## furround you; and may your , RIE days

DERMIT me to folicit your fanction to the following Effay, and to return you my fincere thanks for the great advantages which I have derived from all your works in furgery. You have not only adorned that art by your publick Lectures, but advanced it to high perfection. Your writings and method of practice will be lafting, becaufe they have their foundation in truth. Your cafes will be ever true to nature, becaufe they were given by a man of honour and difcernment. To your active and comprehenfive mind, to your long and extensive experience, to your nice respect for the ufeful observations of the ancients, to your dilidiligence in felecting from them, whatever was valuable, furgeons in particular, and mankind in general, owe the greateft obligations. You formed to be defective in candour, when you aimed to be perfect in knowledge. May you long enjoy your natural vigour of mind, and feel a calm repofe under the benign fhade of laurels that furround you; and may your future days be as exquifitely happy, as your paft have been eminently ufeful.

I am, Sir,

Your fincere friend, And obliged humble fervant,

JESSÉ FOOT.

ON THE

BITE OF A MAD DOG, &c.

ith fach feelings upon t

fore thomas

Marice of four melancholy cafe having

town being the ing

decimation

N compliance to cuftom, I fhall continue to call the difeafe brought on the human fubject from the bite of a mad animal, Hydrophobia; notwithftanding Doctor Mead hath remarked, and with ftrict propriety in my opinion, that the word does not convey the true meaning of the effect of water upon the patient, when this frightful fymptom is upon him, which is not a dread of water, but defpair of gratifying thirft, through the impoffibility of fwallowing it.

B

It

It has been alfo remarked by the fame author, that there are other difeafes, although in a more partial degree, in which this fame difficulty in fwallowing is obferved.

I believe that there are very few men who have thought on this fubject, either with a view to medical utility, or from a recent inftance of fome melancholy cafe having come before them, but what muft be impreffed with fuch feelings upon the occafion, as are dreadful to conceive, and painful to exprefs.

And although it might happen, that from the covering which is worn, and fome accidental caufes, not more than one in ten of those bitten by a mad dog receive the infection; yet the hazardous condition that all continue in from the moment of the wound being inflicted, to the utmost limitation that even fabulists report of the dormant state of the venom, must be an interval of horror not to be envied by such as are devoted to decimation, decimation, or by a wretch in a dungeon fentenced for execution. Yet this interval of fatal apprehenfion hath been filled up by a hope that, however falfe, hath fmothered defpair, and lulled the fenfes into a fallacious fecurity,

This will enable me to explain to my readers what would otherwife appear an inexplicable phenomenon. It will also afford me the pleafing gratification of taking off a ftigma, which would otherwife stain the fair fame of the first medical characters, from the earlieft ages down to the prefent times, who have with uncommon zeal published their opinions upon this difeafe, and who have each given into fome favorite medicine for the prevention of it. One medicine hath been ushered into reputation with flattering applaufe, and hath continued its influence, until by the failure of it, it was abandoned by credulity, and turned out of practice to make room for the fucceffion of another and another.

How

How is it to be explained that fuch a character as Mead, for inftance, and fome before his time, men famed for profeffional fkill and honour, beyond all power of fufpicion, fhould have been fo far deceived, as to deceive others, in giving to the publick a prophylactick medicine to infallibly prevent the effects of a bite from a mad dog, which in the event hath proved inadequate to that end, and is not to be trufted?

Moft of thefe eminent men who have written upon this fubject were actuated from the fpur of the occafion; they had been called to a few cafes where the fymptoms of hydrophobia were actually upon the patient; they had convinced their underftandings of the inevitable fate that uniformly awaited fuch as were arrived at this dreadful ftage; and not being able to afford the leaft relief, they aimed to make a ftand againft the difeafe on its firft approach, judging that they could deftroy that in embryo which was acknowledged by all to be out of their power, when once the evil was ripened ripened to maturity. They were not alfo then aware, as we now are, that fo few received the infection in proportion to the many that were bitten by dogs really mad, not to mention fome that were alfo bitten by dogs only supposed to have been fo. Being themfelves at a lofs for a remedy, they either adopted that which came the ftrongest recommended to them, as Mead did the powder of Dampier, or, upon bare probability alone, offered fomething of their own. Grown confident from the fuccels of fo many escaping the fatal effects, they attributed that virtue to the medicine which it had not, and were induced to give their fanction to that which they deemed infallible, upon the pureft motives. Nor had they an opportunity perhaps, who were fo generoufly difposed, in the course of their life time to be convinced of their error and to retract the practice of it. For it is a fact, not unpleasing to be told, that the instances of those really infected, all of whom infallibly die, are in comparison to the numbers bitten few and scattered ; and many a medical man

man of extensive practice passes through life with having been an eye-witness to no more than one, or perhaps to not a fingle cafe.

Such hath been the caufe, why the hope from various medicines, which flattered in profpect, difappointed in the end. Such hath been the ill fuccefs of the great characters which I allude to, that they only kept their reputation, becaufe they honeftly attempted to increase it. And fuch is our ignorance of the nature of this difeafe at prefent, that, with very infignificant exceptions, we have not gained a point of our anceftors two thousand years ago. We remain in utter darkness, and if there be any thing in future to be hoped for, it must be obtained by beginning de novo, by adopting a new fystem, by fubstituting analogy for blind theory, and by making our advances upon the more folid grounds of comparative experiments. By these exertions we may afpire to effential truths, and acquire that fubstantial information which will

will ftand the teft of reafon, and which will be received only as a politive good, by its politive fuccels.

It might be a gratification expected from me, conformable to the general practice of other writers on this fubject, to explain to my readers the voluminous effays of those who have gone before me, for the information of fome, and for the curiofity of others. Although I do not mean to be either minute or digreffive, I shall not wholly fpare myfelf that labour, becaufe I deem fuch enquiry in fome measure conformable to the intention that induced me to write. For if it be neceffary to urge mankind to fet afide what has been already attempted and failed of its purpofe, it is a justice due to the understanding, that what has been done, fhould be known; for this is a fubject, upon which the private interest of an individual cannot have another defign independent of that which is annexed to the more general caufe of benevolence. The object is fo important, as to justify me in prefuming

prefuming, that the more that ftart fairly in this race of humanity, the more truth might be hoped for and expected, and that the prize of reputation will be given to the merit only that truly exacts it.

Another motive that induces me to give a fhort historical sketch of this difease is, that the publick may be acquainted with the catalogue of prophylacticks that have promifed fo much and that have fallen fo fhort in their performances; for fo prevalent is prejudice, and fo natural is the propenfity of man to adhere to opinions once rooted in his mind, that whenever an inftance occurs of a perfon being bitten by a mad dog, the confidential receipt-book of the good Lady Bountiful is immediately unfolded, the charm or incantation is wound up, the hotch-potch of herbs are prepared, the dog is facrificed, and his liver is chopped, and offered up at the altar of fuperstition. The poor bitten fubject is harraffed by the feveral candidates who throw in their feparate claims for infallibility; he is fent to the fea, he undergoes a ducking

ducking, he is brought back and fent again. In fhort, if abforption of the venom hath taken place, and he really becomes difcafed, he is often deferted through fear by his neareft relatives, or which has been done, a period is put to his exiftence by fuffocacation. I fhrewdly fufpect that if the fecret ingredients of the compounds be difclofed, which are boafted of in families, they will bear evident marks of legitimacy to one or other of thefe prefumed remedies, which I am about to expofe for that very reafon.

The hiftory of the hydrophobia affords a great fcope for fpeculative contemplation; and he that hath enquired into it with the most correct attention, will fcarcely be able to draw from it any thing better than an imperfect conclusion.

It fhould feem as if inftances were formerly rare of this difeafe before the time of Cælius Aurelianus, who flourifhed in the reigns of Trajan and Hadrian. He was born in a city of fome importance, called C Sicca

Sicca Venerea, in Africa. Cælius Aurelianus has given us a compleat hiftory of the hydrophobia, and has painted the fymptoms of it in fuch true colours, that he has always been looked up to as the original author that has treated on the fubject. It appears from him, that if the difeafe had been before much known, it had not been attended to by medical writers, as he has appropriated a whole chapter to the difcuffion of "Whether the hydrophobia was a " new Difeafe or not." And here I cannot refrain from expreffing my admiration of the wonderful penetration of this valuable ancient ; that he fhould have burft forth at once with fo complete and faithful an account of a difeafe, that even now is only confirmed to be what he faid it was, and without the fmallest correction whatever, and that thefe truths fhould have come forth from him at a time when hiftorick doubts were ftarted by others, " Whether " the difeafe had any exiftence in reality or not." \*

\* Vide CæliiA urelian. 226. Ed. Amstelædam. 1622. Of

Of the places where the hydrophobia had raged, Cælius Aurelianus tells us, that at Caria and Crete it had very much prevailed. The ifland of Crete, he fays was particularly free from poifonous animals, but that the canine difeafe had prevailed there very common. He alfo tells us, that none of the ancients had given a cure for this paffion, but he has given a faithful account of what was attempted by them. Artorius advifed. his patient to be plunged into cold water. Niger and Eudemius bled their patients and gave hellebore. Some gave caftor, fome oil of rofes, some scammony, some gave fnow instead of water, judging that the patient may gratify his thirst in that form, when he could not with water ; fome made use of stratagems to induce the patient to drink, which would make the most ferious finile; but Cælius Aurelianus fays, that the strictures produce fuch infurmountable obstacles, that it is beyond a doubt the hydrophobick paffion must prove mortal.

C 2

Celfus

Celfus \* recommends the plunging the patient into cold water. Hieronymus Mercurialis fays, that he was the first of all who wrote on the cure of this paffion +.

Galen fays that many remedies were referred to, fuch as the liver of the mad animal boiled, the Coagulum Catuli Lactantis; but he afferts at the fame time, that thefe remedies, that we may not be deceived, did not effect a cure of that paffion, but rather tended to preferve the bitten from extreme fatal confequences; and with this view, he fays, that no one, who took the powder of burnt crabs before the, fymptoms came on, died of that paffion.

Ætius recommends, theriaca, powder of burnt crabs, and lignum vitæ. 1

- Celfus flourisched Anno Christ. 15. 1 Ætius Edit. Franfort. Anno 1541. Sermon. 2nd.

Hieronymus

Hieronymus Mercurialis tells us, that Oribefius directs a method of afcertaining, whether a fufpected dog be mad or not, by pounding of wallnuts, and applying them to the wound inflicted by a dog, and then throwing them for food to cocks and hens, if they eat them, and the dog be mad, they will die inftantly\*.

We alfo learn from the fame author, an experiment that hath fince been confirmed by modern authors, although not told in that candid manner that it ought to have been. It was, that fome caufed pieces of bread to be rubbed on a fufpected wound, and offered them to dogs in common ; if the dogs eat the bread, the bite was not poifonous, but if the dogs would not eat the bread, it was a fign that the bite was poifonous. Some extracted blood from the wound, aud made fuch an experiment by mixing it with bran.

\* Hieronym. Mercur. Cap. xv. de Rabie. Oribesius, apud Paulum, lib. 5, cap. 3.

### Apuleius

Apuleius recommends the fame experiment, fubftituting barley-meal inftead of bran or bread \*.

Lommius relates that dogs are terrified at the fight of dogs that are mad, or at hearing them bark.

Default, a French author that made fome noife on this fubject fifty years ago, relates the fame circumftances, but without giving the leaft credit to the ancient author above recited. The idea was fuppofed to have been new, and the difcovery was fuppofed to have originated from reports in the hiftory of the Royal Academy of Sciences.

Dr. James's cafe of Field + would be very ftrong in point, for by him it appears, that dogs not only fhun dogs, but men under the influence of the hydrophobia. But unfortunately (for I think myfelf unfortunate

\* James on the hydrophobia, page 33-34.

+ Vide James on the hydrophobia.

when

Dr. James in this laft inftance, who was a man whole medical character I almost adore) I fuspect that Field never was truly poffeffed of the canine difeafe. The circumftance of Field's neighbour's dog, which was bit by his own dog, being hanged at Charing-crofs before his own door, was too terrible not to excite fear, and too alarming not to fill the mind with imaginary horron; I am perfuaded that this was the extent of the injury fuftained by Field. That dogs fhun dogs that have actually the difeafe upon them and at its greateft height, may be true. I have thus far digreffed in order to give credit where it was due to these ancient authors, whose observations have been copied, but not acknowledged.

There are many old authors recorded by Portal, and extracted by him from Draudius's Biblia Claffica \* which I have not been able to procure a fight of, most of them

Mead on Pollons.

\* See the laft page.

written

written in the fixteenth or feventeenth century on this fubject; not that I lament much my want of thefe refources, for wading through thefe volumes would be attended I fear with unprofitable difficulties, fuch as fearching for a road in tracklefs fands through a foreft of firs. A cure is the object, but where among them is it to be found !

Pliny and Ætius both recommend wallnuts internally \*.

Baccus recommends Cantharides.

Van Helmont fays that plunging the patient into, water is the unicum remedium -

But the Cineres Cancri ufti were the ormfkirk of that day, each bearing equal proportion in intrinfick value, and popular credulity.

\* Hippocampus Marinus-Silvestris Rosæ Tuberculum.

t Vide Mead on Poifons,

Dr.

Dr. Martin Lifter, in the year 1694, publifhed an Effay on this difeafe, founded on the authorities of ancient practitioners, being a phyfician of great erudition, and perfectly claffical, the College of Phyficians fanctioned his publication, and it certainly contains the perfection of medical information on canine madnefs, and the mode of treating it up to his time \*.

Dr. Lifter was a complete mafter of the medical lore, from whence he drew his refources, and, like many others, regarded fo highly the obfervations of his predeceffors, as to be more implicit in his confidence on them, than in making out any new method of his own. The only novelty to be found in this effay is his cafes. That of James Cotton, as far as I know, is the firft complete hiftory of an hydrophobick patient upon record. In point of facts, it is defcribed with much minutenefs, but interfperfed with the fuperfitions of anti-

\* Vide Martini Lister sex Exercitationes.

Dam B

D

quity,

quity, fuch as the barking of the patient, his lying in bed in the posture of a dog, &c. There is no novelty in his method of treatment, a copy of a copy, the old ground of Hellebore over again, and the death of the patient concludes the cafe. He has added feven more cafes, but the first and the feventh appear to be the two only true hydrophobick cafes. The reft are imperfect conceptions formed out of the warmth of a prejudiced imagination. But when I fay, that there is not much to praife in Lifter, I ought to fay, that there is not much to blame, he has charmed them into no falfe perfuation of a Prophylactick, he has not deluded his cotemporaries, he has rather handed over to them the ignorance of his predeceffors, and fublicribed his own name under their authority. He has paffively fubmitted to the trammels of their theory, without being energetick in the leaft active experiment of his own.

Dr. Mead, well known to the medical world, has written an Effay on the Bite of a mad

a mad dog. He has introduced it in his ufual manner, with great difplay of reading, and hypothetical conjecture. This, like a great many more of Dr. Mead's Effays, is of no other value, than to fhew how well he was acquainted with the writings of the ancients. I hope it will not be deemed ungenerous in me to affirm, that, if the inftructions of Dr. Mead, for the treatment of this difeafe, were from the time of the bite strictly followed, not one individual, when thus bitten, would ever recover, provided the infection did take place. The most effential object, that of deftroying the power of the action of the virus, by encouraging topical applications for that purpofe, as univerfally advifed from the days of Cælius Aurelianus, by cupping, fcarification, and many other modes, although not entirely perfect, yet all tending to ufe, Dr. Mead has taken upon himfelf to fcout. He has added one more imaginary Prophylactick to the former ftock. This he got from a gentleman of the name of Dampier, in whole family it D 2 had

had been kept a fecret for many years. It would have been well, if it had remained there. It was first published in the Philosophical Transactions, in the year 1670, and confiss of the lichen cinerius terrestris, in English, the associated ground liverwort, and black pepper.

This fallible remedy kept its ground for fome time, I believe during the life-time of Mead, and no wonder, as the fanction of his authority would have made it profane to have doubted the efficacy of it. But I fhould have fuffered this specifick to remain undifturbed, was it not neceffary for me to demonstrate to the publick, that where blind conjecture is the only foundation for politive affertion, mankind in general, without any respect to perfons, are fo much upon a level, that the great name is as little to be credited as the most obscure one. Mead has done much more harm than a man of lefs reputation could have done, for the credit of this filly fecret was raifed, in proportion to that of his eminent character,

ter, as the object that is placed in the higheft point of elevation, is feen at the greateft diftance. But Mead was a man of learning and of credulity. The power of this medicine is not only fhaken, but now deftroyed, and lies entombed in the old London Difpenfary.

Boerhaave confeffes, that " the cure of " this Difeafe, if we except a few inftances, " has been hitherto very doubtful and un-" certain, both in the Prophylactick and " and Theraputick part; the principal caufe " of which is a vain boafting of many fpe-" cificks, and a neglect of that method of " cure, drawn from the Hiftory of the " Difeafe itfelf." \*. He advifes, firft, the application of large cupping glaffes to the part, or the actual cautery. Second, that elothes touched with the poifon be avoided. Third, that the patient is to be plunged in a terrifying manner into the fea. Fourth, to be fweated. Fifth, to foment his feet

\* Aph. 1141.

and

and hands in warm water. Sixth, to drink cold water, and attend to his general conftitution. This is the fummary of Boerhaave's prefcriptions.

Boerhaave alfo tells us, that the Prognofis is drawn from the fatal events that have univerfally followed the bite of a mad dog; fince the moft eminent Phyficians, in all ages, have lamented that there has been found no certain prefervation against the canine poison, nor one fingle instance, fufficiently attested, of the cure of an hydrophobia.

In the year 1735, Dr. James laid before the Royal Society his new method of curing canine madnefs, recommending, in the ftrongeft terms, the ufe of turpeth mineral, and publifhed a pamphlet, on the fame fubject, in the year 1741.

In the year 1756, Claude de Choifel, a Jefuit, and Apothecary to the miffion of Pondicherry, fent fome papers to France, re-

relating to certain experiments he had made with mercury in the canine madnefs. These were published at Paris, and translated the fame year into English. It is evident, that Choifel might, if he did not, have borrowed this practice from Dr. James; for it is no uncommon means, however illiberal, amongst medical writers in both countries, to be studious in concealing how much they are indebted for information to others, and to be avaricious in retaining that literary property they falfely poffeffed. Monfieur Default, Fellow of the College of Phyficians at Bourdeaux, recommended mercury for curing the bite of a mad dog; Default declares, that he did not receive the leaft hint from any author, but that he was led to think, however ridiculous the thought, that worms were the caufe, and feeing that the famous powder of Palmarius was composed of vermifuges only \*, he determined to introduce mercury into the blood, as the fitteft medicine to deftroy worms, which, he fuppofed, were difperfed through all the

\* See the laft Pages.

Cullen

fluids.

fluids. This hypothefis, fuch as it is, Default affures us, led him firft to the difcovery of mercury.

I muft here remark to the reader, that Monfieur Tauvry related, in the hiftory of the Royal Academy of Sciences, for the year 1699, "that mercury, perhaps, given "in large quantities, may force open ob-"ftructions in the circulation, which are oc-"cafioned by the contractions of veins." This obfervation of M. Tauvry was known to Dr. Mead and Dr. Boerhaave. They have both remarked that ftate in which blood veffels are found in the bodies of thofe who died of this madnefs. But neither of them has taken the leaft notice of mercury, with which M. Tauvry propofes to remove the obftructions.

Cheyne recommended mercury.

fluids,

Sauvage published an Effay on Canine Madnefs, and recommended mercury.

Cullen

Cullen recommended mercury alfo.

Many years ago, a medicine composed of pewter filings\*, was printed in the Philosophical Transactions, as given by Sir Theodore Mayerne. This was faid to be by him a specifick against canine madness. To this fucceeded another medicine, commonly known by the name of the Tonquin Medicine, composed of cinnabar, musch, &c. + and first circulated in this country by Sir George Cobb.

But mercury all the world over, and an Englifh medicine amongft Englifhmen, known by the name of the Ormfkirk Medicine, fold by Mr. Hill ‡, appear to be, in the opinion of fome, the confident Prophylacticks of the prefent day. Thus have our expectations been raifed by fucceffions of remedies, and our hopes deluded from time immemorial to this hour, from the

- \* See the laft Pages.
- + See the laft Pages.
- 1 See the laft Pages.

afhes

E

afhes of the craw fifh of Galen, the woman's dream of dog rofe, as mentioned by Pliny, the hellebore, the chopped liver, the mithridate, the fea bathing, the powder of Dampier, the pewter medicine, the powder of Palmarius, the Tonquin medicine, turpith mineral, and various other preparations of mercury, down to the vapid powder from Lincolnfhire, which is, in effect, equal to as much chopped hay, or bread pills.

Opium hath had a liberal trial, but only whilft the patient laboured under the influence of the difeafe, but to as little effect as all the other remedies, which were exhibited in that ftage of it : and notwithftanding what we are told by Lifter, Nugent of Bath, Hillary of Barbadoes, and a few more, who proclaim, that cafes have recovered, after the fymptoms of hydrophobia were actually on the patient, yet it does not appear evident to my underftanding, that any one patient ever recovered from that melancholy condition. Thefe authors did not mean

mean to miflead us; it does not appear but that they implicitly believed what they have related to us; and it is from their ingenuous and innocent confessions that I draw my conclusions. The mind of a perfon, who has been bitten by a dog, fuppofed to be mad, being conftantly under the imprefiion of fo dreadful an attack, is open, and for a long time liable to the tyranny and fport of imaginary affaults. This is not only the cafe in this particular difeafe, but in many others, where the dread of them hath operated with all its influence.

Although the reputation of mercury, as a prophylactick, hath been fpread over the four quarters of the globe, yet unfortunately for its advocates, and more fo for the fufferers daily experience in varieties of cafes, contradict the affirmation. I fhall not enlarge further upon this point, becaufe I confider fuch an enquiry as mere waste of time, because I am firmly perfuaded, that there is not a medicinal power yet known, that will actually, or ever did prevent the fatal progrefs of the difeafe, when once the virus is E 2 gone

gone into the habit; and the moft recent cafes of Dr. Dickfon, Dr. Vaughan, Dr. Fothergill, and in particular that late one, where Dr. Turton, Mr. John Hunter, and Mr. Tufon attended, confirm my opinion

upon this queftion. These facts attested at home, by men of eminence, within the fcope of our own knowledge, must destroy all declarations to the contrary.

But fingular as it may appear, yet it is a truth that ought not to be omitted, that the prejudice in favour of mercury prevails, in fpite of its failure of fuccefs.

Monfieur Laffone, firft phyfician to the King of France, tells us, that fifteen perfons were bitten by a mad wolf; that three of them, who trufted to oyfter fhell powders, and other remedies, of no ufe, died in a few days raving mad; as alfo did another, who did not apply for relief, until two days before fhe died. But that the remaining eleven were, by the States of Macon, near which place the accident happened, put under under the care of a phyfician of Cluny, Monfieur Blaife, who treated thefe eleven with mercurial inunction, and that out of thefe eleven, thus treated, three died.

This we are told in commendation of the mercurial fystem of treatment. Both Meffrs. Laffone and Blaife have my moft cordial thanks for their candid manner of relating thefe truths; but the conclusions to be drawn from them, argue, in my opinion, ftrongly against, instead of for, the falutary effects of mercury. Both Dr. James and Dr. Vaughan agree, that nineteen out of twenty may be bitten, without being infected; then, peradventure, where is the impoffibility that the remaining eight, out of fifteen that were bitten, might not be infected at all? A very ftrong mode of reafoning indeed, and fuch a one as certainly will be followed from the force of the example and inftructions of Meffrs. Laffone and Blaife; that as three out of eleven, who were bitten by the fame mad animal, died, and who at the fame time ufed mercury, fo, theretherefore, mercury is a fpecifick in this difeafe, and fhould be depended upon! This is making a blaze in favour of mercury with a vengeance!

The topical applications to the wounds inflicted by a mad dog, have been neglected to a fault, fince the doctrine of the abforbents has been fo univerfally known, fince the works of Haller taught us to reafon upon that fyftem, and fince the action of poifons, illuftrated by Redi, but more efpecially by that modern and moft ingenious and laborious philofopher, the Abbé Fontana, have now engaged the attention of all thofe who delight in fuch philanthropick queftions of philofophy.

Although Fontana hath not made any of his experiments on the nature and action of this poifon in particular, yet he hath inftructed us by analogy to reafon better, in general, upon this fubject, as he hath afcertained the true laws of the action of other poifons, and of that of the viper in parparticular. Fontana hath filenced those fuperfitious writers, whose remedies he hath brought to the test, and scrutinized by the rigid touchstone of unerring experiment. Fontana, as it appears, made fix thousand experiments on the effect of the bites of vipers. All these experiments tend to prove, that out of the various powers that have been boasted as antidotes to the poison of a viper, not one of them has the least property in reality to effect it.

The volatile alkali, boafted by Juffieu, is demonftrated to be abfolutely ufelefs; for it is clearly feen, that when the venom of the viper is effectually applied, the volatile alkali does not diminifh its activity. Fontana united a great variety of fubftances with this poifon, but did not obferve, that after all, it loft its active quality. He mixed alkalies, neutral falts, oils of vitriol, the nitrous acid, phofphorick acid, and mineral acids.

The

The refult of thefe experiments teach us not to lofe our labour in fearch of an antidote to the bite of a mad dog; for if, after making fix thousand experiments, Fontana is as far off as ever in difcovering a fpecifick for the bite of a viper, how improbable is it, that fuccess should attend fuch an hopeles pursuit for the bite of a mad dog?

But I can put this question much more home to common understanding. Scarcely an individual paffes through life, without having had the fmall pox. That difeafe cannot be prevented from taking effect, if the fubject puts himfelf in the way of catching the infection. The whole of the variolous procefs must be gone through, in one degree or another; for although we find it practicable to correct the dangerous effects of it, yet we know of no power in medicine that will, after the infecting principle be once gone into the habit, infallibly prevent the eruptive fever and the eruptions in courfe. Then, if where we have the opportunity, and to all

and in a milder difeafe, of trying ten thoufand experiments in the fmall pox, to one in the hydrophobia, and are yet at a lofs for a prophylactick in the former, how defperate muft be that idea, which may prompt a man on to expect fuccefs in the latter !

It is furely then high time that we fhould change our fystem, it is high time that we fhould draw the line betwixt an abfurdity and a poffibility; for fince we find, from a fucceffion of remedies, and all ftrongly afferted to be infallible by the most learned of every age, for at least two thousand years, that, in the event, thefe remedies have proved to be empty pretenfions, and delufive in their effect, it would be weaknefs in the extreme to be lulled by fuch expectations any longer. I do, for thefe reafons, not hefitate to declare, that there is no other rational method for the prevention of the dreadful confequences of the bite of a mad dog, but by the cutting out of the part that is bitten; and I promife myfelf an effectual fecurity from future danger, by fuch F cutcutting out of the part, provided that the operation be performed within a feafonable time.

Topical applications to the parts bitten, have been recommended by almost all the great authors who have written upon this fubject; but these have only been confidered by them as parts of a general method of treatment. These were not fo applied as if they were in earnest, as if any dependance were placed in the general good that could be performed by them; thefe were in the various fhapes, in which they were applied, prefcribed as a fecondary measure; as fomething done, without a thorough confidence in it, and which, confidered abftractedly from other means, was fraught with no high expectations whatever. As they did not depend folely upon this method, as they always had in their view fome medicinal prophylactick, as they always joined to it fome prophylactick, fo have they never followed up this practice to that extent which I exact, and fo have they failed of fuccefs.

The

The enlargement of the bitten part, the fcarification of the part, the application of cupping glaffes to the part, the fucking of the wound, the bleeding it by leeches, the actual cautery, the turning the wound into an iffue, the filling it up with gunpowder and fetting it on fire, and the application of various caufticks, are all fallible. Thefe may fucceed, but they are not fecure. Thefe have been put in practice, when notwithftanding the difeafe hath come on. I fhall proceed to point out a recent inftance of the application of cauftick, which failed of the intention ; and my reafon for introducing this cafe here, is obvious upon two grounds. The first is to shew, that nothing lefs than a complete removal of the bitten part from the living fubject, will anfwer the purpole intended thereby. And the fecond is to fhew, that whatever be done fhort of that complete removal, ought to be confidered as a criminal imperfection.

If a cafe under the immediate care of a man of fuch reputed eminence, as Mr. John F 2 Hun-

( 35 )

Hunter, if a cafe, where the earlieft advantage was taken of the injury inflicted, if a cafe, fuppofed to be treated agreeable to the moft exalted fkill of modern practice, if fuch a cafe failed, which it moft affuredly did, it muft have been owing to the inadequacy of the means to the end. And the failure of fuch a cafe, under fuch a combination of happy circumftances of great fkill and immediate refource to it, proves a ftrong neceffity of the pofitive adoption of a method, yet more certain, and not lefs practicable.

Confidering the terms upon which Mr. John Hunter and I ftand, it behoves me to be more fully explicit, that he, as well I, fhould not be mifunderftood ; and that the arguments, which I have yet to produce upon this very fatal cafe, fhould not be fubjected to any mifconftruction. I fhall therefore proceed to give my readers the neceffary part of the cafe, and the letter which Mr. John Hunter wrote to Dr. Hamilton, a phyfician in Suffolk, after the death death of the patient, and that letter will amply ferve to explain all that I want to have explained.

On December the 6th, 1784, Mafter R. was on a vifit in Jermyn-ftreet, where a ftray dog came into the room. A plate of meat was ordered for the dog, which he eat. The young gentleman took notice of the dog, and stooping down to examine it, the animal turned from his meat, and bit him on the right fide of the under lip. He was immediately fent in a coach, which was then ready at the door, to Mr. John Hunter, in Leicester-fields, being at the distance of about a quarter of a mile \*. The confequence of this bite was, that he died the 13th of January, 1785, at his father's feat, in Suffolk. The following letter was fent to Dr. Hamilton, after the death of Mafter R. by Mr. John Hunter. Dr. Hamilton did not attend Master R. after his removal into the country, but as a motive for this corref-

\* Vide Mr. Tufon's account in Hamilton on the hydrophobia.

pondence,

pondence, he was then collecting information upon this fubject, for publication.

#### " SIR,

" I received the favour of yours. I am " always extremely happy when I can give " any ufeful information ; but all the infor-" mation I can give you relative to the Hy-" drophobia, is rather negative good, than " politive. All the means recommended " were ufed in Mafter R.'s cafe. I faw him " only a few hours after the bite. The lip " was torn a good deal. The teeth had " gone through and through, and had torn " out a piece. I immediately applied the " cauftic to every furface that I conceived " had been made by the dog's teeth; and " when those floughs came away, I went " over the fame field a fecond time; but, " from the termination of the whole, I am " inclinable to believe that I did not touch " every part where the teeth had been. He " took the Ormfkirk medicine by the direc-" tion of Mr. Berry who fells it, therefore " we must suppose it was properly given.

3

He

"He alfo took the Tonquin medicine, viz. " mufk, cinnabar, &c. as alfo rubbed in mer-" curial ointment till his mouth was fore. " My whole dependance was on the cauftic, " but did not object to others being given. " I with I could fay more on the fubject in "general. We feem to be as much at a " lofs how to treat it, as they were a thou-" fand years ago. I have not yet heard the " particulars of Master R.'s attack and fymp-" toms. I want very much to learn them. " To afcertain a mode of cure will be very " difficult. For a few cafes not having the " fymptoms, under any courfe, prove but " little. I know where there were twenty-" one people bit by one dog, ; nothing was " done for any of them, and only one was " taken ill. If they had all taken medicines, " then it would have been faid, that they " only loft one out of twenty-one.

" I am, dear Sir,

"Your most obedient fervant, JOHN HUNTER."

A French woman was bitten at the fame time by the fame dog, and fhe died alfo.

Here

Here then is an indifputable cafe terminating fatally, where every favorable advantage might have been taken. A fmall animal inflicted the wound. The fituation of the wound favourable for extirpation, as the parts divided might have been brought together, as in the operation for the hare lip. The early application of the patient for affiftance. The vicinity of the furgeon to the place of the accident. The fmall fpace of time between the infufion of the poifon and the application of the cauftick. All thefe combine fo many feeming fortu-

nate concurring circumftances, as are rarely to be met with.

Mr. Hunter fays, " I immediately applied " the cauftic to every furface that I had " conceived had been made by the dog's " teeth, and when thefe floughs came away, " I went over the fame field a fecond time ; " but from the termination of the whole, I am " inclinable to believe, that I did not touch " every part where the teeth had been."

When

When it is confidered, that the fharppointed teeth of a fmall animal made the wounds, and that the poifon introduced into them would actually pafs to the extremeft points of the wounds ; and when it is further confidered, that fuch wounds partially clofe immediately after that they are made, or are filled up in a great meafure with blood flowing from divided veffels, a man of common reflection would be aftonifhed, but fcarcely ever convinced, how that cauftick could ever pafs to the bottom of thefe little wounds, fo that its action fhould directly and effectually take place.

But admitting that cauftick had been as fitting to the purpole of prevention, as the cutting out of the part, in order for thele two powers to operate comparatively equal, the cauftick fhould be continually applied, until as much of the parts were deftroyed by its action, and in the fame given time, as ought to be taken away by excision. If that had been done, which was not done, and if that had been effectually done, then,

in

in this inftance, the diffinction betwixt the destruction of the bitten parts by cauffick, and the excision of the parts by the knife, would have been, that the former method would have left an unfightly ghaftly fear ever after, and the latter would have finished in a feam not uncomely, by bringing the parts into union, and keeping them there until they adhered together. Mr. Hunter does not prefume to deny, but that had the cauftick been applied effectually, it would have answered the intended end; for he is " inclinable to believe, that he did not touch " every part where the teeth had been." The time was not too long, the opportunity had not paffed by, the wound itfelf was not untractable, but the cauftick was not effectually applied. When the life of an individual hung upon fo nice a point as that of the bitten part being wholly extirpated or not; and when that perfect power of extirpation was as eafily practicable, as that imperfect application of cauftick, which failed, a modeft man, a man of feeling, or a good furgeon, would have blufhed at fuch

( 42 )

an

an apology, as that he was " inclinable to " believe, that he did not touch every part " where the teeth had been."

Having flated this fairly, I fhall leave it for the reader to go on with the comment.

If he had ever deigned to read, he would have found, that by Fontana's experiments, excifion of parts, by the viper, never failed of preferving the animal from the deleterious effects of the poifon, when performed in time, before that abforption had taken place; and he would have alfo found, that the cauftick did fometimes fail, and that nothing elfe could be confidently depended upon, but the timely excifion of the whole of the bitten parts.

Cittes

I fhall proceed to lay before my readers, fome extracts from this very ingenious author. I have chofen the Englifh tranflation of Mr. Skinner, a furgeon in the Royal  $G_2$  Navy, Navy, who a twelve month fince translated it at my request.

## • Bites of the Viper treated with the Lunar. • Cauflick.

' The latter part of my experiments is ' the more important, in having for its ob-' ject the fecuring us against the bite of the viper. My experiments are too few in ' number, and too little varied, either to al-! low the drawing from them all the prac-· tical utility that may be hoped, or to render the method I have propofed, perfect. ' Owing to the feafon, I have experienced a fcarcity of vipers; and the circumftances ' in which I have found myfelf, and the obligations I have had to fulfill, have prevented my applying myfelf more attentively, and in the way I fhould have wifhed, to this fubject. I fhall, for the prefent, publish the refult of fuch experi-' ments as I have been able to make, intend-' ing to return at a more convenient opportunity, to an enquiry that has the good · of f of my fellow creatures for its object. In
f the mean time, I hope that philofophers
f and naturalifts will pay every attention to
f this branch of medicine, and will fpare no
f pains to render it more certain and ufef ul.

I had a middle fized rabbit bit five times
fucceflively in the leg, by a large viper, and,
after making fcarifications, applied the
cauftick, and wafhed and bound the
wounds. The rabbit died at the end of
twelve hours.

I had another rabbit bit feveral times in
the leg by a viper. It died in the fpace
of an hour, although it was treated like
the preceding one.

I had two guineapigs bit in the legs by
a viper, each one three times, and after
making the fcarifications, I applied the
cauftick. Both of them died in a few minutes.

· I re-

I repeated this experiment with the
fame circumftances, on a large guineapig,
which died in the fpace of twenty-four
hours.

' Thefe five unexpected deaths convinced " me how eafy it is to be deceived, even in \* matters of obfervation and experiment, and ' how little truft is to be repofed in analogy. · The minuteft circumftance fuffices to ren-· der what in itfelf would be very ufeful, · both useless and hurtful. Every one may · perceive, that in the present case the whole · difficulty lies in making the cauflick pene-\* trate into all the parts to which the venom \* has found its way. But how can this difficulty ever be furmounted? The holes ' made by the teeth of a viper are very fmall, and often invifible. They run in different directions within the fkin, and · have different depths, according to a thoufand varied circumftances. The fwelling · or inflammation that fucceeds, augments " the difficulty ftill more, fo that the fcari-fications are made almost at hazard.

· I must

"I must not however omit that I have " cured five other larger rabbits by this ' method, after they had been repeatedly ' bit by vipers; as alfo feveral guineapigs ' that I had had bit in the fame way; all of ' which would probably have died, if they ' had not been treated with this new reme-· dy. But I recovered a much greater num-' ber of these animals, when they had been ' bit a fingle time only, although even in ' this inftance fome of them died; and this ' was undoubtedly occafioned in the way 'related above; that is to fay, not by the ' inefficacy of the medicament, but becaufe 'it cannot always reach the parts where the ' poifon bas penetrated and lodged. There 'are likewife other circumftances which ' elude the new method I have propofed, ' and thefe are, when the difeafe, by acci-· dental circumftances, is more internal than ' external; that is to fay, when the venom ' is fuddenly introduced in a large quantity ' into the blood of the animal, by the means · of fome veffel that the teeth may have ' penetrated. And I do not think it impoffible,

fible, but that the bite of the viper may
kill even inftantaneoufly, provided ti
fhould ever happen (which is not abfolutely impoffible) that the teeth fhould
pierce a large venous veffel in fuch a way,
that a quantity of the venom would be inftantly carried to the heart. In this cafe,
which differs little or not at all from the
artificial injection of the venom, the difeafe
may be incurable, and obviate all remedy.

The lunar cauftick, I repeat it, renders
the venom of the viper innocent, and is
its true fpecifical remedy; but much remains to be done, to apply it with the
greateft advantage in the bite of this animal. It would perhaps be ufeful to fwallow it, diluted with water, even in pretty
ftrong dofes. If the venom of the viper
derange the blood, and be fatal when it is
introduced into the torrent of the circulation of humours, the lunar cauftick, taken
internally in a liquid form, may weaken
its noxious qualities, and correct it in the
veffels themfelves, to fuch a degree as to -

destroy, or diminish, the internal difeasethat this venom produces.

After my having difcovered that the
'lunar cauftick renders the venom of the
'viper innocent, it is natural to conceive
that I ought to make fome trials on the
'lapis infernalis; I have indeed made feveral.

I found that a pafte formed of this ftone,
and of the venom of the viper, might be
applied with impunity to the wounded
mufcles of birds; on choofing ten of them
for thefe experiments, not one died. But
of three which I envenomed with the
teeth, and dreffed with the *lapis infernalis*,
fcraped to a powder, two died, one at the
moment of application, the other at the
end of two hours. I had four pigeons
bit in the legs by vipers, and treated them
with the fame cauftick. One died in my
hands immediately after I had applied it,
another in the fpace of an hour, and the

· Not-

Notwithstanding that the feafon was becoming unfavourable, and that I had no
longer a hope of finding any vipers, I
met with thirty-four of them by accident,
in an excellent state, and very vigorous.
The first purpose to which I applied them
was that of verifying my new remedy, and
of feeing, at the fame time, whether a folution in water of the lunar caustick, given
internally, would be at all efficacious to
animals bitten by the viper.

• I defined four very fmall guineapigs • for this experiment, and made them drink • a teafpoonful of the above folution: it was • rather weak, but ftill difagreeable to the • tafte. I wounded the femoral mufcles of • three of them with venomous teeth, made • immediate fcarifications, and applied the • lunar cauftick as ufual; neither of them • died.

I made another fmall guineapig fwallow
two tea fpoonfuls of the above folution,
and it died in my hands. I conclude from
3 'this

' this that the quantity I employed was too ' great. I afterwards gave a fingle teafpoon-' ful, as in the first experiment, to other ' four fmall guineapigs, and had them im-' mediately bit by as many vipers, making ' fcarifications inftantly after. They all four ' died. One when fcarce bitten, another ' in an hour, a third in three hours, and the · last in five. The refult of this experiment fhows, that the bite of the viper is far ' more dangerous, than wounds that may ' be made artificially with its teeth, although filled with venom. One reafon perhaps ' is, the difficulty of conveying the remedy ' nicely to all the parts where the teeth of ' the viper penetrate when it bites at its ' will. I likewife imagined at the time, that the fmallnefs of the animals I made choice of might partly have caufed this, and determined, in confequence, to make trials ' on larger and ftronger ones, better able to 'refift the effects of the poifon; parti-' cularly the internal malady, which is · communicated much quicker in finall animals. I had fix fowls bit in the thigh by H2 ( as

\* as many vipers. Five of them fwallowed
\* three teafpoonfuls each of the folution of
\* the cauftick, the other did not fwallow
\* any. I applied the lunar cauftick in the
\* fame way to each of their wounds; the laft
\* died, the other five all recovered.

I had fix rabbits of a middling fize bit
in the thigh by as many vipers. I immemediately applied the lunar cauftick to
their wounds, and made them all drink the
folution of it. Four of them recovered;
the other two died, one in three hours,
the other in eight.

I repeated this experiment on fix other
rabbits, fomewhat larger than the above,
and neither of them died. On having
four others bit, and treated exactly in the
fame way, they all likewife recovered.

The number of thefe experiments is ftill
too circumferibed to render us certain that
the lunar cauftick is a never failing remedy against the bite of the viper; and this
is

is owing to the difficulty of conveying it to
all the parts into which the venom has infinuated itfelf: three or four hundred experiments would fcarcely fuffice to fully
clear up this important matter; I however have no doubt of the efficacy of this
remedy, and can affirm, that the lunar
cauftick is the true fpecifical remedy againft
this dreadful poifon.<sup>\*</sup>

#### • On the utility of amputating the Limbs bit by • the Viper.

We have already feen that the action of
the viper's venom is not inftantaneous; that
it requires a certain time for its effects to
be perceived in the bitten parts; and that
the external malady does not communicate
itfelf fuddenly to the animal. We have
alfo feen, that if the part bit by the viper
be fuddenly amputated, the animal furvives. All thefe experiments together fupply a certain remedy againft the bite of
the viper, when one can practice it with facility. It is natural to fuppofe, that by

lopping off the difeafed parts, the life of
the animal may be faved; but the amputation ought not to be much retarded, becaufe it is at leaft certain, that the fooner

it is performed the furer its effects. In
pigeons it begins to be even fatal at the
end of fifteen feconds, at which time the
internal malady is communicated, which
the amputation encreafes, and haftens
death, inftead of diminifhing one and retarding the other, as I have been fatisfied
by feveral experiments.

Before I examined into the advantages
of amputations on animals bit by the viper,
I wifhed to fee whether the internal malady would be communicated in a fenfible
way, and fo as even to occafion death in
other animals, in the fame fpace of time
as in pigeons. It was neceffary to try it
on animals that die with much greater
difficulty than thefe laft, but who would
die to a certainty, and in a fpace not too
diftant from the introduction of the poifon. I made choice of very fmall guineapigs,

<sup>s</sup> pigs, becaufe I knew, by experience, that <sup>s</sup> they had all thefe qualities.

I had a guineapig bit feveral times at
the extremity of the foot, which at the
end of twenty feconds I cut off betwixt
the tarfus and the tibia. The animal lived,
and feemed to have no other complaint
than that caufed by the operation.

I had another guineapig bit repeatedly
at the extremity of the foot, by a viper,
and at the end of forty feconds cut off the
leg as above. He recovered in the fame
way with the former.

A third guineapig received feveral bites
in the foot, from a viper, a minute after
which I cut off its leg. It recovered as
well as the others.

• I had another guineapig bit repeatedly • by a viper, in the foot, which, in eighty • feconds, I cut off; this one likewife re-• covered.

' I had

'I had another guineapig bit repeatedly in the foot by a viper, and two minutes after cut of its leg; it recovered likewife.

'I had another guineapig bit feveral times by a viper, in the foot, which, at the end of three minutes, I cut off: this one recovered too.

I had another guineapig bit feveral times
by a viper, at the extremity of the foot,
and at the end of four minutes cut off its
leg: it died three hours after, having a
lividnefs of the mufcles of the leg, and
the auricles and heart filled with clotted
blood.

• I had another guineapig bit repeatedly • in the foot by a viper, and at the end of • four minutes cut off its leg: it recovered.

It must be observed, that the feet amputated at the end of three or four minutes, have unequivocal figns of local malady; these figns are even observed before,
although

' although with more difficulty, are not fo ' certain, and do not exift always.

' Neither of the guineapigs bitten in the feet, and mutilated in lefs than three mi-' nutes, died; but of the two mutilated at ' the end of four minutes, one died, and the other furvived. There are even here then, ' as well as in many other cafes we have feen · above, circumstances in which the bite of ' the viper produces greater or leffer effects; ' but what is more important, and deferves ' all our attention, is, that the internal ma-· lady is not communicated to the animal ' till very late, in comparison to that in the · cafes of the pigeons, or more properly, ' that it does not become mortal till after a 'long time, and that the cutting off the ' part bitten may be made with all poffible ' advantage and fafety, within the limits of ' a much greater time.

But let us continue our experiments, the
number of which has been too fmall to
fupply us with certain conclusions.

1

· I had

## ( 58 )

• I had a guineapig bit feveral times in • the foot, by a viper, and cut off its leg at • the end of four minutes: it recovered.

· Neither of the guincapigs bitten in the

• I had another one bit repeatedly in the • foot by a viper, and cut off its leg at the • end of five minutes : it recovered.

· other furvived. There are even have then,

I had another guineapig bit in this way
in the foot, and at the end of fix minutes
cut off its leg; it died ten minutes after.

• I had three guineapigs bit in the foot by • a viper, each one feveral times, and in four • minutes cut from each a leg: they all re-• recovered.

I had three others bit in the foot in the
fame manner, and in five minutes cut off a
leg from each of them: they all three recovered.

• I had three others bit in the fame way, • and in fix minutes performed the opera-• tion: one only recovered.

· I had

'I had three others bit as above, and in 'ten minutes cut off a leg from each: they 'all died.

( 59 )

'From all these experiments it appears
that this deduction may be made, that
'every thing is to be expected from the am'putation of the leg, if performed on gui'neapigs before fix minutes are elapsed af'ter their being bit by the viper.

It is natural to fuppofe, that in larger
animals the amputation may be made much
later ftill than fix minutes, and experience
has demonstrated it in very large rabbits;
but we may fumble on another inconvenience which confines this method very
much: pigeons are not endangered by
the amputation of the leg; fmall guineapigs bear that of the extremity of the
foot, but not always that of the leg;
larger animals are more apt to die, when
a great part of them, fuch as the leg, is
lopped off; fuch an operation in thefe cafes
is not only ufelefs but dangerous.

· It

'It does not, however, follow, that am'putation, even in large animals, may not
'be ufeful againft the bite of the viper; in
'general it is fo when the animal bears it
eafily, provided it be done at a convenient
time. As amputation may be very ufeful
in a great number of cafes, I thought it
incumbent on me to make experiments,
and to vary them feveral ways, on differ'ent animals.'

The idea of giving this publication occurred to me three years ago, but I waited the event of the two cafes I am about to produce, and fince then, my time hath been filled up with writing on another fubject, only more ferious, becaufe it was more common. The method of preventive cure, by the excifion of parts bitten, is fo very obvious, that it cannot be prefumed but that rational men, in all countries, muft have thought alike about it. I do not pretend to be the firft on the lift in recommending this fyftem. I am content, that it fhould be faid, I have added my cafes to others,

others; that I have confirmed the truths of Fontana, of Monfieur le Roux, of Dr. Hamilton, of Mr. Newfon, and many others. All I afk, is, the confidence of the publick . to these points, that I firmly believe the experiments of Fontana are just, and that the analogy betwixt the bite of a viper and the bite of a mad dog, is fair, in a general fenfe; but that the bite of a viper is much more rapid in its action, and its poifon much more feeble in its power; that the venom of the viper is a continued conftitutional fecretion, harmlefs to the viper who fecrets it, of a more exalted nature in fummer than in winter; that the venom of the mad dog is in its action very flow, difficult to be communicated ; that it is a poifonous fluid which has undergone a change from a healthful fecretion of faliva, and which is produced by a difeafe, fui generis, from a constitutional cause, ab origine, inherent in the dog, and is continued to be propagated by inoculation through the teeth of a mad dog to a dog otherwife found. That the dog, and fome other animals, are fubject to this

this difeafe in all countries, and that it prevails, although not fo common, in extreme cold, as well as in extreme heat. That the venom of each muft be abforbed into the habit, before that the deleterious effects from it can be felt; and that from the torpid action of the venom of the mad dog, thefe deleterious effects might be always judicioufly prevented. I think my two cafes are in point, to confirm thefe affertions.

#### CASE of ELIZABETH PRATT.

much more feeble in its power; that the

ON Wednefday, the 23d of January, 1785, G. G. Efq. and his lady, of Bromleyhill, in Kent, walked into the town of Bromley, accompanied by their Newfoundland dog. To all appearance, the dog was perfectly well, until they came into the town, when he was perceived to fnap at every dog that came in his way : and in the town a great number of dogs were affembled about him. On their return back to Bromley-hill, he then fnapped at the pigs, for which Mr. G. beat him, but fortunately he never

never turned to bite. On enquiry of the fervants, it was found that the dog had been fnapping at every thing in the farm yard that morning. They then began to fufpect that the dog was mad, and ordered him to be chained up in his kennel, which was his ufual place of confinement. It was made of open flips of wood. When this was done, he made not the least refistance. The fervants were all at the time cautioned to keep out of his way: but they were not awakened by this admonition, for Ann Lowe, the dairy maid, on the 24th in the evening, going within the reach of his chain, he flew at her; it was with the greatest difficulty that she could extricate herfelf from him, and not without having her clothes very much torn. The dog that night began to howl and bark in an uncommon manner. On the 25th, in the forenoon, Elizabeth Pratt, the cook, who ufually ferved the dog with food, went to give him water, when, instead of lapping, he fuddenly feized her by the arm, which

bled a great deal. She then began to be

3

tuoda

( 63 )

alarmed,

alarmed, recollecting that the cautions which were before given, of the dog being mad, were founded in truth. Mr. and Mrs. G. being in London, at the time that Elizabeth Pratt was bitten, they were not informed of it until Saturday morning the 26th; and it was not until the evening of the 26th, about fix o'clock, that Mr. G. returned from London to his houfe, accompanied by Dr. John Hunter, of St. Alban'sftreet, late phyfician to the army at Jamaica, and myfelf. The Doctor and I were brought out there for the purpose of doing our best for the cook. The bite was on the external part of the arm, rather nearer the elbow than the wrift. Many punctures of the teeth were apparent, and the parts were inflamed. Late as it was after the accident, we did not hefitate to propofe the excision of the part as the unicum remedium. To this the cook, with fome hefitation, confented, and about eight o'clock it was done. The fkin of the arm, from being exposed to heats and colds, was very thick. The part that was taken out, was about

about the fize of a crown piece; and on account of the part being inflamed, it bled profufely. The mufcle beneath appeared livid, as if it had been contufed by the gripe. Upon examining the excifed piece, I found that the probe paffed through only one of the punctures, made by the teeth of the dog. We dreffed the wound with lint, moiftened. with fpirit of wine, in which corrofive fublimate had been diffolved, and directed that it fhould be continually kept moift with the fame. This, we judged to be a good after application, as it acted like a cauftick, and at the fame time there would be no neceffity for removing the dreffings to apply it. The event of this cafe was, that the wound healed up in due time, as other wounds do; and the cook has continued well ever fince. We staid there all night, and were much difturbed by the yells of the dog; the next morning his mafter releafed him from his agony, when almost expiring, by a difcharge from a blunderbufs. The wooden lattice of his kennel was gnawed almost through.

CASE

# CASE of GEORGE LANE.

GEORGE LANE, groom to J. B. Efq. late of Effex-ftreet, in the Strand, was bit by his mafter's terrier dog, whilft on a journey into the country. The dog had been observed to be not in his usual spirits, when they fat out from town, and had fought with another terrier dog, belonging to the groom, that was tied up in the ftable, and which had previoufly been in familiarity with him. The dog, on the road, difcovered encreafed fymptoms of a difordered ftate, although it was not fufpected even then by them, what was the nature of that difordered state. The groom, conceiving him to be in a fit, got off from his horfe, and on coming up to examine him, the dog, although bred up in the clofest attachment to the groom, flew at him, and bit him. The dog immediately afterwards dashed through the next hedge, and ran off in a ftrait line over the country. The groom purfued him for near a mile, but without fuccefs, and the dog was never heard of more. The

-

The terrier dog that he bit in the fiable, and that was always after kept tied up in the ftable, died mad, in a fortnight, from the bite. It was on Friday, the 10th of June, 1785, at nine o'clock at night, that he was bit; and it was on Monday, the 13th of June, at five o'clock in the afternoon, that I extirpated the part. The wound was on the external part of his thumb, near to the knuckle. I here had an opportunity of taking away much of the furrounding parts, as the wound was not large; and I dreffed it afterwards with lint, dipt in folution of fublimate, with

The diffance of time betwixt the bite of the dog and the extirpation of the part, in the first case, was from thirty-two to thirtyfive hours. The diffance of time betwixt the bite of the dog, and the extirpation of K 2 the

fpirits of wine. Two years fince Mr. B.

informed me, that the groom was well;

and I know nothing to the contrary, but

that he continues fo to this day.

( 67 )

the part, in the fecond cafe, was fixty-eight hours.

This must afford great confolation for many reasons. It gives time to make enquiries concerning the dog, to collect opinions upon the state of the cafe, to fix regulations about that which is neceffary to be done for the fafety of the patient, and to bring together fome of the ableft furgeons refiding in the neighbourhood, to the end that that which is to be done, be done effectually. It fhould be held as a ftanding maxim, that the part bitten be taken away, as foon as it poffibly can be, after the accident. And although, from fome untoward delay, fuch as cannot be forefeen, either incurred from the carelefsnefs of the patient, . or from his not being confcious that he was bitten by a dog that was actually mad, fome time may be loft, yet admitting, that it is well understood, that the patient is bitten by a dog that is mad, I am well affured, that in the fpace of ten hours, an able furgeon might be brought to the affiftance of the patient, let the accident happen

pen wherever it may, in any part of this country.

It is not in my power to form a conclufive opinion, at what period, the patient may be fafe, by the part being extirpated, after the bite is inflicted. But I do not think that the idea ought to be abandoned any time before the fymptoms of hydrophobia have come on; hope forfaken, is fucceeded by defpair. In the quotation that I gave from Fontana, the diftance of time betwixt the bite being given, and the cutting off the part, for faving the life of the fubject, is precifely fet down, and vice verfa. It is to be prefumed, that in proportion to the interval, betwixt the application of any virus to a fubject, and its vifible effect upon the conftitution, will, the time for the taking away the part infected, be fafe or otherwife. One may reasonably fuppofe, that the extirpation of a part bitten by a viper, fhould be inftantaneoufly performed. That the part inoculated with variolous matter might be deferred for more

more than twenty hours; and that the part bitten by a mad dog, yet four times longer, as the hydrophobick fymptoms, upon a general scale, are forty days before they appear, and those of the fmall pox ten. Whenever an opportunity offers, fome experiments, fimilar to the following, fhould be tried. The mad dog fhould be tied up in a latticed kennel, and permitted to bite other dogs. The bitten parts fhould be cut out at different periods. The propagation of the difeafe might be fo carried on, as to afford an opportunity of conducting useful experiments ad infinitum. Thefe would mark the fecurity of the method by extirpation, and would afcertain how long a time it would be fafe, to delay the operation, after the bite, in that animal. The apparent cruelty of fuch experiments would prove to be humanity in the end. As when the full extent of the power of the difeafe, and the remedy over it, be afcertained, we fhould be enabled to apply fuch knowledge to the prefervation of fayorite dogs as well as of ourfelves.

Thefe

These experiments would yet be productive of more utility. They would tend to convince obstinate skepticks, and make the fystem familiar to the most vulgar minds. Whilft those who are endowed with more enlightened understandings, and upon whom the fuperior gifts of education, and the bounties of fortune, are liberally lavifhed, fhould, in return, lend their aid, to remove prejudices deeply rooted in the minds of the uninformed. Their confidence fhould be guarded against delusive remedies, that it may not be practiced upon by the defigning nor the ignorant, to the injuffice of all who fall victims to the fatal error, and to the deep affliction of others, who from ftrong and irrefiftable affection, poignantly feel the lofs from untimely annihilation, in the dearest ties of friends and relations.

From the PHILOSOPHICAL TRANSACTIONS of the Year 1737-8, No. 445.

\* The CASE of a lad bitten by a mad dog, communicated in a letter from Mr. Edward Nourfe, F. R. S. and Chirurgeon to St. Bartholomew's Hofpital, to Cromwell Mortimer, M. D. Secr. R. S.

#### " Dear Sir,

" Prefuming that the following Cafe will be acceptable to the Society, I beg leave to communicate it through your hands.

> " I am, " Your moft obedient fervant, " EDWARD NOURSE."

Jan. 18, 1736-7.

"Stephen Bellafs, aged about fixteen, fome time in June, 1735, was bit by a mad dog through the nail of his right thumb: I was called immediately upon the accident, when I propofed to make a ligature above, and

and to cauterize the wounded part; but that not being complied with, I defired Mr. Gernum, the apothecary, who was prefent, to make up the remedy, mentioned by Dampier, in our Transactions, No. 237 and 443. Of this powder he took a drachm, within an hour after he was bit; repeated it the next morning, before he fat out for Gravefend, where he was ten days, and dipt in the falt water every day; during which time he repeated the medicine night and morning, and continued fo to do for forty days. This boy was without the least fign of being affected by the poifon, till Tuefday laft, the 11th of January, 1736-7, when, in the evening, he complained of a numbrefs in three of his fingers of the hand that was not bit: on Wednefday morning he was fick, had great pain across his ftomach, and in all his bones: in the evening, I was fent for to bleed him, the people about him fuppofing that he had got a cold. When I came, I found him feverifh, with a hard full pulfe. I afked what complaints he had? The answer was, none, for he could not fwallow; L

( 73 )

fwallow; whereupon I looked into his mouth, but there was no inflammation; neither did any thing occur to me, that could poffibly produce the difficulty of fwallowing, he faid he had: I offered him fome fack-whey in a bason, but he started at the fight of it, neither would he fuffer it to come near him. I then offered him a spoonful, which I prevailed upon him to fwallow: the moment it was down, he was convulfed, and a remarkable horror appeared in his countenance, which was fucceeded by a profuse sweat all over his face and head. He afterwards took another fpoonful; the confequence was as before, but in fomewhat a higher degree. I was now convinced, that this was the hydrophobia, and that it arofe from his having been bit nineteen months ago; for after the most strict enquiry, it does not appear, that he had been bit by any other animal fince; and if he had, it is very probable, I fhould have known it, his mafter living next door to me, and the boy knowing how much danger we thought him in, when he was bit. I ac-

I acquainted his friends with my apprehenfions, and defired further advice; upon which Dr. James Munro was fent for, who ordered him to be let blood, a repetition of the above-mentioned medicine, in a bolus, every four hours, and a clyfter: he was blooded, and the clyfter was injected; but he was prevailed upon to take but one of the boluffes. This night was fpent with great inquietude, and without any fleep: Thursday morning he was generally convulfed, and had frequent reachings and and yawnings alternately; about noon, his mind (which continued found till then) left him, and he raved and foamed at the mouth 'till five o'clock in the afternoon; at which time nature feemed quite fpent, and he lay very quiet till feven, when he died."

"The poifon in this boy, you find, was latent near nineteen months; which I know the books mention, but it never fell within my obfervation before.

LZ

es I doi

" I do not know, whether it be neceffary to tell you, that I cut this boy for the ftone laft fummer, about a year after he had been bit; I never faw a wound more difpofed to heal, and he was well and abroad in five weeks."

he was pretailed auron to take but one of

This very remarkable and well authenticated cafe had not occurred to me, but from a conversation which I lately had with Mr. Pott upon this fubject, to all the circumstances of which he was himself an eye witnefs: for he faw the bitten part at first with Mr. N. he faw the lad cut for the ftone, and watched the fymptoms of hydrophobia, when they were on him, from the beginning to the end. And fuch was the impreffion of this cafe upon his mind, that he was capable, at this distance of time, of giving me more minute information upon this fubject, than had been hitherto recorded. Mr. Pott told me, that the lad was brother to Mr. George Bellas, late a proctor in Doctors ComCommons ; that he was playing with an Italian greyhound, which belonged to his mafter, Mr. Bates, a vintner, and late an Alderman of London ; that the greyhound was not then fufpected to be mad ; that he was bitten in the flighteft manner, a little below the nail, on the outer part of the thumb ; and that the greyhound foon after died mad.

cafe proves firongly, that the This flighteft wound, from the bite of a mad dog, is not to be neglected. It might be prefumed, that the diftance of time, before the fymptoms of hydrophobia came on, after the bite of the dog, would keep the mind of a patient in a fimilar predicament, under a longer anxiety, from the force of example, in the event of this cafe. But we must not be, from fuch a motive, afraid to face the truth. This cafe hath been announced as a fingular one. Forty days, as I before observed, is about the general average, from the time of the bite to the time of the coming on of hydrophobick fymptoms. A refolution should be fixed, in confequence

quence of this cafe, and of the arguments already enforced, of depriving the virus from ever acting at any period of time, by an early and effectual extirpation of the whole of the bitten part, if the wound inflicted be ever fo flight.

flighteft wound, from the bite of a mad dog,

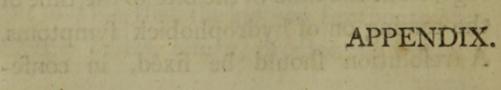

is not to be meglected. It might be pre-

furned, that the diffance of time, before the

the bite of the dog, would heep the mind

sometio

ban tesio miter dist mad.

# APPENDIX.

( 79 )

THAT the following account, as given in the London Medical Journal, for the year 1788, Vol. IX. Part 1. might not be faid to have efcaped my notice, I fhall here tranfcribe it from that Journal.

IX. An Account of an Experiment lately made at Florence, in a cafe of Hydrophobia. Communicated by Mr. J. Fabbroni, Affiftant Director of the Cabinet of Natural Hiftory of his Royal Highnefs the Grand Duke of Tufcany, and Secretary of the Royal Academy of Agriculture at Florence, in a Letter to Sir Jofeph Banks, Bart. P. R. S. and by him to Dr. Simmons.

During the laft fummer we had a great
number of mad dogs in the neighbourhood of this city, and in the city itfelf.
Several perfons, who were bit by them,
died of hydrophobia; and their bodies
were examined after death, but without
affording

affording any information relative to the
difeafe. The vifcera were uniformly
healthy, except in one fubject, in which
the lungs were found adhering to the
pleura; but, in all of them, the brain was
obferved to be more loaded with blood
than ufual.

'In one cafe, an experiment, which the 'phyficians here have long had an idea of 'making, and from which they were not 'without fome hopes, was tried. It was 'indeed fomewhat bold, but in the horrid 'and hopelefs ftate to which the unhappy 'patients in fuch cafes are reduced, every 'thing feems to be allowable; and the per-'fon on whom the experiment was tried 'appeared to be fo near his end, that it 'was thought he could not poffibly furvive 'more than an hour.

In this cafe, a viper was applied to each
of the patient's legs, and at the very inftant of the bite the fymptoms feemed to
increafe in violence; but this was only
f mo=

momentary, as he immediately became
more calm and collected, gave an account
of his relations, afked for fomewhat to
drink, and even drank; but died within
half an hour.

'This experiment did not feem to be at
'all conclusive either for or against; but it
'occasioned fo much popular clamour, that
'I think it will hardly be repeated here, at
'least on a human subject.'

If this had appeared to me to be a mere innocent medical whim only, or if I were fure that the weak and credulous part of mankind would not fall into fuch a palpable fnare, I fhould most certainly have treated the above account with filent contempt.

I fhall give my opinion of this practical experiment in a few words. That I think it the higheft vanity of ideotifm, a difgraceful infult upon human understanding, and M a proftia profitution of the Journal in which it was inferted.

### VAN SWIETEN's Receipt for Palmarius's Powder.

Take of the leaves of rue, vervain, the leffer fage, plantain, polypody, common wormwood, mint, mugwort, baftard baum, (mellifophyllon) betony, St. John's wort, and the leffer centory, each equal parts.

All thefe were to be gathered every year, when in full vigour, and dried. Of all thefe powdered, half a dram, with double the quantity of fugar, was to be taken every morning fafting.

The Pewter Medicine, as it flands in the Philo-Jophical Transactions, from Sir Theodore Mayerne.

Take leaves of rue, picked from the ftalks and bruifed, fix ounces; of London treacle treacle (or which is better, Venice treacle) garlic peeled and bruifed, and fine filings of tin, each four ounces; put them into two quarts of canary, or good white wine; or in cafe of a nice conftitution, into the fame quantity of ftrong and well worked ale, in an earthen veffel well ftopped. Then let there be made a digeftion, or gentle boiling thereof, in a bath heat, for fome hours, flutting in the fteam. Then prefs it and ftrain it.

The dofe is from two to three ounces, or more, to be taken every morning, for nine days.

## Dr. Mead's Powder from his own Book on Poisons.

Take of the herb, called in Latin, lichen cinerius terreftris, in Englifh, afh-coloured ground liverwort, cleaned, dried, and powdered, half an ounce; of black pepper powdered, two drams.

M 2

Mix

Mix thefe well together, and divide the powder into four dofes; one of which must be taken every morning fucceffively, in half a pint of cow's milk, warm.

### Sir George Cobb's Receipt, or the Tonquin Medicine.

Take of native and factitious cinnabar, each twenty-four grains; mulk fixteen grains. Let them be powdered and mixed together.

This powder was taken all at once in a tea-cup full of arrack, and the dofe was repeated thirty days after.

The Ormskirk Powder, prepared by Mr. Hill, and analysed by Doctors Haysham and Black. Vide Medic. Comment. Soc. Edingb. Vol. V. p. 43.

Take of chalk half an ounce, of bole three drams, of allum ten grains, of elecampaine one dram, of oil of annifeed fix drops. Mix these together for a dose, to be taken every morning, for fix times. CATALOGUE of Authours on the Hydrophobia, in Portal's Tableau Chronol. p. 824, tom. 7. and taken by him from Draudius's Biblia Claffica.
