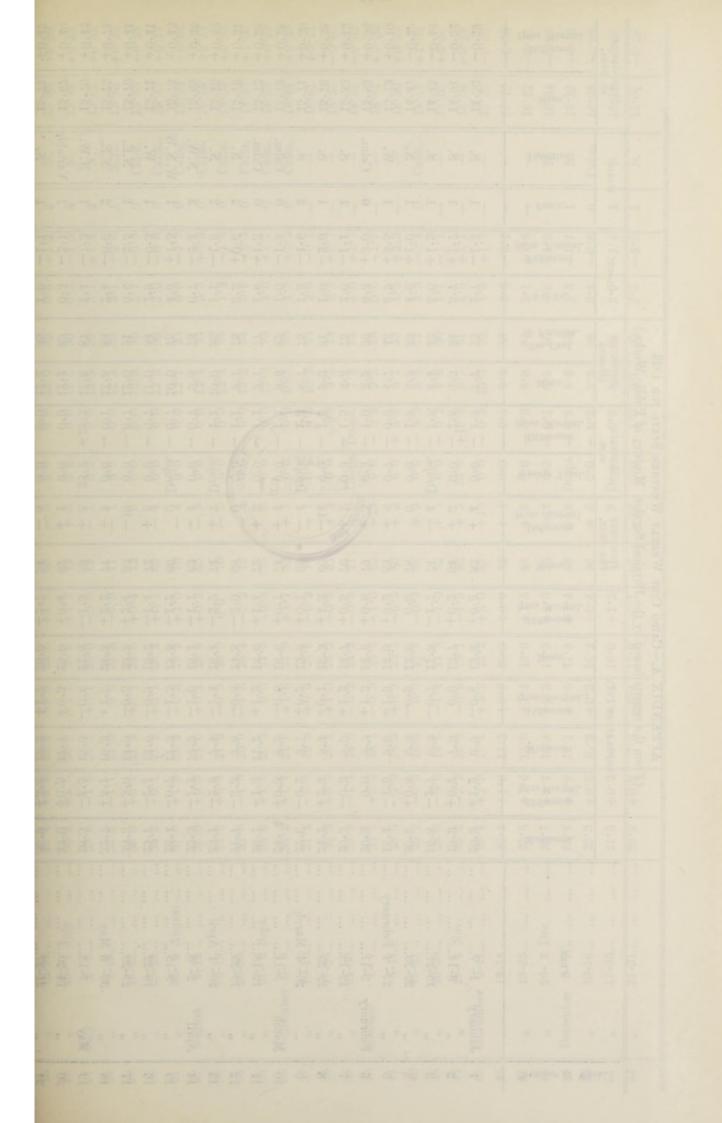

It was estimated that the number of visitors on the last day of the Moulid was 50,000 as against 35,000 in 1922.

The sanitary arrangements were similar to those followed in 1922 with the exception that two extra latrines were added.

Supervision was carried out by the Inspector of the Vidange Control Service and two of his subordinate staff.
