REPORT

BY

DR. W. LESLIE MACKENZIE AND CAPTAIN A. FOSTER

ON A COLLECTION OF STATISTICS AS TO

THE PHYSICAL CONDITION OF CHILDREN ATTENDING THE
PUBLIC SCHOOLS OF THE SCHOOL BOARD FOR GLASGOW

WITH

RELATIVE TABLES AND DIAGRAMS.

I. *Collection of Data.*

In the year 1905, the School Board for Glasgow decided to institute Records of Physical Measurements of the children attending their Primary and Higher Grade Schools. At the same time, they also decided to ascertain certain particulars as to the housing and general physical surroundings of the children.

A Schedule was prepared in such a form that it could be filled in entirely by the Class-teachers ; but with slight additions and modifications it could be used if at any time a system of medical inspection were introduced.

During 1905-6, the Schedules were issued to all the Schools, filled in by the Glasgow teachers during the Session, and returned to the School Board Offices. Returns were made by 73 Primary and Higher Grade Schools. Separate Schedules were used for boys and girls. The School Board provided all the necessary equipment :—weighing machines, standard for taking height, testing cards for eyesight, tapes and forms.

The teachers took the greatest interest in the preparation of the Records. This was shown by the trouble they took to make the Return from each school as complete as possible. The extreme value of their inquiries as to housing is demonstrated in the series of tables.

In most cases, each class was dealt with by its own teacher. The work was spread over the Session and thus the ordinary school routine was not interfered with.

II. *Method of Tabulation.*

The Returns were classified by the Scotch Education Department. From the vast masses of facts, it was decided to select the heights and weights of the children at the various ages, and to classify these in correlation with the housing conditions. The number of rooms in the home is a good indication of the child's nutritional environment. The truth of this is confirmed in the series of tables. The Returns contained many other valuable records ; but these did not lend themselves so readily to precise and accurate tabulation.

The principles followed in this long and elaborate series of tables are exceedingly simple.

After careful inquiry and conference with the officers of the Glasgow School Board, the seventy-three schools were divided into four social groups.

Group A comprises Schools in the poorest districts of the city :—26 schools ; 24,661 children.

Group B comprises Schools in the poor districts of the city :—27 schools, 25,348 children.

Group C comprises Schools in a district of a better class :—11 schools ; 11,453 children.

Group D comprises Schools in a district of a still higher class. In this class are included four out of five of the Higher Grade Schools in the city :—9 schools ; 11,395 children.

That these groups indicate a real social gradation may be inferred from Table No. 10. This table shows the number and percentage of children from different-sized houses examined in each group of Schools. In Group A, the number of one-roomed houses rises as high as 19 per cent. ; the number of three-roomed houses falls as low as 8·7 per cent. In Group D the percentage of one-roomed houses falls as low as 0·6 ; the percentage of three-roomed houses rises as high as 40. Groups B and C fall between these extremes.

It is obvious, therefore, that the grouping followed is confirmed by the distribution of one, two and three-roomed houses.

Returns were made for 72,857 children ; of whom 36,883 were boys ; 35,974 girls. Children mentally defective have been omitted.

If the tables are scrutinised in their sequence according to the index, it will be found that the facts for each group of Schools are set forth so simply that each group can be compared with the others in general and in detail. In the tables of heights and weights, each group may also be compared with the standard average of the Anthropometrical Committee of the British Association. All these heights and weights are further classified in correlation with the houses of different sizes. All the leading conclusions are brought to a focus in a series of six graphic diagrams, which show at a glance the significance of the whole investigation.

III. *General Results.*

At each age from 5 to 18 the average weight of the children is uniformly below the standard of the Anthropometrical Committee.

At the same ages in certain groups, the height of the children appears to be slightly above the standard of the Anthropometrical Committee. But this is

obviously due to the small numbers examined at the particular ages. Up to the age of 14, the children, both boys and girls, are distinctly below the standard. From the age of 15 upwards, there is considerable variation; but on reference to the tables it will be seen that the numbers examined at these ages are very small.

With regard to the boys, the average in each of the four groups falls distinctly below the standard both of weight and height. There is one exception, viz., the children of age 5 in Group D, the best group. In weight those children are practically identical with the standard, and in height are a shade over the standard. On the other hand, the boys from Group A—the poorest districts—fall very much below the Anthropometric Standard. For instance, at the age of 10 years, their average weight is 10·8 lbs. below the standard, and the average height 2·9 inches below. At 13, the average weight is 11·1 below the standard and the average height 3·1 inches below. (See Table 15.)

With regard to the girls, the facts are practically parallel. The girls from Group D—the best districts—show, for the ages of 5 to 7 years, an average slightly above the Anthropometrical Standard. But, with this exception, girls of all ages and from all districts fall distinctly below the standard both in height and in weight. Girls of age 10 years from Group A—the poorest districts—are 2·7 inches below the standard height and 7·2 lbs. below the standard weight. At the age of 13 years, they are 3·4 inches and 14·3 lbs. below the standard. It is significant that the poorest districts provide no school children of ages from 15 to 18.

For all the ages from 5 to 14, the numbers examined are so large that comparison between the different groups can legitimately be made. The gradations in height and weight from the poorest group up to the best group is one of the most striking features of the tables. As surely as a child comes from Group A, he or she is likely to be smaller and lighter than the children from Group B; and a child from Group B is likely to be smaller and lighter than the children of Group C; and so on with the other two groups. But these facts are made immensely more striking when the average height and weight are classified in correlation with the number of rooms in the house. It is not possible here to go fully into a discussion of the figures, but we may direct special attention to Tables 61 and 62, where the whole facts are summarised. If we take all the children of ages from 5 to 18, we find that the average weight of the one-roomed boy is 52·6 lbs.; of the two-roomed, 56·1 lbs.; of the three-roomed, 60·6 lbs.; of the four-roomed and over 64·3 lbs. The respective heights are 46·6 inches; 48·1 inches; 50·0 inches and 51·3 inches.

For girls, the corresponding figures are:—Weights, 51·5 lbs.; 54·8 lbs.; 59·4 lbs. 65·5 lbs. The heights are 46·3 inches; 47·8 inches; 49·6 inches; 51·6 inches.

These figures show that the one-roomed child, whether boy or girl, is always on the average distinctly smaller and lighter than the two-roomed; and the two-roomed than the three-roomed; and the three-roomed than the four-roomed. The numbers examined are so large, and the results are so uniform that only one conclusion is possible, viz.:—that the poorest child suffers most in nutrition and in growth. It cannot be an accident that boys from two-roomed houses should be 11·7 lbs. lighter on an average than boys from four-roomed houses and 4·7 inches smaller. Neither is it an accident that girls from one-roomed houses are, on the average, 14 lbs. lighter and 5·3 inches shorter than the girls from four-roomed houses.

The tables contain all the details necessary for the critical study of these averages; but every table confirms this general result.

The diagrams given at the end exhibit the Glasgow heights and weights side by side with the Anthropometrical Committee's standards. Four of the diagrams summarise the heights and weights in relation to the housing. The variations after

the age of 14 are striking, but they are obviously due, as mentioned above, to the small numbers examined at those ages. From the ages of 5 to 14, the one-roomed curve is uniformly below the two-roomed; the two-roomed curve is below the three-roomed; the three-roomed below the four. All are below the Anthropometrical Committee's standard. The same is true for weight as for height.

This is the most extensive investigation ever undertaken in Britain as to the heights and weights of school children in Primary and Higher Grade Schools. The tables and diagrams ought to be of value for reference, and may legitimately be held to be a provisional standard for future investigations.

W. LESLIE MACKENZIE, M.A., M.D., D.P.H.,
*Medical Member of the Local
Government Board for Scotland.*

A. FOSTER, Capt.,
Inspector of Physical Training.

18th July, 1907.

APPENDIX.

TABLES relating to the Physical Condition of Children attending the Public Schools under the School Board for Glasgow, arranged in Groups according to the character of the district in which the Schools are situated, viz:—

GROUP A, comprising schools in the poorest districts of the city,

„ B „ „ in poor districts of the city,

„ C „ „ in districts of a better class,

„ D „ „ in districts of a still higher class, in which is included four out of the five Higher Grade Schools in the city,

SHOWING:—

- (1) The Number of Children examined in each School and Group of Schools, classified in Divisions and Age Groups, together with the Average Age of the Children in the Division and the percentage of Children in each Age Group.
 - (2) The Number of Children, from different sized Houses, examined in each School and Group of Schools, with the percentage of Children in each Age Group.
 - (3) The Number of Children examined, with the average Weight and Height at each age (5-18), in each School and Group of Schools.
 - (4) A Comparison of the Weights and of the Heights of Children at each age (5-18), according to the size of the House.
-

INDEX TO TABLES.

Numerical Order.	TABLE.	SUBJECT.
