MEDICAL

VULGAR ERRORS REFUTED.

It it be afked, Which ftate of life is moft irkfome, an active employment which wholly takes up all one's thoughts and attention, or an abfolute indolence, and having little or nothing to do? perhaps few people are more competent to anfwer it than myfelf. For, after an extensive practice of above fifty years, with an uncommon share of uninterrupted health nearly all the time, which afforded me an ample specimen of one fide of the question, a late unwelcome visit from a deep seated fciatica, which confined me for many months, let me into the knowledge of the other fide.

B

2

While

While thus at my moorings, in fo long a vacation from bufinefs, to beguile in fome degree the tadium vita, I thought I could not employ my fedentary hours better than in an attempt to break a fpear against fuch deep rooted medical errors as have been permitted to travel down to us from time out of mind, as matters of unquestionable veracity, hitherto uncontradicted by any author to my knowledge; not without hopes, while endeavouring to convince my readers of what is wrong, of happily advancing a ftep farther, and shewing them what is right. The readers I address myself to, are not those of our profession, not having the prefumption to teach my brethren; who, it is to be hoped, have all been fufficiently inftructed already in these matters.

It is to the difficulty people find in getting rid of long rivetted prejudices, and the opinion, that the noble art of healing is involved in fuch impenetrable mystery as fcarcely to be understood, that we must attribute a well known fact, viz. That, in general, gentlemen,

3

little

gentlemen, even of the best education and learning, however they may fhine in other fciences, are most grossly ignorant in this; and though they endeavour to acquire fuch a competent knowledge of law as to guard themfelves from the knavery of the unprincipled in the profession, and of the fword and piftol to defend themfelves from. that of the honourable fraternity of gamblers; they often fubmit their lives to the moft ignorant quacks, let their mode of treating them run ever fo plump, in every refpect, against common fense. It is for the encouragement of fuch, that I shall endeavour to remove fome of the rubbish that obstructs their way in their profecuting this, by far the most useful and agreeable branch of natural philosophy.

When the immortal Harvey demonstrated the circulation of the blood, great expectations were formed of the advantages likely to accrue to the practice of physic from so capital a discovery. But to confess the truth, by comparing the writers before with those fince that time, it appears that very

B 2

4

little benefit has hitherto followed it ; fcience being of fuch flow growth, that it needs many a fostering hand to nourish it, and a length of time to diveft it of its old prejudices. To evince the length of time taken up in this country, before common fenfe has been able to overthrow one of the fillieft and most ridiculous opinions in the world, we have only to recollect, that though England had been ruled for many centuries by kings, lords, and commons, and fapient judges, (reft be to their old bones,) it was not till within a few years, that thefe fages, God wot, ever thought it wrong to confent to the hanging of a poor woman, fuspected of being a witch, provided fhe were but old enough, and had fore eyes, and kept a black cat.

It is no inconfiderable ftep in favour of fcience, to bring ourfelves to doubt of the reality of fome facts advanced for truth, not only by the ancients, as from their own knowledge, but by fome moderns alfo, in fpite of the celebrity of their names. And, perhaps, Mr. Baker's fcheme for the improvement of learning, to burn 50,000 books yearly, till

5

till two or three only, and those the best in each science, were left, was by no means so whimsical.

One notable attempt, indeed, at improvement, entertained the world for fome time, and raifed the expectations of the public to a great pitch; that the most inveterate diftempers might be cured in an hour, by nothing more than decanting the impure blood of the deceased out of one of his arms, and receiving into the other a like quantity of pure blood from a healthy perfon. Our philosophical transactions soon swarmed with well attefted cafes of the fuccefs of this transfusion in different parts of the world, in various diftempers, and in different animals. And by the acrimony of the difputes between the English and the French virtuofi, concerning the priority of their right to the invention, one would have imagined all was thus happily attained that could be defired ; and that the art of phyfic had arrived to its acme of perfection, without calling in the further aid of pills, bolufes, or juleps. But whether it was, that the

B 3

learned.

6

learned, jealous of each other's claim to the glory, took pet and gave over profecuting it with the ardour they had begun with, or whatever was the caufe, the project unfortunately died away, and we have heard of no more cures performed by it from that time to the prefent. Had it fucceeded, as the temper of no man is fo perfect as to admit of no poffible melioration, great things might have been expected from a little dash of blood of another disposition, in various cafes; for example, who knows but that a pound or two of the blood of an English mastiff transfuled into the veins of a fribble officer might remove the paleness from his face, keep his knees from trembling, and enable him to face in battle the fiercest Sans culotte ?

The moderns have affuredly but little right to condemn the ancients for their ridiculous farrago of medicines, while album græcum, peacocks dung, fheeps cuttles, and ftonehorfe dung, continue to be celebrated medicines in our times. Is it not a moft difguftful thing to cram a fick ftomach with a load

a load of the filthieft things in nature, while chemiftry affords us medicines of fimilar but fuperior virtues in dofes of a few grains only? A few grains of fal ammoniac in folution being to the fame intentions a more efficacious and a cleanlier medicine than a quart of the infufion of ftonehorfe dung, though fufficient care had been taken that the dung was dropped in the cleaneft napkin.

Of late, many wheel-barrows full of herbs, roots, barks, weeds, &c. &c. have been thrown out; yet many more are ftill retained in practice that ought to have accompanied them. And it bears hard upon the fagacity of the ancients, that the boafted effects of their Conf. Fracastoril, and their other farrago of Philonium Romanum in diarrhæas, are now supposed to be chiefly owing to one of their ingredients only, the opium. In a complicated formula, fuch as that fweeping of the fhops called Mithridate, and the like, it would puzzle a phyfician to difcover how much each ingredient contributes to the cure, and an accomptant, how much of each there is in a given dofe. Im-

7

provements,

8

provements, indeed, have of late been made in the claffing and diferiminating different plants, &c. but if we ftop here, without inveftigating the certain peculiar virtue of each, we do the art of healing no more fervice than the virtuofi do, who clafs fpiders, butterflies, and fhells.

This tafk has, indeed, fome years ago been undertaken by a foreigner, who, having a genius for chemistry, fancied that fire and different menftruums in chemical proceffes would analyfe and difcover their vir-But unhappily in those experiments, tues. as in the torture of the human fubjects by the Inquisition, it is well known that feveral of them were forced to confess fome things, of which they were never guilty. A young Scotch phyfician is faid to have loft his life in tampering with his own conflitution, by fwallowing different medicines, to observe their effects upon him in their largeft dofes. This was undoubtedly a more accurate mode of discovering the effects of many subjects upon the human conflitution than the foregoing; though against this it may be justly observed,

observed, that medicines may have a very different effect on a difeafed from what they may have on a healthy ftomach; and that a phyfician may in many diftempers, even when he has happened to be fuccefsful, find it a very arduous tafk to difcover how much an approved medicine, and how much the vis medicatrix itfelf, may have contributed to the cure; which confideration may in fome measure help us to account how fome medicines have been dethroned in one century, which had overruled every objection in a former, and the probability of their recovering their reputation again in a fubfequent one. Far be it from me to doubt the integrity of that Spanish physician in boafting of his fuccess, upon the first importation of potatoes into his country, from his having ventured to give fix grains of it three times a day in a dangerous fever, which he cautioully at length raifed to ten grains. All his error lay poffibly in his claiming to himfelf and his medicine the whole merit of the cure ; though, if Hypocrites had been the judge, he would have allotted, in all probability,

probability, the greateft fhare of it, if not the whole, to the vis medicatrix, change of weather, or many other unheeded caufes; not that I would derogate from any good qualities of the potatoe; for after this drug came to be better known in Ireland, it was found to be a fpecific for that grievous diforder of the ftomach, which the poor of that kingdom are fo fubject to, called hunger; when exhibited in the dofe of a pipkin-full roafted; and that too after the vis medicatrix had failed.

Even fuppofing the virtue of a drug well known, and a true indication of cure formed; much ftill muft depend upon an exact knowledge of the dofe neceffary to anfwer the wifhed-for defign. Were a man, when his houfe is on fire, to keep throwing water on it by cup fulls, though he be right in his indication, and applies the appropriated remedy, yet being under-dofed, little good can be expected from it. Many have fuffered their conflitutions to be ruined, though they had for months in intermitents taken bark in ineffectual dofes, who might have been faved

II

faved by taking an ounce or more daily. In fhort, it is a knowledge of the animal œconomy, from a knowledge of the anatomy of the feveral parts of the body, with their feveral functions, and dependance upon each other; together with a watchful and conftant obfervation, and due confideration of all the fymptoms of the fick, affifted with accurate well drawn hiftories of difeafes and their cures, drawn up by phyficians of judgment and probity, and no boafters of their own fkill, the fin that is faid fo eafily to befet us all, that muft lay the only fure foundation for a phyfician's knowledge *what* to do, and *how* to do it.

The fudden cures in various cafes I faw performed, fome years ago behind the Royal Exchange, by the much celebrated doctor of those days, on numbers of poor people, who, as they faid, came up from the remotest parts of the country, whose ailments were pronounced incurable in feveral hospitals, stupified me with utter astonishment, till I fortunately fell in company with a furgeon, who had been employed by him in

in the chirurgical cafes at Pimlico; who affured me, that those wretches I had seen, were by way of decoy ducks, hired alternately to attend there and near the horseguards twice a week, at half-a-crown a piece, to pretend to be cured of such diseases as they were instructed to personify; and that the better dressed to personify; and that the better dressed people that came in coaches, and were shewn occasionally as private patients up stairs, were hired at a crown each, exclusive of the coach.

A well written book, of a variety of well attefted cafes of cures by Dr. Graham, by his Magnetical Electrical Celeftial apparatus only, had a fimilar effect upon me, till, by his becoming religious, he very honeftly confeffed that it was all an impofition.

Thefe inftances, as I had naturally a narrow fwallow, and being no Roman Catholic, have not been in the habit of crediting marvels, have given me an utter difrelifh for marvellous cures performed, even by men of eminence, though attefted alfo by men in high flations; infomuch that I find

find great difficulty in giving implicit credit to Sir Kenelm Digby's wonderful fuccefs from his fympathetic powder, though attefted by his friend the great Lord Herbert of Cherbury; which, by being only fimply rubbed on the fword, which gave the wound, cured the dueller whofe body it had run through, without the painful probings and dreffings of a furgeon, or the leaft confinement. I have also a great backwardness in giving credit to Greatorex's cures, and the French impostures of animal magnetism. As for that beautiful experiment, in proof I suppose of his doctrine, that blood has life in itfelf, which John Hunter contrived, equal to any of Talicotius's, of transferring a cock's fpur from his leg to his head, and making it grow there; I am fure I have no reafon to object to it, as I won a wager that it was not true, which a gentleman paid me freely, upon its having been omitted in a subsequent edition of the quarto Treatife on Teeth. Though the transplantation of a cock's fpur, when fuccefsful, appears not to be attended with fufficient advantage

TS

vantage to encourage the practice; that most ingenious experiment, recorded in the Berlin Medical Memoirs for the year 1778, of hatching chickens in forty-eight hours by electricity, not only faves the poor hen nineteen days painful attention, but might turn out a most beneficial article in trade, and reduce the price of poultry, which is at prefent enormous, if it fucceeded here.

Notwithstanding the above strictures, as I myself have a propensity to a little whimficality, I am ill-disposed to sneer at any medical *jeux d'esprit*; though they may happen not always strictly to answer the ardent wishes of their projectors; from a conviction that the laugh of the unlearned at a first project may at times have proved detrimental to science, by so cramping a man of genius in his ardour for improvements, as to intimidate him from making a fecond attempt, who with a little encouragement might have succeeded better in subsequent trials.

Under this predicament, as fimple a fcheme as any was that of the celebrated Leuenhoek,

15

Leuenhoek, planned for the prefervation of his own health, who had fuch remarkably good eyes, and was fo much accuftomed to make microscopical observations, that he difcovered the fmall veffels or pores through which infenfible perspiration is carried on, which open fideways under the cuticle, of fuch minuteness that 100,000 of them might be covered, he affures us, by a fingle grain of fand; yet his apparatus did not coft him a penny, being a fingle microfcope made by holding a fmall glafs wire in the flame of a candle, till it melted into a little round globe, which he afterwards placed in a hole made to fit it by a pin in a thin bit of flick. With this he was enabled to make greater difcoveries than any fubfequent philofophers with their very coftly microfcopes, which, though they magnified, darkened the object at the fame time.

He pricked the back of his hand with a pin, when in perfect health, for a drop of blood, which he carefully infpected through his microscope; the exact confistence of which he noted down, to ferve for a ftandard

ftandard in a scale to measure any future aberrations from, upon the access of any future illnefs. Thus prepared, when for example, he found it neceffary upon the approach of fome diforder, to infpect the state of his blood, he pricked his hand as before for a drop, which he carefully compared with the note of his former flandard, from which he formed his indication of cure. If he found that the crassamentum exceeded in its proportion, he lived pretty much upon weak flops, tea, weak coffee, lemonade, imperial, and the like; and, on the contrary, when he observed an excess in the ferum, he thickened it by drinking a decoction of Peruvian bark, and a glafs of Port now and then. And I make no doubt, had the virtues of Prieftley's airs been discovered in his time, but that Mynheer, towards the completion of his scheme, by a careful and judicious observation of the blood's colour alfo, and its variation in different diforders, would have added to his Pharmacopœia, the three articles of Azotic, Hydrogene, and Oxygene airs, to remedy all its aberrations

in

in that respect also; for example, if (as it is natural to suppose in a torpid Dutch habit) the blood should happen to exhibit too much of a dark foorbutic red, he would only have had to so fulff up a few nostrils-full, now and then, of Oxygene air, to quicken the circulation, and give it a beautiful pink. If, on the other hand, it appeared too pinkey and florid, he would only have had to lower it with quant. fuff. of Azotic or Hydrogene, till it should be reduced to its natural healthy standard, crimfon.

Notwithftanding truths have been faid to depend upon each other by a continued chain; regularity and connexion cannot be expected to flow from error and confusion; nonfense being, as it were, an independent principle, standing upon its own bottom; that of each person being his own *planta fui* generis, unlike any other man's; no regularity seems to be required in my tumbling out a catalogue of those Vulgar Medical Errors, just as they present themselves to my memory.

C

18

As I may, as I proceed, have occasion to make use of the term *Non-naturals*, so frequently made use of by medical writers, it may not here be improper to begin with it, by observing, that it is a most palpable catachrefis, and made to convey an idea directly the reverse of its natural import.

Another abfurdity I fhall take notice of is, that wherever a phyfician happens to dine in a family, he is generally afked by the company, whether this or that difh be wholefome; or, it may be, which of fome two is wholefomeft : for example, perhaps ftrawberries and cream, or mock turtle dreffed in high gout, with its full accompaniment of acrid poignant force-meat, combuftibled and well be-deviled with pepper, ginger, cayenne, falt, muftard, horfe-radifh, and fundry pickles, aromatics, and Indian provocatives.

To anfwer this queftion, without his perufing the cafe of the eater accurately drawn up, is beyond the fkill of any phyfician. Quite as rational a queftion to a wide dealing merchant, who has a variety of fhips at fea,

fea, would be, which wind he reckons beft; without fpecifying to what particular fhip, and its voyage. This laft queftion reminds me of the egregious abfurdity of fome of our former adulating poets, who (becaufe the Romans, for the purpole of its cooling their fcorched air, were in the conftant habit of invoking their favourite Favonius) were wont to pray for gentle zephyrs to waft over our Georges from Hanover; not forefeeing, were their prayers heard, that it would prove a wind in their teeth.

It may not here be amifs to obferve, that in our diet one kind of food is fuppofed to be diuretic, another cathartic, or the like ;—fo far from this, our aliment in general is, or ought to be, fo bland, mild, and inert, (if one particular fort be not perfevered in for a confiderable time,) as to caufe no remarkable alteration whatever; for were it to do fo, it would quite, by becoming a medicine, fubvert its ufe and defign as aliment, and prove extremely deftructive.

C 2

That

That a physician just called to a patient ought, as soon as he comes down stairs, to inform the family of the name of the distemper.

This, in which the credit of the apothecary is greatly involved, who from his earlier attendance, may poffibly have been rafh enough to give it fome name, may not unfrequently happen to be a very difficult queftion; till the doctor has had fufficient time to difcover it by a most fedulous attention to its various, and poffibly complicated appearances. And it may not unfrequently happen, even after the determination of the diforder, that he may never be able to bring all its variations to answer exactly to any fpecies the very fancifully inventive clafsmaker may have eftablished. How much, for example, would one be to be pitied, whofe reputation, when defired to look at a fore eye, were to be effimated, and depend upon his being able to fpecify identically which of old Chevalier Taylor's 134 diforders of the eye, as delivered in his Lectures, the prefent was ; many of them, probably,

28

as difficult to difcriminate as any of Captain Cook's newly difcovered rocks and headlands. Moreover, if the diftemper be a fever, how often are fevers, which in their accefs are inflamatory, found to become in their progrefs nervous; or putrid intermit. tents to become remittent or continual: and vice verfa? fo that like the man's account of the wind at Maker's Tower, the phyfician's account may daily fhift and vary. And indeed, after all is over, precifely to diftinguish between the peculiar symptoms of the diforder, and those probably owing to the medicines made use of, is no very eafy matter; for the putrid water, for example, and corrupted juices difcharged by ftool in any illnefs where fcammony has been much used, is by no means a proof of the previous existence of those humours; for fcammony given to the healthieft perfon will diffolve the blood into a putrid water, and wafte the whole body by its repeated ufe; the healthy juices being first corrupted by the virulency of the medicine, and then discharged.

Lecture-

21

c 3

22

Lecture-reading class-makers often find great trouble (fo there is in fplitting a hair) in those distinctions without a difference they make in their minute divisions and fubdivisions of fevers; with the view, probably, of appearing fapient to their pupils, rather than any real use they can possibly tend to. Probably the truth may lie between thefe, and a late writer, who, with an ingenuous unaffuming diffidence, ventures to prove, that of fevers there exifts but one fort only; attributing all the variations in their fymptoms to the different Idiofyncrafies of patients, seafons, treatment, &c. &c. And what ftrengthens this gentleman's opinion not a little is the known fact, that two people never had exactly the fame fymptoms in any fever. Mere speculation, indeed, feldom does any good in phyfic, or even in philosophy or divinity; had a learned Prelate, whofe business only it was to prove to us the reality of the demoniac miracle, faved himfelf the needlefs pains he took to puzzle himfelf and his readers, in calculating to a fcrupulous nicety the number of devils and halfhalf-devils allotted to each pig; our belief, taking the whole in the lump, as the infpired Apoftle relates it, would have been equally ftrong, and the Bishop would have escaped much derision.

There are very few vifitors of the fick who do not kindly prefs the infirm perfon, though attended perhaps by a phyfician or two of great fkill, to make a trial, in preference to his prefent medicines, of fome very innocent thing; which, from their own knowledge, they affert has been of the greateft benefit in juft fuch a fimilar cafe.

The first mistake of the busy interfering lady or gentleman may be, (and a very dangerous one it is,) in the *fimilarity* of the cafe. A fecond may be, that this innocent thing, except it be purely an article of food, can be of any use at all; none of our choicest medicines being innocent things when improperly applied. To a person of a tender face who must be shaved, can it be any recommendation of a razor, that it is as innocent as a lath, which can never be too keen in the hands of persons well skilled in its

c4

manage-

24

management? And if by an innocent thing be meant a medicine flow and weak in its operation; is it certain that the diforder may not gain a march upon it, by this trifling procraftination, and great lofs of time; and this innocent noftrum be thus actually converted into a poifonous one, for in many cases non progredi est regredi? Another error may poffibly be, that the art of phyfic is either univerfally innate in mankind; or, at least, is fo very eafily attainable, that fcarcely any body is ignorant of it, except phyficians themfelves. If fo, what incorrigibly egregious dunces must the regularly educated phyficians be, who, after the best classic education, study physic in each of its numerous branches with every advantage for many years at Oxford or Cambridge, completing the whole with a year's attendance upon the most reputable professors and hospitals in London; if after all they are not supposed to be even upon a par with the generality of other people, who pretend not to have profited by any of those advantages.

25

To confess the truth, our brethren the Urine Prophets, and Animal Magnetifers, shew abundantly more good fense than any of us; as, without the least expense, they create themselves Doctors by inspiration; without pretending the least affistance from learning, or its equal substitute a Scotch *diploma*. And as long as the fools in this credulous nation continue fo greatly to outnumber the wise, they will never fail of getting into very lucrative practice, and rapidly making their fortunes.

As government at prefent perfectly acquiefces with any perfons practifing phyfic, who can find people weak enough, and willing, to be practifed upon; Oxford feems to have no great defire to concern herfelf much in the matter, Divinity and the Civil Law being her ftaple commodities. The thing which affects her intereft most is her young fifter Cambridge opening a private bridle road, to the left of the old turnpike one, to let in country curates, and underfell to them Bachelor in Divinity degrees; without keeping terms, and without any previous

previous examination into, or knowledge of, their learning. Had Oxford been politic enough to have elected Mr. Pitt for one of its reprefentatives, he might probably, in return for that honour, have befriended her by inferting a claufe in his act againft fmuggling, againft fo clandeftine a practice, fo injurious to the fair trader, the elder *Alma Mater*. As matters now ftand, I know not what my much respected old nurfe can do better than to open a fimilar poftern wicket, and, like play-houses, after the third act, let in country customers at half-price.

That every man is the best judge of his own constitution.

This is no farther true than that he knows what agrees with him beft in health; as to every thing elfe, when illnefs comes on, the phyfician is the most competent judge.

That in the constitution of Britons most diforders proceed from a scorbutic taint in the blood.

This notion may poffibly have had its rife originally from the itch; and the frequent

frequent appearances of leprous, ferpiginous, tetterous foulneffes of the fkin, and various other eruptions, fo frequent among us; on which the ingenuity of our clafs-makers have not hitherto been able to beftow fufficiently difcriminating names. The fcurvy being a diftemper chiefly confined to failors, or perfons flut up in garrifons, of inactive life; under the want alfo of fubacid, cooling vegetables, and wholefome air; which, after difcovering itfelf firft in ulcerated gums, is of fuch notoriety as not to be miftaken.

That the itch is a diforder of the blood, which requires for its perfect cure a proper regimen, bleeding, purging, and a long courfe of fweetners of the blood, as fome particular medicines are very fancifully called ; and that in Scotland, invidioufly faid to be its native country, it was begotten by the oatmeal diet on which the poor lived.

Whatever ignorant or defigning practitioners may Tay, or make of it, it is no more a diforder of the blood, than moles are a diforder

28

order of a meadow, which they grub up; but is occafioned, as may most evidently appear by ocular demonstration, by little animals of the acori species, which dig, bite, and burrow into the fkin, and therein deposit their ovula in pustules, for the propagation of their species; which form ulcers and fcabs, of horrid appearance when of many years flanding. Agreeable to this account, all applications whatever, which have been known to deftroy all other fmall vermin or infects, are found to answer here alfo. This filthy defædator of the fkin begins of late to be held in proper deteftation, even amongst the poor ; whereas in former times, as it was not a painful diforder, old women never thought of curing it in children, efteeming it a fign of health ; as,' according to their doctrine, it threw out, and cleanfed the blood of its groß fcorbutic humours.

This old ftandard of the blood, the fcurvy, has of late been univerfally fuperfeded by another, though often indeed with as little foundation as itself, viz. a bilious habit; the most fashionable diforder at prefent, and which

which fupplies Bath with the greatest number of its invalids; the chief proof of its existence, and a very slender one it is, is derived from bile's having been accidentally thrown up upon ridding one's ftomach of fomething difagreeable to it; or after a fmart emetic, which must necessarily happen. As if bile, as ufeful and neceffary a fluid as any in the whole animal œconomy, were a preternatural destructive recrement, from whose existence a numerous train of bowel complaints, fevers, &c. are fancied to originate. I have reafon to believe that, in general, most of those cases denominated bilious fevers from vomitings of bile, and a yellowish fuffusion of the eyes and countenance, do not arife from a fuperabundant fecretion of the bile, and its activity upon the conflitution, after its having been reabforbed into the circulation, but that these fymptoms should oftentimes be attributed rather to the texture of the blood being broken down from a putrefcency in the fluids; for it is a well known fact that the bile may be returned into the blood, as in a jaundice,

30

jaundice, without producing any febrile fymptoms whatever. Sydenham thinks those pains in the scrobiculus cordis, and those violent vomitings by which herbaceous coloured matter is thrown up, to be fymptoms of the hysteric colic; caused, he thinks, by a violent impulse of the spirits crouded together in those parts, causing pain, a convulfion, and a total fubverfion of all the faculties; and fays that we fhould not immediately conclude that the difease refides in the humours upon account of their green colour, or is owing to the acrimony of fome humours which require to be rooted out by emetics and purgatives; for fea-ficknefs, from the agitation of the animal spirits alone, in a boifterous sea, causes porraceous vomitings in perfons in perfect health ; and it is notorious, that whenever this green matter appears it is always increased, instead of being cured, by the frequent use of cathartics and emetics; because by both the confusion of the spirits is augmented.

Boerhaave fuppofed that a jaundice proceeds only from obstructions in the vena portarum,

portarum, and the liver; in which cafe the blood, mixing with the reft of the blood in the heart, without fecreting out of it any bile, caufes a jaundice.

So far from this being the only caufe of the jaundice, I believe it hardly ever is; for the liver has frequently been found inflamed, obstructed, and even schirrous, and almost entirely destroyed, without any jaundice. The true caufe of a jaundice feems to originate in an obstruction of the biliary ducts, or in the ductus communis choledochus; from any caufe forcing the bile, already fecreted, to regurgitate, and to be refunded again into the blood. A tumour of the liver may indeed, by its compreffing together these ducts, cause a jaundice; as we alfo often obferve to happen to children a day or two old, from the meconium's ftopping up this duct.

That Abracadabra written on a piece of paper, and worn on the stomach, will in a few days effectually cure a jaundice.

When the jaundice has been caufed by grumous concretions of bile ftopping up its paffage

32

paffage from the gall bladder; the bile, by filling the bladder, may, after a little time, by its diffension, force out the stone that stopped it, and thus give *Abracadabra* the credit of the cure.

That icterical perfons fee every thing yellow.

Though it be a common poetical allufion to fee things with a jaundiced eye; and though this circumftance enters into the great Sydenham's definition of this diftemper; I have feen numerous patients icterical to the greateft degree, yet never knew one who did not fee objects in their natural colour.

That the air furrounding a house infected with the plague has been, in some cases, so contaminated, that birds, in their flight over it, have dropped down dead.

This is not true; it being of late a well afcertained fact, that no infection can be communicated from even an infected perfon without touching him, or fomething which

which he has touched. Farther knowledge than this, either as to its nature or a fuccefsful mode of treating it, has not, I believe, been acquired much more in this, than in the last century; the only chance we had of acquiring any has been loft by the ever to be lamented death of the most benevolent Mr. Howard, and the confequent unaccountable theft of his papers. What puzzles our inquiries very much is a fact, well attefted by modern travellers of reputation, that the plague at Grand Cairo, after its most dreadful ravages, has been constantly known to ceafe totally upon one and the fame particular day annually; after which no person ill of it dies, nor is any one after that day infected by it.

Many hypotheses have been offered by authors to account for the cause of the plague. One fancies that it proceeds from very minute *animalculæ* floating in the air. Another, in an ingenious treatife on unheeded causes, supposes it to proceed from deleterious effluvia arising from orpiment, or perhaps some unknown minerals; assuring

2

us

34

us that it never appears in a country of Cinnabar Veins, though every where around it. And that it cannot be owing to the heat of the climate, and animal putrefcency; as it has never, even after vaft heaps of unburied carcaffes after battles, been known in the Eaft Indies, China, Japan, Batavia, in the land of Negroes, or in the Weft Indies. And that in countries which have been vifited by it, it has been known to come on upon a cold north wind : to this hypothefis Dr. Dover's great fuccefs in profufe bleeding in it, is not a little favourable; which militates againft the notion of its being a putrid fever.

That horse exercise must be improper for invalids, from a condemning observation of Hypocrates, that it brought on swollen legs.

In his time and country, before fiirrups were invented, their legs might have been fubject to fwell, from their unfupported dependent pofture; and invalids were deterred from the use of it, by the difficulty they 10 experienced

experienced in getting on horfeback, which it is believed was by vaulting.

That digestion is performed in the stomach.

I think the ftomach is principally defigned for a repofitory for our food, that we might not be always under a conftant neceffity of eating; and that the fmall inteffines contribute the moft towards digeftion; becaufe being fmaller than the ftomach, and narrower, they can act upon fmaller quantities of food at a time, and have moreover the affiftance of the bile, pancreatic juice, &c.

That vomiting is caused by the contraction and action of the muscular coat of the stomach.

Upon a dog's being opened while in the act of vomiting, it appeared that the ftomach itfelf was quiefcent, and only compressed by the action of the diaphragm upon it, together with the muscles of the abdomen, and its contents.

That

36

That purging medicines act only on the primæ viæ by their irritation.

The contrary of this feems to be proved by children's being purged by the milk of their nurfes, who have taken phyfic; from hellebore bringing on a purging when only applied externally in an iffue; and from a poultice of tobacco laid to the region of the ftomach, caufing -a vomiting. It is alfo well known, that purgatives, even of the moft powerful kind, by being exhibited in fuitable fmall dofes, in conjunction with mild apperients, may be introduced into the habit fo as to become notable deobftruents, diuretics, and diaphoretics, without acting fenfibly by ftool.

That the colon is the feat of colics.

I rather think that the *duodenum* moft generally is, from its being laxer, wider, thinner, and weaker, for want of the *peritoneum*; and becaufe its curvature and depending pofition afford the food a greater *remora*; fo that any morbid change in the *ingefta*, upon their mixture here with the bile,

bils, must have the greater effect upon it, before it comes to be taken up by the *lacteals* in the *colon*.

That an infusion of carduus, chamomile, mustard, or horse-radish, is necessary to work off an emetic draught.

This is a curious contrivance to render an operation, of itfelf fufficiently difagreeable, ten times more fo. If intended to affift the emetic virtue of the draught, of itfelf too weak, why was it not prefcribed of ftrength fufficient; or, after Tiffot's manner, gradually augmented, fo as to require no other affistance than a little hot water, with fome honey added to it occafionally, purely with the defign only to eafe the ftomach in the act? Surely those infusions cannot be expected to act as ftomachics, when they are not meant to lie on the ftomach for half a minute. In working off a vomit it is very dangerous to drink very large quantities of warm weak liquors, for by over filling the ftomach, the orifice of the cardia may be fo preffed clofe together as, inftead of open-

D 3

ing it, to rupture it, which caufed the death of Baron Waffener. Indeed, in many cafes, dry vitriolic vomits, which, with much propriety, may be called *throat vomits*, are found of greater fervice; after which no liquids at all must be drunk, left they carry them down, and convert them into purgatives, which in fome cafes would counteract the intention.

That emetics must be burtful to persons of weak and delicate constitutions.

So much otherwife, that fea voyages have been recommended to fuch with great fuccefs; principally upon the account of the conftant vomitings generally attendant on fea-ficknefs; in the administration of whofe emetics our brother Neptune has in general feldom been accufed of over tendernefs towards his patients. Yet it is a well known fact, that many of the verieft invalids, after daily vomitings at fea for a month or fix weeks together, have been reftored to a degree of health, alacrity, and spirits, unfelt for years before. It is also well known, that medical vulCar errors refuted. 39 that Hypocrates had emetics in fuch good efteem that he recommended their frequent use to perfons in full health.

That when five or fix grains of Emetic Tartar, or three or four scruples of Ipecac. fail to turn the stomach, it is a proof that it is strong and healthy.

It rather argues an infenfible over relaxed ftate of it, which threatens the approach of fome paralytic affection. Not but that children indeed, whofe ftomachs are defended from irritation by an abundant, thick, tenacious, glutinous phlegm, require a dofe much fmarter than, calculating from their age only, could be expected.

That it is necessary to drink plentifully of water-gruel, or some warm diluting liquor, to assist the operation of a purging draught.

The palpable error here is using that as a mean for promoting its operation, which has a tendency on the contrary to weaken it. When in dropsies a very quick smart-D 4 purge

purge is intended, care should be taken to forbid the patient drinking any thing which may dilute away its ftrength. What, in my opinion, may have given the first rife to this practice, must have been an attempt, by a great rush of some mild warm liquor, to diffolve and diflodge fuch hard aloetic pills, or fubftances of an acrid, infoluble, adhæfive quality ; which, by flicking faft to fome part_ of an inteffine, like shoe-maker's wax, may have caufed violent painful gripings by their inflaming, fretting, and penetrating the part. This mode of relieving the patient not having been clearly understood, as to its operation, has continued to be fashionable, gripe or not gripe; even when the caufe requiring it did not exist; as in Glaubers falt, or any other fo foluble and mifcible with the gastric, and enteric liquors it had to meet with in the prima via.

I will rifk my reputation in being the firft perfon that ever fet his face againft a very great abfurdity, which has hitherto never been fulpected of being fuch, viz. an abfolute neceffity of a very ftrict regimen, and

and making a wonderful fuls about confinement to one's warm room, and clothing one's felf much warmer than ufual, on the day a purge is taken. Whereas (mercurials alone excepted, whofe nature it is to be determined by cold weather with violence upon the glands of the throat) I affirm, that a perfon living, and clothed as ufual only, is much lefs liable to take cold, and to fuffer from it, than upon any other days.

I have twenty times fwam in the Ifis, and fo have many others, on the afternoons of thofe days, on the forenoons of which we had taken an ounce or two of Glauber's falt in *Holy-well* water. And in a courfe of fea-bathing, I have often directed many, after purging in a morning with fea-water, to bathe in it on the evening of the fame day. The reafon why no harm can poffibly happen from this practice I conceive to be this; that Nature never at the fame time works by directly contrary ways; never plays faft and loofe; never opens the perfpiratory and fudatory veffels, and clofes them alfo at the fame time.

As

As the purge, by its action upon the intestinal glands, and those of the stomach, and upon all the neighbouring veffels, (as also upon that univerfally pervading Lymph, the existence of which Le Cat fays he has discovered,) brings a flux of humours into the intestinal canal; cold, by its conftringing all the veffels of the external furface of the body, would most evidently tend rather to promote the flux, and operation of the purge, than check and impede it. And, perfectly agreeable to my doctrine, we find that warm diaphoretics, which, by a copious fweat, determine and throw out the acrid humours from the intestines in violent dysenteries upon the external parts, become the most efficacious medicines of any; per contra alfo, in the most dangerous constipations, when no art or medicine has been able to loofen the bowels and procure a motion, fetting the patient to fland naked upon a cold marble hearth, and dashing cold water by pail-fulls against his abdomen, has often most happily fucceeded; and to the admiration of his friends

43

friends inatched him as it were from the very jaws of death.

That delicate perfons of inactive fedentary lives ought to take fome laxative medicine every other night at farthest, to prevent costiveness.

In nineteen out of twenty cafes, of perfons who are in the conftant habit of taking opening medicines, the patients, like Don Quixote, first create the giant, and then combat him; the coffiveness being probably ideal only; for as the inteffines, if drawn out of their folds, are about forty feet long in adults, and the periftaltic motion in fedentary and fludious perfons extremely languid, time fufficient is not allowed the fmall quantity of ingefla their weak ftomachs take in to be properly digefted, and afterwards for its recrement to travel down in its natural pace to the rectum, and by its weight and bulk therein to provoke its ejection; before their unreasonable impatience puts them upon quickening its progrefs by another purge; and this goes on for months and years

years probably, till by conftantly hurrying down their half digefted food, conftitutions, naturally good, are thus imprudently deftroyed.

The fingle chance fuch perfons have of recovering the healthy flate nature intended them, would be their arrival at length to that happy flate of defpair and refignation, fo as to leave off all medicines entirely; from a fuppofed experimental conviction, that it is beyond the power of medicine to fave them. If people will by no means reft from conftantly tampering with laxatives inflead of ufing exercife; the habit to which the French ladies are accuftomed of ufing their *lavement* every evening cannot be fo deftructive, as it irritates twelve inches only of inteffine; and fpares raking down the other thirty-nine feet.

That the weather may be too hot, or too cold, or the time of the moon not convenient for cutting hair, or corns, or paring nails, and for putting hens to lay; and that, agreeable to the cautions given in the Almanacs,

45

are

Almanacs, particular days in particular months only are proper for the operations of bleeding and taking physic.

These have all been so firmly established in the popular belief and opinion, that I should only loose my labour in endeavouring to undermine them.

That bleeding is of the greatest service in the access of fevers, as well as of most other disorders; and particularly every pring and fall, by way of prevention.

Nothing is more palpably erroneous than this doctine, even in fevers; whatever it might have been in Dr. Mead's time, I have obferved it to be a very dangerous practice ever fince. To confefs the truth, indiferiminate blood letting is the moft dangerous and moft common error in the prefent practice in general; and were the queftion put, whether mankind has, within thefe laft fifty years, received more hurt or benefit from the lancet? I am moft clearly and decidedly of the former opinion; unlefs it was done out of whim on perfons in robuft health, who

46

are lefs fubject to fuffer from any injury; upon which account fome of our Infirmaries have, by a writer of fome humour, not improperly been called *Aceldamas*, fields of blood.

Blood letting in general has undoubtedly been inftituted ninety times out of one hundred unneceffarily; and always to a proportionate reduction of the patient's ftrength; (to fay nothing of the very frequent inftances which happen of cutting an artery, or pricking a tendon;) though there are very few indeed of our prefent diforders but admit of much fafer cures by other means, and without its ill confequences. Do we not daily fee inftances of perfons getting blooded, before a phyfician is called in, and their doom thereby fixed, in fuch low putrid fevers as it would exceed the ability of the whole College afterwards to raife and fave them. In a part of the country at fome distance from me, of several hundreds, who were a few years ago afflicted with fuch a fever, not one recovered who had been blooded. And a phyfician in great practice

tice for many years, affured me that he could not recollect his having ever been called to a palfey, an apoplexy, or even to a dropfy of the brain, where the patient had not been previoufly blooded. So great has been, and univerfally is, the rage for the lancet, that, in cafe of death from either of thefe mentioned cafes after any different treatment, it would have been given out that the poor patient had been lamentably neglected, for that he had not been even blooded; the very first *fuppofed* requisite ftep towards a cure.

Are there not, even amongft practitioners, inftances of fome, who, when puzzled what to do in various cafes, rather than wait till nature clearly points out the neceffity of it, take off a cup or two under the very wife pretence of examining the blood; conceitedly giving themfelves an air, as if, forfooth, they were competent judges after they had feen it; and as if there certainly exifted a connexion between certain difeafes, and the appearance of the blood in them ?

For my own part, I confess my inability to affign the true caufe of the buff on the blood in all cafes, though it be generally thought a manifest proof of inflamation; it neverthelefs has been thought a very bad fign, when no fuch cruft has been obferved, in fome of the most violent inflamatory difeases. It is well known, that the proportion of the blood's groffer and thinner parts differs naturally in different perfons ; the red particles being more abundant and compact in firm, ftrong, laborious people ; and the reverse in those who are lax and delicate; and differently fo in different ages; and that it changes its colour and confiftence alfo during the continuance of the fame difease. Buff feeming to be nothing elfe than the pure light gluten of the blood, which takes a longer time to coagulate, by which means the red particles have an opportunity of finking to the bottom. It therefore indicates no lentor, denfity, or tenacity of the blood, as has heretofore been imagined, but rather its thinnefs. We very well know, however, that those appearances are never to be relied on, as certain

*18

certain and fure indications of the nature of . the difeafe; for the blood is often apparently found in very violent and dangerous difeafes; and the appearance of this proteus called coagulable lymph in the first cup, is no conclusive proof of an inflamed state of it, nor a reafon for taking away two or three cups more; it being fo fallacious that various other caufes, very different from inflamation, are well known to affect it ; as may at any time be obferved during the fame blood letting, by making it flow in a full ftream into a deep cup, or a shallow plate, or to trickle down along the arm. From all thefe, and various other confiderations, the very prudent phyfician is ever moft cautioufly fparing of human blood, for once let out it cannot be returned into the conflitution again. And is a fault not to be remedied. For after thus relaxing and weakening the tone of the chylopoietic inftruments, fresh aliment will not be converted into fuch good blood as it has poffibly loft, till the conflitution has had time to recover itfelf.

49

Againft

Against the doctrine I would at prefent inculcate, I know it may be very naturally urged, that if you read over the works of eminent men of former times, and the fuccefs they met with, where the lancet had been recommended ad deliquium animi; it will feem to be ill founded. In answer to this I must observe, that fince our enormous luxury, for above half a century, has fo univerfally prevailed, in foft down beds, carpeted warm chambers, in warm houfes, fophas, fpring carriages, conversion of day into night; rich high-feasoned diet, with ftimulating fauces, pickles, &c. &c.; the free use of a great variety of wines, and fpirituous liquors amongst the rich, and the habitual use amongst the poor of tea and tobacco, who, from the increased price of provisions beyond that of labour, cannot afford to live as they formerly did : a total revolution has of late happened in the conftitutions of Britons, both rich and poor, infomuch that for one inftance which now occurs of an inflamatory fever, pleurify, quinfey, or the like, with fuch a firm, tenfe, full,

51

full, elastic, strong pulse, and fuch really inflamed blood as clearly to demand the lancet, we now fee a hundred cafes of low, flow, nervous putrid fevers, and gangrenous, putrid fore-throats, and the very numerous and complicated tribe of the cold, hysterical, fpafmodic, nervous, hydropical, and paralytic diforders, &c. &c. in which bleeding would prove egregiously detrimental, and if perfifted in, most affuredly in the end fatal. If we ask, why some perfons get blooded who have no apparent malady? we fhall be told, that they are obliged to it, at stated times, for a plethora, not knowing that frequent blood-letting increases the fulness of blood; whereas the proper remedy would be abstinence and exercife.

A late author tells us, that if a finger be laid on the pulfe of the oppofite wrift to that a perfon is bled in, and the pulfe be obferved to rife during the blood's running, that it is an indication to perfift in drawing blood; but if it fhould flag, to defift.

I think this a very vague, inconclusive proof, because, this may more naturally de-

E 2

pend

pend upon the preceding terror of the patient, or other circumftances.

That some fevers originate from a too great thickness of blood.

Though this is a very common notion, I believe it very rarely happens, if ever; for by the vis medicatrix naturæ, or mechanism of the animal occonomy, as foon as the blood attains its due degree of thicknefs, and has a tendency to proceed in the leaft degree beyond it, the exertions become either diminished or suppressed, the body attracts more moisture from the air, and the person grows thirfty, and drinks as much as is neceffary for diluting it; and, on the other hand, if water be wanting, and the thirst cannot be fatisfied, the blood, in fuch a cafe, is fo far from being thickened, that by reafon of a putrefcency begun or augmented, it is much diffolved, becomes acrid, and is with difficulty contained in the veffels.

That

53

That volatile falts promote putrefaction in fevers.

So far otherwife, Sir John Pringle's Experiments prove them to be very ftrong antifeptics; and fixed alcalies are well known to preferve animal fubftances for years.

That a violent stitch, as it is called, or pain in the side, absolutely requires the lancet, as it must originate in an obstruction and inflamation of the part.

When it happens from a little cold taken, or fome error in diet, to thin weakly perfons, without a fever, it is more likely to proceed from wind or fpafms.

That bleeding weakly, fickly, low-spirited, breeding women, apprehensive of a miscarriage, is the safest mode of preventing it.

Hypocrates's opinion, that bleeding fuch women is dangerous, I cannot fubfcribe to, though it might have been always fo in his warm climate; but that it is here always

E 3

prejudicial,

54

prejudicial, and a very ready mean of bringe ing on a mifcarriage, inftead of preventing it, I am very certain, from careful obfervation in innumerable inftances.

Blood letting, in this cafe, feems to be the refult of a very ill founded opinion, that a pregnant woman becomes, from pregnancy alone, gradually fo much fuller of blood, as abfolutely to require it. Whereas, provided fhe is an early rifer, and uses all the exercife she had before been accustomed to, without ever indulging herfelf in any refpect whatever; her emaciated arms, meagre funken vifage, and fharp nofe, will foon most evidently demonstrate the contrary to any perfon who only makes use of his fenses, and whose understanding has not been perverted by any ill founded hypothefis. Uneafinefs, indeed, and new fenfations, must naturally come on, in proportion to the diftention of the uterus, and its gently gradual preffure upon the bowels; which, on a first pregnancy particularly, are apt to alarm the timid and low-fpirited; but these fymptoms, if they at any time become

55

become a little troublesome, will be very eafily and pleafantly removed by a very gentle laxative, or when requifite a gentle opiate.

That parturition, or child-birth, is a dangerous distemper.

By no means: not one in five hundred having occafion to call in obftetric affiftance; and when neceffary, it was in old times when the world was peopled as well as it is at prefent, by female midwives only. Though it be a part of a woman's curfe, that in forrow the shall bring forth children, God furely never intended that a woman fhould naturally incur a dangerous illnefs by every pregnancy; elfe how were mankind to increase and multiply ? or intended that a woman fhould difcontinue her ufual employment and labour, and become an useless burthen to herself and family for nine months; rather than that fhould be its natural inevitable consequence, a merciful God would most certainly have shortened the period of gestation to fo many weeks, or days only. The very pernicious tendency

dency of fuch a notion gaining credit, will most evidently appear by drawing up a cafe, and fuppofing the livelieft, healthieft, modeft, young, newly married country lady of fortune to have reason to believe herself in a state of pregnancy; the moment this comes to the knowledge of the wife good people, both male and female, of her own and hufband's family, they find it immediately neceffary to join in conclave, as they all understand physic, to draw up inftructions for her : what she is to eat, what not to eat; what fhe is to do, and what fhe is not to do; this is improper weather for her to leave her chamber, that to continue, in it; binding up the whole with their united most earnest request by all means to. take every poffible care of herfelf and the babe, upon whom hang the hopes of both the families; fo that by the long catalogue of ftatutes now enacted, and her dread of difobliging her kind friends by tranfgreffing any one of them, by commission or omisfion, she becomes a miserable close state prisoner to all intents and purposes.

56

Her

Her appetite, for the first month or two, may not, peradventure, be yet much impaired; and her strict conformity to these new regulations, and a difuse of all her former excursions, diversions, exercises, and employments, may now begin to beget in her a plethora, in fpite of the natural tendency of her pregnancy to the contrary ; and caufe her to grow torpid, liftlefs, and indolent, and gradually to loofe her former refreshing night's fleep, which fhe endeavours to make up for by an indulgence of fix hours in the morning; and to be troubled with coffivenefs, flatulency, and a general hypochondriacal uneafiness she never felt before. By way of fecurity from a mifcarriage, blood letting is now agreed upon by the whole board to have become abfolutely neceffary, without a fingle diffentient voice but her own; to conform, however, to an endearing fond hufband's most preffing folicitations, fhe at length with infinite fears, apprehenfions, and reluctance, having probably never been bled before, fubmits.

Terrified

58

Terrified at the apparatus, it is likely that her pulse finks, and possibly till a fecond, and it may be a third incifion is made, not a drop of blood comes, and when it comes, fhe perhaps, falls into a fit; for which, ftimulating volatile drops are poured down to burn her throat and revive her. In a month's time the plethora, evidently increased by the former bleeding, which probably for greater fecurity was made a copious one, affifted by a perseverance in the foregoing regimen, gradually improved in its degree of ftrictnefs, as the danger is now fuppofed more urgent, now demands a repetition of the lancet; and fo on, toties quoties, at fhort intervals, till she becomes fickly, pale, bloated, languid, and, in her latter months, fo unwieldy that the very leaft exercise, in ever fo 'gentle a degree, becomes more overcoming, than, with her now broken fpirits fhe is able to undertake.

In the fifth or laft act, a general council is once more held, at the breaking up of which it is finally concluded upon, as, notwithftanding all the poffible care taken of her, fhe

59

the most unaccountably happens to be for fickly a breeder, though the neighbouring old midwife had been regularly inftructed in the Lying-in Hofpital, and had fuccefffully received many fcores of children, that in fo bad a cafe no expence fhould be fpared, and that she should be conveyed to London in a litter, to be delivered by a Mr. Somebody, faid to have made an improvement upon Smellie's forceps; the very mention of which, injudicioufly urged, though meant as an inducement, and as it were an anchor of hope in her worft extremity, to prevail upon her to put herfelf under his care, together with the circumftance fo very fhocking to a woman of modefty and delicacy, of fuffering any male whatever to interfere with her in the proper and peculiar province of the bona Dea ; must inceffantly prey upon her thoughts and fpirits during her whole journey, and with additional force in proportion to her nearer approach to town; fo that it would be much to be wondered at if the were not frightened, in a dream of the forceps at midnight, into an unexpected fudden

60

fudden labour at fome inn near town, and the child received by the firft chambermaid that attended to her bell; while her own maid, rendered nearly as fickly as herfelf, by her conftant watchings and unremitted attendance on her, fuddenly frightened into an hyfteric fit, lies on the floor, unable at the critical minute of affording her the leaft affiftance till all is over.

Having defcribed the young lady's cafe, let us now confider how it may be with a poor man's wife: She truly has fo much conftant employment upon her hands, and her usual hard work within doors and without to maintain her family, that the cannot afford herfelf leifure to be fick and lie by for an hour at a time; and often the pangs come on fo fuddenly, that her next neighbour's wife can hardly be called in in time to receive the child; and having neither hot-fpiced wine, nor a close hot chamber to injure herfelf by, it will not be many days before fhe is feen at the fpout washing her bed-clothes, and following her former occupation, as if nothing had happened.

How

How happens it alfo, that not one woman in a hundred (though, for fear of a difcovery, fhe may poffibly deliver herfelf alone out behind a hay-rick, on a fnowing night in January) feldom, if ever, dies of the birth of a baftard ?

Can anything be more evidently apparent than that the mind of the young lady, fed with imaginary terrors, co-operating with a most pernicious regimen and mode of treatment, converts her pregnancy into a distemper; which simple unperverted nature seems to have exempted the two other forts of women from ?

While I, however, believe pregnancy to be a procefs of nature, wherein is provided every requifite neceffary towards its perfection and completion; I am, on the other hand, far from expecting that it fhould exempt women then from fuch other diforders as may otherwife befall them; when fuch come, let them be prefcribed for. Even emetics, the coarfeft of our medicines, are found by no means hurtful when required, and judicioufly fuited to the patient's ftrength.

62

ftrength. And while I am an advocate for a pregnant woman's living as the was before used to, and following her usual occupation, laborious or otherwife, I would be strict in the prohibition of high narrow-heeled fhoes upon carpeted stairs, riding unmanageable and flumbling horfes, or feeing terrifying fights; as a tumble from the former, or feeing fome perfon rode over at a horferace, may be attended with more than ordinary bad confequences. And while I recommend exercife, of which walking is certainly the beft and fafeft, it would be abfurd to advife ladies, with the view of ftrengthening themfelves, to undertake long journies either in carriages or on foot; whofe former travels, perhaps, reached no farther than from the toilet to the church and the card-table. I am never for difcarding prudence in any; it is that counterfeit wildom which apes it, that I have fo great an averfion to.

That a gradual swelling of the abdomen, together with the appearance of milk in the

the breasts, is a proof of a woman's being with child.

Not always; for in women who were not married till they were in years, thefe appearances have been found to be caufed by wind only; which has come on gradually, and as gradually gone off.

That the umbilical rope often brings on a bernia umbilicalis.

Never when cut close to the body, as it always ought to be.

That a prolapfus uteri is owing to the relaxation of the vagina.

Not always; but fometimes to that of the *ligamenta lata*, which fuffer the *uterus* to be difplaced.

That the separation of the epidermis in a fætus, is a proof of its death.

Ruysch had seen some instances to the contrary.

That

GA

That the menses are owing to an universal plethora.

It feems more rational to fuppofe it to be owing rather to a *plethora* of the *uterus* alone; for it has been affirmed, that ten pounds of blood have been taken away without protracting the interval of the *menfes*.

Some have thought the menses influenced by the moon.

Experience proves the contrary; as they happen indifcriminately at various times, befides full and new moons.

That some women have been delivered of molas.

Ruyich, who from his very numerous diffections, and his connections and intercourfe with the most ingenious anatomists, had the best means of clearing up this point, absolutely denies the existence of molas; people having been imposed upon by different appearances of clotted blood, farcomas, or pieces of indurated placentas, which they took to be molas.

We

We hear of abortions of male and female fætus's in the third and fourth month.

Ruysch informs us, that from the great fimilarity of the parts of each fex at so early a period, no diferimination can possibly be made.

That men only are subject to bernias in the groin.

Women have often had them fallen down to the *labia pudendi*.

That when the mother first perceives the child to move, is the very time when its life commences.

Nothing furely could render this abfurdeft of all abfurdities more truly ridiculous, than the practice of former judges (the prefent, it is to be hoped, will reconfider this bufinefs), in ordering an inqueft of old women to inveftigate this matter, and to difcover whether a woman, allowed to be pregnant, be quick with child; a fact which they are as ignorant of, as of the doctrine of generation; the law, in its tendernefs, having no fcruple

in configning a woman to death, if her fatus has been healthy enough to have hitherto remained quiescent. Hawkins's words are, that a woman can have no advantage from being found with child, unless the be found quick with child. The queftion here put to thefe fagacious old women would puzzle half the Royal Society, as it involves in it another queftion, In what does life confift ? Is not an embrio of the fize of a bee, whofe blood circulates through its heart, as much a living animal, as when, by its enlarged fize and reftleffnefs, it becomes troublefome to its mother? Is not the punctum faliens, which is perceptible in an egg the fecond day of incubation, as clear a proof of the chick's life then, as nineteen days after ; when, by its piping, it gives the hen a fignal to break the shell and free it from its captivity ?

That it must shew great want of affection in a mother in the West Indies, herself and child being white, to let it be suckled by a black, if a white nurse cannot be procured; because, from the offensive smell

fmell of the negroes, their milk must in consequence have a rancid disagreeable taste.

Not at all; for it is faid, that, on the contrary, the child is found to prefer the milk of a negro upon account of its coolnefs; the bodies of negroes, as appears by the thermometer, being not fo fenfibly affected by the heat of the climate as those of whites, upon account of the profusion of oil fecreted by their fubcutaneous glands, wifely adapted to the climate they were intended for; which, by protecting in a great degree their fkins from the heat of the fun, thereby keeps their juices cooler.

However, as they are more carelefs and lefs affectionate than the whites, care ought always to be taken to oblige them to make ufe of an *arcutio* (a little machine made of a board covered with pieces of hoop, like a tilt-waggon) to place the child in bed in, to guard it from being overlaid. It is a most excellent inflitution in Florence, to compel every nurfe to the ufe of this, under pain of excommunication.

F 2

68

That infants ought to be weaned when their mother's-milk is found to curdle in their ftomachs, as will appear by their throwing it up, and by their green ftools.

This fault, attributed to women's milk, has fo little foundation in truth, that, on the contrary, it never curdles at all naturally; nor will it, we are affured, curdle if rennet were mixed with it. It is its cream only, which infants, over-fed with it, are feen fo frequently to throw up; their green ftools muft therefore proceed from fome other caufe.

That the green stools of infants proceed from the admixture of a prevailing acid with the bile, which brings on tumours and obstructions of the mefenteric glands; it being well-known that painters compose a green colour from bile and an acid.

From the obfervation, that infants, when moft fubject to green ftools, are known to look yellower than ordinary; may not this colour fome how or other proceed from obftructions of the bile, brought on by a gluey vifeid *mucus*, generated by their vifeid food;

I

69

for want of which bile to excite the periftaltic motion these tumours may arise? Bile, we are told, turns green only by an admixture of mineral acids; but never from sour milk or vegetable acids.

That nurfing children on the breast is much more natural and preferable to the Spoon.

I grant it, provided it be on its mother's milk, and the mother confine herfelf to a proper diet and regimen; but fhould the mother die, or her natural affection for her babe die, by her unfortunately becoming too fine a lady to fuckle it herfelf; (to cover which to the world, the pretence that fhe is of too weakly a conftitution is generally made use of, though, if that should be the case, perhaps no better means could be used for the recovery of it;) many confiderations, however, induce me to prefer the spoon, or the ingenious contrived inftrument to imitate the breast, before the milk of the lower fort of women; as those in

towns,

towns, and in the country alfo, fince the encampments of the militia, are liable to diforders from idle hufbands; or, by becoming with child, to give the infant what is called falt-milk; and as at their own houses they live mostly on tea, which requires dram-drinking, their milk must be far from healthy; and, indeed, if a poor woman be taken into a gentleman's family, the change from her former poor to a rich diet, never fails filling the infant with humours, not to be eradicated without the cooler milk of a fresh nurse; and the return of all the former difficulty in the choice of one. The first thing the lower fort of women in London generally do by a child, newly born, is to chuck down its throat a dram of warm gin ; the reafon one of them gave me for it was, to comfort the little beart of it upon coming into this wicked world. Surely, if gin be an antidote to the wickedness of the world, the constant drinkers of this specific must be the most orderly people in it.

That

That Earths and Boles are of the greatest use in correcting acidities in the stomachs of infants.

I think them very dangerous; for if there fhould be no acid juices in their ftomachs, thefe are apt to concrete with the mucous matter lodged there into hard indiffoluble maffes, fo as to line the ftomach with a cruft capable of obftructing the gaftric liquor's paffage into it; and alfo of clofing the orifices of the *lacteals*, fo as to obftruct the paffage of the chyle through them into the blood.

Some have endeavoured to controvert this opinion by this exception: After a folution of thefe earths well triturated, in water (wherein was no acid), had been made, and paffed through filtering paper, a portion of a whitifh earthy matter has been found, capable enough of paffing through the *latteals* into the blood. The inconclufiveness of this proof will appear by the confideration, that this *refiduum* was supplied folely from earth naturally contained in the water used, and not at all from the

F 4

earth

72

earth made use of in the experiment; for if pure water distilled had been made use of, though ever so long triturated and digested with the earth, it would have left no *refiduum* at all.

That care should be taken to lay a thick compress upon those sutures on infants heads, called fontanells; and to bind their heads tight with a strong fillet to close them together and strengthen them.

Nature has contrived two remarkable ules of these *futures*; the first, that by closing they may leffen the fize of the head, and thereby facilitate its passage at the time of its birth ; and the second, to enable them again to open gradually, and conform to the enlargement of the brain, in proportion to the child's growth. Hence it must evidently appear, that incurable head-achs must be the natural confequence from the compression the brain must suffer from such a perversion of Nature's design, by the *cranum* having been disabled from yielding to its growth.

73

That care be taken to bind down infants beads by a chin-flay to their breafts.

The reafon I have heard affigned by nurfes is, that they might not throw off their heads from their fhoulders.

Though it fufficiently guards against this most terrible difaster, it may nevertheless be attended with some inconveniencies, namely, by thus pressing the child's chin so tightly against its breast, the *æsophagus* becomes so compressed as to render its swallowing any thing almost impossible, and to cause it incessantly to spit its meat out of its mouth; while it also lays the soundation for distending and swelling the glands of the neck.

That it is very burtful to put infants very young to stand upon their legs, as it will make them crooked and bandy-legged.

By no means; dandling them well, but gently, is very neceffary towards their health; and ufing them to their feet ftrengthens their legs very much; one great caufe of rickets and bandy-legs being the keeping

keeping children too much in the cradle, and their want of due exercise and friction.

That leading-strings are an useful invention to bring on children to walk, and prevent falls.

They are exceedingly hurtful by preffing in the *fternum*, which in infants is very weak, and thereby laying the foundation of afthmas and confumptions, by thus narrowing their chefts. Suffering them to take their falls on carpets or grafs-plats will fooneft bring them to walk cautioufly.

That idiots were born idiots.

I will hazard my conjecture to the contrary. May not idiotifm in general proceed from a St. Vitus's dance, or fome nervous diforder, coming on an infant at too early an age to be difcovered ; which, thus difregarded, may terminate in imbecility and idiotifm ? May it not be frequently brought on by the very common curfed practice of nurfes giving babes gin for fancied gripes, or opiates to quiet their coughs, that they themfelves

themfelves may not be diffurbed in their night's reft? Does not the very remarkable cafe of the Norfolk idiot, who, being thirfty, drank near a pint of white-lead paint inftead of fmall-beer, corroborate my opinion ? He had been an idiot feventeen years; but this medicine difcharged fuch an enormous quantity of worms, fo that he acquired his perfect fenfes for the latter part of his life.

That when a youth, remarkable for his growth, happens to die prematurely, whatever may have been his diforder, his death is generally attributed to his having out-grown his strength.

If this doctrine hold good, the King of Pruffia's tall grenadiers must have been the most feeble corps in his whole army.

That what is called cracking of the voice, in growing-up boys, is caused by their over straining it at a particular time, in loud singing or bawling, or by a great cold.

I believe this change in the voice proceeds from no accident whatfoever, but is naturally brought

75

brought on by the growth and enlargement of the trachæa, and its aritenoid cartilages; large reeds and pipes being deeper toned, and not fo fhrill as fmaller ones. The fame thing may be perceptiby obferved in the gradual alteration of voice in the crowing of young cocks, which become deeper toned as their throats become larger in their growing up.

That wind instruments of music are exceedingly prejudicial to young persons, and naturally tend to induce confumptions of the lungs.

I think otherwise, provided the use of them commence while the lungs are in a perfectly sound state, as by exercise they must be rather strengthened than weakened; wind instrument performers being remarked for longevity.

That young persons of fair, rosy, florid complexions are the most healthy.

Such, though to the ignorant they would feem fartheft from them, are in reality the moft

most liable and apt to fall into confumptions of the lungs; for the pellucidity of the coats of their vessels, is a proof of their thinness and tenderness; and when they attain to nearly their full growth, their blood, promoted by their passions, &cc. runs high; fo that the least excess in the non-naturals will bring on a rupture of them, and an ulceration of the lungs.

That frequent bleedings at the nofe are by no means unhealthy, as they are only proofs of a plethoric fullnefs of the blood-veffels.

I admit it to be generally fo in young and growing perfons; but in habitual fots and dram-drinkers, the arteries are fo relaxed, and their orifices fo wide and open mouthed, as to allow their impoverifhed blood, now become acrid alfo, to run out at the nofe and lungs, fo thin and watery as fcarcely to tinge a white cambric handkerchief. So it happens in putrid fevers and fcurvy.

That

78

That the best relief in a hestic is to get out of bed, or lessen the number of bedclothes.

As it is known to come on in an evening, and probably from the cold then checking perfpiration, it has been fuggefted, that going to bed with one's clothes on would be the beft mean of avoiding it.

That a miliary fever is an original and dangerous distemper.

I believe that it is always created by ill management, warm regimen, and heating medicines. The fweating ficknefs (which first appeared in Henry the Seventh's army, upon his landing at Milford Harbour in 1483, which proved fo dreadfully fatal in Great Britain, and on the Continent, that one half of the inhabitants, in feveral towns, perished in three hours time) having been cured in fisteen hours, by only promoting excefsive sweats by art, may have given rife, probably, to the opinion which has fince prevailed fo universally, that in all eruptive

eruptive difeafes, which feem to difcharge themfelves on the fkin, cold is extremely hurtful; and that therefore the body fhould be fo clofely covered up as to increafe its heat. Experience has, however, fince that time, convinced us, that it is wrong to draw general conclusions from particular cafes; and that increafing the heat of the body in fevers is very pernicious; and that feveral eruptions not only admit, but require, the application of cold air; and that increafing, both by external and internal means, the fweats, in miliary fevers, has often proved fatal.

That after being out in fevere cold weather, or rain, the best cure is a warm room, warm spirituous liquors, a warm bed with additional clothes, and the use of Mudge's Inhaler.

This is all wrong, and the direct way to bring on a *catarrb* and all the ill confequences of taking cold; which may be avoided by keeping quiet and cool, in cool rooms; and by all means avoiding a quick tran-

79

transition into a warm temperature. It is well known, that frozen limbs have mortified by being brought near a fire, or put into warm water, that would not at all have fuffered if they had only been rubbed with fnow.

I have a hundred times, in very fevere winters, efcaped colds, after having not a dry thread about me (as the faying is) for feveral hours, by ftripping myfelf when I got home; putting on a dry fhirt; going to bed for half an hour, or juft as long as the weather-fide of me would take up in acquiring a degree of warmth equal with the other, to avoid a rheumatifm of the part; immediately then getting up, putting on dry clothes, and going out of doors about my bufinefs, without fuffering the leaft injury.

That colds proceed from obstructed perspirations.

Dr. Keil's Experiments feem to contradict this; for he did not find the perfpiration of his body to be diminished upon his taking

taking cold. The reafon of this may poffibly be, that the external perfpiratory veffels of the body, affected by the cold, may be conftringed and obftructed, and caufe a rheumatifm of those parts; yet, by this conftriction, the blood and perfpirable matter may be propelled more forcibly (as is evident from the fever attending it) into more internal veffels; fo that out of the whole body, an equal quantity of perfpirable matter may ftill be poffibly evacuated, but not by its ordinary course.

That the influenza is a very dangerous distemper, and a new one; never known in this country till a few years ago; at which time the College, by their circular letters, cried out for help from all quarters; were themselves greatly alarmed; and spread a general terror.

It is neither a new nor a dangerous diftemper; every perfon going out of a warm room, and riding, by night, against a sharp easterly fog, who had not prudently guarded his nose and mouth from it by a thin

foft

81

foft handkerchief, must have caught it; and fo may any one in fuch circumstances catch it; whether under the new name of influenza, or the old common one of catarth.

The prefent, ftyled the age of diffipation, may, in my opinion, have pride and pedantry very properly added to the bill. Afk. the dirtieft, most ragged child you see playing upon a dunghill, whose child he is; you are answered, Mr. Such-a-one's. Master, formerly a title of eminence, is now worn and affumed by the very loweft of mankind; there are no women to be had at prefent; even those at a two-penny puppetshow of a country village, forfooth, are all called the Ladies. Though at prefent we cannot pretend to be advanced in stature above former times; yet we distance them far in our affectation of dignity, pomp, and confequence. Such is our improvement in philology alfo, that fince a travelled fine gentleman has been pleafed to dub a common cold, which feized him in his return from a warm climate over Mount Cenis, with a foreign name of influenza; all our catarrh-

82

catarrhous colds, amongst our gentry, have affumed the fame name and importance; except amongst ferious aged people; who hardly thinking it worth while to newmodel their language, when they catch it, fnivel and drivel it off under its former name. In the commutation of terms, fufficient care is at prefent taken not to exchange for the worfe; formerly vomits and purges were in use, they are now superfeded by emetics and opening medicines; boils, which a fervant maid was formerly used to poultice and open with a pin, are now a tumour maturated by cataplasms, and to be lanced as an abscess. There are now no apothecaries; they are all furgeons; and thefe all physicians. There are now no ensigns and lieutenants; they are all noble captains. Let a ball, in very fultry weather, be ever fo much thronged, nobody now fweats, though large drops continually trickle down their faces, and require the conftant application of handkerchiefs; the company only per-Spire freely, though every one knows perfpiration to be infenfible, and not to be

83

feen.

feen. No lazy, greafy, fœtid, over-fed gentlewoman, is at prefent *fat*, though of the full weight and admeafurement of Dolly Crampton, cook at the George; the lady is only *jolly*.

No ftreet-walkers, though half rotten, confefs themfelves *infected*; they are only *injured*. No fribble officer, pale, and trembling through fear upon being ordered into battle, has now the courage of Sir John S-ck—ing bravely in the face of his country to call it *cowardice*; no, he only complains of having naturally *bad nerves*.

Thefe may be allowed to be trifling inflances of pedantic folly; but that it fhould infect a great affembly, whom we were in the habit formerly of looking up to as patterns for ftyle and every ornament of fpeech, is really lamentable; as we now can have no pleafure in reading the fpeeches, becaufe we do not underftand them. We know what a man, bred a fcholar, meant when he faid *be would not commit a fault*; but never when he faid he would not *commit bimfelf*. We knew what a man meant when he faid he

he was bound to declare the truth; but when he faid he was free to declare it, we loft him again, unlefs the gibberifh of bound and free meant the fame thing, which we well know to be contradictory terms.

That it is difficult to conceive how a catarrh is brought on.

When a cold affects the face, &c. the arteries of the face, nofe, and fauces are fuddenly conftringed, and their ferum retained, caufing a running at the nofe and down the trachera to the lungs, whofe veffels, thus diftended, caufe a difficulty of breathing, &c. Poffibly the ingrefs of cold air into the nofe may alfo condenfe the warm vapour exhaled from the lungs, as in an alembic, fo as to make it trickle down in greater abundance than what it could be fuppofed to have done on the principle of a ftoppage of perfpiration only.

That cold does not contract all substances; for it is known to dilate water into ice.

G 3

This

86

This happens from elastic air being included in it; for ice in thaws is heavier than water.

That a cough is often a primary distemper of itself.

Strictly speaking, I believe it is not more fo, absolutely, than sneezing, both being fymptoms of an irritating cause; yet a cough is often a most dangerous and incurable symptom of many disorders. Perhaps indeed fevers themselves, though classed in general amongst original distempers, each *fui generis*, may in reality, did we know more of them than at present we do, possibly be discovered to be mostly symptoms of other distempers,

That the lungs are not subject to pain.

This is not true; but the reafon why they do not give fo much pain as a tenfe membrane, is owing to their more lax and yielding texture; all pain proceeding from a diftraction or overftretching of the fibres; and

and a progress in them towards a *folutio* continui.

That flannel worn next the skin must be too warm in hot climates.

Juft the contrary; for it is the warm wet bath of a perfon's own fweat, confined by a linen fhirt, which renders the heat of a warm climate fo infupportably troublefome. Flannel, by promoting perfpiration, favours its evaporation; and it is a well-eftablifhed fact that evaporation always produces pofitive cold.

That casting of teeth is a dangerous distemper in children.

Cutting them is painful, and often dangerous in groß children; but the fhedding them is by no means fo. The teeth originally are like gelly, in a cartilaginous flate, included in little bladders, of which there are two in each *alveolus*, one lying upon the other, which by degrees harden into bone; at which time the lower, by their growth, by degrees, thruft out the upper ones; that

87

as the jaws grow there may be no vacancy between the teeth, and that they, by being larger, might quite fill up the hiatus's.

That burnt alum is an excellent dentifrice.

In direct contradiction to this, acids of every kind are the most pernicious applications of any to the teeth, as they foon corrode even their enamel. Hence it is, that perfons in apple and cyder counties have rotten teeth. Every nostrum that has any thing sharp in it, ought to be carefully avoided. The best dentifrice is finely levigated charcoal, foot, or in some cases finely powdered Peruvian bark.

That Squinting comes naturally to some children, and is incurable.

I believe it is most generally brought on by using children to caps or bonnets that come too forward, which they turn their eyes to look at; covering the strong eye with a plaster, to compel the constant use of the weaker one, seems a reasonable mode of cure, and the wearing the instrument

89

ftrument called goggles for a length of time, is faid to have been very fuccefsful.

That spectacles greatly preserve and strengthen the eyes.

By no means; though there may come a time when their ufe may become abfolutely neceffary for all perfons, as their eyes by age decay; yet the ufing them before that time, ftrains the eyes greatly, and accelerates the real neceffity for ufing them.

That fnuff clears the head, and revives the fpirits; and that the fnuff-box is a pleafant companion to folitary people.

Snuff of a particular fort, in particular cafes, and ufed no longer than those cafes require it, that it might not degenerate into a habit, has often been of eminent fervice. Though the *dura mater* invests the internal furface of the skull fo completely, that the whole *encepbalon* is included in it, and protected from any external communication whatever; it is, however, known, notwithstanding

90

ftanding that those passages of ears and nose, by what means foever it happens, are a drain from the brain, by which very extraordinary humours have been difcharged to the removal of very obstinate diforders; and by which, in like manner, fome volatile medicines, fnuffed up the nofe, have been found to affect the brain. Common fnuff in habitual fnuff-takers has been found to penetrate into the finuses communicating with the nofe, and into the antrum bighmorianum, wherein it has formed horrid abfceffes. It never fails also by being carried down to the ftomach, to tinge the blood, and confequently the fkin of a brown colour; as is very perceptible in the fickly fallow complexion of fuch ladies as have made themfelves flaves to it.

That there is fomething in tobacco inimical to the human conftitution is evident, from the fact already mentioned of a poultice of it proving emetic, and alfo from an experiment that a thread dipped in its oil, and drawn through a wound made by a needle medical vulgar errors refuted. 91 needle in any animal, will kill it in seven minutes.

That a pipe of tobacco in a morning is very conducive to health, particularly as it pumps up a great deal of cold phlegm from the stomach.

That it can as well pump up any thing out of the imoaker's fhoes as out of his ftomach, I can eafily believe; for nothing can come out of the ftomach but by vomiting. What is hawked up and fpit out of the throat, is the mucous fluid fecreted by the tonfils to lubricate and defend the a fopbagus; together with the faliva fecreted by the fublingual, parotid, and fubmaxillary glands, which is fo abfolutely requifite towards promoting the neceffary process of digeftion: the wanton wafte of which liquors is the greateft evil attendant upon fmoaking or chewing tobacco. The nafty filthy habit which fome flovens have contracted of hawking and fpitting without any reafon or provocation whatfoever, is nearly as bad.

92

That the heat we find on the earth is folely to be ascribed to the effects of the sun.

Not abfolutely fo; for in the cave of the Obfervatory at Paris, only 90 feet under ground, the heat keeps the thermometer at 53, without any affiftance from the fun; it being never fenfibly increafed by the moft fcorching feafons beyond what it naturally is in the fevereft winters. And it is well known, that in the deepeft mines the earth and water are always found to be the hotteft, which fact encouraged the ingenious Dr. Randolph to attribute the heat of Bath water to a fimilar caufe—an exhalation from the central heat within the earth.

That frost is owing to nitrous particles in the air.

By no means, for spirit of nitre diffolves ice.

It is difficult to account how water quenches fire.

It is not from its coldnefs, becaufe hot water quenches it as well as cold. Not from its

its moifture, becaufe fpirits of wine will not quench it. It is effected by its keeping off the free accefs of air from it; for coals on fire, included in a veffel where no frefh air is admitted, though blown upon by a bellows included in the fame veffel, will go out.

Pit coal has of late been faid to owe its origin to extensive woody tracts buried in the earth by the deluge, as appears by chemical analysis.

The travels of fuch philosophers feem not to have extended far from their laboratories. Coal being well known to be a foffil like other minerals, with regular veins, ftrata, &c. and to have acquired none of its qualities from wood, turf, or any vegetables, any more than petroleum, Barbadoes tar, &c.

That amber is of vegetable origin, the exfudation of certain trees.

It has been found at Kenfington and in many gravel-pits.

Amber-

Ambergris has also been affirmed, by Cronfted, to be from the exsudation of certain trees.

Since the eftablishment of the South-Sea fishery, ambergris is very well known to have been taken out of the body of the spermaceti whale.

That a dram of brandy is of fervice in warm weather, as it is cooling; in cold weather, as it warms; in fetting out on a journey; in coming home off a journey; at rifing in the morning, and going to bed at night; after goofe, becaufe it is hard of digestion; and after fish, becaufe it digests too fast; and upon a variety of other occasions.

This, like tobacco, gains upon us by habit, and feems at length to be come almost neceffary, though both at first wantonly introduced by young people without any reason for either.

That nobody can dispute the absolute necesfity of a dram of gin for a colic.

This

94

This proceeds upon the notion that all colics arife from flatulency. Common fenfe ought to convince us that in colics attended with inflamation, this panacæa must be of a fatal tendency.

That breaking up wind (belching) is a certain proof of indigestion and of a difordered stomach.

Not always, I believe; it being moft frequently a filthy habit only; which valetudinarians, and indeed fome whole families, while in perfect health, indulge themfelves in, from an opinion of its healthfulnefs, not knowing that the ftomach always contains air, and that this operation may at all times be performed *ad libitum*, by perfons fond of exhibiting fuch wind mufic.

That the carminative feeds are the best medicines for expelling and destroying wind in the bowels, and spasms in the abdomen.

It is difficult to conceive how these should destroy wind, when, as it appears by the air-

96

air-pump, they are found to yield more air than any other fubftances whatfoever. Thefe are probably beft cured by dry cupping on the part; which, by irritating the nerves, will caufe a revultion, like the acupuncturation, the moxa, and the practice in Afia of burning the foles of the feet with hot iron, for colics and dyfenteries.

That filings of steel, unless foon purged off, must injure the intestines, by sticking to them.

Sydenham never faw any ill effects from them, and fays that they are carried off, involved in the mucus, better without purges.

That Inuffling proceeds from Speaking through the nofe.

It, on the contrary, proceeds from not being able to fpeak through the nofe; by reason of some obstruction in it, or some defect in the adjoining palate. The use of the nofe is not folely for fmelling and for modulating the voice; but alfo to enable a child

child, while fucking, to draw its breath; it being ufual for nurfes, when they chufe to make it leave off fucking, to compress the child's nofe between a finger and thumb.

That not intermittents only, but all fevers, bave certain exacerbations, called critical days ; which at those times require particular attention.

This was the opinion of Hippocrates, who, the better to observe the progress of fevers, &c. left them in a great measure to Nature, with little or no affiftance from medicines, to difturb them; which gave his enemies a handle to accuse him of attending his patients with the view rather of observing in what manner they died, than how to cure them. It is poffible enough that fomething like critical days appeared in his part of the world, in perfons of great fimplicity of diet and way of life, (of which class all his patients were,) in fevers undisturbed; yet in our time we are compelled to own that the fuccefs which the pulvis antimonialis is often attended

98

attended with at any stage of a fever, has very much shaken the foundation of this doctrine.

That at the crisis of intermittents, the urine will shew a separation and deposition.

In hot climates it will not; which may perhaps be owing to a lefs quantity of mucilage, and a greater quantity of alkali in the urine, on account of a more putrefcent ftate of the fluids there than in cold climates; for upon adding a little vinegar to the urine in the forementioned cafe, it became turbid, we are told, like the urine of fevers in Europe.

That the greatest care be taken not to give the bark in intermittents, except in the absence of the fit.

Though this caution might poffibly be prudent in cold climates, yet fo far from it being fo in hot climates, were we to wait for the absence of a paroxyfm, the greatest number of patients would, we are affured, be lost.

No

No time fhould therefore be loft, as foon as an intermiffion is difcovered, to throw in the bark.

That after the cure of an intermittent, a purge will renew it. Most practitioners deny this.

That bark, though it may cure agues, does infinite mischief, by getting into the bones.

Peruvian bark, fo far from being dangerous, has often been of great fervice in fome diforders of the bones.

That in the choice of bark, the fmall quilled fort is the best.

The quilled being that of the fmalleft young branches, must be of inferior virtue to that of the large trunk of the tree, if there be any analogy between Peruvian and oak bark; the tanners, who are the best judges, prefer that of the oldest oak. The reason why we see more of the quilled fort than that of the body of the tree is, not that the large fort is thrown away, and the small

pre-

99

preferred for its virtue; but that, from the fcarcity of the trees to answer the yearly increasing great demand, and their observation that if a tree is barked it will die, they therefore spare the body, and only bark off fome of its small branches.

That vinegar possesses a coagulating power, was the opinion of Dr. Friend.

This miftake may have arifen from his fuppofing, as they are both acids, that vinegar and the acid of vitriol are of equal virtue; whereas vinegar, blood warm, mixed with fresh drawn blood before it coagulates, resolves it, and prevents its coagulation.

That the diabetes is a diforder of the kidneys.

Though difcoverable by the flate of the urine, diffections prove it to be a diforder of the liver.

That to hide the taste of pills, they ought to be covered with leaf gold.

-STO

Wafer

Wafer paper is much better; for if *Dutch* gold, which is copper, fhould for cheapnefs be fraudulently fubfituted in the flead of it, it might have a bad effect.

That vinegar improves the virtue of mustand cataplas.

animal fluids (, and above, all, 14

It certainly injures them; as its acid neutralizes their volatile falt, and alfo blunts their effential oil. Strong wine would be a better fubflitute.

That chickens from cock pheafants and common hens, growing up stronger, and being more prolific than their progenitors, prove the falsity of the received opinion that mules will not breed.

This cafe proves no more than that pheafants and dunghill fowls are of the fame fpecies, like the fox and the dog.

That the animalcules feen in femine mafculino are young homunculi, intended to be deposited in the female uterus for nourishment and growth.

Many

Many objections are made to this hypothefis; the wafte of fo many thousands of those embryos for a few that succeed : that such animalcules are seen in other of the animal fluids; and above all, Haller's obfervation, if true, of his having seen young pullets completely formed in unfecundated eggs.

That the jelly-like matter called ftar-fall, bas been dropped from some meteor, or some birds.

This has been proved to proceed from the oviducts of frogs, and to be the albuminous part of their ova, defigned to protect and feed the embryos.

That toads are poisonous.

Mr. Daines Barrington has proved them to be inoffenfive, harmlefs animals; and Mr. Twifs affures us that, upon account of their coldnefs, Spanish ladies make pets of them, and wear them in their bosoms.

That the floating of dead bodies in water is owing to their putrefaction.

Not always; though the caufe is not eafily affignable, it is a known truth, that after a battle, fome corpfes have been feen to float that have been thrown overboard, when others funk. It is a truth within my own knowledge, that an old man, of rather a corpulent make, having fallen into the tide, floated upon his belly, as foon as he was drowned, along with the tide.

That dead bodies weigh more than living ones.

This is rather fo in appearance than in reality; people in a fwoon, or drunk, appear fo alfo.

That pleurisies are all on the left side, and the heart also.

As a pleurify is an inflamation of the *pleura*, a membrane that affords a common coat to all the parts contained in the cheft, it may, and often does affect any part of it. And as to the heart, though its apex points a little to the left, its bafis is fituated in the middle.

The

The cæcum was by the ancients counted among the large inteffines.

Their miftake muft have happened from their having taken their defcription from that in dogs; whereas in the human fubject it is by much the fmalleft of any.

- That the urethra is fubject to caruncles.

It is very much doubted by fome whether what are deemed in general to be caruncles, are not rather strictures of the urethra, from ulcers cicatrized therein.

That urine not following a catheter, is a proof that the bladder contains none.

This may happen from coagulated blood, or very thick urine. Filling the holes of a catheter with butter, fhould be tried; which being diffolved by the heat of the parts, may poffibly bring the urine to follow.

That obefity proceeds from a natural difpofition, hereditary in some families, so as not to be avoided; and that high-boned, illMEDICAL VULCAR ERRORS REFUTED. 105 ill-formed people, or ill-shaped bullocks, are not fo subject to it.

Though well-fhaped perfons are most fusceptible of fat; I believe, without one exception in an hundred, that it is the natural effect and production of overfeeding in folids or liquids, or both, nourifhed by an indolent, lazy, lying-a-bed habit, as evidently as ever the hawking up of thick phlegm in a morning, thin lips with a black dry lift, a ruby nofe, and rich face, are, of hob-nobbing, and dram drinking. And as to its running through a family where the mode of living is the fame, what elfe can be expected? Fat in the cellular membranes, by covering and furrounding all the muscles, and filling up their interstices, interrupts and impedes their activity, fo as to induce an indolence; which indolence again contributes to beget fat. This is most evidently proved by its having been cured by its contraries, abstemioufnefs, low living, and early rifing. A gentleman communicated to me a very remarkable

able inflance of this in a neighbouring clergyman in Cornwall, who after having grown fo enormoufly fat that he was obliged to reft, and make three ftages, from his parfonage houfe in the church-yard to the reading-defk, laid fo ftrict an embargo on his gullet, that in a year's 'time he walked twenty miles to a visitation in perfect health; feeling no other inconvenience from the maffive load he had got rid of, but that the fkin of his arms never recovered itfelf, but continued loofe like the fleeve of a morning gown. Exercife, in cafe of obefity, were it used, in as much as it would improve the appetite, may be more likely to contribute to it than leffen it. The above are the only effectual means; but they muft be rigidly perfifted in, not fafting a little now and then, by fits and ftarts, like Roman catholics on Wednesdays and Fridays, without leffening the weekly bill.

That the bones are of a white colour.

They are only fo after having been expofed for a time to the air, and dried; but in

in their natural flate they are of a blueifh colour, owing to the blood in their veffels; and children's are much more fo than those of adults, because they have more blood veffels.

That the substance contained in the vertebræ, is spinal marrow.

It is not marrow at all, being fallely fo called, but a fimple continuation of the medullary fubftance of the brain.

That the valvula tulpii is of fuch strength as to resist the farther ascent of glysters.

Inftances to the contrary have been known. A quart of linfeed oil, having been, by means of a ftrong ox's bladder, and a great force, driven up, fo as to be thrown up by the ftomach. The fuccefs Hippocrates met with in forcing up air by means of a ftrong bellows, evinces the fame thing.

That boiling water is always of the fame heat.

It differs a little, according to the different denfity of the atmosphere; but when compreffed

pressed in Papin's digester, it becomes enormous.

That medicines of one only quality, are called fimple medicines.

What are termed fimple drugs, or medicines, are never ftrictly fo; for example, gentian and aloes, though claffed as bitters, have other medicinal virtues befides; and what are called even chemical principles, are not really fo, but are compounded; fpirits, being compounded of oil, water, and falt; and oils and falts, are again compounded of earth, &c. &c.

That metals, stones, and minerals, do not grow, but were so from the creation.

Inflances to the contrary ha

Mr. Homberg thinks he has proved the contrary; for after having, by means of Tchirnhaufen's burning glafs, forced the fulphur of a piece of iron to rife in fumes, and the earth and falt remaining to vitrify by degrees, he contrived, by adding the fulphur of charcoal to the glafs, to reftore it to iron as before.

That matter is divisible in infinitum.

Though we cannot conceive the very minuteft particle to be fo fmall as not to be divifible into two, and fo on; yet fome philofophers would think it unreafonable, (though arithmetic does,) that nature can admit of that infinite divifibility; for, in reality, must there not be a vacuum to admit the fmallest particle A. to move to the fmallest particle B; or elfe there would be no motion whatever?

That on a trial for the murder of a child, the finking of its lungs in water, is a proof of its never having breathed through them; and their floating, of the contrary.

This experiment is not conclusive, even fupposing it were fairly made, and no portion of flesh left to adhere to them; for uninflated lungs will float, and become specifically lighter than water, as soon as any degree of putrefaction begins to take place in them; which, after death, takes no long time to commence.

That

109

That bronchotomy is a fafe operation; and that, in the opinion of a great anatomist, if the recurrent nerve should happen to be cut in the operation, the voice will not be affected, provided the superior branch still supplies the larynx.

In opposition to this, Martin, upon his cutting the recurrent nerve of a pig, found that it loft its voice, and in a little time its appetite, and at length pined away and died. In my opinion, the best mode of performing the operation would be, by a trochar all at once, and leaving in the canula, in preference to the tedious trouble of feveral incifions, &c.

That death, from hanging, proceeds from a luxation of the vertebræ.

I believe this is never the cafe, except from being turned off from a great height; elfe perfons who had been hanged would never recover, of which there are many inftances. Death here feems to proceed from the interruption of the air going into the lungs.

TIL

The

That a stone in the bladder is always attended with a tenefmus.

Not in women, except it be very large, by reafon of the interpolition of the uterus between the bladder and the *rectum*.

That a quantity of red fand in the chamber pot, is a proof of a gravelly complaint.

Not at all; for this is only the falt in the urine, concreted like tartar from wine; for upon the patient's making fresh urine upon it, the warmth of it disfolves it fo that, till it cools again, it will totally disappear.

That to confine ourfelves folcly to a vegetable diet, would be most conducive to health.

The ftructure of our organs, compared with those of carnivorous and graminivorous animals, fufficiently demonstrates, that we are intended for a mixture of vegetable and animal food.

That all our food is formed into chyle by the chylopoietic organs, and carried by the lacteals into the fubclavian vein.

4

The fudden refreshment from a glass of wine held in the mouth of a person unable to swallow it, and the amazingly quick passage of asparagus into the bladder of urine, has induced some people to fancy fuch instances to proceed from a direct abforption into the blood, and not along the highway of the *receptaculum chyli*.

That caftor is generated in the teftes of the beaver.

This a great miftake; for it is found in two glandular fubftances, fituated in the pofterior part of the female, as well as the male.

The ancients, from observing a hen to hold up her head in drinking, conceived that our food passed into our stomachs by its weight only.

The contrary to this would have appeared, had they remarked how horfes and longnecked animals drink, or feen rope-dancers drinking a glafs of liquor while hanging by their toes, with their heads downwards, which

which would have convinced them that this was effected by the action of the muscles of deglutition.

That it is a very falutary mean to affift digestion, provoke an appetite, and preferve health, for healthy people to drink a glass of good bitters every morning.

People of fortune in general, from the variety of their food, and the luxury of their tables, and from the pleafure they find in it, eat much more than they ought to do; or, than nature requires. And inftead of bitters, pickles, and cruet drugs, which hurry down their half-digefted food through the primæ viæ, and thus create a craving for more than the ftomach can digeft; they ought rather, if cram and gormandize at any rate they must, to invent and use dampers, to prevent crapulas and crudities in the ftomach, fuch as the coarfest bread with much bran in it, or the rafpings of fome infipid tree, fuch as the poor in Norway make use of for bread.

I

That

113

That hydatid tumours are feated in the follicles of the glands.

They are feated in arteries dilated with water, being found in the fpleen, ovaria, placenta, lungs, &c. in parts not glandular, as well as glandular.

That the most proper diet for persons weakened and relaxed after a fever, or long illness, would be calves-feet, calves-feet jellies, eggs, chickens, veal, lamb, fish, puddings, and pastry.

Not at all; for these gelatinous subfrances, by their oiliness and viscidity, are apt to lie heavy on the stomach already relaxed, and blunt the little appetite they have. Ham, Dutch beef, or roofed tongue, between slices of bread and butter, good old Cheshire cheese, and the like tasty things, in small quantities, frequently repeated, with good small beer, or genuine London porter, are infinitely better, and will sooner restore them to health.

That

114

IIS

That bot water dishes and plates, and chafing-dishes, are excellent contrivances to keep our dinners bot and good.

They may certainly ferve to keep them hot, but not good; for by fo doing they very much relax and hurt the flomach. Perfons of weak relaxed flomachs ought to eat their meat cold, or at leaft very nearly fo; be it folid or fluid; every warm thing being naturally difagreeable to the flomach; hence it is that children always call for cold fmall beer after fupping hot broth; and it is a well known fact, that nothing affords fuch inflant relief to a flomach loaded with fmoking warm food, as a glafs of cold water.

That to cure a fractured patella it is abfolutely neceffary to bring the fractured ends together, and firmly to fecure them in that posture with pasteboards and firm bandages, and a long confinement in bed.

I remember a cafe brought before the ingenious Mr. Samuel Sharp at Guy's Hofpital, of a woman carrying on her head a heavy 12 pail,

pail, who by a fall broke both the patellas. This afforded him an opportunity of declaring to his pupils, that he would not fet one of them, from the numerous bad confequences he had often feen to attend fuch practice in others, fuch as a ftiff knee, if not an anchylofis for life, and its very great aptitude again to break ; whereas he affirmed that no ill confequence of any kind can happen from leaving it entirely to nature. He therefore earneftly exhorted his pupils to fet fuch a value on their characters in private practice, as to put it out of the power of ill-wishers to accuse them of gross ignorance, or, what is worfe, condemning their patients to a tedious and a painful confinement for the fole lucrative purpose of charging them for an operation and long attendance, while they must in conscience be perfectly convinced that all they do is not unneceffary only, but generally mifchievous to a great degree.

> That the vena medinensis is a species of plant whose seed entering under the toenails

nails of Indians in the water, grows up among st the muscles of their legs.

Late obfervations have difcovered this to be a fpecies of infects, called gordius or bair worm, infefting people's legs in hot climates, which, after appearing in a tumour that breaks, like a fourth fiddle-ftring, must be coiled up by gradually and very gently drawing it at each dreffing, round a bit of flick, left it break and caufe a troublefome ulcer.

That the best way to prevent colds is to increase the number of one's clothes.

It is going out of warm air fuddenly into cold air that gives us colds; for perfons out continually in cold air never take cold. Were we accuftomed to as many coats as an onion, in fuch a cafe they could not protect us; I believe a Dutchman, notwithftanding his half-a-dozen pairs of breeches, would fuffer in going out of a clofe warm room into a very cold air, very little lefs than a Scotch *fans culotte* highlander.

That

That a blifter not rifing on a patient, not bereaved of his sense of feeling, forebodes his death.

This proves nothing more than that the flies were added with too fparing a hand in its composition, or were spoiled and become effete and damaged by long keeping; or that the plaster was of too stiff a consistence to allow them to act.

That it is a great improvement, and an applauded happy invention, to interpose a bag of fine gauze with powdered camphire, between a blister-plaster and the skin, or to rub its surface well over with disolved campbire, to prevent a strangury.

I by no means approve of this ingenuity, even if it fhould anfwer this purpofe; it being my firm opinion, that a blifter, in fevers particularly, (in which cafe the greateft benefit is expected from them,) if it do not produce or excite fome degree of ftrangury by entering into the circulation, (which

may

may afterwards be fufficiently kept under by mucilaginous emulfions, and the camphire julep, or at worft by removing the plafter,) never fufficiently anfwers all the good purpofes expected from it; for if nothing more be defired than its procuring a copious difcharge of water from the part, fcalding hot water inclofed in a bladder, and applied to any part, will, in a quarter of a minute, bring on a bladder, and a greater flow of waterfrom it than any blifter, without any ftrangury, or pain in dreffing it afterwards; as is the cafe from flies the firft time of dreffing, which often fall on the raw part from the removed plafter.

That when the intention is to foften and relax the folids, and obtund acrimonious humours, tickling coughs, heat of urine, and inflamations; expressed oils of unctuous vegetables would seem better adapted than emulsions of them with water, as being of more powerful virtue and smaller in bulk.

14

119

Far otherwife; for thefe emulfions, notwithftanding their being lefs emollient than oils themfelves, or animal fats, have this great advantage over them, that they may be given in acute or inflamatory diforders, without the ill confequences which may poffibly attend the others; for fpermaceti fats, and oils, kept in a degree of heat greater than that of the ftomach, foon grow rancid and acrimonious, while emulfions tend rather to grow four.

That some ointments, or dressings, exceed others in their sanative virtues.

It is certain that fome ointments irritate more and do more harm than others, efpecially when ill prepared; (as the *Cerate*, *e lapide calaminari* when the calamy has not been finely levigated;) but it is very much to be doubted whether any ointments deferve the appellation of *fanative*; that is, have the power to make an ulcer heal, and grow up, any more than an application of any thing can make a branch of a tree to grow. Probably, the whole that can be expected

expected from any kind of applications or dreffings, is a negative kind of virtue only, viz. that they do no harm themfelves, nor fuffer any harm to happen to fores from the ill effects of the air ; or from being injured by the clothes fretting them. Hence it is that an eminent furgeon honeftly declares one ointment only to be necessary in most cafes, and that to be composed of different proportions of bee's-wax and fweet oil only. In many cafes the habit must undoubtedly be amended by internal medicines, before any good can be expected from any external applications. When this is once effected, a fore can hardly be prevented from healing of itfelf, as is well known from the conftant, trouble and difficulty which many perfons find in keeping their iffues open.

That a fungus, or proud flesh, shooting up in an ulcer, is a certain proof of its great virulence and malignity.

Not always; for it frequently proceeds from the ignorance or neglect of the dreffer, in his not having continued an equal preffure upon

upon the bottom part of the ulcer, by which means it is fuffered to grow up more luxuriantly than its edges. The brain after this manner rifes as a fungus after the trepan, for want of an equal preffure on it; fo alfo hernias are formed, when the muscles of the abdomen are divided by a wound, without injuring the peritoneum; fo alfo in aneurifms.

That a corroborating plaster, worn for fome time on the backs of fickly women, bas a confiderable virtue in strengthening them.

I have often found it of fervice; but apprehend that this was effected not by any ftrengthening quality it poffeffed; but by its adhefion, heat, and great irritation, whereby it caufes a confiderable eruption, rafh, or fharp humour, to break out under it.

That for a burnt part, the first care ought to be, to use proper means to take the fire out of it.

It

It is very reafonable to expect, that a burnt part, where the veffels are reduced to a dead horny efchar, fhould take a much longer time to fuppurate and heal, than a common fore, or a cut from a fharp inftrument; for, in the former, there will be a flough to be removed; whereas the parts in the latter cafe may only have fuffered a bare feparation, or *folutio continui*; which, upon their being brought together again by a juxta polition, may foon heal. It is the effects of the fire, and not its continuance in the part, that is to be attended to, and to be removed; the effects of the cutting inftrument, and not the inftrument itfelf.

It is faid to be a good method to open burns and fcalds, to turn out the waters out of their bladders.

This is a most injurious practice, as it promotes the corruption of the extravalated humours, and removes the defence afforded by the cuticle to the tender nervous pulp which lies underneath it, and is fo extremely painful when uncovered, and becomes thus ready

123

ready to be injured by the air, and any applied remedies. But in a part burnt by actual fire, hot oil or the like, the efchar requires to be feparated from the living parts by fcarification, and to be treated with emollient ointments, cataplafms, and fomentations. All deficcatives and aftringents are here bad; particularly fpirits of wine, for they all harden the efchar, and augment all the bad fymptoms.

That opium is a tonic medicine, which gives ftrength and spirits, as is evident from the use the Turks make of it in going into battle.

The Turks, who are accuftomed to it, may poffibly take it then as our foldiers do tobacco, from habit only. When taken however in a full dofe, it much refembles fpirituous liquors, occafioning a temporary madnefs generally, foon ending in weaknefs, tremors, and the utmost dejection of fpirits; not but that strong coffee, which the Turks are much accustomed to the use of, is found to be a great corrector of it.

Opium

Opium is faid to act upon the fenforium of the brain, by being carried thither in the course of the circulation.

Some cafes would almost induce us to doubt this; for by opium remaining in contact with the internal furface of the ftomach, it produces fuch a change on the nerves thereon diffributed, as to blunt the fenfitive faculty in the brain; for a grain or two of opium in a pill, will continue a long while, by reafon of its tenacity and refinous texture, undiffolved in the ftomach, and yet quiet the fense of pain for at least eight hours; and what is furprifing, the pill has been vomited up next morning, in feveral instances, undiffolved. Some poifons, as the cicuta aquatica, seem to act on the stomach only, for as foon as brought up by a fmart emetic, all their horrid fymptoms abate ; whereas, had they proceeded farther than the ftomach, they would continue still longer to difturb the body. Too large a dose of opium, however, has been known to corrupt the fluids with the force of a poifon.

That

125

That strong opiates are specifics in the cure of a locked jaw.

They are certainly of use in all such as are brought on by an affection of the nerves; but those caused by a concretion, and growing together of the ligaments, &c. from neglecting to cleanse the mouth in falivations, result all medicines.

That in violent fluxes, Sc. astringents and opiates are the best medicines.

They are never fafe till the morbific matter is first fufficiently expelled; for if by the use of these the acrimonious matter in dyfenteries be confined in the intestines, it will inflame and corrode them to such a degree, as frequently to bring on a gangrene.

That in uterine hæmorrhages, the vis vitæ onght to be kept up with hot wine and volatile alkaline spirits.

In my opinion, it is a much fafer practice to attempt a coagulation of the blood in the extremities of the open veffels, and to abftain from all heating and flimulating things; for

for bark, fteel, white vitriol, &c. prove ftyptics more from their invigorating the fyftem, than from their application as topics. In cafes of bloody urine in the fmall-pox and hæmorrhages, inftead of ftyptics and aftringents, the foffil acids, as oil of fulphur, &c. are the beft medicines. The greateft care, however, ought to be taken to diffinguifh well between bloody urine, and the menfes.

That scarifying mortified parts, and dressing them with warm applications, are always the most proper treatment.

Mr. Pott has proved them extremely improper in mortifications of the toes and feet of old people, and that in fuch, the liberal use of opiates, together with the external application of fedatives, and relaxants have performed great cures, where fcarifications, &c. by the great pain they give, would have proved hurtful.

That the best way to exfoliate a bone, in order to its separation from a sound part, is by scraping it.

By no means, for the fcraped parts muft exfoliate again, and fo on; cauterifing with a hot iron, muft alfo be a very bad method; as this cannot be done without injuring the fubjacent found part, which found part, now aduft, muft be again exfoliated before the cure can be expected. The beft method certainly is to perforate it gently by many fmall adjacent little foramina down to the diploe.

That when spunge is necessary to dilate a wound, it must be melted in wax or plaster.

A better way may be to dip it in water, wring it out, and then wind it about with packthread as tight as poffible, the fpunge then to be cut off as it is wanted, letting the thread remain on the reft of it.

Hypocrates's advice to prevent infection from the plague by great fires, has been condemned by fome authors, from an opinion that heat is more likely to increase every kind of putrefaction than to correct it.

However,

However, late well-conducted experiments have perfectly juftified him; fire and fmoak having been found to be certain infallible correctors, or rather deftroyers of infection in all cafes, whether arifing from noxious effluvia of ftagnant marfhes, or the contagion of difeafed bodies; it having, for example, never been known that a fhip which had been carefully fmoaked, though before ever fo infectious, had not immediately become healthy. And from parity of reafon, the like good effects of it may be expected in the plague.

That in fevers, after a due concoction of the febrile matter, nature generally difcharges it by the kidneys.

It fometimes does; but there are numberlefs inftances of critical difcharges having been made by the fkin from blifters which had dried for days before, alfo by fweats, by apthæ, and by ftool.

A French physician has given it as his opinion, that the swellings and sickness, K which

130

which attend the eating of mushrooms, are caused by the eggs which spiders deposit in them.

The practice of old women's giving fpiders to be fwallowed as a cure for agues, is inimical to this opinion. This ficknefs is probably owing to the richnefs of the mufhrooms; the fame thing is known to have happened to fome perfons after eating mufcles or rich falmon.

That the fwelling, after eating muscles, proceeds from the poisonous quality of the pisum, or little crab inhabiting them.

This has no better foundation than the opinion of the ancients, that mufcles, as they themfelves are not able to move, take thefe little crabs into their fervice to go out to cater for them, and alfo to run in at the approach of an enemy, to give them a fignal to fhut their fhells, of which Oppian has verified a curious fable.

That nature, the vis medicatrix, always aims aright in the removal af all diforders,

orders, and that a physician has little more to do than attentively to study her motions, and follow the way which she points out.

Though nature is poffeffed in the animal ceconomy of most wonderful resources for relieving herfelf, yet, in many cases where she even aims aright, the skill of the phyfician is of the utmost confequence, to diftinguish when the ought to be affisted, and in what cases to be absolutely restrained, or her efforts to be diverted into another channel; for example, it would be very dangerous with forcing medicines to urge her on when she has already raised a fever by her endeavours to force a stone from the kidney into an ureter, whose diameter is much too narrow to receive it.

That it argues want of skill in the physician, who, with the co-operating aid also of this vis medicatrix, cannot cure every distemper not in its nature incurable. ł

Many caufes may happen to thwart his attempts, and best-laid schemes to regulate

K 2

nature's

nature's fails and helm; for if a fudden hurricane comes on, and the particular flate of the fhip be fuch as not to permit it to anfwer the helm, it would be very hard to blame the pilot if fhe went upon the rocks, while the fame care and conduct would have faved a fhip of a better make.

That quacks boast of infallible nostrums, with which physicians are unacquainted.

It was the fenfible remark of an ingenious author, that though the Ignorant boaft of infallible remedies for every diforder, a man of real skill cannot venture a positive affurance that he can cure a cut finger.

That quacks have the fagacity to find out a patient's diforder by the infpection of his urine only.

The most learned physicians know this to be a flagrant imposture, because it is impossible to draw any certain prognostic from urine alone, without the concurrent aid of many other symptoms; as, in some perfons in health, the urine, even when fresh made, manifests

manifefts an alcaline, and in fome, an acid tendency; and it alters, and affumes the fmell and hue of the medicines or food laft taken in, as is evident after afparagus, terebinthinate medicines, or the like; and from the numerous laughable tricks played upon those pretenders, it is very evident they do not know urine from many other liquors.

That when a man's time is come be must die.

If particular, abfolute, unconditional predeftination be true, and a man's fate has been irreverfibly fixed before the foundation of the world, God has created medicines and the phyfician in vain. And, according to this doctrine, a rope need not be thrown to a failor fallen overboard in a ftorm in the middle of the vaft atlantic, for he will fwim a few thoufand miles to fhore, agreeable to the decree, if, as the proverb has it, he was born to be hanged.

That it is wrong, and a great pity, to difturb a patient, supposed to be dying, with any more medicines or applications.

Of all vulgar errors, this is certainly the most pernicious. Without taking into confideration the very great uncertainty of our forming a true prognoftic of death, if the patient be fo low as to be incapable of any fenfation whatever; were there but one chance in ten thousand of faving him, by fome uncommon means or medicines, a trial most undoubtedly ought to be made; particularly as no harm whatever can happen from its failing: Should we not rather redouble our exertions at the pump, in proportion to the increasing urgent danger of the fhip's finking ? Have not many drowned perfons, in whom the pulle and all the vital actions had long ceafed, been by active means and proper applications reftored to life ! Is there not a well authenticated anecdote of a great perfon in Devonshire, twho, after having lain in state for a confiderable time, was brought to life by his infolent butler, who before locking up at night, having carried up a bottle of brandy to give the women who watched the corpfe a glafs a piece, took off the napkin covering his mafter's

+ Sir Hugh Ackland, who left a legacy to this Butter by way of reward, after his real death.

ter's face, and with this taunting fpeech, "Come, old gentleman, I will not pafs you "bye, you fhall have one glafs now you "are dead, of what you loved dearly all "your lifetime;" fo faying, he opened his mafter's mouth, and poured a glafsful down his throat, which inftantly fet him a coughing, and brought him to life, after which he lived feveral years? And have no inftances been known of corpfes having been reftored to life, who had undergone a too hafty fepulture by the unfeeling inhumanity of their relatives?

That were the medicinal virtues of all the many thousands of herbs, plants, trees, and their roots, barks, seeds, &c. carefully examined, specifics might be difcovered for most distempers.

Great discoveries may possibly be made by ingenious persons, as to the virtues of some; but it is a most erroneous notion to suppose all these to have been designed for medicines, and not for a thousand various other purposes. But as to specifics, if their

idea

idea be explicable by fuppofing an admiral fent down channel, acrofs the Bay of Bifcay, and up the Mediterranean, with express orders to attack the Maltefe, but with the ftricteft charge not to moleft any other flate whatever; I cannot conceive any medicine fuch a fpecific as to conform most punctually with fuch orders, to act vigorously against one particular gland or humour of the body, without in the least affecting or diffurbing any other, or, like a sheriff's officer, ferve his writ upon the individual perfon it was intended for, and on no other perfon, in a mistake.

That were medicines all correctly classed according to their several virtues, peculiar properties, and certain modes of operation, the practice of physic might be brought to great certainty.

Nothing can be urged against this but its impossibility, for the very fame drug or medicine acts very differently on different constitutions; for example, there is no fuch medicine existing as a certain universal deobstruent;

obftruent; for in weak, flabby folids, with poor pituitous inert blood, the deobftruents muft be all of the clafs of flimulators; and on the other hand, in firm, tenfe, elaftic fibres, and an inflamatory flate of the blood, the deobftruents muft be of the tribe of coolers, emollients, and laxatives; and it is very well underftood that diaphoretics and fudorifics, as to their action, differ only in degree. The percuffion alfo of an elaftic ball muft have a different effect upon different bodies, and vary as those are more or lefs elaftic: fo the fun hardens clay, while it melts wax; hence the adage, quicquid recipitur, recipitur ad modum recipientis.

That the virtues of drugs are drawn out more effectually by a long than by a short decoction.

This does not hold good without exceptions; for inftance, a fmall quantity of *fenna* boiled only for a few minutes, retains more of its purgative quality, than four times as much boiled in the like quantity of water for an hour or two; befides, the longer the decoction,

decoction, the more the *fpiritus rector* of any plant is diffipated. And it is very remarkable, that an infusion of *fenna* four ounces, in water three ounces, will not purge as briskly as one fcruple, in fix ounces of water; the reason of this feems to be, that the water can take up but a determined quantity of it only.

That the virtue of galls, tormentil roots, and fuch like astringents, may to a greater degree be extracted by decoction than fimple cold infusion in water.

Quite the contrary; for a decoction of these, kept on to the confistence of an extract, totally destroys their astringency, if kept for any time. Tanners, who have the greatest experience in these matters, prefer a cold infusion of their oak bark only, to an infusion in boiling water, or even a decoction. And chemists find that a cold water infusion of Peruvian bark is stronger than its decoction.

That

That joining together a number of various ingredients in a prescription, may add to its efficacy; as some may bit the case, if the rest fail.

This was a foible in the great Sydenham; and, in my opinion, would be a likely means of spoiling the whole. One drug, and that the principal in its class, with its necessary cookery, well fuited to its intention, must affuredly be far preferable; for example, if a sweet be indicated, would it not be abfurd to think of improving the tafte and virtue of fugar-candy, by beating up Spanish liquorice with it? If the ingredients are of different qualities, may they not be apt to deftroy each other ? Befides, if the compound fhould difagree with the patient, it will be more difficult to difcover the delinquent ingredient amongst a hodge-podge of many others, fo as to be able to omit it in a subsequent prescription. Possibly, indeed, the difcovery of the true nature and feat of a diftemper, and the true indication of cure, may, in most cases, be much greater than

than in finding out proper medicines afterwards to execute it with. Though, to fupply his various cuftomers with whatever medicines they may call for, an apothecary is obliged to ftore his fhop with a vaft variety of drugs; yet, from 15 to 20 of the beft would, I believe, be as many as the moft able phyfician would think neceffary to take with him for his refidence during life, at Otaheite or Bolabola.

That it would be of the greatest public utility that physicians, retiring after many years practice, should leave behind them treatises upon all the disorders' we are liable to, for the improvement of future practitioners, instead of our being cloyed with those of young ones, who have had little or no experience, and can be expected to teach us, like shew-boards, little more than where they live.

This, prima facie, feems good fenfe, particularly as it is confined to phyficians who have been in long practice, and can have no finister views; however, I would object even

even against their composing complete treatifes upon all diforders, from my fears that the greatest part might be nothing more than compilations from other authors, whole errors, from not having had the opportunity, or courage, fufficient to fcrutinize them with the neceffary freedom, they would, by this means, propagate, as it would feem, by their concurrent teftimony. Inftead of fuch, were each to leave to the public a post obit legacy, confisting only of those improvements and discoveries in any branches of his profession he may have been fortunate enough to discover, and that in ever fo fmall a pamphlet, it would carry with it fufficient merit.

That the infupportable stench brought on after the skin of a sheep instantly killed for the purpose, split sucking pigs, whelps, pigeons, or the like, applied reeking hot to patients in some disorders, is a sure proof of their amazing good effects, by their thus imbibing and drawing out of their bodies, the noxious miasmata, bruises, Sc.

This

This fector is caufed entirely by the putrefaction brought upon the fheepfkin by the heat and moifture of the patient's body, and would therefore be more likely to add to, rather than take away, any febrile miafma. The fame thing would happen upon the application of these to perfons equally warm, who are in perfect health.

That mercurials induce a putrescency of the bumours, as is very evident from the fætor of the breath in a salivation.

This cannot be the caufe of it; falivation being always attended with inflamation, and a ftrong texture of the blood; the action of mercury being ftimulant in general, and in particular a falivary one.

That pains remaining in the tibia, and other bones, after a complete falivation has been undergone, prove that a portion of the venereal virus is still lurking there.

That this may not always be the caufe, has appeared from an accumulation and a greater degree of these pains having been the consequence

quence of a fecond falivation, inftituted and undergone for the more certain and effectual removal of them. The true caufe, not unfrequently, of fuch complaints, may have been, the mercurial ointment having been made of mercury which had been adulterated with tin foil of looking glaffes, or an amalgamation with lead, and recovered from its admixture; the finer mercurial particles of fuch amalgamation paffing freely themfelves through the very minute veffels of the bones, and there feparating from the more grofs particles of the lead, which are too large to pass with them; the particles of lead thus difunited or decomposed, are depolited and remain in them. In proof of this doctrine, an ointment composed of mercury, which had been well purified, has been found to be the only certain means of removing the former obstructions, and carrying off the dregs, which the adulterated had deposited there. As lead is much cheaper than mercury, it is a very common fraud to adulterate the quickfilver with it, which will evade a difcovery both by the 6 ufual

143

144

ufual teft of paffing it through fhamoy leather, and even by diftillation, if that be not performed in an appropriated retort, whofe neck is confiderably longer than the height which lead can rife to, along with the quickfilver.

Mr. Boyle affirms, that the flow poifon which the Indians make use of, as a great secret, is nothing but hair cut short, and conveyed into the person's meat.

I can give no credit to this; as it is well known that the old women's receipt to kill worms in children, is their own hair cut fhort; cowhage feems to act on worms upon the fame principle.

That the hyp, or hypochondriacal diforder, is all imaginary.

By no means; I believe that many, even maniacal cafes, originate in obftructions of the mefenteric glands. And were we to allow that fome hyppifh perfons, as they are called, have but little caufe of complaining at the commencement of this malady, the

145

the workings of their imaginations will however, most affuredly, in a little time bring on those evils which existed at first in fome degree in imagination and idea only, unless the greatest care be taken that the mind's attention be properly diverted. As fuch perfons are generally in the habit of feeling their own pulses, it ought to be ftrenuoufly inculcated to them, that there is great uncertainty in deducing any prognoffic from the pulse, even by the most fagacious phyficians; it being quicker in women generally, than in men; flower in the morning, than at night; flower after fafting, than after a meal; and when at reft, than when in motion; afleep, than when awake; in cold, than in hot weather; not to enumerate its remarkable variations from the different paffions; fo that it would behove fuch perfons to confult their feelings only, and not their pulfes.

That when the pulse, after a long illness, gives three, four, or five strokes, and L then

then a jar or tremor, it presages approaching death.

I have fometimes, though but rarely, obferved fuch a pulfe in fome perfons in a ftate of nervous debility, when not in reality very ill.

That in a severe iliac passion, crude quicksilver in large quantities is the best medicine.

Perhaps a pint of cold drawn linfeed oil, drank for a dofe, may be a much better.

That foft down beds are most agreeable, and ' bealthy, for invalids.

Quite otherwife; for by their finking under them, they warm and relax the kidneys fo much, as to lay the foundation of gravelly complaints, which are beft prevented by lying on beds hard ftuffed, but even, like pincufhions, upon broad-bottomed bedfteads, which will not fink like facking, placed on an inclined plane, like guardhoufe platforms, with a crofs board at the feet, to fecure the bed cloaths from falling down.

That

147

That kings formerly cured the king's evil.

From a form of folemn fervice at the altar in our old prayer books upon fuch occafions, it must be allowed to have obtained undoubted credit in those days. Mr. Morley's vervain root feems to fall under the fame predicament with Queen Anne's piece of gold, fuspended in like manner from the patient's neck. As Mr. Morley, by his pamphlet, is faid to be a gentleman of fortune, and by this means to have cured hundreds gratis, it would be hard not to allow him fome degree of credit. I can vouch for confiderable benefits, having, more than once, attended an application of my own in incipient strumous schirrhuses, quite as What I built the rationale of my fimple. attempt upon was, a most incontrovertible fact, that when the mind is in a continual alarm and apprehension of the approach of danger to a part affected; it conftantly determines an erethifma, congestion, or influx of humours upon it, be the difease ever so flight,

L 2

143

flight, and thereby keeps up a certain conftant degree of heat and inflamation in it, which, by the continual action of the fame caufe, grows worfe and worfe. On the contrary, a firm reliance upon the skill of the physician, and a strong faith and expectation of a cure, from the continued ufe of fome one thing he prefcribes, and requires to be rigidly perfifted in for a confiderable time, without the least alteration, will actually remove, from incipient fchirrhuses and tumours of the strumous kind, this most injurious erethism, and will thus become of infinite fervice. The patient, now refting the cure folely upon the reputation of the fpecific, be it what perfectly inactive thing it may (for perfectly inactive it is neceffary it fhould be,) religiously abftains from tampering with any applications or medicines whatfoever, which, by drawing the mind's attention to them, would most certainly irritate, and foon induce a pain in a part before abfolutely indolent.

That

That the invention of a medicine which would cure the gout, and prevent its return, would be a great defideratum.

I think there is reafon to doubt Dr. Cheyney's opinion, that a patient, after a regular fit, is as free from it, excepting a disposition to acquire it de novo, as if he had never had it; becaufe I have known a gentleman through every joint of whole body the gout had made a most painfully fevere fcrutiny for fix weeks duration, who, after all his pain and feverishness had left him, happening to have a flight fall from his horfe the first day of his airing, had a return of it with greater violence than before; whence I conclude, that the gout, like an attentive waiter in an adjoining closet, feems to be always within call. And perhaps none are more to be pitied than fuch as have not in their conftitution matter fufficient to bring on a fit, and yet fufficient to teafe and prevent them from enjoying any eafe, or quiet. It is probably matter from overfeeding upon luxurious high-feasoned viands,

with

with rich ftrong wines and fpirituous liquors, in a lazy, indolent habit, unaffimilated and unconcocted in a relaxed ftomach, taken into the circulation by the relaxed open orifices of the lacteals, of too grofs a nature to be therein properly circulated and carried off by perfpiration, which caufes obftructions in the minute veffels of the ligaments and cartilages of the joints which are remoteft from the action of the heart, that brings on that fever, which is Nature's means for expelling it, called a paroxyfm, or fit of the gout.

Hence appears the wonderful abfurdity of those perfons, who, instead of purfuing a temperate regimen, prefer still keeping it up, (as the bon-vivants call it,) and indulging in the free use of strong wines and spirituous liquors, under a pretence of guarding and fortifying the stomach against its attacks, as if what had sirst induced it was the best means of taking it away, or committing fin were the best means to make grace abound.

I believe the Portland powder (as it was called) would go a great way towards an fwering

ing the defideratum; but that unfortunately, if continued for the full time it is directed, the remedy would be worfe than the difeafe, as by tanning the villous coat of the ftomach, and the fine veffels of the lacteals, it will most affuredly, by a commutation act, exchange the gout for a palfey, or apoplexy, and when this happens to an old debauchee, whofe conftant diet has been ever high, and ftimulated with the provocative affiftance of mustard, garlic, horseradish, salt, pepper, cayenne, and the whole tribe of heating aromatics, rich fauces, pickles, and Indian cruet drugs, and whofe conftant drink has been the richeft cordial, inflamatory wines, and spirituous liquors; can any thing be more unreasonable than for fuch a person to expect a cure from shop medicines of far inferior virtues to those he has all his lifetime made his food? Would not this be to fend a cow to overtake a hare? It must be clearly evident, that in fuch a cafe nothing but a total change of his mode of life, diet, &c. (like the new birth to profligate finners,) can be of any avail.

151

That.

152

That claret is a most improper liquor in the intervals of the gout, as being more apt than any other to bring on a fit of the gout.

This effect of it, fo far from being objectionable, may rather be much in its favour; for as a fingle bout or two of claret drinking, (as has been obferved,) which is often more than fufficient to bring it on, cannot be fuppofed inftantly to ftore the blood with fo much gouty matter as would be fufficient to furnish out a fit of it (Nature working by much flower degrees); fuch bouts can no otherwife produce a fit, than by ftrengthening the ftomach and bowels, by the wine's fubacid aftringency, generous warmth, and spirit, upon the fame principle exactly as the Bath water; infomuch that the conftitution becomes then enabled to drive out the dormant gouty humour, which before lay difperfed through the habit. And furely, if there be any medicine or liquor that can throw out any noxious humour out of the body upon its proper seat, it ought to be esteemed a friendly act in it.

That the matter of the gout has been known to be translated, and to fly from one foot or joint to another.

This may poffibly, for ought we know, happen from a new deposition of gouty matter on those parts, after the first have been so filled as to admit of no more of it.

That oil-cafe coverings are excellent applications to the knees, or other joints, of gouty people.

So far otherwife, they have been known to bring on a rigidity of the articulation.

That as health depends upon exercife, the strongest and most active kinds are best, such as fox hunting, cricket, tennis, &c. &c.

When exercife is medicinally recommended, no other forts are meant but fuch recreations as require only gentle bodily, or horfe exercife. Walking, if the invalid be able, is by much the beft of any, as more of the mufcles of the body come into action, than

than in any other mode of it. The beft carriages by much are open chairs, phaetons, or landaus, where the air has every free accefs to the body; coaches and chaifes are generally too hot, like little chambers, and if a glafs or two be let down, the cold air let in upon an invalid, who may probably by long illnefs and confinement to a warm bedchamber have been rendered a hot-bed plant, will moft undoubtedly give him a cold. Violent exercife excites violent fweats, which exhauft the conftitution more than other evacuations, being nothing lefs than the pure ferum of the blood, the very matter of nutriment to the whole body.

Young lufty men, indeed, who indulge in overmuch eating and drinking, do not immediately fuffer fo much from violent exercife, as they by this means carry off their plethora.- It is, however, well worth the confideration of thofe, that fuch is the natural ftructure and mechanism of the body, that in proportion to the degree of ftrength they exert, and the more vigorous their circulation, they fooner wear out, and bring MEDICAL VULGAR ERRORS REFUTED. 155 bring on the mors fenilis, when the arteries grow rigid, and lofe their elaftic power, upon which the circulation and life both depend.

That in prescribing a regimen for Valetudinarians, care should be taken to probibit them the use of malt liquors.

This, though as ridiculous, as it is at present a general practice, must arise solely from the ufual routine, whereby one prefcriber follows another without a wellweighed confideration, and a fufficient knowledge of the virtues and nature in general of what they thus in the lump condemn. It is most certainly the duty of the physician who prefcribes wine in preference to it, to inform his patients where this wine is to be procured genuine, or at leaft to fupply them with a vial of those drops which discover whether its pleafant flavour be owing to the poifonous fugar of lead added to it, or to the natural flavour of the juice of the grape. It is well known that all the white wines of ' Portugal have not in themfelves a body fufficient, without a confiderable addition of brandy,

brandy, to keep them in that very hot climate from a fret, even while they are carrying down to their own ports, and we by experience find that all the cookery of our coopers after their arrival in this much colder climate, by the addition of perry and brandy, is not able to prevent their giving us the heartburn, if taken on an empty ftomach. Port, indeed, having naturally a better body, does not require fo much brandy, unless when it is to be paffed upon hard drinking people for extreme good found genuine old port. Elixir of vitriol, the common ingredient in the port of public houses, is a cheat fo eafily discoverable by the taste, that it may be avoided. As to any kind of fpirits, from infernal hogwash gin, through all the gradations of whifky, arrack, rum, and brandy, up to fpirits of wine, any farther than the little fervice they afford us in making tinctures of certain drugs, it would have been well if they had never been invented, for I am most firmly perfuaded those enjoy the most health who never taste them in any form. I know that brandy, and rum,

rum, and water, have been often recommended as the beft common drink for low fpirited women, upon the fuppofition that when much diluted they can do no harm. But when it is confidered that by habit the ftrength of them becomes imperceptible, I would most particularly caution females of delicate conflitutions totally to abstain from them, not folely from the confequence of thin lips with a black lifting, four breath, red nofe, and a richness of countenance, with morning hawkings up of tough phlegm. imperceptibly brought on though undoubted proofs of the caufe they originate from; but becaufe they will also most affuredly lay the foundation of schirrhous livers, gravel, dropfy, palfey, and all the cold and nervous diforders in weak, fedentary, inactive perfons.

Well fined porter, from a capital houfe in London, above fophifticating it, agrees with most people. But to deliver with justice the praife or dispraise of malt liquors in general, without first perfectly knowing the nature of the waters they are brewed with, and the length of time taken up in boiling them

them in different counties, (two articles which give Welch ale its fuperior excellence,) their ftrength, colour, age, finenefs, palenefs, and the goodnefs of the malt and hops, would be nugatory and abfurd. But moft certainly, when well brewed, pale, clear, and well hopped, and not too ftrong, or kept to become beerifh, they have all the good qualities that can be reafonably wifhed for in any drink; and when taken in the quantity of a few glaffes only, is a lefs inflamatory cordial than any at prefent in ufe, being nutritious alfo and ftomachic, without inducing coffiveness as red wines do, or raking the kidneys as cyder, perry, and other diuretics are known to do; infomuch that Cyprianus, the great Lithotomist, has declared, that out of 1500 whom he had cut for the ftone, he had never cut an aledrinker; and it is a well-known truth, that few, even hard drinkers, whole constant and only liquor has been ale, have ever fuffered much from the gout. Notwithftanding this just encomium on good ale, the ale of public houses is frequently most

14

abo-

abominably adulterated, by an addition in its brewing of the poifonous berry called cocculus indicus, meant to fave malt, and facilitate intoxication. It is hardly credible what quantities the druggifts import, and fell under-hand for this fole purpose; as to the other use of it, sometimes to poison fish, would hardly answer its importation. The ale thus cooked up is clear and very ftrong, and remarkably heady, and of a deep colour; and that its tafte may not betray it, artful brewers fometimes add to it grains of paradife, ground-ivy, or wormwood, to difguife it, pretending thereby to make it more healthy.

That the vital functions continue their actions with greater vigour and activity during our fleep, than while awake.

Though this was *Boerbaave*'s opinion, it cannot be true; for during fleep, though refpiration feems, from its rattling, to be ftronger and more vigorous, it is really much weaker, only more laborious; for there is then lefs air taken in, and the circulation, not being affifted and forwarded by the actions

159

160

actions of the muscles of the body, and also by the fenfes, becomes much flower. Hence perfons afleep appear much paler, which is a proof of it. It is also evident from the pulse, which is much flower, and the animal heat much lefs, as may be proved by the thermometer. Hence it is that a perfon fleeping in a chair, if not wrapped up with more cloaths than when awake, foon finds himfelf very cold. *Boerbaave* was probably misled by *Sanctorius*'s experiments, who faid,

"That we perspire more in the same space of time when asleep, than when awake."

De Goerter, upon trying Sanctorius's experiments over again, difcovered the miftake. It is well known that animals, the more they fleep the more plethoric and fat they grow; and per contra, the lefs they fleep, the more thin and meagre. All the fluids, as milk, urine, &cc. are fecreted in larger quantities by perfons awake than while afleep; hence it is alfo that we become more hungry while awake, from the fecretions becoming then more plentiful.

Great

Great cures have been attributed to the ufe of a few grains of millepedes as an alterative, and to a few grains of faffron as a cordial.

I am inclined to believe fuch cures must have been effected by fome other means, or the vis medicatrix alone, and are not owing to medicines of fuch trifling virtues in fuch fmall dofes.

That it is a dangerous practice to put an inked pen in one's mouth, or to lick up a blot of ink from the paper.

Ink, though extremely harfh, is not poifonous, being only a very ftrong tincture of fteel, which when fufficiently diluted, would be no very bad medicine of that clafs.

That the palate is the organ of taste, hence an epicure is said to be a person of a nice palate.

This is a figurative expression; the palate, though fensible of weight, cold, or the like, is not in the least fensible of taste; for the curious *Bellini*, upon trial, found that he M could

could perceive no manner of tafte upon preffing fapid fubftances, even of fome degree of acrimony on his palate, lips, gums, &c. but the tongue alone, which is furnifhed with conical-figured numerous nervous papillæ, covered with a fine fkin and epidermis, was the true organ of tafte, when fapid fubftances were preffed upon it by the palate.

That animal food becomes more or lefs nutritious, as it is more or lefs boiled or roafted.

Undoubtedly the contrary; the lefs it lofes of its blood and juices in the cookery, or the more of them it retains, the more alcalefcent and nutritious it is, being moft fo when raw; and *per contra*, the more boiling and roafting it undergoes, the more its juices are exhaufted. An ox's mufcle has, for experiment, been boiled in different waters fo long, that nothing but the fibres or fkeleton of it remained, which thus prepared will never putrify, nor will it be eaten by a dog if thrown to him. Roafted and

and boiled flefh differ confiderably, during the fame time of cooking, in their qualities; the juices of the roafted are kept in and protected from the exhausting power of the fire by the cruft formed round it; whereas in boiling, the water penetrates it and exhausts its juices greatly, as is very evident from its favory broth. The fatter any flesh is, the more it tends to an alcaline state, and the more it will pall the stomach.

That one hearty meal in the day is more wholefome than three or four slender ones at stated intervals.

By no means; on the contrary, the lefs the ftomach is loaded and oppreffed, the better the process of digestion is carried on.

That it is best to wait for a confiderable degree of hunger before we eat our meals.

Not at all; for the painful uneafinefs we call hunger, in proportion to its duration and increasing violence, must be very prejudicial to the stomach; whether we suppofe it to proceed from the attrition of its

coats

coats against each other when there is nothing interposed between them, which must inflame its most tender villous coat, or from the corrofive quality of a certain gastric liquor, of fuch digeftive power as to prey upon itfelf, and even after death, according to fome authors.

May it not be probably one reafon, viz. to guard against this attrition, why an oftrich fwallows fuch a vaft variety of things of all kinds indifcriminately as he can pick them up, neither apparently adapted like gravel for chickens to triturate their food, nor to affift its digeftion, fuch as cloth, grafs, wood, nuts, stones, bones, glass, brass, tin, filver, copper, lead, iron, &c.? May it not alfo be for the like intention that Wiltfhire farmers always cram their working horfes with great quantities of innutritious chaff and douft, as they call it, mixed with their corn, fancying that they never work fo well as when their bellies are kept full and tight? Hence alfo it is that the Indians, when provifions grow fcarce upon long hunting expeditions, find much benefit from binding a board 4

MEDICAL VULGAR ERRORS REFUTED. 165 a board tight against their stomachs, probably to prevent attrition.

That fick perfons ought invariably to be reftrained to a very strict observance of rules, as to diet, as well as medicines.

Hippocrates thought otherwife, especially if the thing recommended should happen to cross the appetite of the patient; for, as he observes, meat and drink, though somewhat worse, if pleasing, ought to be preferred before better which is displeasing, so much depending upon the particular idiosyncrasy of the patient, which it is no easy matter for another to discover.

That a collection of recipes of physicians, taken off the files of apothecaries, may very well fave the expence of employing physicians.

Pretty nearly as well as a cheft of his tools may fave the expence of employing a watchmaker. If it were known what particular intention a *recipe* was directed for in a particular diffemper; the ages of differ-

ent people and their temperaments, and the various fpecies, combinations, and complications of their diforders would flill be matter of most neceffary investigation, before such, or the ready-made ones of pharmacopœias and hospital dispensatories, and their doses, could be ventured upon. Sydenbam wished to be esteemed a physician, not a prescriber of medical forms, which two arts or provinces he thought to differ widely from each other,

That green and bohea tea are the leaves of one and the fame tree; differing only from the different feafons of gathering them, and the different ages of the trees.

These trees are of late become so common in our gardens that they are well known to differ remarkably from each other. The bohea is a very tender shrub, which requires a greenhouse in winter, and is perfectly distinguishable from any other teas by its berries. But the green is a hardy shrub, and will stand the weather in our climate, and live out with our gooseberry trees. The

The relaxing quality of the infusion of teas proceeds from our drinking it hot, if it be made weak, particularly the green; for when this is made ftrong and drank cold, it is a remarkable aftringent, and when very ftrong proves emetic. The Chinefe, who must be the beft judges of the qualities of teas, make use of bohea only for their own drinking, of which a fufficient quantity for the whole day's beverage is made in the morning, and carried out with them to their rice ground, or other employments; which they always drink cold, and without fugar; they do not infuse it after our manner, but boil it in a tea-kettle, (ufing tea-pots only as ftrainers,) probably the better to evaporate the fine fmell of their best teas, which are faid to have an intoxicating quality, unless they are kept a year or two before they are ufed.

A more convincing proof of the deleterious quality of our fine green tea can hardly be conceived than Dr. Percival's. He confined, by a little weight of lead upon his back, a frog upon the rim of a faucer full of green tea, of the heat and ftrength which

our

our ladies are accuftomed to drink it, in fuch a manner, that one leg fhould lie in the tea, which foon became paralytic; he then, in like manner, tried another leg, which fuffered alike; and fo on with the reft, to that degree that the animal could not make the leaft use of either of them.

The mode of manufacturing their teas is faid to be as follows: the leaves, when gathered off the trees, have a cauftic oil upon them; to take off which, they infufe them in water for fome time, after which they with their hands roll the green tea leaves upon copper-plates, heated by a flove underneath. The fmall remains of the acid oil, ftill adhering to them by its corroding the copper, is thought to communicate to it the green colour which the English look upon as the teft of its goodnefs. The bohea not bearing fo good a price in Europe, though dearer in China, is rolled on a common table with lefs care, and afterwards dried by flirring it in heated iron pots, with as little trouble as may be; a little tinge from the iron may probably be one reafon for its greater

greater healthfulnefs, and the caufe of its colour; and as it is fo cheap, there is not the fame temptation to adulterate it. The dealers in London, after buying a lot of green tea. fpread it upon a long table, and employ women to pick and separate it into several different forts, as to the colour and fize of the rolls, &c. to which they afterwards give what names they think proper, as hyfon, imperial, cowflip, &c. &c. However, towards cowfliping a portion of the former, to enhance its price, one or two drops of otto of roles is added to a canifter of it, to give it the fine fmell it is admired for. What tree, or contrivance, produces what is called fouchong, I have not learnt; all we know of it is, that it differs much from bohea, as it has no berries in it, and often makes people fick whom the bohea perfectly agrees with.

> That the fine green colour of pickled famphire, cucumbers, &c. is a proof of their goodnefs.

> > It

It proves quite the reverfe, and that they have been ftained of that colour by the verdigrife from vinegar and copper: their being of a black colour would indeed be a proof of their inoffenfivenefs, and of their having been done, as all pickles ought to be, in iron pots.

That cochineal is a kind of grain; whence all filks and cloths dyed in it are faid to be dyed in grain.

A wager first determined this matter, and the microscope has fince very plainly difcovered them to be little flies. And when we are told, to enhance the value of a piece of fine yellow, green, or white cloth, that it has been dyed in grain; it is a palpable imposition, as there is no red in it. It is an ingredient in many medicines, from its beautiful colour only; as even from an ounce or two of it, little more medicinal virtue could be expected, than from fo much millepedes. After Dr. Berkenbout had difcovered the fecret of communicating its dye to cotton, for which he received 5000%. the

the cotton dyers, to whom it was offered gratis, (would any one believe it?) have refufed to ufe it; being contented with the dull dirty red in prefent ufe; fo that government has thought it better to keep it still a fecret than publish it, which would enable foreigners to beat our cottons out of every market.

That bodily pain is an evil.

In a moral fenfe, it was certainly introduced, as well as death, by original fin; but poffibly in its natural defign it may never have been intended by a merciful God, who can over-rule evil for good, to make us unhappy; but rather to teach us our dependance upon him, and to guard us from mifery and greater pain in death. Were it not for pain, we might, in many cafes, be destroyed before we were aware of it; it being only excited when fome violent injury is offered, or, as in hunger and thirst, to stimulate us to provide a proper fupply of nutriment for the fupport of the body; as, but for this uneafy fenfation, we might be fo engaged in

171

in our purfuit of pleafure or profit, as to neglect to fupply ourfelves with the neceffary fresh chyle. It is pain, also, that admonishes, and even compels us, to guard against growing difeases, and to use all our endeavours towards a speedy removal of them when they afflict us. Lassitude also, the natural painful consequence of excesses and debaucheries, is an excellent monitor to convince us of the injury they bring upon us.

That it is a fortunate circumstance that the rattling noife which the rattle-fnake is obliged to make in its motion, affords travellers in the woods notice of its proximity and their danger.

This is fo far from being the cafe, that the fnake, in its ordinary motion, is not heard to rattle at all; the rattling being only excited at will by the fnake, for the fole purpofe of frightening hares, fquirrels, and birds, out of their bufhes and hiding-places, to become its prey.

That liquids are the best form for medicines, as being easiest to swallow.

Not when there are ulcers in the throat; in which cafe, more mufcles are brought into action towards fwallowing liquids than in fwallowing pills or bolufes.

That bark in fubstance, given in a phthifis pulmonalis, causes obstructions, and an inflamation of the lungs.

Some authors deny this. It is, however, certain, that by its fermentation in the ftomach, it is apt in a variety of cafes to produce flatulencies, head-aches, and difficulty of breathing; however, a gentle emetic removes thefe fymptoms.

That it would be of the greatest use to collect all the recipes and nostrums recommended for persons bitten by mad dogs, that the miserable patients may give them all a fair trial.

Of much greater benefit would it be to perufe Dr. Berkenhout's treatife, wherein he proves that in the hydrophobia, (the only true fymptom

fymptom of infection,) all the cried-up medicines, fuch as the Orm/kirk medicine, (which is nothing but dirt;) meads lichen, mufk, opium, mercurials, and fea-water, &c. are not of the leaft efficacy; and that, without lofs of time, new trials ought to be made of fome other means, without confiding in any thing hitherto recommended.

That the nerves (like fiddle-strings) are fometimes too much relaxed and unbraced, producing fainting fits, despondency, and palsies; and at other times screwed up to too high a pitch, causing the violent passions of anger, rage, and fury.

The above is a figurative mode of fpeech only, which people have made use of to exprefs what they could form no right conceptions of; the nerves, so different from all this, being simply continuations of the brain only, the softest pulp imaginable.

That the doctrine of the nerves, as to their mode of action, and the existence of their animal spirits, is involved in so much obscurity

fcurity and darkness, that little or nothing certain is known of them.

Great difficulties there certainly are upon this fubject, as well as many others in the animal œconomy. It is, however, no objection against the existence of the nervous juice, or animal spirits, that the fine veffels containing it cannot be demonstrable to the eye; for who can demonstrate the wonderfully fine veffels that are well known to exift in our cartilages, nails, and bones, and in the fmalleft animals, who are univerfally allowed to be hydraulic machines? The animal fpirits are fuppofed to be formed of the most diluted lymphatic parts of the blood, a fine bland liquor, like the spiritus rector of plants, or the vapour of water. We know that nothing which is not in the greateft degree mild, and endued with perfect lubricity, can be fuitable to the nerves; for substances of the leaft acrimony would foon deftroy them. It can, therefore, have not the least refemblance to spirits of wine, fire, or lightning darting with incredible velocity, backwards and

175

176

MEDICAL VULGAR ERRORS REFUTED.

and forwards; there being no fuch thing in the blood.

From the difficulty of accounting for the inflantaneous communication of fensible objects by the nerves to the brain, and vice versa, some philosophers suppose the nervous fluid to be of an electrical nature.

This cannot be; for the electrical matter could not be confined within the nerves; as it is known to exert its force upon the flesh and fat as well as on the nerves. A ligature also on a nerve is known to take away fense and motion; but it can by no means ftop the motion of the electric matter.

The nerves of the *cerebrum* prefiding over the animal functions are exceedingly fimple, being a collection and continuation of the fecretory tubes or medulla of the brain, and contained within a coat from the *dura mater*. They are not branches iffuing from trunks, but are only fimply feparated; their fibres continuing all along entirely diftinct like fkains of threads; by which wife contrivance, a confusion of fenses is prevented. But

But those of the cerebellum, prefiding over the vital functions, are larger ; the cerebellum being more firm, denfe, and folid, than the cerebrum, and having more cortex in proportion to its medulla; its veffels alfo unite together and form larger tubes, and by this means take up lefs room; for had they been, like the former, separate and diffinct, they must have taken up a larger space; hence the motion of the animal spirits must be more equable and quick in them. But as they form frequent ganglions in which they are intimately blended together, they produce no diffinct fenfations, but are thought to be the caufe of the fympathy observable between certain particular parts, though fome think these fympathies not to depend upon the mere connection of these nerves. but on the impreffions made upon and transmitted through the brain to the fympathifing organ.

Bellini's experiments feem evidently to prove the existence of animal spirits. After having opened the *thorax* of a dog on one fide, (had he opened both fides the dog N would

173

would have died,) he pinched the *diaphrag-matic* nerve between his finger and thumb; upon which the *diaphragm* inftantly loft its action, but upon letting it go, it inftantly recovered its action again. After having loft its action, upon being pinched as above, when he ftripped it downwards below the pinched part, and by that means fqueezing downwards the animal fpirits, its action became again reftored. When he ftopped it a fecond time in the fame place, it would not recover its action; but if he ftopped or pinched it a little higher up, and from thence ftripped it downwards, it would then very manifeftly recover its action again as before.

That it is impossible to form a right conception of the mode by which the nerves convey their fensations to the fensorium commune.

It is really fo; all that is supposed is, that it is effected not only by the nerves themselves, but also, by their coats, which have the power of stopping their contained liquor. And if a vessel be full of a fluid,

a fluid, and an impreffion be made at one end of it, we know it will be inftantly conveyed to the other end of it. But were this their fole mode of action, we could be fenfible only of magis & minus. However, befides this, their coats muft contribute greatly afterwards towards enabling us to judge of the different qualities of objects, as may be gathered from the nature of pain, which is nothing more than a *folutio continui*, by the acrimony of the blood acting like little cutting inftruments upon the part; for when a part is cut off, it becomes void of fenfe. Titillation feems alfo to proceed from a change of difpofition in their coats only.

That the fmell of a lime-kiln preferves people from confumptions; and that pregnancy has the fame effect.

I fear neither affertion is true; becaufe I knew a woman, of about thirty years of age, who was attended before and after pregnancy by an ingenious phyfician, in a confumption, who died of it fome months after her delivery, though fhe was born, and N 2 always

always lived as near as poffible to eleven lime-kilns in conftant work, during the feafon, the fartheft not 200 yards from her houfe. An unmarried girl, her next door neighbour, died alfo confumptive.

That in difficult cases, where all other medical assistance has failed, electricity has performed surprising cures.

For fome time it certainly was looked up to, like tar water, as a cure for almost all diforders; yet confidering the great powers of electricity, as an inftrument in philosophical experiments, it is not a little wonderful how very few flubborn diforders it has hitherto been actually known in reality to have cured. To evince which, Dr. Graham's confession, himself a host in this matter, is certainly proof fufficient; that, as I before hinted, notwithstanding he had an apparatus which far excelled every thing of the kind on the face of the earth, and had for ten years, ten thousand more patients than any phyfician in Europe ever had, and confequently greater opportunities of discovering

its

its virtue; yet upon his confcience pricking him, and to render mankind all the reparation in his power, that of preventing them from being duped by other fubfequent electricians; he openly confessed that, with all his electrical, aerial, magnetical, and cœleftial apparatus, he never had in his lifetime cured one perfon (though his book of wellattested cures is no fmall one, agreeable to the cuftom of puffing quacks) whom he might not have cured by the common ufual means and medicines without it. As for the boafted cures of other electricians, it is natural enough to conceive that a man of a warm imagination, who having purchased a wheel and apparatus to amufe himfelf with, from a ftrong defire to convert electricity to fome more real use than to exhibit bocus-pocus tricks, should first impose upon himself, and then upon the public, ftrange fancied cures of many diforders. As to the question whether electrical experiments upon the human body have, in fact, done most good or harm, much may be faid on both fides. On one fide, interested perfons have publifhed N 3

listed numerous accounts of pompous cures by it. But of those perfectly healthy, who from twelve-penny shocks from itinerant electrical shewmen, undergone from mere curiosity only, who have been thereby thrown into incurable palsies; though many such have happened, few of such cases, as people are a little shy in owning their disappointments, have been published. Of late indeed, fince the invention of electrometers, electrifiers know a little more of the danger attending it, and therefore will run the less risque of shocking the nerves so terribly as formerly.

All I can, from my own knowledge, fay is, that after having feen a great variety of trials long perfifted in, and conducted by profeffed electricians, in a variety of diforders, I had recommended trials to be made in fuch as gutta ferenas, palfies, chronic rheumatifms, fcrophulous eyelids, &c. I never faw one fuccefsful cure. Neverthelefs, I do not prefume to fuppofe, that for the fugacious pains of low-fpirited hyfterical people, of ftrong expectations of cure, from crede

183

10

crede quod babes et babes, fome relief may not have been given them by electricity, as it very often has happened from nothing at all, that is to fay, from Mefmer's tricks. I have never known it tried in the cafe of the fufpenfion of vital action in drowned perfons, where, from its being fo powerfully active an inftrument, I am inclined to believe it may poffibly be of fervice, but I never had an opportunity of trying it.

That Sea-water, taken internally, causes great thirst, and is a great heater.

This happens only when it is not fufficiently diluted to pafs through the kidneys without irritation. The beft way to take off its difagreeable tafte is, to take half a pint of it in one hand and half a pint of common water in the other, the latter to be fwallowed inftantly after the former, before it has had time to imprefs its tafte upon the tongue. Sea-water thus wafhed down haftily, is not difagreeable, and being thus diluted, paffes through the kidneys without caufing any pain in the back,

N 4

or feverishness, and without the least fickness procures a gentle motion.

The only preparation neceffary towards a courfe of fea-bathing in general, is to bathe in a hot fea-water bath for an evening or two firft, to relax and open the pores of the fkin; after this, cold fea-bathing, and drinking it, fhould commence, and be continued every morning. In hot weather, however, from July to the end of Auguft, when the nights become difagreeably fultry and warm, the moft prudent mode may be to drink the water in the morning, and bathe in it late in the evening of the fame day, which will enfure a cool and agreeable night's reft.

Cold fea-bathing, as it is about feven times warmer in general than a cold bath of fpring water, and a forty-fifth part heavier, is advifed upon a very different principle from the latter, whofe virtue confifts folely in its chilling coldnefs, and the force with which the flock of it impels the blood with violence upon the heart, and its confequent

0

glow

glow from the heart's elaftic re-action in forcibly throwing it back again upon the external parts. On the other hand, the warmer the fea is, which I have always felt to depend upon the roughness of its waves, the better effect it has in foaking into the minute abforbent *canaliculi* of the skin, and in fcouring the glands of it, by a faponaceous quality which it possibles in an eminent degree, whereby it becomes so very remarkably ferviceable in their various obstructions, and the consequent defædations of the skin from checked and obstructed perspiration, in luxurious fed and indolent hysterical people.

It is a well known obfervation, though the bladder may have been emptied entirely at going into the fea, that after a quarter of an hour's fwimming in it, a very confiderable quantity of clear limpid water will, by abforption, have found its way into it; it is likewife well known, that in that most dreadful fituation of failors cast away in a boat, being almost burnt up with raging thirst, for want of water,

water, wetting their bodies with towels out of fea-water has afforded them remarkable relief. This being fea-water's peculiar excellency, together with its faline quality, oilinefs, and ponderofity, thofe who expect all poffible benefit from a hafty dip or two, out of a bathing machine, will affuredly meet with difappointment, as in this expeditious manner of ufing it, it must be greatly inferior to a cold bath.

In chronical, deep-feated, rheumatifms, hot fea-bathing and fumigations properly conducted and confifted in for fome time, will effect very great cures, provided they are perfected by a fubfequent courfe of fea-bathing as I have experienced in cafes which have refifted every contrivance in the application of the Somerfetshire baths. I have alfo known the like fuccefs in inveterate leprofies, impetigoes, tetters, and various eruptions, and defædations of the skin by drinking and bathing ip it.

DEL VI

It

It has been an old prevailing opinion, that the gushing out of blood from various parts of a body murdered, upon the touch of the person supposed to have been the murderer, was certain proof of his guilt.

When we confider how natural it is for a great number of people to flock in to view a murdered corpfe, which muft heat a fmall room, and that poffibly alfo the corpfe may have been moved, and carried from fome diftance off, and in warm weather; it would in fuch a cafe be no wonder that being full of blood, upon a putrefaction coming on, fome blood veffels fhould burft open, as they all will in time, as well on the touch of an innocent perfon, as on the touch of its murderer.

That a pure dry air, well ventilated, is of the utmost service to all weakly valetudinarians.

Not without exception; for those of a dry temperament and emaciated, require the moist air of vales, &c. no air having an

an abfolute, but only a relative virtue, as what is agreeable in food to one conftitution, may be defiructive to a different one.

That acid gargles are of the greatest fervice in quinseys.

I have thought them hurtful, becaufe they contract the emunctories of the falivary and mucous glands, and thicken their humours. A decoction of figs in milk, with the addition of fome fpirit of fal amoniac, which will thin the faliva, and caufe the glands to fecrete more freely, will be a much more proper gargle.

That the use of rouge on a lady's face is perfectly inoffensive.

By clogging up the fine pores of the fkin, it will by degrees bring on a fcurfy eruption, by checking perfpiration, and defpoiling the fkin of that fine oil intended by nature to lubricate and keep it finooth; the natural confequence will be in time the deftruction of that beauty it is intended to improve. But every kind of white paint is danger-

dangerous in the extreme, and is fure to bring on a cadaveroufly flinking breath, rotten teeth, tubercles in the lungs, and confumptions, together with a train of nervous diforders.

That it is difficult to conceive how a fudden diminution of beat is produced by perspiration.

The fluid which exhales from the body confifts chiefly of watery moifture, which uniting with a large portion of fenfible heat, is carried off in form of fteam. Hence by promoting a fudden evaporation, water may be fpeedily congealed into ice, even in the hotteft climate; for example, let a very thin vial uncorked, containing a fmall quantity of water, be kept wetted on its outfide with a feather, repeatedly dipped in æther; (a fluid which evaporates quicker than any other yet difcovered;) the water, as foon as its temperature is reduced to the freezing point, will begin to congeal and form a cake of ice.

That

190

That cold is an opposite principle to heat, for it is observed to produce effects diametrically opposite to those of heat.

It is not fo, but a negative quality; cold being nothing more than an abfence, or diminution of fenfible heat, just as darkness is of light; for the coldest bodies in nature, as fnow or ice, contain a quantity of latent heat sufficient, when evolved in its fensible form, to diffolve iron or the hardest metals.

That death from suffocation, or hanging, is caused by a surcharge of blood upon the brain, causing an apoplexy.

Not at all, for no extravalation of the blood, or ferum, in fuch cafes has been found in the cavaties of the brain.

And the carotid arteries of a dog have been tied for fome weeks, and yet he enjoyed perfect health and vivacity. And a dog has been hung by a cord round his neck for three quarters of an hour, after an opening had been previoufly made in the windpipe

pipe below the cord, fo as to admit air freely into the lungs, and he furvived it; but upon fhifting the cord below this opening, fo as to obstruct the air from going into the lungs, and then hanging him up, he died in a few minutes. Neither is death from drowning brought on, as vulgarly imagined, by the introduction of water into the windpipe; for it is faid to have been proved by experiment, that two ounces of water, a quantity greater than is found in the lungs of drowned animals, may be injected into the wind-pipe without proving fatal. Death in all the above cafes is most affuredly caufed by an obstruction of the vital air's paffing into the lungs. In an old man I once diffected, I found the foramen ovale quite open. How long fuch a fubject could have lived under water is a problem of very difficult folution.

That the vulgar opinion that life quits the body in an aerial form, at the inftant refpiration ceafes, appears to be very erroneous; for, on the contrary, the principle of irritability being an innate property of the living

living folids, maintains its refidence in the vital organs a confiderable time after motion and fenfation have ceafed. The principle of fenfibility, or nervous influence, like that of electricity, often remains in a dormant ftate, without betraying the fmalleft fign of its prefence, till it happens to be roufed by the proper modes of excitation, as has appeared in numerous inflances in the recovery of drowned perfons by the Humane Society.

In sudden excessive loss of blood, floodings, &c. occasioning syncopes, a glass of generous wine is necessary.

All ftimulants are here very dangerous; reft alone feems most preferable, to allow the ends of the vessels to close. In such cases, transfusion of blood, if practicable, would feem indicated.

Many perfons in a dysphagia bave been given up and starved, for want of a contrivance

trivance to get any nourishment down into their stomachs.

Poffibly in fuch a cafe an eelfkin drawn over a probang, tied below and above its fponge, with a little flit made in it juft above the upper ligature, might convey (after introducing it into the ftomach) broth, milk, wine, or the like, out of a gum elaftic bottle, with much eafe, and as often as there fhould be occafion for it, to the great relief of the patient.

In an apoplexy, where the patient (who fome time before had a fevere ftroke of a palfy) fell down inftantly deprived of all fenfe and motion, and whofe teeth were fo faft clofed, that they could not be opened to adminifter any kind of medicine whatever; I directed a ftimulating folution of half a drachm of white vitriol in an ounce of water, by way of emetic, to be fyringed through the noftrils; which, to the furprife of all prefent, perfectly anfwered as an emetic, though in an apparently incurable cafe.

That

That as foon as a limb is mortified, amputation must immediately be had recourse to, to prevent its spreading.

It is at prefent the prevailing opinion of the most able furgeons, that the mortification ought to be cured by proper medicines and applications, before amputation be inftituted, which would otherwife only hasten the patient's death.

As various kinds of animals are known to be batched and breed in the ftomach, it feems difficult to give credit to those experiments, which prove that the gastric liquor is so strong a menstruum as to difsolve balls of ivory and bone, without dissolving those tender creatures, and moreover the stomach itself, which contains them.

The reafon given for this furprifing fact is, that thefe living animals, as long as the vital principle remains in them, are not affected by this folvent; but the moment they lofe the living principle, they become fubject to its

MEDICAL VULGAR ERRORS REFUTED. 195 its digeftive powers; for even the ftomach itself is faid to be then digested by it.

That there are certain years (viz. every Seventh) of a person's life, wherein there is great danger of his death, and two more particularly, called the grand climacteric, wherein the planets are most obnoxious.

All this, though handed down to us from remotest ages, has not the least foundation in truth, but is an aftrological reverie.

FIFTY more vulgar errors, detected by my own observation, might, I doubt not, be added, not lefs ridiculous than those the Reader's patience has been already exhaufted with, could I call them to mind; for, notwithstanding the adage, ubi definit Philosophus ibi incipit Medicus, in general, there is not only much less of philosophy, but even of common sense, in use among pretenders to phyfic in all its branches, than perhaps in any art whatever, the art of farriery always most particularly excepted; as every thing there

there is involved in a chaos of Egyptian darknefs: farriers being in general totally ignorant, notwithstanding their numerous publications of the very anatomy of a horfe, of the nature and caufes of his difeafes, and alfo of the nature and operation of the medicines they use. And fo it will continue till the veterinarian inftitution employs ingenious perfons thoroughly to fludy that branch of learning, after cancelling all the unmeaning barbarous terms and jargon in prefent use, together with their farrago of drugs, fo as to have a rafa tabula, and to begin the whole, like a child's guide, de novo; it being much better to erect a new building all the way from the foundation, than to attempt to patch up a rotten one.

Scarcely had our most eminent furgeons, after numerous unsuccessful trials, given up and difcarded the operation of cauterifing the abdominal rings of the human body, first fuggested by the vain expectation that its efchar would fo effectually ftrengthen the part as to prevent the return of a reduced hernia, when our jockeys took up the idea, 31970 pre-

IICO

pretending that firing and cauterifing the ligaments and tendons of the fine legs of a hunter would add to his ftrength and agility; and that Nature's blunder in the formation of faid legs might, by thus crimping up and coalefcing their fine fheaths, (wifely contrived for the free, loofe, eafy play of the fine tendons contained in them,) be confiderably mended by the affiftance of this fancied artificial ftiffening.

Many a dull project may pass muster, as a whim which nobody thinks it worth while to contradict; but when an attempt is made to fupport it by rational argument and experiment, its abfurdity becomes infufferable, as it may poffibly induce credulous people to ruin many a good horfe. To recommend this operation, Bartlett adduces the observation, " that perfons used to the laborious " employment of filing and rafping, find " great benefit, and their arms much " ftrengthened, by binding them up firmly " with tight bandages." True, but what poffible fimilarity can be perceived in these two cafes? To have convinced us of a fimilarity, 03

fimilarity, he ought to have told us that the bandages were made out of the fcorched and burnt fibres of the arms of those filers and raspers, and not from cowhide, or some other such materials.

As I am fond of a good horfe, and from my foul abhor the pain and deformity of thefe cruel and ridiculous fcarifications; if *Bartlett* will be but merciful enough to abftain from his most cruel use of his fireirons, and only borrow the raspers' bandages for them, or laced stockings, or tight boots, if he thinks they will answer the fame purpose better, I shall have no quarrel with him.

That nicking a borfe, to make him carry bis tail well, is of great ufe.

Befides the unnatural appearance his cocking up his tail like a pug-dog gives him; he, by this ingenuity in mending Nature's error, loofes the natural ufe and defign of it, in clofing up his fundament, and beating off the flies at grafs, as he unceafingly continues to do, to prevent their entering and crawling

crawling up into the rectum, to deposit their ova in it, to be hatched into future botts.

That if a horfe should cast his shoe ever so often in a day, a smith must pare his hoof each time; or, which is a more expeditious mode, burn it with the red hot shoe, the better to sit it for nailing on.

Having never thought it worth while to examine the hoof of a dead horfe, to fee how amazingly thin it is, or confidered upon how many horfes he had brought that kind of lamenefs for which no cure can be expected, under a reft for many months, perhaps in a foft marfh, to allow it fufficient time to grow up again.

That it is better that a horfe should break his rider's and his own neck, by sliding over a pavement, than that, agreeable to old custom, the frog placed there for no purpose by another of Nature's blunders, should not be pared away.

For the deftroying of which, however, no reafon has ever been attempted to be given.

That fome medicines have been recommended to us as very fuccessful in diffolving calculous concretions, and stones in a borse's gall bladder.

Our obligations to the author of this difcovery would have been greater, if he had first inquired of fome perfon, who had in skinning a dead horfe feen him opened, whether horfes have any gall bladder at all. If Nature has forgot in its hurry in horfemaking to make him this bladder, the expence of this medicine may well be faved, though its merits may have been ever fo well boafted of.

That manger-biting (cribbing) borfes ought to be prevented, by covering the manger with tin, as by this means they would bring on colics, by their fucking in a great quantity of air.

No farrier will ever comprehend that this is nonfenfe, till he is taught that no air is ever infpired into the ftomach, but into the lungs only.

That,

That, in hard riding, it is abfolutely neceffary that the rider should pull in his horse's jaws with all his might, to force him to keep them open, on purpose thereby to ease his breathing, and so save him from breaking his wind.

This translated into Irish would run thus; the best mode of keeping a horse's windpipe open and clear for eafe of breathing in hard running, is to violently fqueeze and compress its fides together closely against his jaws; or, in other words, the best way of enlarging the paffage of his breath is to contract it, and make it as narrow as poffible. This clearly explains the true reason, why horses, that in running pull very hard, are efteemed the beft hunters; because, having more sense than their riders, they forcibly and effectually refift, and prevent their being able to pull in their jaws, and by that means enjoy a freedom in breathing, of which their riders have not fufficient ftrength of arms to deprive them.

That

That those are the best riders, who, by standing on the stirrups, keep continually jumping up and down upon the saddle like magpies.

As if this most violent pounding a horfe's kidneys gave the horse no uneasines, and as if standing thus on the stirrups took away all the weight of the rider.

That it is neceffary to avoid wetting the feet of flable borfes, and that their boofs ought to be kept well fluffed with bot refinous ingredients.

Such applications, inftead of foftening the hoofs, for which they are intended, on the contrary dry and contract them. The beft way to keep their hoofs foft, is to ride them twice a day into the water.

That thick, heavy, long, concave shoes are the best; and that the bars ought to be kept down, pared, and kept open.

This is the most hurtful practice that can be thought of; for the frog (even if it has

not

not been pared) is by this means raifed fo high above the ground, that it becomes abfolutely ufelefs, and the heels are thus deprived of that most ufeful fubstance the bar, which was most wifely provided by Nature to keep the cruft extended to a proper width and distance, to prevent the contraction of the heels, and a confequent lameness from their being thus, as it were, fixed in a mould. Instead of the above kind of shoe, a short flat one, thinned on the inside, is the only proper one.

That a good horfe requires a close warm stable.

Our grooms think that there is fome analogy between a horfe and a cricket, for that each does beft in a warm place. And I have wondered that fome of our noblemen of the turf, who are implicitly, and, I may fay, often blindly led and guided by their jockeys, have not built ftables with fire-ftoves within them to keep their horfes in a pine-apple heat, which would certainly make

make their coats fleeker and finer. Many inftances may fhew how, with a good deal of ingenuity, we may be able, in fome refpects, to act contrary to Nature with a fuccefs much beyond what could rationally be expected, as in keeping fifh out of water, or the like; carps in Holland having been hung up in cellars with their mouths open, and fed with bread and milk.

By a fimilar perversion of Nature's defign, instead of keeping our horses out all the year in fields, having open hovels only where they may run in for their hay at will, and shelter themselves from funshine and hail, the weather they diflike the most, we find that they may be made to endure close warm stables, with the inconvenience only of being rendered exceedingly tender and fusceptible of colds upon the most triffing occasions. Yet, if we follow Nature, and confider that a horie was clad with hair fufficient to enable him to bear the inclemency of the weather, and that naturally he is an inhabitant of very inhospitable climates, our stables in this country can never be top

too large and airy, though as open as tennis courts.

That when it enters into the head of a groom that it is neceffary to give a horfe a purge, becaufe he is taken in from laxative rich fucculent grafs, or becaufe it is the proper time of the moon, or some fuch equally wife reason; though nothing certainly can be more abfurd than to habituate a healthy horfe to purges to lay the foundation of colics which he naturally would not be fubject to; the regimen is this: As foon as he has swallowed his dose, he is tied up from meat for twenty-four hours, covered with body-clothes up to the eyes, and kept in a close stable, whose every crevice, key-hole included, must be stopped up from the admission of the least particle of wholefome fresh air, and on the following day, he must be constantly supplied with hot water, and rode out for hours till he is in a lather of fweat, and fo fick and faint as hardly to be able to ftand. Inftead of this abfurd management, when it really becomes neceffary to purge a horfe upon account of fome

fome real illnefs; let him after having taken his medicine, if he be a grafs horfe, be made an out-patient, and turned to grafs, where he will directly drink at the brook, eat his grafs, and in due time will be purged without the leaft ficknefs at all; and if he be a ftable horfe, let him have his corn, hay, and cold water, as ufual, and let him not be plagued with clothing, hot water, or exercise to fweat him, which would entirely counteract the operation of a purge.

That when a horfe has made a falfe step by striking his foot against a stone, and is tripping, he ought to be instantly pulled up tightly, to hold him up, and prevent his falling down upon his nose to the ground.

An Irifh taylor has been faid, in this cafe, when he found a horfe he had hired to go too much by the head, to have tied a heavy ftone to his tail to trim and preferve the proper balance. Perhaps the beft way of fettling this matter is, to obferve how, in fuch a cafe, the horfe himfelf, who muft be allowed to be as competent a judge as the moft honourable or difhonourable connoiffeurs

noiffeurs at Newmarket, endeavours to fave himfelf from falling; and we shall find his mode is to firetch out his neck, not to draw it in. Mr. John Wefley affures us, that he has for forty years rode (perhaps more than most men) not less upon an average than eight hundred miles per month, upon various horfes, and on all forts of roads, in Great-Britain and Ireland; and most usually alfo read fome book upon a good trot, and always gave his horfe the bridle, and his own free liberty to recover himfelf without ever checking him in the leaft, whenever he happened to make a falfe ftep; and he believes that both he and his horfes have had fewer falls than travellers in general of a contrary conduct, who have not rode a hundredth part of his journies. I have myfelf also rode for fifty years occasionally, and always with a flack rein, and can recollect my having had few, or no falls. I own when a horfe trips, his rider naturally pulls up his bridle to fave himfelf out of fear, by inftinct, as Hudibras is faid to have pulled the trigger of his piftol, and not fo much to fave his horfe, which, in my opinion, he has

has no power to do. The fallacy feems to lie in this, that the rider while he pulls up his horfe, as he imagines that he does, never confiders himfelf as a part of or one with his horfe, as in this cafe he most certainly is, and that what he imagines he gains by pulling up his horfe's head, he proportionally lofes in preffing down his back, from which his ftirrups hang, which are his fulcrum; nor does he feem to confider that it is upon his legs, and not upon his head, he walks when liable to make a falfe ftep; and that by hitting his toes against the ground he falls, from a weakness of the extenfor muscles of the legs which at the time give way, for the legs must bend at the knees to let him down on his nofe. Were the rider indeed to ftand upon two pillars, with the horfe detached from and unconnected with him, between his legs, and were he of fufficient ftrength, and had a proper apparatus with ftrong girths round his own fhoulders, and under the horfe's belly; he might, in that fituation, prevent and keep up his horfe from falling : otherwife, as well might an ignorant

ignorant, ill-bred, inland clown, when a boat carries him down a ftream, expect, while fitting at the ftern, to ftop it, by pulling a rope faftened to its bow. Both cafes feem to me to be perfectly fimilar; before the boat can, in the leaft, anfwer to the clown's pulling, he ought to be firft feparated from it, and ftand on firm ground, like the rider upon the pillars.

The advocates for always riding with a ftrongly pulled hard rein, in preference to a flack one, fay, that a horfe will be more fleepy, carelefs, and liable to ftumble in the latter cafe; the anfwer to this is, that a fpur always ready at his fide will fufficiently keep him alert, and in mind of what he is about.

When the great utility and value of that beautiful animal a horfe is duly confidered, and the numberless diforders brought upon him by his being intrusted to the care and management of the most conceited, and confequently the most ignorant of our fervants, who from the most unnatural P and

and ill-founded notion that his ftable and cloathing can never be too clofe and warm, actually make a hot-bed plant of him, and render him fo delicately tender as to become fusceptible of colds and fixed rheumatifms upon every little occasion, of a change of stable, a shower of rain, hail, or snow, or the usual practice of being drawn through a cold horfe-pond while reeking hot, after a hard day's chace, which, in proportion to the power of the caufe, must produce a greater or less degree of stiffness in his joints, and confequent lamenefs; in attempting to remove which, after he has been tampered with perhaps cramped fhoes, and a great number of applications and drugs ignorantly administered, he passes for incurable, and is given over as foundered in the cheft, shook in the shoulders, or some such equally unintelligible jargon : I fay, when all this is duly confidered, and for how many diforders more than our farriers can fpell the names of, it is poffible that a cure upon rational principles might be ob-

obtained. I have wondered much that it has never occurred to any fenfible man to propofe and forward fo beneficial a fcheme as the contriving a commodious equine bath in the city of Bath, from the refuse water turned out of the King's or hot bath. Such a one, properly and conveniently conftructed, with every neceffary well-contrived apparatus for fumigating, fwimming, and pumping upon any part defired of invalid horfes, according to what their different cafes might require, might be conftructed at a very moderate expence, and would, over and above the confideration of its public utility, most assuredly turn out to greater profit to any private perfon, who should undertake to convert the water, at prefent running to wafte, to fo good a purpofe, than fo fmall a piece of ground, thus taken up, could, by being applied to any other ufe, be found to answer.

As mules are as ftrong as horfes, and will work as well, if trained young, are much longer lived, not fo liable to diforders, and

P 2

main-

maintained cheaper; they are certainly preferable to them in fome refpects, particularly if what the Monmouthshire people, who rear great numbers of them, fay be true, that a mule 20 years old, and nearly past its labour in England, will fell for exportation to Barbadoes, for as much as a young one, aged ones being much better adapted to bear the heat of that climate than young ones, who foon die there.

The last vulgar error I shall at prefent take notice of is,

That gentlemen reviewers, who criticife any author's work with due feverity, ufe him very ill.

Speaking as to myfelf, I think otherwife; and that I ought to feel myfelf under the greateft obligation to them, and endeavour to fraternife with them; for what elfe can they do than fhew me my errors, and thereby teach me to mend them, in the very fame manner as I have here attempted to do by those of others? Can any thing be more II friendly

213

friendly and useful to me, than proper inftruction? after which kind correction, I shall be less ignorant, and consequently less opinionated, and shall be enabled, by adopting their hints, greatly to improve my book in a Second Edition.

THE END.
