LIBRARY REGULATIONS

(a) Books, periodicals and pamphlets may be borrowed by Fellows, Ordinary Members, Associates and Affiliates personally or by a messenger producing a written order. The person to whom such publications are delivered shall sign a receipt for them in a book provided for that purpose.

(b) Publications may be borrowed through the post, or by other means of carriage, upon a written order. The postage or carriage of publications returned to the Society shall be defrayed by the borrower.

(c) A borrower may not have more than three publications in his possession at one time.

(d) A borrower will be considered liable for the value of any publication lost or damaged while on loan to him, and, if it be a single volume or part of a set, for the value of the whole work thereby rendered imperfect. Marking or writing in the publications is not permitted, and borrowers are requested to call attention to damage of this character.

(e) Books and pamphlets may be retained for twenty-eight days. Periodicals may be retained for fourteen days. Applications for extension of the loan period must be made in writing before its expiry. No publication may be kept longer than three months.

(f) Books and pamphlets added to the library will not be lent until after the expiry of one month from the date received. The current number of a periodical may not be borrowed.

(g) Borrowers retaining publications longer than the time specified, and neglecting to return them when demanded, forfeit the right to borrow until they be returned, and for such further time as may be ordered by the Council.

Any borrower failing to comply with a request for the return of a publication shall be considered liable for the cost of replacing it, and the Council may, after giving due notice to him, order it to be replaced at his expense.

No publication may be reissued to the same borrower until at least seven days have elapsed after its return, neither may it be transferred by one borrower to another.

(h) Publications may not be taken or sent out of the United Kingdom.

(i) Publications returned through the post must be securely packed in a box or otherwise adequately protected.

(j) The Library may be used for reference by Fellows, Ordinary Members, Associates and Affiliates during the office hours of the Society.

(k) Parcels should be addressed:

Appendix D - continued			
D.3	Households in Dwellings containing Two Households by (1) Size of households in each combination (2) Age and Marital Condition of Head in each combination, giving 6 items of information viz., numbers of (i) Households (ii) Persons (iii) Rooms (iv) Households without exclusive use of piped water (v) Households without exclusive use of watercloset (vi) Households without exclusive use of cooking stove	Five Selected Areas	144
D.4	Households in Dwellings containing Three or more Households: Sizes of Household Occupations and numbers of non-married persons living alone	Part of Westbourne Ward of Paddington Met.B.	147
D.5	Households in Dwellings containing Three or more Households by Rooms Occupied giving numbers of: (i) Households (ii) Persons (iii) Rooms (iv) Households without exclusive use of piped water (v) Households without exclusive use of watercloset.	Part of Westbourne Ward of Paddington Met.B.	148
Appendix E			
E.1	Characteristics of Households and Dwellings	Wards of Birmingham C.B.	150

Programme of Census Reports and other census information

The *Census 1951, England and Wales, Preliminary Report*, published in July, 1951, contains a general note on the taking of the census, some brief preliminary statistical commentary, and provisional populations for all local authority areas (counties, boroughs, urban and rural districts).

The *Census 1951, Great Britain, One per cent Sample Tables*, published in two parts in July and November, 1952, present an advance picture of the pattern of the main results. The tables relate to Great Britain and, with correspondingly less detail, to various smaller areas according to the size of their populations. The subjects covered are Ages and Marital Condition; Occupations; Industries; Housing, Characteristics and Composition of Private Households; Non-Private Households; Education; Birthplace and Nationality; Fertility; Welsh and Gaelic Languages; together with a Conurbation Supplement.

The 1951 series of *County Reports*, already published, comprises most of the statistics of predominantly local interest, namely, populations and acreages of local government, parliamentary and petty sessional areas; private households, the rooms and dwellings in which they live and the household arrangements possessed by them, together with the complementary record of institutions, etc., housing various categories of non-private population; birthplace and nationality; education; social class; distribution of the local populations according to sex, age and marital condition.

The *Report on Welsh Speaking Population* gives the statistics on the speaking of the Welsh language by those enumerated in Wales, including Monmouthshire, with a brief commentary on the census enquiry.

The *Populations of Ecclesiastical Areas (England)* gives populations of ecclesiastical parishes and dioceses in England.

The *Index of Place Names* gives the location and the census population of places with defined boundaries.

The *Report on Greater London and Five Other Conurbations* gives statistics for the six major conurbations in England and Wales (Greater London, South East Lancashire, West Midlands, West Yorkshire, Merseyside, Tyneside) and for certain main divisions and sub-divisions, as already identified in the Sample Tables, generally on the lines of the County Reports.

The *Report on Usual Residence and Workplace* contains tables showing the population resident in one specified area and working in another, the units of area being boroughs, urban and rural districts; tables comparing the enumerated census population in local areas, using the same units of area already mentioned, with an alternative allocation based on the statement of usual residence returned on the census schedules, together with the numbers enumerated there who were usually resident outside England and Wales, and tables classifying the latter by country and usual residence and by age.

The volume of *Occupation Tables* gives statistics of the occupied population based on their personal occupation (classified according to the unit groups of the *Census 1951, Classification of Occupations*), including statistics of local populations according to the area in which they were enumerated, and with reference to age, marital condition, industrial status in employment (manager, employer, etc.) social classes and socio-economic groups.

A volume of *Industry Tables* will give statistics of the occupied population based on the industrial activity to which their occupations contribute with identification of industrial status categories, age-groups, and married women, the industry units being those of the Standard Industrial Classification. Statistics of local populations will be based on the area (borough, urban and rural district) containing the place of work. The

volume will also contain an analysis of each important industry or group of industries showing the principal occupations contributing to the industry.

The *General Tables* volume mainly comprises summaries of the information given in the County Reports on local populations (with figures for county court districts in addition), the various categories of non-private population, birthplace and nationality, ages and marital condition, and education.

The present *Housing Report* summarises the housing information given in the County Reports relating to private households, with a commentary on the figures.

The *Fertility Report* will give statistics derived from the questions put to married women under the age of 50 on the date of marriage and number of children, with a commentary.

The *General Report* will contain a report on the census operation as a whole, together with a commentary on those fields of census statistics not covered elsewhere, such as the occupation and industry, education, birthplace and population tables.

Note:

With regard to census information not presented in the published reports referred to above, Section 4(2) of the Census Act, 1920, empowers the Registrar General, if he so thinks fit, at the request and cost of any local authority or person, to cause abstracts to be prepared containing any such statistical information, being information which is not contained in the census reports made by him, and which in his opinion it is reasonable for that authority or person to require, as can be derived from the census returns.

This provision is available to meet any special demand for census statistics of a greater degree of elaboration, whether in respect of subject matter or area, than those given in the official reports. An estimate of the cost and an assessment of the practicability will be given on receipt of any requests of this nature.

General Explanatory Notes

1. **General Note.**- This volume contains the main 1951 Census statistics on housing and households in respect of the population enumerated in England and Wales as at midnight, 8th/9th April, 1951. Detailed figures for Counties and local authority areas have already been published in the County Report series. These are the final figures, replacing the figures based on a sample of the census records which were published in Section IV, Housing of Private Households, and Table V.I, Private Households by Marital Condition, Age and Sex of Head, of the *Census 1951, Great Britain, One per cent Sample Tables*; some account of the difference between the sample and the full figures as it arises from sampling itself will be given in the *General Report* (now in preparation), but a difference in definition of private and non-private households (referred to further in paragraph 8) should be noted.

This volume also contains a commentary on two sections of the Sample Tables, namely Section V, Social and Economic Characteristics of Private Households (apart from Table 1) and Section VI, Composition of Private Households, where it was not regarded as necessary to carry out any full scale tabulations. Some additional tables on these subjects have been derived from the sample analysis and are published for the first time in this volume.

2. **1951 Census Population.**- As on previous occasions, the census population which forms the basis of the statistics relating to each area is the de facto population, whether of British or non-British nationality, actually enumerated within the area on census night, 8th/9th April, 1951. It comprises visitors from abroad (including Armed Forces of Commonwealth or foreign countries except those on board foreign naval vessels) or from other areas in the United Kingdom, as well as those residents who were at home, but not people usually resident in the area who were absent on census night. It includes the crews and passengers of ships, boats and barges, allocated, with as much accuracy as the information in the census record allows, according to the position of their anchorage or mooring at census midnight, or, if they were then on a coastal or fishing voyage or an inland river journey, to their next port or place of call. Persons travelling during the night or otherwise inaccessible were counted as part of the population of the area at which they arrived on the following day, unless they had been previously enumerated.

3. **Basis of Enumeration and Tabulation.**- The enumeration was carried out on household schedules (a copy of which is reproduced facing p.xviii) and these together with the enumeration records compiled by the enumerators constitute the main portion of the census records. The schedules contained a question on usual residence, which enabled a distinction to be drawn between those persons enumerated as being usually resident at the address to which the schedule related and visitors with a usual residence elsewhere.

A distinction has been drawn in the census tabulations between private and non-private households as defined below. The statistics given in this report relate almost exclusively to persons in private households. The treatment adopted throughout except in Appendix A follows the practice of previous censuses in that no adjustments have been made in respect of persons enumerated in households to which they did not belong, and in consequence absent from their own household.

4. **Comparison with 1931 and earlier census figures.**- In Table 13 the comparative figures are based on the areas as constituted in 1951 except where otherwise stated. In other tables 1931 figures for the Standard Regions and Conurbations have been adjusted as nearly as possible to relate to the 1951 areas; 1931 figures for Counties relate to the areas as constituted at the date of the 1931 Census. Particulars of the changes made in County boundaries since that date are contained in the 1931 *Census County*

Reports, Parts II, and the 1951 Census County Reports; these also give particulars of changes in local authority boundaries in the intercensal period

N.B. Comparison is also affected by changes in definition (see below).

5. **Abbreviations.**- The abbreviations A.C., C.B., Met.B., M.B., U.D., R.D. and C.P., denote respectively - Administrative County, County Borough, Metropolitan Borough, Municipal Borough, Urban District, Rural District and Civil Parish.

6. **Names.**- The spelling of place names follows generally that adopted by the Ordnance Survey Department.

7. **Areas for which statistics are given.**- Statistics are given for the following in addition to local authority areas; an outline map showing the boundaries of Standard Regions, Conurbations and Counties is included opposite.

Counties.- Figures for counties relate either to the Administrative Counties alone or to the Administrative Counties combined with the respective associated County Boroughs as explicitly stated in each case. For this purpose York C.B. is regarded as being associated with the West Riding of Yorkshire.

New Towns.- The New Towns identified in Table 13 relate to the areas designated in Orders made under Section 1 of the New Towns Act, 1946, as at census day.

Standard Regions.- The geographical regions into which England was divided for purposes of statistical analysis in the 1931 Census Reports (see *Census of England and Wales 1931, General Report, page 10*) have been superseded by the Standard Regions; these were the areas standardised in 1946 for various administrative purposes.

The constitution of the English Standard Regions identified in the 1951 Census Reports is as follows:-

Northern

Cumberland
Durham
Northumberland
Westmorland
Yorkshire, North Riding

Northamptonshire
Peterborough, Soke of
Nottinghamshire
Rutland

Midland

East and West Ridings⁽¹⁾

(3) All except the areas stated in (2) above.

(4) All except East Ham C.B., West Ham C.B., Barking M.B., Chingford M.B., Dagenham M.B., Ilford M.B., Leyton M.B., Walthamstow M.B., Wanstead and Woodford M.B., Chigwell U.D. and Waltham Holy Cross U.D.

(5) All except Barnet U.D., Bushey U.D., Cheshunt U.D., East Barnet U.D. and Elstree R.D.

(6) All areas stated in (4) above.

(7) All areas stated in (5) above.

Conurbations.- The conurbation areas used in this volume are those which were agreed in 1950, under the aegis of the Interdepartmental Committee on Social and Economic Research and the Central Statistical Office, for the presentation of official statistics generally.* They each consist of an aggregation of entire local authority areas.

For more detailed statistical analysis the conurbations have been divided into divisions and sub-divisions which are set out in full, illustrated by maps, in the *Report on Greater London and Five Other Conurbations*.

The constitutions of the conurbations and of their divisions and sub-divisions, and the nature of the latter, are broadly indicated below.

Greater London

8. Definitions, etc.

Dwelling means a structurally separate dwelling and generally comprises any room or suite of rooms intended or used for habitation by persons living in private households having separate access to the street or to a common landing or staircase to which the public has access. Caravans (or a group of two or more caravans when occupied by the same household) and houseboats (or other vessels used as such) were treated as dwellings if occupied on census night but not otherwise.

Households. - The groups of persons enumerated together on each census schedule are broadly of two types conventionally designated as private or non-private households.

Non-private households, which are excluded from all tabulations in this Report, comprise all persons enumerated in Hotels, Boarding Houses and Institutions or otherwise grouped in establishments of one kind or another for some functional purpose other than the mere provision of food or domestic convenience, and include also defence establishments, ships, and a small miscellaneous element; households were treated as boarding houses, and therefore as non-private, either when the census records indicated this fact, or, if the total number of persons in such a household was 10 or more, when the number of boarders exceeded the number of the householder's family including domestic servants. (N.B. This is slightly different from the definition used in the 1931 Census Reports and in the 1951 Census Sample Tables, where the same convention was used but without regard to the size of the household in question.)

Private households form the remainder and can broadly be regarded as comprising single persons living alone or groups of individuals voluntarily living together under a single menage in the sense of sharing the same living room or eating at the same table; boarders and domestic servants were included in the household with which they were enumerated, as also were visitors. But a lodger or group of lodgers having or sharing separate accommodation to themselves should have been enumerated on separate schedules and were thus treated as separate private households, distinct from the main occupying household of the dwelling, whether or not they relied on the latter for incidental service in the matter of room cleaning, food preparation, etc.

Head of Private Household. - The census legislation required the head, or person acting as head, of a private household to make the census return in respect of the members of that household. In general therefore the head is the person described as head by the person completing the return. Where two persons were described as head, the first person so described was taken as head. Where no person was so described, the first person on the schedule was taken to be the Head.

Boarders and Lodgers. The division of treatment in the so-called boarder and lodger classes of person should be noted. A boarder living with a family in the sense of sharing the same living room or eating at the same table was treated as part of the accommodating household. But a single lodger or group of lodgers having or sharing separate accommodation to themselves should have been enumerated on separate schedules, and was thus treated as a separate private household, distinct from the main occupying household of the dwelling, whether or not they relied on the latter for incidental service in the matter of room cleaning, food preparation, etc.

Rooms. - For the purpose of the census, the rooms counted were the usual living rooms, including bedrooms and kitchens, but excluding sculleries, kitchenettes, landings, lobbies, closets, bathrooms or any warehouse, office or shop rooms. Rooms shared by more than one household in multiple household dwellings were included in the count of rooms in the dwelling as a whole, but were excluded from the rooms allocated to the separate households.

Where households occupied less than one room, they were treated as occupying one room, although the dwelling was still classified with its proper number of rooms. A slight difference in the wording of the enumerators' instructions (see footnote*) may have led to some kitchens being excluded from the 1951 count that would have been included in 1931, but its practical effect is not thought to be sufficient materially to impair intercensal comparison.

Where a household occupied part of a structurally separate dwelling of which the remaining portion was vacant on census day, in the dwellings tabulation (e.g. Table 1) the dwelling was treated as a single household dwelling containing the full number of rooms in the dwelling, but an adjustment was made in the totals of occupied and vacant rooms to give the true figures in each case; this followed 1931 census practice and ensured that the dwelling was classified according to its actual size in rooms, but it is not possible from the information available from the census record to say how many households would occupy the vacant portion. In the household tabulations (e.g. Table 2) the household was treated as a household sharing a dwelling, classified according to the number of rooms actually occupied.

Where one or more private households occupied rooms in a dwelling which was partly private and partly non-private, they were treated as if the private portion were self-contained, i.e., an independent structurally separate dwelling, the remainder being treated as occupied by a non-private household.

Household Arrangements. - The 1951 census schedule contained the following instructions:-

Piped water supply within the house means water laid on either from the mains or from a storage tank, if the tap can be reached without leaving the shelter of the building or an attached covered structure. It does not include a tap in the open yard or a public standpipe.

Cooking stove or Range means any cooking stove, kitchen range, or other fixed grate using gas, electricity or any other fuel, provided there is an oven. One or more gas-rings, hot-plates or portable electric ovens are not by themselves enough to be called a cooking stove or range.

Kitchen Sink means a sink inside the building, whether in a kitchen or not, with a drain pipe leading outside the building, and normally used for washing up, etc. It need not have water piped to it. It does not include a wash basin designed for personal toilet.

* The actual instructions given to the enumerators in 1931 and 1951 to guide them in making the count of rooms were as follows:-

1931 Enumeration Book, Instruction 21. "... The kitchen should be counted as a room; but the enumerator must not count a scullery, landing, lobby, closet or bathroom, or any warehouse, office or shop rooms. It is not easy to furnish a precise definition of a scullery; but it may be taken that a room or annex or recess which adjoins a living-room and which is only used for purposes of washing, cleaning or cooking and not as a place where meals are eaten may be regarded as a scullery and excluded from the count."

1951 Enumeration Book, Instruction 26. "... All rooms in which the household live, eat or sleep, including the kitchen if so used, should be counted, but a scullery (or kitchenette), landing, lobby, closet, or bathroom should not normally be included. Any store room, office, warehouse, shop or other room not used for any domestic purposes should also be excluded. But the name given to a room may sometimes be misleading. Thus the name kitchen, kitchenette or scullery may be given to a room, annex or recess used only for purposes of washing, cleaning or cooking, and not as a place where meals are eaten, in which case it should be excluded. But a kitchen or kitchenette where meals are eaten should be included as a living room."

Watercloset here means a watercloset flushed by water, either from a cistern or by hand, and emptying into a main sewer, septic tank or cesspool. It does not include a chemical closet or earth closet.

Fixed Bath means a bath permanently installed and connected with a waste pipe leading outside the building. It does not matter for this purpose whether there is water piped to it, or whether the room where it is installed is used only as a bathroom or not.

Social and Socio-Economic Classification. Since the 1911 Census it has been customary to arrange the very large number of unit groups of the the Occupational Classification into a small number of broad categories (traditionally called Social Classes) as an aid to certain kinds of statistical analysis. Each occupational unit group has been assigned as a whole to the appropriate social class.

For certain investigations it has been felt that the social class grading is not entirely adequate, and accordingly at the 1951 Census, a different arrangement of occupational unit groups taken as a whole into slightly more sharply defined groups was introduced, the groups being called socio-economic groups.

The specific assignments of occupational unit groups to social classes, and to socio-economic groups are set out in Table 1 of the *Census 1951, England and Wales, Occupation Tables*, and these should be studied for a proper appreciation of their content. They are more fully described on pp. x and xi of that volume. Their general nature is sufficiently indicated by the following broad descriptions:-

Social Class.

- Class I - Professional, etc., Occupations
- Class II - Intermediate Occupations
- Class III - Skilled Occupations
- Class IV - Partly Skilled Occupations
- Class V - Unskilled Occupations

Socio-Economic Groups

A. Agricultural		B. Non-Agricultural	
		I. Non-Manual	II. Manual
1. Farmers		3. Higher administrative, professional and managerial	9. Foremen
2. Agricultural workers		4. Other administrative, professional and managerial	10. Skilled workers
		5. Shopkeepers (including proprietors and managers of wholesale businesses)	11. Semi-skilled workers
		6. Clerical workers	12. Unskilled workers
		7. Shop assistants	
		8. Personal service	
C. Special group not included elsewhere			
13. Armed Forces (other ranks)			

INSTRUCTIONS

Fill this page back for guidance while filling up Columns R, C and Panel T.

Relationship, Column B.

1. **Visitors.** Anyone who has a more usual residence elsewhere should be described as "Visitor" whether invited to the head of the household or not.
2. **Residents.** Persons enumerated at a hotel, club, hostel, boarding-house, etc., at which they have a settled residence without a more usual place of residence elsewhere, should be described as "Resident" or "Boarder", not as "Visitor".

Usual Residence, Column C.

3. **Visitors from abroad,** unless they have a settled residence in this country, should give their full postal address in the country overseas where they normally reside.
4. **Hotels, Boarding-Houses, etc.** For persons enumerated at a hotel, club, hostel, boarding-house, etc., at which they have a settled residence without a more usual place of residence elsewhere, write "Here".

5. **Resident Staff, etc., who "live in".** The private house, boarding-house, or other premises where they live should be registered in their usual residence. If enumerated at their living premises, write "Here". If enumerated elsewhere, their living address should be given as their usual residence.

6. **Scholars, Students, Undergraduates, etc., of a residential school, college or university, if enumerated at home,** should give the address of the boarding school or college at which they usually reside during term. University students who reside during term in lodgings in the university town should regard such lodgings as their usual residence for this purpose.

7. **Members of His Majesty's Forces on leave** should give the name and address of their barracks, quarters, station or shore establishment.

For instructions on Columns N-R see numbers 12 to 22 on the page below Columns A, B and C.

Household Arrangements: Panel T.

8. **Piped water supply** within the house means water laid on either from the main or from a storage tank, if the tap can be reached without leaving the shelter of the building or an attached covered structure. It does not include a tap in the open yard or a public standpipe.
9. **Cooking Stove or Range** means any cooking stove, kitchen range, or other fixed gas using gas, electricity or any other fuel, provided there is an oven. One or more portable, hot-plate or portable electric ovens are not by themselves enough to be called a cooking stove or range.

10. **Kitchen Sink** means a sink inside the building, whether in a kitchen or not, with a drain pipe leading outside the building, and normally used for washing up, etc. It need not have water piped to it. It does not include a wash basin designed for personal toilet.

11. **Watercloset** here means a watercloset flushed by water, either from a cistern or by hand, and emptying into a main sewer, septic tank or cesspool. It does not include a chemical closet or earth closet.

12. **Fixed Bath** means a bath permanently installed and connected with a waste pipe leading outside the building. It does not matter for this purpose whether there is water piped to it, or whether the room where it is installed is used only as a bathroom or not.

EXAMPLE

For a household with the exclusive use of a gas cooker, a kitchen sink without a tap, and a watercloset, but drawing water from an inside tap used also by another household, and having no fixed bath, the entries would be—

Piped water supply within the house	Cooking Stove or Range	Kitchen Sink	Water Closet	Fixed Bath
S	E	E	E	None

WINDSOR 1950 SUPPLY. 20711. C.B. 2.5.5. L.B. 10. 1948

CENSUS, ENGLAND, 1951

SCHEDULE

Prescribed by Regulations under the Census Act, 1938, as the form to be used in England (excluding Households), for the purpose of returns in respect of (a) Private Households, (b) Hotels, Clubs, Boarding-houses or Common or other Lodging Houses, and (c) Other persons in respect of whom no other form of schedule is prescribed.

This space to be filled up by the Enumerator.

No. of Registration District	No. of Registration Sub-District	No. of Enumeration Districts

Name of household or other person responsible for making the return

Postal Address

NOTICE

1. The Head, or person acting as Head, of a private household is required by law to make a return in this form in respect of all persons (members of the household, including visitors, employees and boarders) who are present at midnight on the night of Sunday, 8th April, 1951, in the dwelling, and all persons who arrive at the dwelling and join the household on Monday, 9th April, 1951, before the collection of the schedule, and who have not been enumerated elsewhere.

2. The manager or other person in charge of a hotel, club, hostel, boarding-house or common or other lodging house is required by law to make a return in this form in respect of all persons who are to be regarded as residents or members of the establishment for Census purposes, namely, all who are present at midnight on the night of Sunday, 8th April, 1951, in the establishment, and all persons who join the establishment on Monday, 9th April, 1951, before the collection of the schedule, and who have not been enumerated elsewhere.

3. Every such person is required by law to give to the person responsible for making the return such information as may be necessary to enable the return to be made. His use may, however, be made of such information by the person to whom it is given except for the purpose of making the return.

4. A person who has applied in the prescribed manner to make a separate confidential return will not be liable to give information to the Head or the Manager; and in such case the person responsible for making the return will only be liable to include in his return in respect of that person the particulars required in Columns A and B within.

5. The schedule will be called for on MONDAY, 9th APRIL, by the appointed enumerator; in order that he may not be delayed it must be ready with the answers written in the proper columns early on the morning of that day. If the answers appear to be incomplete or inaccurate, the enumerator must ask any questions necessary to enable him to correct the schedule.

6. The person responsible for making the return may, if unable to deliver the schedule to the enumerator personally, arrange for some other person to do so on his behalf. If desired, the schedule may be handed to the enumerator under cover.

7. If any person whose duty it is to make a return or to give information refuses to do so, or wilfully gives false information, or omits otherwise than for the purpose of making the return any information given him for that purpose, he will be liable to a fine not exceeding Ten Pounds.

8. The contents of the schedule are strictly confidential.

GEORGE NORTH,
Registrar General.

STRICTLY CONFIDENTIAL

Please read the Column Headings below and the Instructions and Examples on the back. Then fill up the Schedule carefully in Ink.

To be filled up by the Enumerator
No. of
Schedule

The Persons to be included in this schedule are all those who are alive at midnight on the night of Sunday, 8th April, 1951, and who, whether as members of the family or as visitors, boarders or employees— (1) pass the night in the dwelling of this household or in this establishment, or (2) arrive and are received into the household or establishment on Monday, 9th April, 1951, before the collection of the schedule, not having already been enumerated elsewhere. No one else may be included.			Sex	Age	Particulars as to Marriage				Birthplace	Nationality	Education	Occupation and Industry			
Name and Surname	Relationship to Head of Household	Usual Residence	If Male write "M", if Female write "F"	In years and months.	Particulars as to Marriage		Whether she has given birth to— a. How many children born alive during the last twelve months, i.e., on or after 1st April, 1950. ("Yes") or "No."	(1) If born in Great Britain or Northern Ireland, write the name of the County, and of the Town or Parish. (2) If born elsewhere, write the name of the Country, and of the State, Province or District, or, if born at sea, write "At sea".	For all persons attending a school, university or other educational establishment for the purpose of receiving instruction, state age in years and months, and write "Full-time" or "Part-time". See Instructions 14 and 15 for persons in whom this column does not apply.	To be answered only in respect of persons aged 15 or over.					
					Date of Marriage	Children Born in Marriage				Personal Occupation	Employer and Employer's Business	Place of Work			
<p>Instructions:</p> <p>For persons aged 15 or over, state whether "Single", "Married", "Widow", or "Divorced". If married, state the date of marriage, or, if married more than once, state the date of last marriage, and write "D".</p> <p>For persons included in this schedule who usually reside at this dwelling or establishment, write "Here".</p> <p>For those who have a more usual residence elsewhere, state full postal address of usual residence.</p> <p>For those who have no settled place of residence, write "Home".</p> <p>See Instructions 3 to 7.</p>

For Instructions on columns M to R fold towards the left hand side of this sheet.

Commentary

CHAPTER I: INTRODUCTION

The 1951 Census of England and Wales was taken as at midnight on Sunday April 8th, the record relating to all persons present in the country at midnight, April 8th/9th, including temporary visitors but excluding residents of England and Wales who were not in the country at the time. The treatment of persons arriving in or departing from the country, and of persons on coastwise or fishing voyages, on April 8th or 9th, is explained in the Notes on p.ix. The total population enumerated excludes members of the Armed Forces and Mercantile Marine who were outside the country, and in this respect omits a number of persons who belonged to families living in the country.

As on previous occasions the census was also taken on a de facto basis in the sense that visitors in private households were included in the census statistics in the households in which they were enumerated, no details being transferred to the households to which they belonged. The choice of date was made with the object of securing a record in which as many persons as possible were enumerated at their usual places of residence: it was thought that Sunday would be the best day of the week on that account, and that, a fortnight after Easter, comparatively few people would be on holiday or away from home for other reasons at that time of year.

The census record was obtained on household schedules, the head of every household being responsible for completing a schedule in respect of all persons enumerated in his or her household. Private and non-private households were distinguished in the census office on the basis of information on the schedules or in the enumeration books. Among the items of information which the head of every household was required to furnish was the relationship to him (if any) of all other persons enumerated in his household and the identification as 'visitors' of persons not usually resident in it. He was also required to give certain particulars about domestic arrangements obtaining in the dwelling accommodation occupied by his household. As at the 1921 and 1931 censuses responsibility for recording numbers of rooms in each dwelling and, in the case of dwellings occupied by more than one household, in the occupation of each private household, was laid on the census enumerator who also collected particulars of vacant dwellings and of the numbers of rooms they contained.

The two main concepts which are the basis of the part of the census record which relates to housing are that of a private household and that of a dwelling for the occupation of a private household or households. The formulation of definitions of these terms, in a form suitable for use by census enumerators, is difficult and has always been one of the main problems of those responsible for taking censuses which cover housing, both in this country and elsewhere, on account of the very wide variety of housing conditions. In present day Britain the majority of the population live in types of private household comprising family (i.e. related by blood or marriage) groups with each household occupying a whole dwelling. There are, however, many private households which contain persons unrelated to the head and the borderline between a private household and, e.g., a small boarding house is not always easy to define so sharply that two different observers will infallibly treat the same establishment in the same way. Neither is it always easy to decide whether unrelated, and in some cases related, persons should be regarded as part of a household, or as a separate household living in the same dwelling - there may sometimes be doubt as to whether a person is a boarder (and therefore part of the household) or a lodger (and a separate household).

The dwellings in which private households live are also of very varied types, particularly in those older parts of the larger cities and towns

whose buildings were originally designed to house the larger families of the contemporary generations; many of these have since been converted or adapted either to form smaller units of residential accommodation or to provide shops, offices, or accommodation for industrial undertakings. It is easy to construct a definition of a structurally separate dwelling for the usual type of family house or flat originally constructed as such, but it is difficult to devise a form of words to cover every type of converted building in such a way as to provide, in a simple classification, a measure of the different degrees of separation which one dwelling space may have from another; on the justifiable grounds of simplicity the boundaries are inevitably made to appear more sharply defined than they really are.

Housing was expressly included as a characteristic to be observed at the first census of Great Britain in 1801, the relevant instructions to overseers being "How many Inhabited Houses are there in your Parish, Township or Place; and by how many Families are they occupied?" The subject has been included in all succeeding censuses in England and Wales.

The stages in the development of census taking in this country, for the purpose of measuring housing conditions, may be outlined as follows. A house, the definition of which had been left to the discretion of the census enumerator up to and including 1841, was defined at the 1851 Census as "all the space within the external and party walls of a building". Under this definition buildings of all kinds, whether family residences or public institutions such as schools, hospitals, etc., were counted as houses; a block of flats was counted as one house; a block of shops containing one or more residences was one house; a factory containing the living quarters of a caretaker was one house. This definition, which was adopted by the International Statistical Congress (held in London in 1860), was maintained at successive censuses up to 1901. It was not until 1911 that a more specific form of description was used in terms similar to those now used to define a structurally separate dwelling, and a distinction was made, for tabulation purposes, between private and non-private families. Only then did it become meaningful to tabulate separately such dwellings as contained more than one household, although this form of tabulation was not adopted until 1921. Since 1911 the definition of a structurally separate dwelling has remained virtually unchanged and, while there is some doubt as to whether it was fully understood and correctly applied in 1911, the 1921, 1931 and 1951 census tabulations may be regarded as comparable provided that it is borne in mind that in 1921 there was probably some slight overstatement of separate dwellings and a corresponding understatement of shared dwellings.* This was not regarded as seriously affecting the delineation of broad trends.

The term "family", which was replaced by the term "household" in 1951 without any change in the meaning attached to it, appears to have referred to the same basic concept since the time of the first census in 1801 although there has been some variation as between one census and another in the wording of instructions to the enumerators. Lodgers, who were to be regarded as separate families, were explicitly mentioned in the definitions as far back as 1861, but such qualification as "not boarding with a family" was only introduced in 1911.

The formulation of definitions for the 1951 Census, in the field of housing, is based on the accumulated experience of the previous censuses. The definitions used are fully set out in the Notes on p.xvi. The main elements in the framework of concepts which they represent are as follows:-

- (i) private households are persons living alone and groups of persons living together under a single menage.
- (ii) non-private households consist of persons enumerated in hotels, boarding houses, schools, hospitals and other residential institutions.

* See Census of England and Wales 1931, Housing Report, pp. x, xi.

- (iii) dwellings are buildings (or parts of buildings) structurally separated from other buildings (or parts) which are used for the housing of private households.
- (iv) an individual dwelling may contain one, or more than one, private household or may be vacant.
- (v) rooms are the usual living rooms, including bedrooms and kitchens but excluding sculleries, bathrooms, etc., and any warehouse, office, shop, etc., rooms.
- (vi) the head of a private household is taken to be the person described as head on the census schedule, or the first person so described, or the first person on the schedule if none was described as head. No definition of the term head of a private household has been made for census purposes.

These definitions form the basic units in the scheme of tabulations designed to demonstrate the housing conditions of 1951. Their use permits comparison with 1931 and 1921 over a wide field and more limited comparison with earlier census dates, because they have been developed and tested at successive census enumerations all of which have been carried out under essentially similar conditions, that is, the collection by enumerators of particulars about families or households and the dwellings which contain them.

Certain limitations are inherent in the nature of classified data in that there are bound to be some descriptions which do not fit precisely into a classification designed to meet the principal conditions encountered in practice while retaining the degree of simplicity essential to the preservation of co-operation by the public. As already remarked, there may sometimes have been difficulty in practice in drawing the line between the two classes of boarders and lodgers - this difficulty arose not only in relation to private households but in relation to boarding houses, in determining whether a house whose rooms were occupied as bed-sitting rooms was to be counted as a boarding house or as a collection of one room occupations inhabited by separate households sharing the same dwelling.

It is important also to bear in mind that the census tables do not distinguish between those structurally separate dwellings which were built as such and whose arrangements remained in use as originally designed, and those which were the result of "conversions" effected with very varying amounts of building work and differing widely in the extent to which separate domestic and sanitary arrangements were provided. Between 1931 and 1951 such conversions were made on a considerable scale, in part to meet local housing shortages arising from population growth and migration, in part to provide smaller units of accommodation and in part to meet popular demands for greater privacy for households already living in shared dwellings. Conversions of this latter kind involved such structural alteration as would qualify the living spaces to be regarded as separate dwellings in the 1951 census, but they did not involve any change in the number and size distribution of individual household occupations and in many cases will have been effected with very little building work. Most other types of conversion will also have involved constructional work on a much smaller scale than that needed to build new dwellings. Changes in numbers of dwellings in the 1931-51 period, as reflected in the census tables, on this account give an inflated idea of the amount of new residential building work that had taken place.

The basic tabulations which cover the last three censuses are those which relate to the numbers of dwellings and the numbers of rooms which they contained and those which analyse households by numbers of persons and numbers of rooms occupied. These tabulations are precisely comparable save in three minor respects: (i) there was a slight change in the definition of a boarding house for the 1951 Census, which brought into the

private household category certain households which would not have been classed as private households on the 1921 and 1931 definition (see p.xvi); (ii) there was a change in the treatment of rooms shared by more than one household as between the 1921 and 1931 tables; and (iii) there was a small change in the wording of the definition of rooms (see p.xvii). The number of households affected by the change in the definition of a boarding house is not known but it may have had an appreciable effect on the proportion of larger dwellings recorded in the occupation of private households. It is probable that the other two changes referred to (in the treatment of rooms) are of little significance in any of the tabulations.

In addition to these basic tabulations the 1951 presentation gives the distribution of private households by the age, sex and marital condition of their heads, and information about the availability of certain household domestic arrangements, namely, piped water, kitchen sink, cooking stove, watercloset and fixed bath. Most of the tables given in the present report summarise tables given in more detail for counties and other local authority areas in the 1951 Census series of County Reports which have already been published. The present volume also contains some tables on the composition of private households in Great Britain and some on their social and economic characteristics based on special analyses published in the *Census 1951, Great Britain, One per cent Sample Tables* (Sections V and VI). The tables on these subjects in this volume in part summarise and in part extend those already published.

It is to be noted that the de facto basis of the census enumeration, that is, by place of sojourn at midnight of census day as distinct from usual place of residence, affects both the tabulations of households and dwellings and the tabulations of population, but in different ways. A count of persons distributed according to place of enumeration will differ from one according to place of usual residence only if these two places are in different geographical units of tabulation; counts of households on these two bases, by any of the characteristics shown in the tables, will, however, differ to the extent that persons are enumerated in households other than those in which they usually reside. The household tables for England and Wales as a whole, as well as those for local areas, are affected, probably in some cases appreciably, as discussed elsewhere in this Report; but it is not to be suggested that the picture of housing conditions as given by de facto tabulation misrepresents to any serious extent that which would be portrayed by statistics on a usual residence basis.

CHAPTER II: DWELLINGS

At the 1951 Census a total of 12,389,448 occupied and vacant dwellings (as defined on p.xvi) were identified in England and Wales. This comprises all the accommodation which was available for the housing of private households, but excludes 69,531 miscellaneous habitations and institutions housing non-private households. The present report is concerned almost exclusively with the population living in private households, which comprised 95.6 per cent of the total population enumerated.

Table A provides a broad indication of the changes in the amount of dwelling accommodation that have taken place in England and Wales in the whole period of 150 years covered by the population census records. Exact comparability is necessarily impaired, for the reasons already discussed, by the gradual improvement both in the concepts used and in their definition. The real changes are, however, very large by comparison with the possible differences attributed either to the increasing precision of the record at successive censuses or to the two specific changes of concept which took place for the 1911 Census, namely (1) the introduction of

Table A. - HABITATIONS, HOUSEHOLDS, POPULATION 1801 - 1951.

(1) Change in 20 year period.

(11) On the basis of dwellings.

tabulations of 'dwellings' and (2) the exclusion of non-private households from the tabulations which in previous censuses had included them. With regard to these last two specific changes data on both bases for 1911 are instructive: the difference between 7,550 thousand houses and 7,691 thousand dwellings is largely accounted for by the fact that the former figure includes 88 thousand hotels and public houses and 25 thousand institutions, but only 77 thousand blocks of flats (counting each block as a 'house'), while the figure of 7,691 thousand dwellings excludes 62 thousand dwellings containing non-private households (hotels, institutions and a few other types of establishment but not public houses), but includes 280 thousand individual flats which the 77 thousand blocks contained. The small differences for 1911 between persons per house (column (g) of Table A) and persons in private families per dwelling (column (h)), between families per house (column (j)) and private families per dwelling (column (k)), and also between persons per family (column (l)) and persons per private family (column (m)) give sufficient indication that for each type of measure either of the alternatives may be used in examining secular trends.

Table A indicates, in columns (a) and (b), that the number of dwellings existing a hundred years ago was roughly a third of the number existing in 1951, and the number existing at the turn of the century, in 1901, was not much more than half the number in 1951. These increases are of course net figures which represent the excess of new dwellings built and additional dwellings obtained by the structural sub-division of large dwellings, over those demolished or converted to other uses. Little is known of the numbers falling into these respective categories in so far as intercensal periods before 1921 are concerned and information available about the period 1921-51 is limited to figures of new houses built and of demolition of house property by the local authorities in administering the inter-war slum clearance and overcrowding legislation.

Elements of Change in Numbers of Dwellings

It may be of interest to set out briefly such evidence as exists about the several elements of change in numbers of dwellings. In the Housing Report of the 1931 Census it was estimated from Ministry of Health records that about 1,600 thousand houses were built in England and Wales in the 1921-31 intercensal period. A further 3,400 thousand were built in the following twenty years. In these figures each flat in a block is counted as a house, the figures in this respect being comparable with census figures of structurally separate dwellings. Prior to the Housing Act of 1919, which considerably extended governmental responsibility for ensuring the provision of homes for the people, new house building had been very largely in the hands of private enterprise with little need for such administrative control as would result in regular returns of progress made, and there were no comprehensive records of numbers of houses built. The 1911-21 period was affected by the curtailment of building in consequence of the 1914-18 war and house building was probably on a comparatively small scale.

The only comprehensive figures of demolitions of house property which exist are of about 200,000 houses completely destroyed by bombing in the 1939-45 war, 272,836 houses which were demolished or declared not fit to be used for human habitation in the period up to March, 1939, under the Housing Act, 1930, and the comparatively small numbers demolished under earlier housing legislation. There is no direct information about the possibly much larger amount of demolition which has taken place at the direction of private owners of house property.

There is no direct information on a comprehensive basis about the extent of conversion of residential property to other uses, either for recent or earlier intercensal periods, but, in view of the considerable expansion

of the commercial and industrial centres of many of our older cities in the latter half of the nineteenth century and in the present century, it is likely that the numbers of houses affected will have been considerable. Between 1861 and 1931, for instance, the aggregate population of the City of London and the Metropolitan Boroughs of Finsbury and Westminster fell from 498,033 to 210,466. Although this reduction was probably accompanied by the demolition of houses on a scale above that experienced in the country as a whole, it was certainly accompanied by the conversion of many houses for use as business premises.

The sub-division of large houses into two or more smaller dwellings is probably a twentieth century development due largely to the considerable fall in the size of families. At the 1921 Census there were only 18,177 structurally divided private houses. The census records since 1921 throw light on this development only indirectly.

Secular Changes in Numbers of Houses or Dwellings

The relative increases in numbers of houses or dwellings in intercensal periods are shown in column (c) of Table A. Intercensal rates of increase were higher between 1821 and 1841, during which an average rate of 2 per cent per annum obtained, than in any succeeding period. The period 1911-21 is outstanding with its indication of low building rates due to the 1914-18 war. The relative increases for the periods since 1921 are higher than those obtaining in any previous intercensal period in the last hundred years. The increase of 32 per cent in the 1931-51 period was achieved in spite of the 1939-45 war during which considerable damage to house property by bombing took place in addition to the inevitable and almost complete cessation of house building. The important part played by conversion of existing houses to non-residential uses in this period and by the structural sub-division of large houses is referred to below in the discussion of size of dwellings.

The almost uninterrupted decline since 1851 in the average number of persons per house, shown in column (g) of Table A, must be due to an appreciable extent to the increasing scale of new house building since the average number of persons per separate occupier (column (1)) does not decrease so steadily. It appears that the main factor was an increase in the availability of houses rather than a decrease in family size. The increase in the figures between 1911 and 1921, and in the corresponding figures in column (h), however, suggest that one effect of the low building rates of the 1911-21 period was to limit the extent to which newly formed family groups could occupy separate dwellings.

The remaining columns in Table A, relating to families or households, complete the historical record. They will be referred to specifically in the next chapter.

Size Distribution of Dwellings

Table 1 shows the dwellings for the occupation of private households according to the number of households they contained, analysed by numbers of rooms. In 1951, 91 per cent of the dwellings of England and Wales were each occupied by one private household, 5.3 per cent by two private households and 1.2 per cent by more than two; 2.5 per cent were vacant. Nearly two thirds (63 per cent) of these dwellings were of four or five rooms, 13 per cent were of six rooms and 11 per cent of three rooms. Only 5 per cent had fewer than three rooms.

Changes in the size distribution of dwellings in the 1931-51 period are shown in Table 3, and Table B takes the record back to 1921, the first census which provided reliable figures of dwellings for private households, by numbers of rooms.

Table B.- Distribution of Dwellings by Size } England and Wales
1921, 1931 and 1951; and
Intercensal Changes }

Rooms occupied	Percentage distribution of dwellings (occupied and vacant)			Percentage increase in numbers of dwellings	
	1921	1931	1951	1921-31	1931-51
All sizes	100.0	100.0	100.0	17.8	31.8
1 - 3	16.9	15.4	16.0	7.0	37.4
4 - 5	48.8	52.6	63.3	27.1	58.4
6 and over	34.3	32.0	20.7	9.9	- 14.5

The main changes in size distribution which are shown in Table B comprise the increase in the 1931-51 period from 53 to 63 in the percentage of dwellings of four or five rooms, and the corresponding decrease from 32 to 21 in the percentage of dwellings of six or more rooms. These changes are due on the one hand to the emphasis on four and five room dwellings since 1919 in house building programmes, and on the other to the decreasing use of larger older private houses as single dwellings. The latter transformation is in part due to the conversion of residential property to commercial uses, in part to the sub-division of large houses into multiples of smaller dwellings, and in part to demolition on account of obsolescence and bomb damage. The 1921 figures in Table B suggest that some of the factors which attained important proportions in the later period had already begun to operate in the 1921-31 period.

The more detailed comparisons made in Table 3 for the 1931-51 period show that well over half the increase in 4 - 5 room dwellings was in those of 5 rooms whose numbers increased by 71 per cent; dwellings of one room more than doubled in numbers; most of the decrease in numbers of larger dwellings was in those of 8 or more rooms. The figures recording decrease in numbers of dwellings of 8 and 9 rooms underestimate the real change owing to the change in the method of distinguishing between private and non-private households referred to on p.xvi. Dwellings containing more than one household decreased by 40,000 altogether, in the 1931-51 period, although there was an increase of 17,500 in those of five rooms with more than one household.

Size Distribution of Household Occupations

Table 2 enables the dwellings containing more than one household to be analysed according to the numbers of rooms occupied by each, and Table C gives an indication of the changes which have taken place since 1921 in the distribution by size of individual household occupations.

While the majority (59 per cent) of private households were living in 4 or 5 room occupations a quarter had three or fewer rooms. The former proportion increased from 45 to 59 per cent in the whole period 1921-51 while the latter decreased slightly. The proportion of household occupations of six or more rooms decreased from 25 per cent in 1921 to 15 per cent in 1951. The rates of change in the later intercensal period were rather higher than those in 1921-31.

Table C.- Distribution of Household Occupations by Size 1921, 1931 and 1951; and Intercensal Changes

England and Wales

Rooms occupied	Percentage distribution of household occupations			Percentage increase in numbers of household occupations	
	1921	1931	1951	1921-31	1931-51
All sizes	100.0	100.0	100.0	17.1	28.2
1 - 3	29.7	28.4	25.7	12.1	15.6
4 - 5	45.3	48.3	58.9	24.8	56.5
6 and over	25.0	23.3	15.4	8.9	- 15.3

Regional Variations

The census material shows considerable variations between different parts of the country in the provision of housing accommodation for its inhabitants and in the changes that have been taking place. Table D sets out certain salient features of these variations, in the form of extracts from the national and regional figures in Tables 1 to 4.

The fact that many parts of northern England have on average smaller houses is shown by the exceptionally high proportions of 1 - 2 room and 3 room dwellings for the Northern Region and the East and West Ridings: 32 per cent of the dwellings of the former and 24 per cent of those of the latter contained under four rooms (section 2 of the table) in spite of considerable decreases in numbers of 1 - 2 room dwellings in the 1931-51 period (section 4), as compared with only 16 per cent for the country as a whole. London and South Eastern Region is the only other region showing above average proportions of these small dwellings: in this region, however, the high proportions are associated with large increases in numbers in the 1931-51 period, and are to be accounted for by the conversion of large houses into multiples of smaller ones as well as by new building of flats. The considerable variations in the incidence of households sharing dwellings are discussed in Chapter VII on p.lxxxiii.

In every region more than half the total number of dwellings were of 4 or 5 rooms, the emphasis being on those of 4 rooms in the two northern regions already referred to and in the North Western Region, and on those of five rooms in the midlands and south and in Wales. In every region, however, the relative increase in numbers of 5 room dwellings was considerably higher than that for 4 room dwellings. The proportion of dwellings of 6 or more rooms was considerably higher in Wales than in any of the regions of England, and among the latter was higher in the south than the north, the Midland and Eastern Regions taking intermediate positions. The London and South Eastern Region had the highest proportion of dwellings of 6 or more rooms, among the regions of England, although it also had comparatively high proportions of small dwellings.

Changes in numbers of dwellings in the 1931-51 period (section 4 of Table D) ranged from 20 per cent increase in the case of Wales to 43 per cent increase in the Eastern Region. In the London and South Eastern and the Southern Regions the increases in numbers of 1 - 2 room and of 3 room dwellings were exceptionally high; in the two northern regions the decreases in numbers of 1 - 2 room dwellings are equally striking. The largest relative increases for 4 and 5 room dwellings occurred in central and northern England and in Wales. The considerable decrease in numbers of dwellings of 6 or more rooms is apparent in the figures for all regions.

Owing to the considerable amount of sharing of dwellings by two or more households the proportions of households living in the smaller occupations were much higher than the proportions of dwellings in the same size categories. In England and Wales as a whole 10.8 per cent of households were living in one or two rooms and a further 14.9 per cent in three rooms although only 16.0 per cent of dwellings had as few as three rooms. The disparity was particularly great for the London and South Eastern Region, 29 per cent of whose private households were living in shared dwellings: 36.5 per cent of household occupations were of three or fewer rooms although only 17.7 per cent of the dwellings of the region were as small as this.

The last section of Table D shows that there has been a levelling up since 1931, as between regions, in the proportions of households living in the smallest occupations: relative increases in the 1931-51 period were substantially higher for one room occupations than for larger occupations in

the two midland regions, in the Eastern Region and in the Southern Region, all of which had comparatively small proportions of one room occupations in 1931; in the Northern Region and the London and South Eastern Region which, for different reasons, had comparatively large numbers of one room occupations in 1931, numbers of one room occupations decreased substantially between 1931 and 1951.

Variations in the distributions of household occupations, cross-classified by size of household, are further discussed in Chapter III (see Table J and p. xxxiii).

Aggregate Variations

Table E provides a comparison between the five main density divisions of the country (viz. urban areas classed by size of population and rural districts), in the distributions of dwellings and household occupations by size. Changes in the 1931-51 period cannot be shown for them on account of intercensal alterations in administrative boundaries.

Table E.- Dwellings and Household Occupations: (England and Wales and
Distribution by Size (Aggregates Summary)

Percentage of Households in shared dwellings	14	22	17	12	8	4

Section 2. Percentage distribution of dwellings (occupied and vacant) by size

All sizes	100.0	100.0	100.0	100.0	100.0	100.0
1 - 2 rooms	4.7	6.2	3.0	3.3	3.9	4.7
3 "	11.3	13.6	8.8	8.5	9.5	11.5
4 "	28.1	26.9	28.7	28.1	29.1	29.0
5 "	35.2	31.8	39.3	40.2	37.6	33.7
6 and over	20.7	21.5	20.2	19.9	19.9	21.1

Section 3. Percentage distribution of household occupations by size

All sizes	100.0	100.0	100.0	100.0	100.0	100.0
1 room(s)	2.7	4.1	2.6	2.3	1.4	1.2
2 "	8.1	10.5	6.7	6.8	6.3	4.9
3 "	14.9	19.5	12.9	11.2	11.2	11.9
4 - 5 "	68.9	53.3	61.6	63.6	63.9	61.9
6 and over	15.4	12.6	14.2	16.1	17.2	20.1

Small dwellings and small household occupations were more common in the conurbation aggregate. The other urban areas had the smallest proportions of 1 - 2 and 3 room dwellings and the largest proportion of 4 - 5 room dwellings. More definite gradients are to be seen in the proportions of household occupations of each size. The proportions of 1 and of 2 room occupations in the rural areas were less than half those for the conurbations. The proportion of 3 room occupations in the rural areas was 11.9 per cent compared with 19.5 per cent in the conurbations. The steep gradient in the incidence of households sharing dwellings and some large differences between individual conurbations are discussed in later sections of this report.

Vacant Dwellings

Table 1 shows 309,736 dwellings in England and Wales vacant on census night. This represents 2.5 per cent of total dwellings and compares with 2.9 per cent in 1931. The census record distinguishes between furnished and unfurnished vacant dwellings: of the total in 1951 171,457 were furnished and 138,279 unfurnished.

It seems reasonable to assume that the majority of vacant furnished dwellings were tenanted and only temporarily unoccupied, and that it is only the vacant unfurnished dwellings that were available as additional housing accommodation. Unfurnished vacant accommodation comprises new dwellings completed before census date but not by then occupied, and dwellings which were in process of changing hands or were in the market for sale or to let. Family formation and dissolution is a continuous process within the population, and, at any one time, a proportion of established households are moving from one house to another either for economic reasons or in order to secure accommodation of choice. There must, therefore, always be a margin of unoccupied dwellings even at times of severe shortage of housing accommodation. The proportion of vacant unfurnished dwellings was 1.1 per cent in 1951 as compared with 1.7 per cent in 1931. The only previous census year for which broadly comparable information was made available was 1901, when the total number of uninhabited "houses" amounted to 6.7 per cent, 2.8 per cent being identified as "in occupation" leaving 3.9 per cent which were regarded as tenantless.

The following figures show that in 1951 the proportion of vacant unfurnished dwellings was lowest in the conurbations and the largest towns outside the conurbations and highest in the rural districts.

Class of area	Percentage of vacant unfurnished dwellings
Conurbations	0.78
<i>Areas outside Conurbations</i>	
Urban areas with populations of 100,000 and over	0.76
" " " " " 50,000 and under 100,000	0.89
" " " " " under 50,000	1.09
Rural Districts	2.12

The size distribution of vacant unfurnished dwellings is of interest. Table F compares 1931 with 1951 in this respect.

Table F.- Dwellings of Each Size Vacant and Unfurnished: Comparison between 1931 and 1951

Rooms	All sizes	1	2	3	4	5	6	7	8	9	10 and over	
1951	Total dwellings (thousands)	12,389	103	484	1,398	3,485	4,348	1,582	499	253	113	127
	Percentage vacant unfurnished	1.1	2.9	2.3	1.6	1.2	0.8	0.9	1.0	1.3	1.3	2.6
1931	Percentage vacant unfurnished	1.7	3.6	2.5	1.8	1.5	1.4	1.7	2.0	2.5	2.4	3.8

The percentage vacant unfurnished (0.8), for 5 room dwellings, which are more common than those of any other size, was lower than that for any other class. Generally the proportions vacant unfurnished were highest for the size classes which were least common, viz., for the smallest and largest dwellings. The picture was similar in 1931, though the percentages were distributed at a higher level.

CHAPTER III: PRIVATE HOUSEHOLDS

At the 1951 Census a total of 13,117,868 private households were recorded in England and Wales; these were contained in 12,079,712 dwellings. There were 11,245,945 households in sole occupation of a dwelling and 1,871,923 (14 per cent) sharing a dwelling with one or more other private households.

Secular Changes in Numbers of Private Households

Columns (c) and (d) of Table A (p. xxiii in the previous chapter) indicate that, as in the case of dwellings, there were, in 1951, about three times as many private families or households as a century earlier in 1851, and nearly twice as many as at the turn of the century in 1901. Owing to the reduction in household size these changes have been accompanied by much smaller increases in total population: the population in 1951 was less than two and a half times its size in 1851 and only a third larger in 1951 than in 1901.

Columns (l) and (m) of Table A indicate the extent to which average household size has been reduced during this period. The figures in column (l) relate to all households, including hotels, institutions and others of a non-private nature, while those in column (m) relate to private households only. As has been explained, no distinction was made between private and non-private households until 1911. It seems reasonable, however, in view of the small difference between 4.51 in column (l) and 4.36 in column (m) for 1911, to regard the two sets of figures as a single series for the purpose of indicating broad secular changes in the size of private households. The figures indicate that, apart from the period 1851-61, average household size remained fairly stable throughout the nineteenth century. The steep fall in this index began early in the present century and gained momentum in successive decennia up to 1931.* Allowing for some inaccuracy in the figures for earlier censuses it is yet possible to say that the period between 1911 and 1951 saw a reduction of nearly 30 per cent in the average size of private households after a period of comparative stability. During a large part of the nineteenth century the average size of private households must have been close to 4.5 persons, as compared with 4.14 persons in 1921, 3.72 in 1931 and 3.19 in 1951.

Size Distribution of Private Households

Table 2 analyses the private households of England and Wales by the numbers of persons they contained, and in Table 6 the distribution in 1951 is compared with those of 1921 and 1931. Households of two persons were most frequent in 1951, those with 3 persons being nearly as common and those with 4 persons coming next in order of frequency of occurrence. Nearly three quarters of all private households were of two, three or four persons. Households of one person amounted to 11 per cent of the total.

The decline in average household size, which has already been referred to, is seen to have been associated in the 1921-51 period with large increases, both absolute and relative, in households of one, two and three persons, and decreases in the numbers and proportions of households of six or more persons. 64 per cent of private households were of three or fewer persons in 1951 as compared with only 45 per cent in 1921. The proportions of households of three and four persons have changed relatively little.

Regional and Aggregate Variations

The variations between different parts of the country in household sizes are, as might be expected, considerably smaller than the variations in size of dwelling or size of household occupations. The distributions of

*It should be borne in mind that evidence from the Sample Family Census taken by the Royal Commission on Population in 1946 suggests that the decline in family size, as measured by the ultimate number of children produced by each marriage, which had also been taking place, did not persist among marriages after 1930 (see Tables 1 and 17 of the Summary, pages 3 and 11, *Papers of the Royal Commission on Population, Volume VI, Part I*, which contains the final report on the Family Census).

dwellings by size depend to some extent on the economic circumstances of the areas at the times when substantial numbers of their houses were built, and houses, unlike people, are not subject to migration movements. Nevertheless the extent to which newly married couples start their married lives by living with their "in-laws" (thus postponing the formation of new households) as an alternative to forming separate household units, must depend to some extent on the size of dwelling inhabited by the "in-laws" as well as the availability of alternative accommodation. Some areal variation in household size on this account is to be expected but this will be superimposed on variation due to the more fundamental differences in fertility and mortality and other factors unconnected with the availability of houses. The distributions reflect the combined effect of both factors, without separating them.

Table G shows the 1951 distributions of private households by size for regions, and Table H provides corresponding figures for the aggregates summary.

The most outstanding feature of these two tables is the generally small amount of areal variation. In Table G, however, relatively low proportions of small households and high proportions of large households are shown for

the Northern Region in spite of the abnormally high proportions of small dwellings and small household occupations shown for this region in Table D. This may be attributed largely to the comparatively high birth rates of this region, which increase the proportions (and the size) of those households which contain children, and partly to the comparatively high death rates which reduce proportions of small households containing older married and widowed persons. The high proportion of one person households in the conurbations is largely due to the high proportions of 13.6 and 12.9 per cent respectively for Greater London and West Yorkshire. This feature of the conurbations figures may reflect, to an appreciable extent, exceptionally high proportions of young unmarried persons constituting separate households in these areas. It will be seen from Table O (p. xlvii) that the proportion of heads of households who were unmarried and under 40 fell in a gradient from 25 per 1,000 in the conurbations to 17 and 16 respectively in large and medium sized towns to 13 and 14 respectively in small towns and rural districts; this might account for the slightly higher proportions of small households shown in Table H in the aggregates of urban areas as compared with the rural aggregate.

Regional distributions of households may be further considered by examining simultaneously the variations by numbers of persons and numbers of rooms occupied. The latter were discussed separately in Chapter II. Table J sets out the numbers of households for each region, classified both by persons and rooms occupied, and compares them with "expected" numbers obtained by rating the corresponding England and Wales figures to each regional total. The difference lines in this table show the main regional variations.

The abnormally high proportion of one person households occupying one room in the London and South Eastern Region accounts to a considerable extent for deficiencies in actual as compared with "expected" numbers of such households in all other regions and obscures the fact that the proportion of such households was higher in the Southern and South Western Regions and lower in the North Midland Region and Wales than in the remaining regions other than London and South Eastern. Apart from this, the main regional features are set out in the following paragraphs.

In the Northern Region the combined effect of a large average size of household and a small average size of occupation is most marked in producing relatively high numbers of households of three or more persons occupying three rooms and relatively low numbers occupying five or six rooms: in particular, households of three or more persons in three rooms in the region numbered 133.2 thousand (15 per cent of the total) as compared with an expected figure of 70.5 thousand (8 per cent); and households of four or fewer persons in five or six rooms in the region numbered 184.0 thousand (20 per cent) as compared with an expected figure of 290.0 thousand (32 per cent).

In the East and West Ridings Region the deficiency in numbers of occupations of six or more rooms is seen to have been spread over all sizes of household; excesses were largely confined to the three and four room classes of occupation, but the relative differences between actual and expected numbers for these classes were not very large for individual sizes of household.

In the North Western Region the relative excess of numbers of four room occupations was progressively larger the smaller the household, and more than a third of all one person households were occupying four rooms; the relative deficiencies in numbers of two and three room occupations were also greater in smaller households.

In the North Midland Region 28 per cent of one person households were in five room occupations as compared with 16 per cent in the country as a whole; relative deficiencies in numbers of two and three room occupations were considerable in all sizes of household.

Table J. - Households by numbers of persons and numbers of rooms occupied in each region, as compared with those "expected" on the basis of the distribution for England and Wales as a whole

In the Midland Region the most noticeable feature is the deficiency of one and two person households, particularly of one person households occupying one or two rooms which numbered 26.7 thousand as compared with an expected figure of 46.9 and two person households occupying three rooms which numbered 43.5 thousand as compared with an expected figure of 62.8. If the effect of London and South Eastern (referred to above) is removed by calculating the "expected" on the basis of the remaining regions, the expectations are reduced to 33.3 and 51.7 thousand respectively.

In the Eastern Region the feature to be remarked is the deficiency of two and three room occupations, in particular those containing households of three or more persons which numbered 56.4 thousand by comparison with an expected figure of 97.2. There was also an excess of five room occupations spread over all household sizes.

In the London and South Eastern Region the combined effect of exceptionally large numbers of one person households and of small occupations distorts the shape of the table considerably, mostly along the line for one person households: among 448.9 thousand one person households in this Region altogether, over a quarter were occupying one room, and another quarter two rooms. The total for these two classes was almost double the expected number. Numbers of one person households in 4 or more rooms were however less than the expected numbers, the actual number for four room occupations being only two thirds of the expected figure. It is to be noted that the census provides no direct evidence of the extent to which numbers of small occupations are increased as a result of pressure to form one person households or numbers of one person households are increased by the nature of available accommodation. The amount of property of obsolescent size which was available for the formation of one room occupations was, however, probably relatively greater in the London and South Eastern Region than in any other.

In the Southern Region the differences between actual and expected numbers were generally small. There was a small relative excess of occupations of 5 rooms or more spread over all household sizes and the minor divergence already noted in relation to one person households in one room. In the South Western Region the pattern was very similar.

In Wales the relative excess in numbers of households occupying 6 or 7 and over rooms applies to every size of household. The proportions of two room occupations were also comparatively high in Wales, the relative excess of households in them being mainly among those of three or more persons. Compensating deficiencies were to be found among almost every size of household in the remaining occupation size classes, the number of two or three person households in three, four or five rooms being 239.7 thousand in Wales (32 per cent of all households) as compared with an expected figure of 298.3 (40 per cent). The deficiencies measured by the relative difference between actual and expected figures were, however, most marked for households of one, two and three persons in one or in three rooms.

The changes in distribution which took place in the different regions in the 1931-51 period may be seen in Table 6. The main features are common to all these areas. In every region the shift in numbers has been toward the smaller classes of household; in every region the proportions of one, two and three person households increased considerably - in several cases households of one person constituted proportions twice as high in 1951 as in 1931; in every region the proportions of households of four and five persons showed little change while the proportions with over 5 persons were considerably smaller in 1951.

The results of the analysis of household composition and of the analysis of heads of households by sex, age and condition, which are described later in this chapter, may be anticipated here to throw light on these general changes in the size distribution of households. A large proportion of the households of 1 or 2 persons comprise elderly people; more than half of the one person households were people at least 60 years old, and more than 40 per cent of the two person households had heads who were aged 60 or over; more than a quarter of the two person households were married couples at least one of whom was aged 60 years or more. Changes in fertility and the increasing tendency of young persons to marry at younger ages than formerly will have played an important part in altering the distribution of households by size, and social and economic factors may well have led to increased numbers of young persons leaving the parental home under circumstances other than marriage, but the effect of reduced mortality, especially of women, must not be underestimated as an important factor leading to increased numbers of elderly couples and unmarried or widowed persons who have augmented the numbers of households of the smallest sizes.

Factors Governing the Number and Size of Private Households

The *Housing Report* of the 1931 Census contained a discussion of the main elements in the formation, growth and dissolution of families and of the consequential effects upon the number and size distribution of the households into which a population is divided at a given point of time. A family normally begins its life when a man and woman detach themselves from two existing families to marry and form a separate unit. Such a family is initially composed of the married couple only, but in course of time its size is increased by the addition of children of the marriage. After a period of increasing size births of additional children cease, existing children who have grown to maturity leave the parental home to make their own marriages, and deaths of members of the family have a higher incidence. Quite apart from any variations from year to year in the incidence of these natural events there will, at any point of time, be families in existence at all these stages of development, so that all families taken together will be distributed in size over a wide range. The 1931 Report also drew attention to the fact that households, in the census terminology, are not the same as families in the sense described above, pointing out that some families have persons other than their spouses and children in their household, that children may leave home for reasons other than marriage or death, and that some households contain no married couple (for example a widow and her children). While the need for knowledge of the constitution of households to supplement data on their size was recognised, no comprehensive tables on household composition were prepared for the 1931 Census.

The absence of information on household composition in 1931 has been remedied by the inclusion in the series of 1951 Census reports of two new kinds of tabulation. First, an analysis of a one per cent sample of the private households of Great Britain, to show their household composition, has been published in the *Census 1951, Great Britain, One per cent Sample Tables*. The tables in Appendix A of the present report summarise and supplement these tables. The main analysis of this material relates to Great Britain as a whole, but the subsidiary tables which separate England and Wales from Scotland give sufficient indication that the results may be taken to represent broadly the patterns of distribution in England and Wales. Secondly, Table 12 of the present volume gives distributions of the private households of each size according to the age and marital condition of the head of household: this tabulation is given for the country as a whole, for regions and for the aggregates summary; it summarises data given in similar form for counties and in abbreviated form for individual local authority areas in the 1951 Census series of *County Reports*. The need for additional information on the lines of these two sets of new tables was more pressing in the circumstances of shortage of dwelling accommodation in 1951 than in 1931, and these new tables have been provided with the object of showing what kind of household groupings were in existence. In particular they show how many married couples were living with their "in-laws" or with another family.

These two new types of tabulation are discussed in the two following sections.

Sample Analysis of Household Composition

In Section VI of the *Census 1951, Great Britain, One per cent Sample Tables* an analysis was given of the composition of the private households of Great Britain in 1951, in terms of the inter-relationships of the individuals forming them. The scheme of analysis constructed for the preparation of these tables had as one of its main objectives the separate identification of those private households which consisted only of a Primary Family Unit* (in general consisting of a married couple or a single or widowed or divorced person, their children if any, and other close relatives) and those which contained other persons in addition. Within this broad classification further analysis of primary family units indicated the numbers of children still within the families of parents in different age-groups, and the numbers of such units which contained other close relatives, separately identifying those which contained one parent or both parents of the head of the household or of his spouse. Subdivision of the remainder elements of those households which contained other persons besides the primary family unit was also made, in order to identify separately groups, termed Family Nuclei*, consisting of persons so related to each other that they might be regarded as self-contained families. The tables which presented the results of this analysis were constructed with the object of showing the numbers of different types of household (the type being defined by the age and marital condition of head of household and the number of children of the head) which contained one or more parents of the head or of his spouse, and the numbers of each type which contained family nuclei or other persons. They also show separately those family nuclei which contained a married or widowed son or daughter of the head of the household.

The main elements in this analysis which are of interest from the point of view of housing thus comprise (i) the primary family unit, (ii) such parents of the head of household or of his spouse (ancestors) as were contained in the primary family unit, (iii) family nuclei containing a son or daughter of the head or of his spouse, (iv) other family nuclei, (v) other persons. While recognising that households comprising any combinations of these elements may be formed as a result of the free choice of their members, rather than on account of circumstances preventing them from separating into smaller households, it is clear that a certain amount of compulsion affecting household groupings will exist if there is a housing shortage and that such compulsion will bear more heavily on some of these elements than on others.

* For full definitions of all the terms used for this analysis see Appendix A, pp. 121-123.

In fact the division of households into the particular elements used for this analysis was governed largely by the desirability of distinguishing elements which would be less likely to secede from the primary unit under more favourable conditions from those which would be more likely to do so. It is envisaged that use of the material in the formulation of housing policies will be contingent upon ability to translate the census distributions into measures of real needs and desires, and to adjust the distributions to take account of such regroupings as have been effected by post-census building programmes. The census analysis is an objective analysis only of conditions which existed at census date and which reflected not only those groupings enforced by the housing shortage but some which were desired.

The analysis made for publication in the *One per cent Sample Tables* was an experimental one of a type not hitherto made in this country, and the tables were produced, without any accompanying discussion, in a very detailed form in order to allow the user full freedom to summarise the data in any of a large number of possible ways. The analysis was based on a special coding of relationships etc. among the members of each of the 144,815 private households contained in the one per cent sample of private household census schedules. No corresponding analysis of the remaining 99 per cent of the schedules has been made and the tables produced in Appendix A of this volume relate to Great Britain (and not to England and Wales) and should be used in conjunction with the more detailed tables published in the *One per cent Sample Tables*. It is to be noted that visitors enumerated in a private household (i.e. persons who were not normally resident in it) were excluded from both these sets of tables*.

Table A.1 shows that 12½ millions of the 14½ millions of private households enumerated in Great Britain were of the primary family unit type, i.e., they contained only specified close relatives of the head and did not contain subsidiary family units (family nuclei) even when these were immediate descendants of the head or of his spouse. The remaining two million households were of the composite type containing one or more of other elements in addition to the primary family unit.

Parents of Head present in household

Table A.1 shows that 580 thousand parents of the head of household or of his spouse were living with such heads, i.e. in the homes of their children. 74 thousand of these "ancestors" were in married couples and it may reasonably be supposed that the remaining 506 thousand were spread over almost as many households. As is to be expected, most of these parents of the head (443 thousand) were to be found in households headed by married persons under 60 years of age. Reference to the more detailed tables published in the *One per cent Sample Tables* shows that 520 thousand "ancestors" were in primary family unit households and 60 thousand in composite households. Primary family unit households more commonly contained ancestors than composite households, the proportions being respectively 3.9 and 2.9 per cent.

Family Nuclei in household

Table A.1 also shows that 952 thousand composite households contained one or more family nuclei, the total number of family nuclei being 982

* The following comparison for Great Britain shows that the net differences, in the distributions by size on the two bases, were small:-

	Number of persons in household						
	All sizes	1	2	3	4	5	6 and over
Percentage of households, including visitors, of each size	100.0	10.7	27.7	24.8	19.1	9.6	9.1
Percentage of households, excluding visitors, of each size	100.0	11.3	28.6	24.9	18.7	9.1	7.4

thousand of which 810 thousand contained direct descendants of the head of household. Table A.3 shows that 93 per cent of all the family nuclei had married heads.

Age and Marital Condition of Heads of Primary Family Unit and Composite Households

Table A.1 also analyses households by the age and marital condition of their heads and shows that, while the majority were headed by a married couple or person (10,974 thousand or 75.8 per cent of the total), 2,420 thousand (16.7 per cent) were headed by widowed or divorced persons and 1,088 thousand (7.5 per cent) by single persons. This distribution is analysed in more detail in the next main section of this chapter dealing with the age and marital condition of heads of household, but it is relevant to examine here to what extent households with these categories of head are primary family unit or composite households and which types of composite household more commonly contain family nuclei. This is shown in Table K derived from the detailed statistics given in the *One per cent Sample Tables*.

Table K.- Primary Family Unit and Composite Households } Great Britain
and Family Nuclei, by type of Head of
Household

Type of head	Number of households (hundreds)			Households containing F.Ns. (hundreds)	Number of F.Ns. (hundreds)		Percentage of composite households	Percentage of households containing F.Ns.
	Total	P.F.U.	Composite		Total	Closely related to head		
	a	b	c		e	f		h
All types	14,481.5	12,501.2	1,980.3	952.1	982.2	810.0	13.7	6.6
Married and aged under 40	3,553.3	3,392.4	160.9	34.7	35.2	3.9	4.5	1.0
Married and aged 40-59	5,222.5	4,819.3	403.2	285.0	294.3	258.0	11.6	5.5
Married and aged 60 and over	2,197.8	1,836.7	361.1	204.3	211.3	197.4	16.4	9.3
Widowed and Divorced - Males	556.7	387.4	169.3	119.2	121.7	103.7	30.4	21.4
- Females	1,863.3	1,386.5	476.8	260.4	269.9	242.5	25.6	14.0
Single - Males	360.9	279.7	81.2	27.2	28.0	1.9	22.5	7.5
- Females	727.0	599.2	127.8	21.3	21.8	2.6	17.6	2.9

This table shows that the households with widowed (or divorced) heads were more commonly composite than those with married heads. Among the latter the proportion of composite households was comparatively low for those with heads under 40 and was highest for the 60 and over class. Family nuclei were most commonly found in the households with widowed heads; among those with married heads the proportion with family nuclei was 1.0 per cent for those with heads under 40, 5.5 per cent for those 40-59 and 9.3 per cent for those 60 and over. Except in the case of heads married under 40 and the categories of single heads, nearly all the family nuclei were closely related to the head, i.e., they contained an adult son or daughter of the head or of his spouse. The low proportion of composite households in the case of married heads under 40 must not be taken to imply that these married couples less commonly live in "three generation" households, for it is this class which more commonly exists in family nuclei in other households with older heads or, when providing the head of a household, more commonly has "ancestors" in the household.

The Simplest types of Household

The more detailed tables in the Sample report also show that 11½ million of the total of 14½ million households were of the simplest types comprising (except for domestic servants in a few cases) only the following groupings -

- (i) married couples with their children (if any)
- (ii) widowed (or divorced) persons with their children (if any)

(iii) single persons living alone.

These simple types of household are analysed in Table L.

Table L.- Simple Households

Great Britain

Type of household*	Number of households (hundreds) with head aged:			
	All ages	Under 40	40-59	60 and over
Married heads with no children	3,166.3	724.5	1,274.6	1,167.2
Married heads with non-married children (of all ages)	6,102.1	2,483.4	3,019.6	599.1
Widowed (or divorced) persons living alone	900.5	14.0	886.5	
Widowed (or divorced) heads with non-married children (of all ages)	755.3	39.4	715.9	
Single persons living alone	589.1	87.2	501.9	
All households of these simple types	11,513.3	3,348.5	8,164.8	

* The presence of domestic servants in a household did not affect its classification for this Table.

Thus there were 9,268 thousand households composed only of a married couple (or person) and their children if any. This number represents 84 per cent of all households with married heads and 78 per cent of the total of all households or family nuclei with married heads. 3,166 thousand households contained a married couple only, the head being 60 years of age or older in more than a third of these cases. More than three quarters of married couples under 40 in these simple types of household had children living with them. There were 900 thousand widowed (or divorced) persons living alone and nearly 600 thousand single persons living alone, only just over one seventh of the latter being under 40 years of age.

Children in Households

Table A.1 shows the numbers of designated children in each type of household identified. Although a few others are included the designated children are, generally, the children of the head of the household who were living with their parents at census date. The table shows the total number of such children in each type of household in two age-groups (a) under 5 and (b) under 16. The numbers of children aged 16 and over can also be derived. Table A.2 supplements this information by showing distributions of households according to the numbers of children in these three age categories, a form of presentation which is more appropriate in this context than Table A.1 and which shows explicitly the extent to which children over 16 remain in the parental home. Table A.2 shows that among married heads of household under 40 years of age 45 per cent had no children under 5, 39 per cent had one child and only 16 per cent had more than one; 23 per cent had no child under 16; 2.5 per cent had a child aged 16 or over living in the household. Among married heads in the middle age-group 40-59 only 13 per cent had a child under 5 but 48 per cent had a child under 16 and 38 per cent had a child 16 or over in the household. 31 per cent of married heads aged 60 or over had a son or daughter aged 16 or over living with them. Among widowed (or divorced) persons aged 40 or over 9 per cent had a child under 16 and 36 per cent had a child 16 or over. There was not a great deal of difference between primary family unit and composite households in the presence or absence of children but for all ages of married head, the average number of children of the head in primary family unit households was 1.27 as compared with 1.02 in composite households, and in the middle age-group 40-59 of married heads children of school age were more commonly present in the primary family unit than in the composite households; and among the households with widowed (or divorced) heads children 16 or over were more common in the primary family unit households

than in the composite households. These figures demonstrate what common-sense would suggest, namely that apart from the force of individual economic circumstances, two general population factors operate: the older the parents, the older in general will be the children; the more children there are, the less room there will be for persons outside the primary family unit.

Types of Family Nuclei

Table A.3 analyses the 982 thousand family nuclei and shows that more than three quarters of them consisted of young married couples (or persons) under 40 years old with their children (if any). Altogether 363 thousand nuclei contained no children, many of them probably being couples only recently married, and 437 thousand contained only one child. Over 80 per cent of all heads of family nuclei or their spouses were sons or daughters of the head of the composite household.

Table A.4 shows to what extent the presence of children in the primary family unit affects the likelihood that the household will contain a family nucleus, and whether family nuclei with children were found more often in some types of household than in others. As already indicated family nuclei are more likely to find accommodation where there are fewer children in the primary family unit: the incidence of family nuclei in all households with married heads 40-59 fell from 8 per cent where there were no children still in the primary family unit to 4 per cent in those with 3 or more; for married heads 60 and over the corresponding gradient was from 10 to 8 per cent; and for widowed and divorced heads the decline was steeper - from 27 to 12 per cent for male heads and from 17 to 8 for females. The value of Table A.4 lies in its indication of the family groupings contained in composite households. For example the most frequent of the combinations was that of a widowed head aged 40 or over and a family nucleus with either no children or only one child; the same combination with a married head aged 60 or over came next in frequency. There was a general tendency for the family nucleus to contain more children when the head of the primary family unit was aged 60 or over; this may be accounted for simply by the fact that time must elapse before such children are produced. It is of interest that although the incidence of family nuclei was lower in households with children in the primary family unit, the number of children in such family nuclei was not constrained by the number of children in the primary family unit, i.e., they carried on their family building without apparent regard for the living space available to them.

Regional Variations

Table M shows some of the regional variations, within England and Wales, in household composition which existed in 1951. It is derived from Table 8 of Section VI of the *One per cent Sample Tables*.

Wales and the Midland Region had the highest relative numbers of family nuclei (9.0 and 8.6 per cent of households respectively) and the four regions in the South had the lowest relative numbers, the figure for the London and South Eastern Region (5.0 per cent) being lowest of all. This low incidence for the London and South Eastern Region is probably due to the prevalence of smaller household occupations in this Region (see Table D); it is not, however, appreciably affected by the relatively large number of very small households in this Region (which comes into the denominator of the index). There were appreciable differences between the regions in the distributions of households by the numbers of children contained in the primary family unit: the Northern and Midland Regions and Wales had comparatively low proportions of households with no designated children in the primary family unit (39, 40 and 42 per cent respectively) and contrast with the London and South Eastern and the South Western Regions which each had 47 per cent. The Northern Region had 15 per cent of households with 3 or more children in the primary family unit but the London and South Eastern Region had only 9 per cent.

Table M.- Proportions of Composite Households, Households with Family Nuclei, and Households by numbers of Designated Children

(England and Wales, Regions of England, Wales

Area	Total number of households (hundreds)	Total number of family nuclei (hundreds)	Family nuclei as percentage of households	Percentage of households with designated children as follows:-			
				0	1	2	3 and over
England and Wales	13,043.5	901.0	6.9	45	27	17	11

Wales (including Monmouthshire)	780.1	67.8	9.0	42	28	17	13

Household Composition by Size of Household

Table A.7 shows the numbers of each type of primary family unit and composite household, in the classification by the age and marital condition of the heads and the numbers of designated children of the heads of primary family unit households or components, analysed by size. Table N shows these distributions of households by size in percentage form. It shows that the primary family unit households within each class, as defined by age and condition of head and numbers of children, are very uniform in size, the proportions in the modal size category for those with 0, 1 or 2 children being at least 85 per cent for those with married heads and over 80 per cent for those with widowed and divorced heads. Only the households with bachelor or spinster heads appeared to include, in a considerable proportion of instances, parents or other close relatives. This table also shows that among primary family unit households 61 per cent of those with married heads aged 60 or over were two person households, and almost half those with widowed or divorced heads and more than half those with single heads were one person households.

Among types of composite household concentration in the modal size class was much less pronounced, reflecting the fact that, while many of them contained just one person outside the primary family unit, many contained family nuclei.

Table A.7 also provides a convenient representation of each size class of household, according to the types of household contained. Among one person households over 40 per cent were widowed or divorced women aged 40 or over and over 20 per cent were spinsters in this age-group; the corresponding proportions for males were much smaller, viz., 11 and 7 per cent respectively; only 9 per cent were persons under age 40, including some married persons whose spouses were absent from home on census night.

Among two person households over 70 per cent consisted of married couples* with no children (three quarters of them having heads aged 40 or over), and 11 per cent of widowed persons with one child.

Among three person households nearly three quarters consisted of a married couple* with one child, and 5 per cent of widowed or divorced persons with two children.

* In a small number of households with married heads the spouse was absent, but this class was not numerically large enough to invalidate these general conclusions.

Table N. - Distributions of Primary Family Unit and Composite Households by Size by type of head and number of designated children

Among four person households about 70 per cent consisted of married couples* with two children, and among five person households nearly 60 per cent consisted of married couples with three children.

The proportion of households which were of the composite type varied from 7 per cent for two person households to 38 per cent for households of six and over persons.

Age and Marital Condition of Heads of Private Households

Table 12 analyses the private households of England and Wales and of its main geographical aggregates by age and marital condition of their heads, distinguishing households of different sizes; and Table 13 supplements this by identifying the two types of head most variable in their incidence, in order to demonstrate local area differences. These tables are complementary to the household composition analysis discussed in the previous section, but there is no exact comparability of detailed figures between these two sections for three reasons: the household composition data relates to Great Britain, is on a sample basis, and excludes the visitor element in private households which is included here. In spite of these differences in coverage and treatment, however, the broad patterns shown are the same and the two sets of analyses can be considered together in many respects. The material in Table 12, moreover, not being on a sample basis, admits of geographical sub-divisions on a much more extensive scale than the household composition data.

Table 12 shows that in England and Wales as a whole more than a quarter of the 10 million households with married heads contained two persons and a slightly larger number contained three persons. Although a small number of households with married heads were enumerated without the presence of the head's spouse - the One per cent Sample data shows the number to be about 6 per cent of households with married heads in Great Britain - most contained both partners of the marriage. Thus about a quarter of the households with married heads may be assumed to have consisted of the married couple only and another quarter to have consisted of the married couple and one other person. Almost half the households with married heads in the 60 and over age-group were two person households, but in the two younger categories of married heads three person households were the most common. More than a third of the households with non-married heads in the under 40 age-group consisted of persons living alone, and nearly two-thirds consisted of either one or two persons. Among households with widowed and divorced heads in the 40-59 age-groups, appreciable numbers of which included children, the most common size of household was two persons; in the case of single heads in this age-group and both single and widowed and divorced heads in the 60 and over age-group, one person households were most common.

Table O demonstrates the salient features of the age and condition distributions of heads of households for the regions and aggregates of England and Wales. It shows a large measure of similarity between the areas identified. Among the regions the proportion of married heads varied from 742 per thousand for the North Western Region to 784 for the North Midland Region; among the non-married classes there were relatively larger differences between the proportions, the high proportions of single heads in the two younger age-groups in the London and South Eastern Region being outstanding. Among the aggregates the conurbations had the lowest proportion of married heads and the rural areas the highest; this was complementary to the high incidence in the conurbations and large towns of non-married heads in the under 40 age-group, and of widowed and divorced females in both of the older age-groups. Widowed and divorced males in the 60 and over age-group were however relatively more frequent as heads in rural areas than in towns; they were in fact relatively more numerous in the population in the rural areas than in the towns.

* In a small number of households with married heads the spouse was absent, but this class was not numerically large enough to invalidate these general conclusions.

* The figures relate married heads of either sex to the male population. The justification for this treatment derives from evidence from the One per cent Sample, in which 96 per cent of married heads of household were males, and almost all the female married heads were enumerated without their husbands being present in the household.

Table O also shows the proportions of heads of households in the total population of each of the sex, age and condition classes, except that married heads have been taken as proportions of total males in the corresponding classes of the population, the One per cent Sample data having shown that for almost all households with married heads the husband was recorded as the head, those with a married woman as head being generally households of which the husband of the head was absent. While the ratios given on this basis for married persons do not give strictly accurate measures of the statistic desired*, they give a basis for valid comparisons between the three age-groups and between the areal divisions shown. In all the areas identified nearly all the married males aged 40 or over were heads (or spouses of heads) of their own households, the lowest proportion being 94 per cent for the 40-59 age-group for the Southern and South Western Regions, for Wales and for the rural areas in the aggregates summary. Only 80 per cent of married males under 40 had their own households, and this proportion varied among the regions, from 76 per cent for Midland to 85 per cent for London and South Eastern. This regional variation is broadly consistent with the variation in the ratio of number of family nuclei to number of households, shown in Table M. Among the non-married classes it is seen that those aged 60 and over were more frequently heads of their own households than those in the 40-59 age-group, and that females more frequently lived in their own households than males. 57 per cent of non-married males and 62 per cent of non-married females aged 60 and over were heads of their own households. In the 16-39 age-group only 4.1 per cent of non-married persons were heads of households. The conurbation aggregate in general gave higher proportions of heads of household in the classes of non-married persons identified than the rural areas; for the 16-39 age-group and some of the older age-groups shown for males and females there was a definite gradient between these two extremes within the aggregates summary.

CHAPTER IV: THE HOUSING OF PARTICULAR SECTIONS OF THE POPULATION

In the previous chapter private households were analysed according to the classes of population, by sex, age and marital condition, which constituted their heads and by the relationship or non-relationship of other classes of person in the household to the head. Particular reference was made to other married or widowed persons and to the children of the head of household. The analysis sought to answer questions such as "What sort of people are to be found in this type of household?"

To complete the picture presented in Chapter III, the present chapter considers the pattern from the point of view of a given class of population (as distinct from the point of view of a given class of household) and answers questions such as "In what sort of household are persons over 60 years old to be found; how many live alone; how many live as heads of households containing younger persons; how many live as members of households of which they are not the head?" The analysis includes about two million persons housed in non-private households in England and Wales in addition to those in private households. The classes of population considered in this way are (a) married persons (b) children under 5 and children under 16 and (c) persons aged 60 and over. Since the analysis is based largely on the household composition tabulations of Appendix A it is given for Great Britain rather than England and Wales. For the sake of internal consistency One per cent Sample figures have in some cases been used when corresponding non-sample figures were available.

* The ratio desired is the ratio of A to B where A is the number of married males each of which is either a head of household or a husband of a head of household, and B is the total number of married males in the population.

Married persons

The total number of married* persons in the population of Great Britain was given by the *One per cent Sample Tables* as 24,357.2 thousand, and the number of married couples enumerated together on the same census schedule as 11,330.9 thousand. The following statement sets out the numbers for each sex:-

	Numbers of married persons enumerated in Great Britain (<i>hundreds</i>)		
	Persons	Males	Females
Total	24,357.2	12,112.3	12,244.9
Enumerated with spouse	22,661.8	11,330.9	11,330.9
Enumerated without spouse	1,695.4	781.4	914.0

The household composition analysis discussed in Chapter III enables these married persons to be analysed as in Table P.

Table P. - Married persons by Status }
in household } Great Britain

	Couples (<i>hundreds</i>)	Persons (<i>hundreds</i>)
Heads of private households with spouse	10,320.1	20,640.2
" " " " without "		653.5
Heads of family nuclei with spouse	782.2	1,564.4
" " " " without "		132.0
Parents of head or spouse, in couples	36.9	73.8
" " " " " not in couples		-(a)
Remainders of private households, not within F.Ns.		295.6
Domestic Servants in private households	5.3 (b)	25.8
Visitors in private households	186.4 (c)	242.7
Persons in non-private households		729.2
Total enumerated	11,330.9	24,357.2

(a) Assuming all parents of head not enumerated in married couples were non-married.

(b) From Table VI.7 of the *Census 1951, Great Britain, One per cent Sample Tables*, and assuming that all married male domestic servants were enumerated with their spouses.

(c) The figure of 186.4 thousand for this item has been derived as a remainder, and does no more than indicate the order of magnitude: it is affected by certain reconciliation adjustments which probably inflate it considerably; on the other hand there is an element of understatement in that in special enumeration districts (S.E.Ds.) the sampling unit was a person, not a household, and in consequence the two members of a married couple enumerated together will not both have been selected. The total number of persons enumerated in S.E.Ds. was 1,357 thousand of whom many were in hospitals or Service establishments where the likelihood of married couples having been enumerated together is comparatively small.

Children under 5 and children under 16

Table Q gives certain information about the distribution by types of household of the 4,189.3 thousand children under 5 enumerated. Table R gives corresponding information for the 11,623 thousand children under 16 (including those under 5) enumerated. Thus 83.9 per cent of all children under 5 were enumerated in primary family units - 78.9 per cent in primary family unit households and 5.0 per cent in composite households. 11.6 per cent were in family nuclei. Taking the primary family units and the family nuclei together, 3,087.5 thousand children under 5 (more than three quarters the total in private households) were the designated children of married persons under 40 years old. Nearly half the children under 5 were in primary family units containing only one such child, and more than a quarter were in units containing two such children. The proportion in composite households did not differ appreciably as between primary family units with one, two or

* The term "married" is applied only to those whose spouse is still alive and whose marriage is still unbroken i.e. widowed and divorced persons are excluded.

Table Q. - Children under 5

Great Britain

Status of children	Number of children (hundreds)		
	Total	P.F.U. households	Composite households
Total Children under 5 in Primary Family Units	3,516,2	3,306,6	209,6
Children under 5 in P.F.U.s. with 1 such child:			
All Types of Head	1,968,9	1,847,5	121,4
Head Married and aged under 40	1,374,2	1,315,5	58,7
Head Married and aged 40-59	533,5	489,6	43,9

Head Married and aged 60 and over	6,2	4,8	1,6
Head Widowed or Divorced	10,0	5,8	4,4
Head Single	5,4	1,8	3,8
Children under 5 in P.F.U.s. with 3 such children:			
All Types of Head	303,0	285,6	17,4
Head Married and aged under 40	251,4	228,8	12,8
Head Married and aged 40-59	47,7	44,7	3,0
Other Types of Head	3,9	2,1	1,8
Children under 5 in P.F.U.s. with 4 or more such children:			
All Types of Head	52,5	51,7	8
Head Married and aged under 40	42,8	42,8	-
Other Types of Head	9,7	8,9	8
Children under 5 in Family Nuclei - Total	486,9		486,9
- With Head of F.N. Married and aged under 40	445,9		445,9
- With Head of F.N. Married and aged 40-59	27,3		27,3
- With other Heads of F.N.	13,7		13,7
Total Children under 5 in Private Households (excluding visitors)	4,003,1	3,306,6	696,5
Total Visitors aged under 5 in Private Households	69,5		
Total Children under 5 in Non-Private Households	116,7		
Total Children under 5 enumerated	4,189,3		

three children under 5, but where the head was elderly or, especially, when unmarried, it was much more common to find that the household had also acquired persons outside the primary family unit. Reference to Table VI.2 in the *One per cent Sample Tables* shows that 3,124 thousand children under 5 (78 per cent of the total in private households) were in primary family unit households with no near relative, i.e. in households consisting (apart from domestic servants in a few cases) only of the head of household, his spouse if present in the case of married heads, and his children (including adopted children and the other occasionally occurring classes included in the definition of designated children).

Turning to the larger age-group under 16 (which includes those under 5), shown in Table R, it is seen that 88.5 per cent of children under 16 were enumerated in primary family units - 81.4 per cent in primary family unit households and 7.1 per cent in composite households. Only 6.8 per cent of children under 16 were in family nuclei. 5,726.2 thousand children under 16 in primary family units or family nuclei (52 per cent of the children under 16 in private households) were the designated children of married persons under 40 years old. 24 per cent of children under 16 were in primary family units containing one child under 16, 31 per cent in primary family units containing two such children and 18 per cent in those with three.

Table R. - Children under 16

Great Britain

Status of children	Number of children (hundreds)		
	Total	P.F.U. households	Composite households
Total Children under 16 in Primary Family Units	10,288.2	9,467.7	820.5
Children under 16 in P.F.U.s. with 1 such child:

- With other Heads of F.N.	66.9		66.9
Total Children under 16 in Private Households (excluding visitors)	11,074.6	9,467.7	1,606.9
Total Visitors aged under 16 in Private Households	230.7		
Total Children under 16 in Non-Private Households	318.1		
Total Children under 16 enumerated	11,623.4		

Some differences between the housing of children under 5 and older children may be seen by comparing Tables Q and R. The proportion of children of school age in composite households was higher than the proportion of children under 5, a reflection of the obvious time factor in the development of composite households; the proportion of children in family nuclei was, on the other hand, lower for children of school age than for those in the younger age-class - again a time factor operates since it is uncommon for a family to wish to remain in the status of family nucleus long enough for children to grow up.

The above discussion makes no reference to children who live in composite households containing children both in the primary family unit and in the family nucleus elements. Although no analysis on these lines is given in respect of the two age-groups of children which have been discussed, Table A.4 shows the relevant distributions in respect of "designated children of all ages" (i.e. including children over 16), the total number of such children in family nuclei being 855 thousand, a number which can be

derived from Table A.3. Reference to the definitions will recall that persons aged 16 or over enumerated with a parent who was head of a primary family unit or family nucleus (with the exception of such as were themselves heads of family nuclei or were married) were among those designated as children of the head of a primary family unit or a family nucleus. Table A.2 indicates to what extent children aged 16 or over were enumerated in their parents' homes, showing that there were 3,607 thousand households containing one or more children aged 16 or over. The total number of such children in these households was 5,080 thousand (Table VI.8 in the *One per cent Sample Tables*). Single persons aged 16 and over enumerated in Great Britain numbered 8,236 thousand. Out of 855 thousand children of all ages in family nuclei Table A.4 shows that about 500 thousand were in households with no children in the primary family unit and at least 165 thousand were in households with one child in the primary family unit. In both these classes of household the family nucleus commonly contained only one child.

Persons aged 60 and over

Table S analyses persons aged 60 and over in Great Britain according to characteristics of the households in which they were living, with special reference to persons living alone and in two person households. This table is largely derived from Table B.1 and, unlike Tables Q and R, the households which are analysed in it include visitors.

Table S. - Elderly People in status of Head of Private Household } Great Britain

	Age-group (numbers in hundreds)				
	60-64	65-69	70-74	75 and over	Total 60 and over

3 and over*	31.0	27.5	24.0	25.0	26.8

* On the assumption that the spouse when not enumerated with the head, was only temporarily absent.

† This class was fairly evenly divided between males and females.

Table S indicates that about 97 per cent of all married males in the 60 and over age-group were enumerated in the status of head of household (or spouse of head), the proportion being only slightly lower, about 94 per cent, for the oldest age-class shown, viz., 75 and over. In fact about half these households (1,080.5 thousand or 49.2 per cent) were two person households. Not quite all of them consisted of a married couple since a few will have contained a resident member other than the spouse, or a visitor. That almost all of them consisted of a married couple living alone can, however, be inferred from Table VI.2 of the *One per cent Sample Tables* and Table A.7 in this volume, both of which analyse households exclusive of the visitor element: Table VI.2 gives 1,151.4 thousand households* with married heads aged 60 or over and no other person apart from spouse (if present) or visitors; Table A.7 shows that in only 62.1 thousand or just over 5 per cent of these was the spouse absent. It may reliably be estimated that one half of married couples of which one was the head of a private household, and of which the husband was aged 60 or over, were in fact living without other persons resident in the household.

Reference to Table K in the previous chapter shows that 16.4 per cent of households with married heads aged 60 or over were composite households, and 9.3 per cent contained family nuclei. It is important to remember that in completing the census schedules it was left largely to the household to decide which member of it should be regarded as the head. In some households, especially those containing family nuclei headed by married son or daughter of the head of household, a member of the older generation may have been deemed the head of household in preference to a younger person in circumstances in which the former was not, in any real sense, the head. Some persons aged 60 or over recorded as heads of larger households, especially composite households, may well have been living in circumstances of economic or physical dependence on younger members of the household.

Table S indicates that rather more than half of the non-married persons aged 60 and over were recorded as having the status of head of household, the proportions being not very much lower in the oldest age-group, 75 and over, than in the 60-64 and other age-groups shown. These proportions were rather higher for females than for males (62 as compared with 55 per cent for the 60 and over age-group as a whole). Reference to the figures for England and Wales in Table 12 shows that widowed and divorced persons were much more commonly heads of their own household than single persons: in the 60 and over age-group only 39 per cent of single males but 64 per cent of widowed or divorced males were heads of household; the corresponding figures for females were 47 and 68 per cent respectively.

The lower part of Table S shows that more than a third of these households with non-married heads aged 60 and over were one person households, the proportion being higher for females (44 per cent) than for males (36 per cent); altogether nearly three quarters of them were of either one or two persons. Reference to Table K shows that considerable proportions of the larger households with widowed and divorced heads contained family nuclei; the percentage with family nuclei among households with widowed or divorced heads was 21.4 for males and 14.0 for females.

It is not possible from the tables available to make a full analysis of the kinds of households, private and non-private, in which there were considerable numbers of persons aged 60 and over other than heads of households. Table T, however, which relates to the whole adult population gives some indication of their distribution.

* The figure of 1,151.4 of Table VI.2 differs from that of 1,080.5 in Table B.1 because the former refers to households with a married head aged 60 and over and spouse (if present) but with any number of visitors (who do not appear in the analysis), while the latter is restricted to two person households including visitors, i.e. a married couple enumerated alone apart from visitors will be in the first figure but not in the second.

Non-Private Households	Persons	2,086.2	729.2	1,357.0			

* Estimated.

† Assuming all ancestors not "in married pairs" were non-married.

Table T shows that there were 729 thousand married persons of all ages enumerated in non-private households and 243 thousand as visitors in private households; 296 thousand were enumerated as lone married persons in the remainder sections of private households. It also shows, that 251.2 (10,540.4 - 10,289.2) thousand married male heads and 402.0 thousand married female heads were enumerated without their spouses. The corresponding numbers of married heads of family nuclei enumerated without spouses were 16.9 thousand males and 115.1 thousand females. Thus the lone married persons living in other people's private households were not numerous enough to partner as many as half of the married heads of primary family units and family nuclei enumerated without their spouses, even in the unlikely event that all were spouses of such heads. The numbers enumerated as visitors and in non-private households (where residence is often only temporary) were much larger though not as numerous as the absent spouses of married heads of households and family nuclei. In addition it is very possible that the spouses of some heads of household appear as heads of other households - many separated couples have possibly been recorded in this way. In view of all these possibilities it is clear that the census tabulations cannot distinguish between married couples temporarily apart on census night and those legally or otherwise "separated".

Among the non-married persons in the age-group 16 and over taken as a whole, over a quarter were enumerated as heads of private households; 40 per cent were in the status of children of head of household (other than those who were married or, if widowed or divorced, had children of their own present); 9 per cent were near relatives of the head of household in the status of ancestors or brothers or sisters in the primary family unit sections of households; 7 per cent were in remainders of composite households, outside the primary family unit or family nucleus; 11 per cent were enumerated in non-private households; and only just over 1 per cent were in family nuclei. Bearing in mind that the majority of family nuclei were "closely related" to the head of household, the proportion of the adult (16 and over) population

enumerated as members (other than domestic servants) of the private households of persons to whom they were unrelated, is seen to be very small: using Table T and Appendix Table A.3 it may be estimated as under 4 per cent of the total persons aged 16 and over enumerated.

In the 60 and over section of the adult population of non-married persons a much larger proportion, 60 per cent, were heads of households and of those who were heads over 40 per cent were in one person households, i.e., about a quarter of all non-married persons over 60 were living alone. Persons aged 60 and over are not very likely to be in the class of designated children, but the majority of those in the class of ancestors of the head of household are undoubtedly over 60 (more than half were ancestors of heads aged 40 or over). From the information in Table A.1. about the other class of near relatives of the head of household, brothers and sisters of head, it is clear that a considerable number must have been elderly since they were in households with heads in the older age-groups. Considerable numbers of elderly persons were also enumerated in certain classes of non-private households. Data to be published in the *Census 1951, England and Wales, General Tables* volume give the following numbers of non-married inmates (or guests) aged 60 or over, for England and Wales: 58,000 in hospitals, nursing homes, etc., 42,000 in mental institutions, 54,000 in homes for the aged or infirm 17,000 resident in the larger hotels and boarding houses (those containing at least 10 rooms).

Looking at the picture as a whole it seems reasonable to postulate that of the 1.4 million non-married persons aged 60 and over who were not enumerated as heads of private households, a quarter or more were enumerated as ancestors of a head of household, and a rather smaller number as other near relatives, viz., brothers and sisters of the head (within the primary family units). About 20 per cent were probably enumerated in non-private households, the majority of them in hospitals and homes or in hotels and boarding houses.

CHAPTER V: SOCIAL AND ECONOMIC CHARACTERISTICS OF PRIVATE HOUSEHOLDS

In the foregoing discussion in this report no reference has been made to the differing household compositions of households with different social and economic characteristics although the census record enables a limited examination to be made in terms of the gainfully occupied members of households, and although such discussion is clearly very relevant to housing conditions. The increase in the main census tabulation programme which would have enabled this aspect of housing conditions to be fully analysed was thought to be out of proportion to the value of the tables which could thereby have been produced, since at best the record, being in terms of class of occupation and industrial status, could provide a very imperfect index of the financial strength of households. The availability of a one per cent sample of the census schedules for special analyses on the occasion of the 1951 Census, however, has provided an opportunity for a limited examination of some of the factors at work and certain tabulations of social and economic characteristics of private households were published in Section V of the *Census 1951, Great Britain, One per cent Sample Tables*. Appendix C of the present report reproduces the contents of some of these tables and adds some new information not hitherto published.

The tables on this subject analyse private households of Great Britain by the Social Class and Socio-Economic group of heads of households by the number of earners (viz. gainfully occupied persons) each household contains, and by the number of children under 16 each contains. The composition of the Social Classes and Socio-Economic groups is described on p.xviii. The basis of the tables is slightly different from that of the household composition tables of Appendix A, in that persons enumerated as visitors in a

private household (i.e. persons who were not normally resident in that household or establishment) are included in the tables of Appendix C*. In the classification of households by numbers of children under 16 there is also a difference of concept: all children, whether of the head of household or in a family nucleus or in some other position in a household, are included in the classification for the tables of Appendix C.

Table C.1 shows the general distribution of private households of Great Britain according to combinations of the following characteristics: (i) total number of persons in household, (ii) number of children under 16 in household, (iii) number of gainfully occupied persons (earners) in household. In total 45 per cent of persons enumerated in private households were earners; 47 per cent of households contained one earner, 26 per cent contained two and 13 per cent three or more; 14 per cent contained no earner.

Nearly all the households with no earners were of one or two persons. Most of those of one person among them will either have been retired or will never have been gainfully occupied; most of those of two persons will have been elderly married couples. Only 11 per cent of households with no earners contained children under 16.

Table U shows the distributions by numbers of earners in households of each size.

Table U. - Number of Earners in households
with different numbers of Persons } Great Britain

Persons in household	Percentage of households with numbers of earners as follows:-				Ratio of earners to persons
	0	1	2	3 or more	
All sizes	14.0	46.9	26.3	12.8	0.45
1	59.4	40.6			0.41
2	20.7	54.4	24.9		0.52
3	4.8	51.1	36.9	7.2	0.49
4	2.3	48.0	28.9	20.8	0.43
5	1.7	38.7	29.3	30.3	0.40
6 and over	1.7	23.8	23.7	50.8	0.39

Only for households of one or two persons was the proportion with no earners considerable (59 and 21 per cent respectively). The households with one earner and those with two or more earners were spread more evenly among households of different sizes, the proportion with two or more earners increasing with size of household. The proportion with one earner ranged from 54 per cent for two person households to 24 per cent for those of 6 or more persons. The ratio of earners to persons in households ranged from 0.52 for two person households to 0.39 for those of 6 or more persons.

Very few households with children under 16 were enumerated without an earner (3.6 per cent) but, not unexpectedly, the higher the ratio of earners to persons the smaller the number of children in the household - 0.56 for households with no children, declining to 0.27 for households with three or more children.

The separate lines of Table C.1, within the sections for each size of household, indicate that households containing three or more persons aged 16 or over more often had two or more earners than one earner. The situation most frequently arising in any of the relevant classes of household

* See footnote on p.xi which shows that the net differences in the distribution of households by size, due to the exclusion of visitors, are small.

specified in Table C.1 was that in which all except one person aged 16 or over in the household were gainfully occupied: nearly two thirds of all three person households and more than half of all four person households were of this type.

In view of the correlations between numbers of earners, numbers of children under 16 and size of household, Table V is given to show the numbers of households of different sizes by the numbers of children under 16 which they contained.

Table V. - Number of Children under 16 in households with different numbers of Persons } Great Britain

Persons in household	Number of households (hundreds)	Percentage of households with numbers of children under 16 as follows			
		0	1	2	3 or more
All sizes	14,481.5	56.8	21.3	13.8	8.1
1	1,556.1	100.0	0.0		
2	3,998.5	96.9	3.1	0.0	
3	3,592.8	49.4	48.7	1.9	0.0
4	2,760.5	27.0	24.9	47.0	1.1
5	1,393.5	14.8	24.7	26.1	34.4
6 and over	1,180.1	6.3	14.7	22.5	56.5

Only 43 per cent of private households contained children under 16. Three person households were almost equally divided between those with one child under 16 and those with none and only 1.9 per cent of them contained more than one. Nearly half the four person households contained two children under 16, most of the remainder having either none or one. Nearly all the households with three or more children under 16 were, of course, households of five or more persons. Only 45 per cent of households of five or more persons, however, contained as many as three children under 16.

Differences between the Social Classes and the Socio-Economic groups in the distributions of households of each size by number of earners and number of children under 16 are exhibited in Table C.2 and Table W which is derived from it. It is to be noted that in this presentation households have been assigned to social and economic groups by reference to the occupations of their heads and it is likely that many of them contain gainfully occupied persons in a different class or group from that of the head, by virtue of their differing occupation. It is also to be noted that these tables contain a substantial number of households not classified by Social Class or Socio-Economic group. It can be inferred from the census data that at least two thirds of all widowed and divorced women heads gave no gainful occupation* - among those aged 60 and over the proportion was at least five sixths. From this it can be deduced that more than half the heads of the unclassified households were widowed or divorced women of whom probably more than two thirds were aged 60 and over. A small proportion also of the unclassified heads will have been married women recorded as head of household on account of the absence from home of their husbands on census night.

Variations by Social Class

The percentage of households with no earner varied little among the Social Classes; it was actually lowest (6.9) for Social Class III and highest (8.4) for Social Classes I and II. These percentages are substantially smaller than that (14.0) for All Households, the latter including the unclassified element with 52 per cent of households with no earner. There was a substantial Social Class gradient in the proportions of households with one,

* either because they came into the occupation category "home duties" or because they were not and had never been gainfully occupied.

two, three or more earners: the proportion with one earner decreased from 61.8 per cent for Social Class I to 41.9 per cent for Social Class V; the proportion with three or more earners increased from 6.4 per cent for Social Class I to 20.7 per cent for Social Class V.

There was also a Social Class gradient in the ratio of earners to persons in households, the ratio increasing from 0.40 for Social Class I to 0.49 for Social Class V. The same gradient was apparent in the figures for each size of household except those of one person, for which it was reversed. It should be borne in mind that households of which the head had never been gainfully occupied or had recorded 'home duties' as personal occupation, cannot be classified by Social Class or Socio-Economic group. Thus for one person households no such persons are included in the calculation of these ratios. For larger households, however, persons, other than the head of household, recording 'home duties' are included. The households which were not classified by Social Class on this account numbered over 2 million, a third of them being one person households and as stated above more than half of them being widowed or divorced women. The ratio of earners to persons for one person households in this unclassified group is, of course, zero, and this accounts for the national figure of 0.41 earners per person for all one person households being much lower than the ratio for any of the Social Classes, which ranged from 0.71 to 0.84. The contrast in Social Class gradient in the ratios of earners to persons, between one person households and larger households, should not, therefore, be taken at its face value. It is, however, noteworthy that among one person households composed of persons occupied in or retired from a gainful occupation a higher proportion were at work in Social Class I than in Social Class V.

The first section of Table W shows some appreciable Social Class differences in the distributions of households by size: there were relatively fewer one person households in Social Class I (4.2 per cent) than in Social Class V (7.9); fewer households of 5 or more persons in Social Class I than in Social Class V - 15.5 per cent as compared with 24.3; but considerably more 2-4 person households - 80.3 per cent as compared with 67.8. Differences of this kind would tend to make the Social Class differences in the ratio of earners to persons shown in Table U smaller than they would otherwise be because the ratio tends to be smaller in larger families; the comparatively low earners per person ratios in Social Class I cannot therefore be explained by variations in household size.

The third section of Table W enables this same feature to be examined in terms of numbers of children in households. The Social Class differences were not large, but the somewhat larger numbers of children in the lower social classes affect economic strength. This means that for any particular size of family there are, on the average, more children and fewer adults in Social Class V than in Social Class I. This would tend to restrict the available number of adults in Social Class V as compared with Social Class I and thus to reduce the ratio of earners to persons in the former, for a fixed family size. It follows that the proportion of earners among the adults themselves rises more steeply from Social Class I to Social Class V than would be suggested by the columns of the fourth section of Table W.

Variations by Socio-Economic Group

The variations in the numbers of earners in households were, as would be expected, rather larger among the more homogeneous Socio-Economic groups than among the Social Classes, and the proportions of households with no earner differed more widely. Households with heads in group 13 (Armed Forces - other ranks) had the highest proportion with no earners, presumably because occupied members of the Armed Forces are not, in general, in a position to be enumerated as heads of households; group 7, shop assistants, showed the lowest proportion. There was considerable variation in the percentages of households with 3 or more earners, high figures being shown for unskilled and semi-skilled manual workers (20.7 and 18.2 respectively), farmers (19.5), personal

service (16.1), foremen - manual (15.6); low figures being shown for Armed Forces (other ranks) (4.0), higher administrative, professional, etc. (6.4), intermediate administrative, etc., and clerical (each 8.6) and shop assistants (9.2). Generally these percentages were higher for manual workers than for non-manual workers, the personal service group being exceptional; they were high for farmers, but slightly below average for agricultural workers. The exceptionally low figure for Armed Forces should not be taken as representative of conditions for families with heads in the Armed Forces, since these census figures only cover those households with heads retired or on leave, and the small numbers who were living in private households.

The ratio of earners to persons varied among the Socio-Economic Groups, exclusive of group 13 (Armed Forces), from 0.40 for the higher administrative, professional, etc. group to 0.58 for the personal service group. The exceptionally high figure for the latter in part reflects the high proportion of one person households in this group, but the earners per person ratios were exceptionally high in this group for households of every size above one.

The variations discussed above, between Social Class and Socio-Economic groups, are superimposed on a pattern of broad features common to all, viz., an average ratio of earners per person between 0.4 and 0.5, decreasing with increasing size of household, and being in many groups nearly twice as high for one person households as for those of 6 or more persons. A considerable part of the variation within this general pattern is a function of the type of economic activity of the head of household and independent of variation in either size of household or numbers of children under 16 in household.

CHAPTER VI: HOUSING CONDITIONS AS EXPRESSED BY DENSITY STATISTICS

In Chapter II some account has been given of the number and size (in terms of rooms) of the dwellings which existed in the country in 1951, distinguishing the separate household occupations of dwellings containing more than one household. Chapters III and IV have analysed the households which occupied these dwellings, in terms both of size and of household composition. In the present chapter these two broad aspects of the housing of the population are brought together; the relationships between households of different sizes and types on the one hand, and the dwelling space (in terms of rooms) which they inhabit on the other, provide important and well recognised indications of the adequacy of housing.

Since housing conditions became matters of concern to public authorities and social reformers, questions have arisen as to the extent of overcrowding of persons in dwellings, and standards have been formulated by means of which the incidence of overcrowding could be measured. Many of these standards are primarily concerned with the number of bedrooms needed to give adequate separation of the sexes among persons over the age of, say, 10, while making comparatively small space allowances for sleeping quarters for younger children. Some of these standards make additional allowance for living rooms, while others do not.

Accommodation Standards and Overcrowding Standards

Among the standards devised by public authorities for use in their housing administration is the bedroom standard which was adopted by the Manchester Public Health Committee about 1920. The general principles on which this standard is based are that in any household (a) the sexes must be separated where aged 10 or over, except in the case of married (or ostensibly married) couples, and (b) counting persons aged 10 or over as 1 and persons under 10 as $\frac{1}{2}$, there must not be more than $2\frac{1}{2}$ persons per bedroom on the average. This standard is thus only concerned with bedrooms and can therefore be applied in different ways according to whether, for example, rooms structurally arranged as living rooms are counted as potential bedrooms. The authors of

the *New Survey of London Life and Labour*, working about 1930, computed the incidence of overcrowding in parts of London on the Manchester standard in three ways assuming overcrowding (a) when bedrooms needed were more than bedrooms provided, (b) when rooms actually used for sleeping were fewer than the number needed, and (c) when bedrooms needed were more than the total rooms occupied by the household less one in the case of occupations of two or more rooms, and when more than one bedroom was needed in the case of one room occupations.

Sections 1 to 12 of the Housing Act, 1935, together with the First Schedule, contain the specific provisions of that Act for the abatement and prevention of overcrowding. Previous to this Act there had been no statutory overcrowding standard in this country although overcrowding had long been recognised as a cause of bad living conditions: among the provisions of the Sanitary Act of 1866, for instance, was the addition, to the list of "Nuisances" defined for the Nuisances Removals Acts, of "Any House or Part of a House so overcrowded as to be dangerous or prejudicial to the Health of the Inmates." The following extracts from the Housing Act, 1936, which consolidated previous legislation, provide the definition of "statutory overcrowding":-

58. - (1) A dwelling-house shall be deemed for the purposes of this Act to be overcrowded at any time when the number of persons sleeping in the house either -

- (a) is such that any two of those persons, being persons ten years old or more of opposite sexes and not being persons living together as husband and wife, must sleep in the same room; or
 - (b) is, in relation to the number and floor area of the rooms of which the house consists, in excess of the permitted number of persons as defined in the Fifth Schedule to this Act.
- (2) In determining for the purposes of this section the number of persons sleeping in a house, no account shall be taken of a child under one year old, and a child who has attained one year and is under ten years old shall be reckoned as one-half of a unit.

FIFTH SCHEDULE

NUMBER OF PERSONS PERMITTED TO USE A HOUSE FOR SLEEPING

For the purposes of Part IV of this Act, the expression "the permitted number of persons" means, in relation to any dwelling-house either -

- (a) The number specified in the second column of Table I in the annex hereto in relation to a house consisting of the number of rooms of which that house consists, or
- (b) the aggregate for all the rooms in the house obtained by reckoning, for each room therein of the floor area specified in the first column of Table II in the annex hereto, the number specified in the second column of that Table in relation to that area,

whichever is the less:

Provided that in computing for the purposes of the said Table I the number of rooms in a house, no regard shall be had to any room having a floor area of less than 50 square feet.

ANNEX

Table I

Where a house consists of -

(a) One room	-	-	2.
(b) Two rooms	-	-	3.
(c) Three rooms	-	-	5.
(d) Four rooms	-	-	7½.
(e) Five rooms or more	-	-	10, with an additional 2 in respect of each room in excess of five.

Table II

Where the floor area of a room is -

(a) 110 sq. ft. or more	-	-	2.
(b) 90 sq. ft. or more, but less than 110 sq. ft.	-	-	1½.
(c) 70 sq. ft. or more, but less than 90 sq. ft.	-	-	1.
(d) 50 sq. ft. or more, but less than 70 sq. ft.	-	-	½.
(e) Under 50 sq. ft.	-	-	Nil.

The relevant extracts from the Act relating to the re-housing obligations of local authorities are as follows:

136. For the purposes of the provisions of this Act which relate to the obligations of a local authority with respect to re-housing, or which relate to Government contributions to the expenses of local authorities in providing accommodation available for displaced persons, the Minister, unless he is satisfied that owing to special circumstances

some other standard of size or accommodation should be adopted -

(a) shall not approve the provision of any house which is not either -

- (1) a two-storied house with a minimum of six hundred and twenty and a maximum of nine hundred and fifty superficial feet; or
- (11) a structurally separate and self-contained flat or a one-storied house with a minimum of five hundred and fifty and a maximum of eight hundred and eighty superficial feet;

such measurements being calculated in accordance with rules made by the Minister; and

(b) shall treat a house containing two bedrooms as providing accommodation for four persons, a house containing three bedrooms as providing accommodation for five persons, and a house containing four bedrooms as providing accommodation for seven persons.

In 1944 the report of the Design of Dwellings Sub-Committee of the Central Housing Advisory Committee appointed by the Minister of Health under the Housing Act, 1935, was published under the title *Design of Dwellings*; in the same year the Ministry of Health published the *Housing Manual 1944*. After four years experience in post-war building, the *Housing Manual 1949* was published. It is in general agreement with the recommendations of a sub-committee of the Central Housing Advisory Committee and a panel of architects appointed by the Associations of Local Authorities who were appointed to assist in its preparation. These three publications contain, inter alia, the Ministry's advice to those concerned with the provision of housing accommodation after the war, on standards in terms of numbers of rooms for different kinds of household.

The *Housing Manual 1944* was particularly concerned with the provision of homes suitable for the younger families who, by reason of war conditions, had been unable to obtain a separate home of their own. It is of less lasting interest than its successor of 1949 which was concerned with long-term problems of providing for the varying needs of the population as a whole.

The *Housing Manual 1949* recommended three basic types of house:-

- (i) *The Kitchen-Living room house* containing a large kitchen-living room, a scullery containing the sink and in rural areas a separate wash house. In houses for a family of five or more persons a separate sitting room was also to be provided.
- (ii) *The Working Kitchen house* containing a good working kitchen for cooking and laundry, and a large living room in which meals can be eaten or a living room with a dining recess or separate dining space.
- (iii) *The Dining Kitchen house* containing a living room and a kitchen large enough and suitably arranged to take a table for meals. A separate wash-house was to be provided containing a wash boiler and a deep sink.

The manual contained no advice about the different numbers of bedrooms required by households with different household compositions, but gave the following recommendations for the number of bedrooms and the superficial area for two-storey houses for households of different sizes:-

Number of persons	Number of bedrooms	Superficial area (floor-space) for two-storey houses
4	2	750- 800 sq.ft.
5	3	900- 950 " "
6	3	980-1,030 " "
6	4	1,000-1,090 " "
7	4	1,100-1,175 " "

It was envisaged that some of the houses for six persons might be provided with two double and two single bedrooms as an alternative to three double bedrooms.

The Use of Census Statistics to Indicate Levels of Spaciousness Attained

The population census of this country provides, both for the country as a whole and for local areas, comprehensive cross-tabulations of numbers of persons in households and numbers of rooms occupied by households. For census purposes, however, rooms are 'habitable rooms'; no distinction is made between bedrooms and living rooms and neither are the dimensions of rooms measured. Moreover the information tabulated for local areas about households is limited to data on numbers of persons and on the sex, age and marital condition of heads of households, the latter data representing a new tabulation which is not available in censuses prior to 1951. The scope of the tabulations for the country as a whole is broadly similar except for the addition of the One per cent Sample household composition analysis for 1951 and some special tabulations constructed for Sheffield and Camberwell from the 1931 Census records, from which some generalisations were made in the *Housing Report* of the 1931 Census. Thus it is not possible to use census data directly to measure the incidence of overcrowding, but it is obvious that areas with comparatively high proportions of overcrowded households will also have comparatively high proportions of households living at high densities in terms of persons per room. Such density statistics will, moreover, be particularly valuable in comparing the incidence of overcrowding as between one census date and another and, with some reservations, between one area and another.

The value of using census data in this way has long been recognised - indeed it appears that Charles Booth, working on his *Survey of London Life and Labour* towards the end of the nineteenth century, was one of the advocates for this purpose of the addition of a rooms question on the census schedule in 1891. (The question was applied only to tenements of four or fewer rooms in 1891 and 1901, but has been generally applied at subsequent censuses.) Sir H. Llewellyn Smith and Professor A.L. Bowley, writing in the *New Survey of London Life and Labour**, considering the same question some 40 years later, claimed that in crowded areas there was a close correlation between the number of households living in an area in overcrowded conditions (as defined by the (c) version of the Manchester standard described above on p.lxi) and the number living in it at densities of two persons per room or more; the correlation was lower, however, for areas of low average density.

The *Census 1931, England and Wales, Housing Report* draws a similar parallel for three densely populated urban areas (Camberwell Met.B., Sheffield C.B. and a group of 95 Crowded London Wards) between the incidence of overcrowding on a defined standard and the incidence of households living at over two persons per room. In this case the defined standard was in terms of characteristics obtainable from the census schedule, viz., numbers of married couples, children under 10, other males and other females in a household, and the number of habitable rooms it occupied. On the basis of this examination it was suggested that the proportion of households living at more than two persons per room would provide an index of overcrowding valid for making comparisons between areas. It seems wise in view of the evidence of the *New Survey of London Life and Labour* to limit the overcrowding implication of this type of index to urban areas of comparatively high average density. Nevertheless, without any specific implication of overcrowding, such an index also provides a valuable guide, in a simple form, to the incidence of high density housing in local areas generally.

*The *New Survey of London Life and Labour*, Director Sir H. Llewellyn Smith, G.C.B., undertaken by the London School of Economics and Political Science in 1928. Volume III published in 1932 by P.S. King and Son, Ltd.

It is perhaps not out of place to call attention to an important distinction between a direct measure of overcrowding and such indirect measures as can be obtained from census statistics. Even if a perfect relationship existed such that the number of households found to be living at a density of more than x persons per room in an area was the same as the number overcrowded on, say, the statutory overcrowding standard, this would not necessarily mean that the overcrowded households were the same households as those living at more than x persons per room. For example, the number of households in an area living at 2 persons per room or higher density has been found to be a measure of the number of households overcrowded on the (c) version of the Manchester standard. Yet according to this standard a household consisting of a married couple and one child under 10 would not be overcrowded living in one room at three persons per room; but a household of three non-married adults would be overcrowded living in two rooms at $1\frac{1}{2}$ persons per room. In other words a simple density standard may be valid when applied as a statistical average to summarise the general conditions of a large group of households, for example those in a particular area, but it cannot be used to determine whether a particular household is overcrowded.

The density statistics which have been produced from the 1951 Census material are of two distinct types. In the first place cross-tabulations of households by numbers of persons and numbers of rooms, and derivatives of this material, have been produced on a pattern similar to those tabulations produced in previous censuses: such tabulations form the basis of comparisons over time and between local areas. In the second place the sample Household Composition tables of Appendix A provide evidence with which to compare the housing conditions (in terms of persons per room) of different types of household unit (in terms of the relationships, etc., of other members of the household to its head) in Great Britain as a whole in 1951. These two aspects are discussed in turn in the following sections. A third aspect, the sharing of dwellings by more than one household, is discussed in Chapter VII.

Conditions in 1951 and Changes in Intercensal Periods

Persons in Relation to Rooms by Size of Household

The cross-tabulations of households by numbers of persons therein and by numbers of rooms occupied, given in Table 2, provide the basic material for studies of density on a basis which allows comparisons to be made between areas and between one census date and another. Density conditions reflect, in large part, the sizes of the dwellings available to households of different kinds and sizes but it must again be emphasised that they will not necessarily reflect the needs or desires of the population. The statistics provide an objective picture of conditions existing in 1951. Table 2 specifies households of every size up to 12 persons and occupations of every size, in terms of numbers of rooms, up to 14, for England and Wales, for the Standard Regions, and for the aggregates summary. With considerably less detail by size of household similar information is also given for the conurbations, for London A.C. and for the five County Boroughs with more than 500,000 population. Similar tables for all individual local authority areas are contained in the 1951 Census series of *County Reports*, and indices from them are contained in Table 13 of this report.

Table X provides a summary comparison with previous censuses of the proportions of households living at densities of over 2 persons per room, in so far as the earlier records are available. Households living in 1 - 4 room occupations at a density of more than 2 persons per room represented 7.86 per cent of all households in 1891 but only 1.12 per cent in 1951. The proportion of all private households living at such densities has fallen from 5.69 per cent in 1921 to 1.18 per cent in 1951.

* Standardised ratios for 1921 and 1931 obtained by weighting persons per room ratios for each size of household by the corresponding proportion of the population in households of that size in 1951.

Table Y gives the average densities of occupation of households of different sizes for the last three census years. Since dwelling size is generally less capable of variation than household size there are naturally very large differences in the density conditions of small and large households. In 1951 densities ranged from 0.30 persons per room for one person households, to 1.90 for households of 10 and over persons. The ratios increase steadily with size of household, all size groups of households with 5 or more persons having persons per room averages exceeding one. To a very great extent the reduction in the average number of persons per room for households of all sizes which has taken place between 1921 and 1951 may be attributed to the reduction in the size of families and the increasing proportions of small households into which the population was, in consequence, divided. The evidence suggests that a considerable part of the reduction in proportions of households living at over 2 persons per room, shown in Table X, will have been due to the same causes. Another, though less important, aspect of the increased proportions of smaller households is the existence of an acute housing shortage after the 1914-18 war which probably impeded the formation of new households: this temporarily depressed the number (and distorted the size-distribution) of the separate households into which the population was divided in 1921 and inflated the increase between 1921 and 1951 in the proportion of smaller households.

The basic data of Table 2 is summarised for Regions, aggregates and other large areas by persons per room categories for households of all sizes in Table 8 and comparison with 1931 is provided for the proportion of

population living at a density of more than two persons per room. In 1951, 84 per cent of the private households of England and Wales, containing nearly three quarters of its population, lived at densities of one person per room, or less. Among the Regions the Northern was exceptional with only 75 per cent of households with a density as low as this. The Eastern Region, with 88 per cent, had the highest proportion. Among the aggregates the conurbations and the group of urban areas outside the conurbations with populations over 100,000 had slightly lower proportions than the other aggregates with densities of 1 person per room or less. The change in density conditions between 1931 and 1951, as indicated by the lower proportions of population living at densities of over two persons per room in 1951, has been general in all parts of the country. The reduction in this index was greatest in the areas in which the figure was highest in 1931, the largest absolute reduction in this percentage being that for the Tyneside Conurbation, from the outstandingly high figure of 24.0 per cent in 1931 to 6.2 per cent in 1951. The figure for Greater London was reduced from 9.4 per cent in 1931 to 2.0 per cent in 1951.

Table 9 summarises the data of Table 2 in a different form for England and Wales, giving more information about the households at the lower end of the density scale, and providing it in such a way as to throw light on the possibilities of augmenting the stock of dwellings existing in 1951 by structural sub-division or adaptation of possibly "under-occupied" dwellings. A corresponding analysis is given for 1931. In this classification of rooms in relation to persons the most commonly found conditions in 1951 were of households with one room in excess of the number of persons in the household - 23.1 per cent of households were living in such conditions. A further 20.8 per cent had 2 rooms in excess of persons, 13.4 per cent had 3 and 8.2 per cent had 4 or more rooms in excess of persons. It thus appears that there were over a million household occupations in England and Wales in 1951 with at least 4 rooms in excess of persons. Moreover 430,000 of them were occupations containing at least 7 rooms. The class of households with one room in excess of persons was also the most commonly occurring class in 1931, but it contained a smaller proportion then, 18.9 per cent, of all households. The main difference between the two dates has nevertheless been a shift towards the left hand side of Table 9: the proportions of households in the 3 classes containing more persons than rooms were all considerably lower in 1951. There has also, however, been some heaping up at the middle of this classification and the proportion of households with 4 or more rooms in excess of persons has fallen from 9.8 per cent in 1931 to 8.2 per cent in 1951. The area analysis given in very similar form in Table 10 shows that these more spacious conditions were more common in rural areas than in the towns. This table is confined to households of 6 or fewer persons and among them the proportion with 4 or more rooms in excess of persons was nearly twice as high (11.2 per cent) in the rural aggregate as in the conurbation aggregate (6.0 per cent). A steady gradient is to be seen in this respect in the classification by type of area. It is perhaps not unreasonable to suppose that many of the larger households do not want more than one habitable room in excess of the number of persons in the household, although it would be unrealistic to assume that the occupants of all the dwellings with 4 or more rooms in excess of persons have sets of 3 or more habitable rooms which they would be prepared to let to another household. Nevertheless the census statistics show that some housing difficulties may be caused by small households living in dwelling accommodation which is too big for them. To the extent only that these conditions arise extra housing accommodation may be potentially available by the rearrangement of households within existing dwellings, whether or not accompanied by structural sub-division.

Regional Variations

The distribution of households of different sizes up to 6 persons (covering 97 per cent of all private households) according to the number of persons in excess of rooms, is shown in Table 10 for the Regions, aggregates summary and other large areas. In England and Wales as a whole nearly half the one person households and more than half the two person households had 2 or 3 rooms in excess of persons; more than 60 per cent of 3 person

households had 1 or 2 rooms in excess of persons; 38 per cent of 4 person households had 1 room in excess of persons and 28 per cent had rooms equal in number to persons; over 40 per cent of 5 person households had rooms equal in number to persons; and a similar proportion of six person households had one fewer rooms than persons. The above percentages indicate the most commonly found combinations in this distribution for each household size and show that excesses of rooms in relation to persons were larger in the smaller households. They add meaning to the average numbers of persons per room given in Table Y for different sizes of household.

* Standardised ratios obtained by weighting rooms per person ratios for each size of household by the corresponding proportion of the population in households of that size in England and Wales.

Some important variations between the areal divisions shown in Table 10 are to be noted. The main features of these variations are shown in Table Z. Households with one room in excess of persons occurred with greater frequency than any other of the classes shown, in nearly every area, and comprised in most cases nearly a quarter of all households. Among the regions, North Midland and Eastern were exceptional in that households with 2 rooms in excess of persons were slightly more frequent than those with only 1 room in excess; and in the North Western Region these two levels of excess were almost equally frequent. The Northern Region (containing Tyneside) had 8 per cent of households with 2 or more persons in excess of rooms. Among

the regions, North Midland and Eastern were exceptional in that households with 2 rooms in excess of persons were slightly more frequent than those with only 1 room in excess; and in the North Western Region these two levels of excess were almost equally frequent. The Northern Region (containing Tyneside) had 8 per cent of households with 2 or more persons in excess of rooms. Among the aggregates the rural areas had a larger proportion of households with 2 rooms in excess of persons than in any other class; and among the conurbations South East Lancashire was outstanding with 25.2 per cent of households with 2 rooms in excess of persons, and Merseyside and Tyneside with 6.1 and 10.0 per cent respectively of households with 2 or more persons in excess of rooms. Apart from differences in the shape of these distributions the broad areal differences in housing density are indicated by variation in the total proportion of households with one or more rooms in excess of persons which ranged from 74 per cent in the Eastern Region, 73 per cent in the North Midland, and 72 per cent in the South and South Western Regions down to 64 per cent in London and South Eastern and 56 per cent in the Northern Region; from 72 per cent in the rural aggregate to 63 per cent in the conurbation aggregate; and within the latter from 71 per cent in South East Lancashire to 52 per cent in Tyneside.

There were considerable variations between areas in the proportions of households with 4 or more rooms in excess of persons, the proportions being in general low in the north and high in the south and in Wales; low in the conurbations and high in the small towns and rural areas. Among the conurbations Merseyside was exceptional in that despite its high percentage with more persons than rooms (16.7) it also had 6.3 per cent of households with 4 rooms in excess of persons and 3.2 per cent with an excess of 5 or more rooms.

The last two columns of Table Z show the average number of persons per room in each area standardised for areal differences in the distribution of population in households of different sizes, as well as the unstandardised ratios. Here also the Tyneside conurbation stands out exceptionally, with the high standardised ratio of 0.86 persons per room. All the conurbations except South East Lancashire had high averages and there is also a clear gradient from a standardised ratio of 0.78 persons per room for the conurbations down to 0.68 for the rural areas in the Aggregates Summary Classification. In three regions which do not contain conurbations, viz. Eastern, Southern and Wales, the standardised ratio was as low as 0.69 persons per room.

Comparison between the standardised and unstandardised persons per room ratios given in Table Z indicates that areal variations in household size distributions are large enough in some regions to have an appreciable effect on this density index and, by implication, on the distributions of differences between rooms and persons in individual households. The total number and the size distribution of dwelling units also sets limits to the way in which the total households can be accommodated. The effect on the density indices of areal variations in the numbers of rooms occupied by private households is in some cases appreciable, as the following comparison for Regions indicates:-

Region	Persons per room ratio		
	Crude	Standardised for variations in distribution of households by size (a)	Standardised for variations in distribution of room occupations by size (b)
England and Wales	0.74	0.74	0.74
Regions of England			
Northern	0.84	0.80	0.79
East and West Ridings	0.76	0.76	0.74
North Western	0.73	0.73	0.73
North Midland	0.71	0.70	0.73
Midland	0.76	0.73	0.77
Eastern	0.69	0.69	0.71
London and South Eastern	0.74	0.77	0.73
Southern	0.69	0.69	0.72
South Western	0.69	0.70	0.71
Wales (including Monmouthshire)	0.72	0.69	0.76

(a) From Table Z.

(b) Obtained by weighting persons per room ratios for each size of household occupation by the total number of rooms contained in household occupations of that size in England and Wales.

It is clear from the disparities between these two sets of standardised figures that the balance of influence of variations in household size and variations in room occupations differs from region to region. The high crude ratio of 0.84 for the Northern Region is due to comparatively large numbers of large households in an area which contains comparatively few large household occupations; the three regions with the lowest crude ratio (0.69), viz., Eastern, Southern, South Western, are regions with comparatively large numbers of large household occupations; in Wales, the crude ratio (0.72) was a little below the national figure because the relatively greater number of large household occupations in this region more than offset the excessive share of large households.

Table J in Chapter III enables the separate effects, on density, of regional differences in the size distributions of households (persons) and household occupations (rooms) to be measured. The "expected" numbers in this table are those which would obtain if the total number of households in each region were distributed among the cells of the table in proportion to the households of England and Wales as a whole. The crude persons per room ratio for England and Wales, D , may be thought of as a weighted average of the ratio for each cell in a table with lines for numbers of rooms and columns for numbers of persons, the weights being proportional to the aggregate number of rooms in the households relating to each cell. The deviation from D of the density $\frac{1}{j}$ in the cell relating to households of i persons occupying j rooms is $\frac{1}{j} - D$, the sum of the contributions from all such cells, when weighted by the proportion of rooms occupied by such households, being zero. Table AA sets out the elements in this weighted average.

The contribution of the ij cell to the difference between the average density d for a region and the national density D , is $\frac{1}{j} - D$ multiplied by a weighting factor which is the difference between the regional and national proportion of rooms in the ij cell. In terms of the elements of Table AA

this contribution may be written $\frac{\Delta}{j} (d - D) = \frac{1}{R} (\frac{1}{j} - D) (n_{ij} - C_r N_{1j}) \times j$

where n_{ij} is the number of households (hundreds) in cell ij in the region, given in Table AA, N_{1j} is the expected number, R is the total number of rooms (hundreds) in the region and C_r is a factor approximately equal to unity. C_r is in fact the ratio of the regional to the national average number of

Table AA. - Households, rooms, persons per room

England and Wales

* i.e. difference between persons per room for each cell and average persons per room for all households (p.p.r. = 0.7356).

rooms per household occupation and varies among the regions from 0.924 for the Northern Region to 1.069 for the Eastern Region.*

It can be seen from Table J that the crude persons per room ratio for the Northern Region was high largely on account of comparatively large numbers of occupations of 4 or fewer rooms inhabited by households of 3 or more persons and the comparatively small numbers of larger occupations. The excessive proportions of three, four and five person households in three room occupations and of four person households occupying five rooms, and the comparatively small proportions of two person households occupying five and six rooms, made the more important contributions to the overall difference in density of this region as compared with the country as a whole.

As has been said, the three regions with the lowest overall p.p.r. ratio (0.69) all contained comparatively large numbers of large household occupations. In the Eastern Region the excessive numbers of five room

* The factor $n_{ij} - C_r N_{ij}$ is approximately equal to $n_{ij} - N_{ij}$ (values of which are given in the difference lines in Table J) for most of the cells which make the important contributions to $d - D$. The following schedule gives the values of $(\frac{1}{j} - D) \times j$ for values of i up to 5 and of j up to 6 as an aid to the evaluation of the Δ_{ij} ($d - D$) components of $d - D$ for any region.

Schedule of values of $(\frac{1}{j} - 0.7356) \times j$

i (persons)	j (rooms)					
	1	2	3	4	5	6

5	4.264	3.529	2.793	2.058	1.322	0.586

occupations containing small households and the comparatively small proportions of three room occupations had appreciable effects on overall density; in the Southern and South Western Regions the differences in pattern were less concentrated in occupations of particular sizes, most classes of household with 4 or fewer rooms being slightly under-represented and all those with 5 or more rooms being over-represented as compared with the national pattern.

In Wales the comparatively small difference from the country as a whole in overall density conceals the effects of comparatively large numbers of small households in six and seven room occupations and comparatively small numbers of 2 person households.

The distributions for the London and South Eastern Region show exceptionally large proportions both of small households and small occupations. To a large extent, however, the small households were in the small occupations, with comparatively little effect on overall density: in the London and South Eastern Region 31 per cent of households were of 1, 2 or 3 persons occupying 1, 2 or 3 rooms, as compared with only 21 per cent in England and Wales as a whole.

In the North Western Region the excess of four room occupations was outstanding. They contained comparatively high proportions both of one and two person households and of larger households, and the net effect on overall density was small.

In the North Midland Region there were comparatively high proportions of households of up to three persons in five room occupations, and comparatively few households occupying three rooms, both these distribution differences contributing to a lower overall density than in England and Wales.

Persons in Relation to Rooms for Different Household Compositions

Table A.1 shows the number of persons in, and the number of rooms occupied by, the households in each main household composition class, and enables the average number of persons per room to be calculated for each such class. This information is summarised, for primary family unit* households and for composite households, in Table AB. Reference to Table N on p.xlv indicates the extent to which the households in each composition class were of the same size.

In columns (d) to (g) and (p) to (s) of Table AB purely hypothetical figures are given, of persons per room, estimated on the basis of four different hypotheses about numbers of rooms in which households of different types might be accommodated. These hypotheses have been formulated for illustrative purposes only and must not be taken to imply in any way an approach to official housing standards. Comparison between the hypothetical persons per room ratios on each of these four assumptions, and the ratios which were found in each class of household in 1951, indicates which kinds of families in 1951 enjoyed more living space so far as is indicated by numbers of rooms. The four hypothetical schemes have been constructed to conform as closely as possible, within the limits of the data analysed in the household composition tables, to generally accepted principles. As has been seen, these principles are concerned primarily with the provision of sufficient sleeping accommodation to allow the separation of the sexes for persons over, say, ten years of age; and with the smaller extent to which rooms are needed for young children. This approach was used by the authors of the *New Survey of London Life and Labour*, and applied to selected areas in the 1931 Census Housing Report. On this occasion, however, it has been possible to apply the hypotheses to a representative sample of the households of Great Britain.

* See notes on pp. 121-123 for definitions of terms in the household composition analysis.

Table AB. - Persons per room by Composition of Household and Comparison with Hypothetical Density Ratios

* For statements of these hypotheses, see p. lxxiii.

The hypotheses assume the need for separation of the sexes in respect of persons 5 years or over (since the household composition tables give a choice of division at age 5 or age 16 but not at any intermediate age); that at least one habitable room in every household occupation can be a living room and that all other rooms can be bedrooms; and that in some cases a second room can make a second living room. With these general assumptions the four schemes, which are outlined below, represent four different levels of spaciousness of accommodation, in terms of numbers of rooms, in relation to households of particular compositions.

Hypothesis A envisages one living room per household and a bedroom for each of its members, except that

- (a) married couples identified should share a bedroom
- (b) one but not more than one child under 5 should share the bedroom of its parents or of the head of household
- (c) In primary family unit and family nucleus sections of households taken separately
 - (i) up to 3 children under 5 should share a bedroom
 - (ii) one child under 5 and one 5 or over, of the same or opposite sex, should share a bedroom
 - (iii) two children aged 5 or over of the same sex should share a bedroom
- (d) Two or more domestic servants should share one bedroom
- (e) Two brothers or two sisters of head of household or of his spouse, contained in the primary family unit, should share a bedroom
- (f) Two adults of the same sex, not closely related to the head and not in a family nucleus should share a bedroom.

Hypothesis B envisages the same allocations as hypothesis A with the deletion of the sharing of bedrooms allowed for in (e) and (f), i.e. it envisages sharing of bedrooms limited to married couples, children and domestic servants.

Hypothesis C envisages a second living room for every household which contains a family nucleus, more bedrooms for parents and their children than in hypotheses A or B, but the same allocations as for hypothesis B for brothers and sisters of head in primary family units and for adults not closely related to head and not in family nuclei, i.e. it envisages the bedroom allowance of (a), (c) (ii), (c) (iii) and (d) of hypothesis A but with (c) (i) replaced by "(c) (iv) up to two children under 5 should share a bedroom".

Hypothesis D envisages two living rooms per household for all types of household and bedroom allocations as in hypothesis C.

The persons per room ratios in column (c) of Table AB demonstrate more directly than Table Y the extent to which density of occupation of dwellings increases with the number of children in household, besides showing the different densities of households with heads in the various age and marital condition classes.

Comparison between the persons per household figures of column (b) and the density ratios in column (c) also shows clearly the correlation between density and size of household, the more so because, as has been seen in Table N, the very great majority of primary family unit households represented on most lines of Table AB, were of one size. Table AC also illustrates this.

Table AC. - Variations in Density (persons per room)
for Households with given numbers of
Children in different classes, by Age
and Marital Condition of Head

Among primary family unit households with married heads and no children the persons per room ratio was higher (0.61) for heads under 40 than for either of the two older age groups (0.48 and 0.47 respectively); the corresponding figures for households with 2 children were 0.98, 0.88 and 0.84 respectively in these three age-groups. Among primary family unit households with widowed or divorced heads, the average density conditions of those with one child, in each of the two age sections, correspond closely with those of households with married heads and no children. The modal size of household was two for all these classes. Primary family unit households with single heads and no children were living at higher persons per room densities than those with widowed and divorced with no children but such households more frequently contained a second adult in addition to the head (the proportion of households of the modal size of 1 being much less than 100%).

The density ratios for composite households were higher than those for the same class (as specified by age and condition of head and numbers of children of head) for primary family unit households, but there is similarity about the pattern of their variation. As with the primary family unit households there was not very much variation in density between classes with similar average numbers of persons per household.

It seems evident that much of the variation in density between households in different classes by type of head and numbers of designated children is reflected in the density figures for different sizes of household.

The variations in density according to numbers of children of head of household, shown in column (c) of Table AB, indicate relative density conditions on the assumption that every member of a household, however young or old in whatever relationship to other members of household, makes an equal

claim on the rooms occupied in the dwelling. The figures make no allowance for the fact that married couples in general share a bedroom and that it is reasonable to suppose that children, particularly small children, in many cases do not require a bedroom each. As has been explained, the hypothetical figures in columns (d) to (g) and (p) to (s) represent attempts to make some allowance for such variations in requirements.

The very small differences between the hypothetical persons per room ratios, on the A and B hypotheses, reflect the comparatively small numbers of households containing two or more brothers or sisters of the head of household and, in the case of composite households, the comparatively small numbers containing two or more persons not closely related to the head and not in family nuclei.

Differences between the B and C hypotheses in the primary family unit household section result from the smaller amount of sharing of bedrooms by children envisaged on hypothesis C: the biggest difference is for households with married heads under 40 with one child, such child being under 5 years of age in nearly two thirds of these households and envisaged as sharing its parent's bedroom on hypothesis B but as having a bedroom to itself on hypothesis C. In primary family unit households with married heads in the older age-groups and one child most of the children were at least 5 years old, and the differences in the persons per room ratios were comparatively small. Hypotheses B and C give the same results for primary family unit households with two children whatever their combination by sex and age but there was appreciable difference for households with 3 or more children, again affecting most the households with married heads under 40. A somewhat similar pattern of differences applied to primary family unit households with non-married heads. Differences in persons per room ratios between hypotheses B and C for composite households were considerably larger on account of the extra bedrooms and extra living room postulated for households containing family nuclei.

Differences in persons per room ratios between hypotheses C and D reflect merely the extra living room postulated, for primary family unit households: for example 1.14 persons per room on hypothesis C for households with married heads under 40 implies 3.06 rooms per household as compared with 4.06 on hypothesis D. The comparatively small difference (between 5.29 and 5.45) for composite households reflects the fact that households containing family nuclei were "allowed" a second living room on hypothesis C, and it is only on account of households without family nuclei that results on hypotheses C and D differ.

In spite of differences in the persons per room ratios on the four hypotheses, and the different ways in which the constitution of households in the different classes affects them, there is a substantial measure of similarity in the patterns of variation between the different classes of household on any given hypothesis. Such agreement lends considerable support to the view that a comparison between actual and hypothetical persons per room ratios, by type of household, may provide useful indices of relative density conditions in different types of household - indices which in many respects are more closely related to real conditions than crude persons per room ratios. Columns (h) to (l) and (t) to (w) in Table AB give such indices.

The persons per room ratios of hypothesis D accord more closely with conditions which existed in 1951, than do those of hypotheses A, B or C. The actual numbers of rooms contained in the dwellings occupied by private households in Great Britain were for primary family unit households 7 per cent higher than the hypothesis D numbers and for composite households 8 per cent lower. The figures in columns (l) and (w) give some indication of the classes of household which were most spaciouly housed, in terms of rooms, in the sense implied in hypothesis D. Both in the primary family unit and in the composite section the highest ratio, representing the most spacious conditions, related to households with married heads aged 60 or over with no children: a ratio of 1.41 for primary family unit households

of this class as compared with 1.07 for all primary family unit households indicates the greater spaciousness of the accommodation of these older married persons; among composite households the ratio was 1.07 for this class as compared with 0.92 for all composite households. Both in primary family unit and composite households the ratios (in columns (1) and (w)) were lowest for the two classes of households with non-married heads aged under 40, viz., among primary family unit households, 0.88 for those with single heads and 0.76 for those with widowed and divorced heads, and among composite households 0.77 and 0.76 respectively.

Households with married heads both under and over 40 were also more spaciouly housed (in the sense of hypothesis D) than households with non-married heads of corresponding ages, this being also true of households within each class with the same number of children of the head. The figures also show that, as would be expected, households in each class by type of head were, with one exception (see next paragraph), more spaciouly housed the fewer the number of children of the head they contained, ratios in column (1) for primary family unit households with married heads in the 40-59 age-group for instance being 1.36 for those with no children as compared with 0.86 for those with three or more children. Lastly, it is noteworthy that a large part of the overall difference between the ratios for primary family unit households and those for composite households is common to almost every class by type of head and number of children of head.

The differences between classes of household in the ratios of actual to hypothetical numbers of rooms followed patterns which were broadly similar on each of the four hypotheses. The only exception which seems worthy of note relates to households with married heads in the under 40 age-group with one child. For this class, the figures for hypotheses A and B fit into the pattern of ratios decreasing with increasing numbers of children, but those for hypotheses C and D do not. These differences are due to the fact that a very considerable proportion of these children were under 5 years old, thus qualifying for an additional room on hypotheses C and D but not on hypothesis A or B.

Broadly speaking this comparison between rooms actually occupied, and those derived from the application of any of the four hypotheses to the distribution of households of different compositions in Great Britain, indicates some substantial differences between the levels of living space attained by different types of household.

One other aspect of these hypothetical figures is noteworthy. Even on the extremely restricted room allocations of hypothesis A many of the related persons per room ratios for the classes of household shown in Table AB are considerably below unity - the lowest figure is 0.53 for widowed or divorced female heads aged 40 or over with no children, in primary family unit households. Moreover the range of variation in these ratios is very great, the highest figure for hypothesis A being 1.48 for married heads under 40 with 3 or more children in primary family unit households. These figures are only averages but it is clear that the mere ratio of persons to rooms, which takes account only of size of household, does not measure the extent to which accommodation may fail to reach a particular standard which takes specific account of household structure and of the varying needs of different members of the household. However the homogeneity in composition of households of a given size, which has been demonstrated, allows much of the variation in room requirements consequent on variation in household structure to be taken into indirect account if the persons per room ratios of households of different sizes are considered separately. In this context the average persons per room ratios for all households, on each hypothesis, are of interest: the households of Great Britain could be housed at the hypothesis A level at an average of 1.07 persons per room, and at hypothesis D level at an average of 0.78 persons per room. The figure of 1 person per room, which has been extensively used in considering the adequacy of housing conditions, would seem to be a useful index to apply to areas which have fairly normal household distributions.

Column (x) of Table AB expresses the density conditions of composite households in 1951, in terms of average numbers of rooms per household occupation, and column (y) expresses the corresponding hypothesis D figures in the same form. Column (z) applies the hypothesis to those parts of composite households exclusive of their family nuclei and column (aa) applies it merely to their primary family unit components. These figures illustrate the extent to which the presence of family nuclei or other persons not in the primary family unit is responsible for differences between actual and hypothetical conditions. It appears that the relatively high density of occupation of dwellings (in relation to hypothesis D) for composite households with heads under 40 was due largely to the presence of lodgers or other persons not closely related to the head and not in family nuclei. Among households with older married or widowed or divorced heads, however, family nuclei were relatively more important in their claims on the available rooms in the occupations; on the whole the members of these households other than the family nuclei they contained would have enjoyed a level of spaciousness not far from the average for all types of household if the family nuclei had been removed. In households containing three or more children neither the presence of family nuclei nor the presence of other remainder elements accounted entirely for the comparatively dense conditions of their occupation of dwellings.

The indices given in Table AB, being averages, provide very little information about particular sizes of household occupation that were in excess or deficiency in the 1951 stock of dwellings. Table AD provides distributions of occupations by size in the classification of households by type of head, and compares them with corresponding distributions estimated by the application of hypothesis D to members of households. In this demonstration no account is taken of the family nuclei elements of composite households in calculating the hypothetical figures by types of household, but they are included as separate household units on the bottom lines of the table to illustrate the effect of assuming that each such nucleus was provided with a separate dwelling unit. The effect of varying the allowances for rooms other than bedrooms is shown for households of all types in the two sections at the bottom of the table.

Table AD shows a substantial shift towards the larger room occupations in the actual as compared with the distributions of occupations of hypothesis D: as compared with an average number of rooms per household of 4.24, the hypothetical distribution gave an average of 3.95 if the family nuclei were left out of account altogether or 3.93 if they were accommodated in separate dwellings. The hypothetical figure was higher than the actual figure for those classes of household with heads under age 40 and lower for those with heads over 40.

The table shows that 5.1 million private households in 1951 could have been housed at the standards implied by hypothesis D if each had had a three room dwelling. About a third of these were one person households and about two thirds were married couples*. In fact there were only 2.4 million room occupations of three rooms, 1.4 million of two rooms and under half a million of one room. Even if the requirements of hypothesis D were reduced by regarding the households of one person as adequately housed, at a higher density, in one or two room occupations, the number of three room occupations available for married couples forming two person household units would have been substantially below the number of three room occupations still required. On the general presumption that for each line of the table the larger households on the whole inhabited the larger occupations, the figures suggest that most of this deficiency related to married couples at ages over 40 in two person households, many of which were housed in larger occupations. However, many married couples with heads under 40 and no other person in the household were evidently living in one or two room occupations.

* or units of one person or one married couple in households whose other members consisted of family nuclei.

*Basis of hypotheses

Bedrooms:

one for a married couple
one for each two children of head except where both are aged 5 or over and of opposite sexes
one per household for domestic servants for each household containing one or more
one for each other member of household

Living rooms (other than bedrooms)

Hypothesis D two per household
D(1) one per household of one person; two for each larger household
D(11) one per household of one person and for 50 per cent of larger households: two for the remainder
C one per household

The number of four room occupations was substantially below, and the number of five or more room occupations substantially above, the numbers suggested by hypothesis D. About half the deficiency of four room occupations related to households with married heads under 40, the presumption being that many households with one child in this class were living in three or fewer rooms. The corresponding deficiency for married heads aged 40-59 in occupations of four rooms (and also of three rooms) is more than balanced by surpluses in larger occupations. Most of the excess of actual over hypothetical numbers of five room occupations related to households with married heads aged over 40.

The last section of the table shows that the deficiencies, in actual as compared with hypothesis D numbers, of three and four room occupations are appreciably increased if family nuclei are included as separate units in the hypothetical figures.

In considering the census figures of household occupations of different sizes it needs to be borne in mind that the census figures relate to habitable rooms defined in terms of the use to which they were put. The enumerators' instructions relating to the types of room to be included contain the following:- *".....All rooms in which the household live, eat or sleep, including the kitchen if so used, should be counted, but a scullery (or kitchenette), landing, lobby, closet or bathroom should not normally be included"*. It is thus possible that a good many household occupations, the smaller ones in particular, contained kitchenettes which did not count as habitable rooms and that, for example, many two room occupations contained in addition both a kitchenette and a bathroom. In such circumstances it is perhaps unrealistic to make hypothesis D require every household to have two habitable rooms in addition to bedrooms. One person households in particular will in many cases be adequately housed with only one habitable room in addition to a bedroom. In the two sections at the bottom of Table AD, therefore, the effect is shown of varying the hypothesis D allowance of two living rooms per household.

The application of these various hypotheses, with due emphasis upon the fact that they are not put forward as standards but are only for illustrative purposes, does indicate the extent to which the stock of dwellings existing in 1951 failed to match in shape the general distribution of households with regard to size and composition. On hypothesis D there were both too many small occupations and too many larger occupations and insufficient concentration at the middle of the range. On the modified hypotheses D(i), D(ii), and C the excesses of large occupations were even greater. At the other end of the scale, however, they suggest deficiency in numbers of two and three room occupations. With regard to the excess of large occupations it has to be borne in mind that the hypotheses are related only to adequacy, not to personal desires.

CHAPTER VII: HOUSEHOLDS SHARING DWELLINGS

A feature of the housing situation which has been given more attention in the 1951 Census than in previous censuses is the extent to which private households share with other households in the occupation of structurally separate dwellings. The importance of this aspect arises from the fact that many residential buildings still in use today were designed for larger households of former generations living in very different social conditions. In some cases large houses have been sub-divided to form several structurally separate units each occupied by a single household: the census data do not measure the extent of such sub-division but increases during the present century in numbers of dwellings, and a shift towards smaller dwellings in their size distribution, are in part a reflection of such changes. In other cases large houses previously occupied by a single household have been

adapted for use by more than one household without complete structural separation: the census figures show an increase in numbers of dwellings occupied by two or more households between 1921 and 1931 representing the excess of increases due to such changes in the mode of occupation of dwellings over decreases which are probably due mainly to the demolition or change to industrial or commercial use of houses in multiple occupation; in the 1931-51 period the small decrease in numbers of dwellings in multiple occupation indicates that the balance was reversed. As has been seen in Chapter II there was a decrease between 1931 and 1951 (see Table B on p.xxvi) in the proportion of dwellings of six or more rooms, from 32 to 21 per cent, associated with a decrease of 14 per cent in their numbers.

The sharing of a dwelling by two or more households is one of the more difficult concepts to translate into precise terms for record on a census schedule, and the tabulations of this aspect of the census record must be treated with some reserve, particularly in making comparisons between one census date and another. The *Census 1931, England and Wales, Housing Report* called attention to defects in the 1921 record of sharing households which probably led to some of them being counted as occupying a whole dwelling. This was the first occasion on which dwellings containing more than one household were separately tabulated. The editing and checking of the 1931 returns included comparison with the 1921 record in cases of doubt, and the 1931 figures are probably much more reliable than those of 1921. The instructions given to enumerators in 1951 were prepared in the light of experience of two previous censuses, and the records have been given close scrutiny. No comparison with 1931 records has been possible, however, on account of their total loss in 1941. On the whole it seems justifiable to accept the 1931 and 1951 figures as giving a reasonable indication of the extent of sharing at these two dates and of the broad changes that have taken place in the 1931-51 period; and to accept the 1921 figures as somewhat under-estimating the extent of sharing at that time.

In 1951, 14 per cent of private households were recorded as sharing a dwelling with one or more other private households. Subject to the reservation made above, Tables AE and AF and Table B provide comparison between 1921, 1931 and 1951 for England and Wales as a whole.

Table AE. - Dwellings in Multiple Occupation

England and Wales

	Number of dwellings (thousands)		
	1921	1931	1951
Dwellings occupied by 1 household(s)	7,007	8,284	11,281
2 "	598	660	656
3 "	155	122	98
4 or more "		57	45
Total Dwellings occupied	7,760	9,123	12,080

Table AF. - Households in Multiple Occupations

England and Wales

	1921		1931		1951	
	Number (thousands)	Per cent	Number (thousands)	Per cent	Number (thousands)	Per cent
Households in separate dwellings	7,007	80.2	8,284	80.9	11,281*	86.0
" 2 in a dwelling	1,196	13.7	1,320	12.9	1,311	10.0
" 3 " " "	536	6.1	365	3.6	293	2.2
" 4 or more "			264	2.6	233	1.8
Total households	8,739	100.0	10,233	100.0	13,118	100.0

* This number includes a few households which were enumerated in dwellings which had a part vacant on census night, and for this reason differs from the figure of 11,246 obtained as the difference between all households and households sharing dwellings in Table 2.

The extent of sharing of dwellings by private households, both absolutely and relatively, decreased appreciably in the 1931-51 intercensal period. It is probable that the extent of sharing in 1921 was inflated on account of the abnormal shortage of dwellings which accrued during and immediately after the first world war, and this may account for the fact that the proportion of households sharing was higher in 1921 than in 1931. Nevertheless, despite the inflation, the absolute number increased appreciably. The increases in numbers of households sharing dwellings between 1921 and 1931 took place concurrently with the decrease in family size which had begun to take place about the turn of the century.

The following statements show the extent to which the incidence of sharing was concentrated in the smaller households and the smaller household occupations.

	Number of persons in household						
	All sizes	1	2	3	4	5	6 and over
Households sharing dwellings - number (thousands)	1,872	430	643	433	223	84	59
- percentage of all sharing households	100.0	23.0	34.3	23.2	11.9	4.5	3.1
- percentage sharing among all households of each size	14.3	30.7	17.7	13.1	9.0	6.6	5.7

	Number of rooms in household occupation						
	All sizes	1	2	3	4	5	6 and over
Households sharing dwellings - number (thousands)	1,872	258	605	615	267	82	45
- percentage of all sharing households	100.0	13.8	32.3	32.8	14.3	4.4	2.4
- percentage sharing among all occupations of each size	14.3	73.2	57.1	31.5	7.4	2.0	2.2

Compared with the average figure of 14.3 per cent of sharing households, the proportion sharing was 30.7 per cent among one person households, 73.2 per cent among households occupying one room and 57.1 per cent among those occupying two rooms. 80 per cent of households sharing dwellings were of 1, 2 or 3 persons as compared with 64 per cent of all households.

The following statement compares dwellings occupied by one household with those occupied by more than one and indicates that much of the sharing must have been by households in small room occupations in combination with other households also in small occupations: two thirds of the dwellings occupied by more than one household contained no more than 6 rooms.

Rooms per dwelling	Percentage of occupied dwellings containing	
	one household	2 or more households
1-4	46	11
5-6	48	54
7 or more	6	35
All	100	100

Table AG shows how households of different sizes were accommodated in dwelling occupations of different sizes, and indicates the extent to which households of the same size living in shared dwellings have fewer rooms than those in sole occupation of dwellings. As has been seen, 80 per cent of such households were of 1, 2 or 3 persons.

Among one person households those in shared dwellings, constituting 31 per cent of all one person households, were living at an average density of 0.48 persons per room, more than two thirds of them living in either one

or two rooms. This contrasts with an average density of 0.26 persons per room for one person households in undivided occupations, nearly two thirds of which were living in at least 4 rooms. Of the total of 1.4 million persons living alone, there were in fact 600,000 living in separate dwellings of at least 4 rooms on the one hand, while, on the other hand, nearly 300,000 lived in one or two room occupations in shared dwellings; 364,000 were living in undivided dwellings of 3 or fewer rooms, presumably in most cases in flats or converted houses, and the remaining 134,000 were in occupations of 3 or more rooms in shared dwellings.

Among two person households those in shared dwellings were living at an average density of 0.76 persons per room, 84 per cent of them in occupations of 3 or fewer rooms. Those in undivided occupations had a much lower average density (0.45 persons per room) and only 21 per cent were in occupations with as few as 3 rooms. Of the total of 3.6 million households of two persons, more than half were living in undivided occupation of dwellings of 4 or 5 rooms, and nearly half a million were living in larger undivided dwellings; more than half of the remainder were living in smaller undivided dwellings, but 640 thousand were living in shared dwellings, more than 500 thousand of them in occupations of three or fewer rooms.

Average density for three person households was 0.65 persons per room among those in undivided dwellings as compared with 1.04 among those in

shared dwellings. Three quarters of the three person households in shared dwellings, as compared with only 16 per cent of those in undivided dwellings, were occupying 3 or fewer rooms. Only 13 per cent of the total of 3.3 million households of 3 persons were, however, living in shared dwellings. Nearly two million three person households were living in undivided dwellings of 4 or 5 rooms, and nearly half a million in larger undivided dwellings; over 300,000 were living in shared dwellings in 3 or fewer rooms, but this was smaller than the number (460,000) in undivided dwellings of 3 or fewer rooms.

For occupations of the same size, density for sharing households was little different from density for all households, standardisation of the persons per room ratio by reference to the distribution of all occupations by size in fact reducing the average figure for sharing households from 0.93 persons per room to the figure for all households (0.74). For households with the same number of persons, however, density was considerably higher for sharing households (see Table AG), and standardisation by numbers of persons in households increases the persons per room ratio for sharing households to 1.18.

On the assumption that households of a given size in shared dwellings were distributed by type of head and numbers of designated children in a manner similar to the corresponding distribution for households in undivided dwellings, Appendix Table A.7 enables broad estimates to be made of the numbers of occupations of different sizes which would be needed in order to house them according to given hypotheses about requirements. The tables do not show whether for households of a specific size those which, by virtue of their composition, needed the larger allocations of rooms actually occupied the larger dwelling units. If this was the case there will have been about half a million households in shared dwellings occupying smaller units of accommodation than would have allowed for a living room for each household, a bedroom for each married couple and for each pair of children and a bedroom each for other persons. If, on the other hand, the households were so arranged that the number having fewer rooms than their hypothetical requirements was as great as possible (a most unlikely contingency) the number would have been about 850,000. The former of these two cases is probably not very wide of the mark. Looking at the census evidence as a whole it does not seem unreasonable to suppose that about half a million households in shared dwellings provided their occupants with fewer rooms than the above criteria require. This includes 150,000 one person households living in one room occupations.

Region and other areal variations

Table AH shows the proportion of sharing households (of all sizes) for the regions, aggregates, conurbations and conurbation divisions. The latter areas are included because they illustrate well the comparatively high incidence of sharing in some of the older urban centres.

The most striking feature of Table AH is the high incidence of sharing in many areas whose houses were built for former generations and which are too large for single occupation under present day conditions, and the low incidence in the more recently developed areas. For example the highest figure of all in Table AH, 53.7 per cent for Division III of the Greater London conurbation, relates to an area containing many solid and substantial properties which have been extensively sub-divided or adapted for occupation by several households - notably in parts of Kensington, Paddington, Islington and Hammersmith. The Metropolitan area has an exceptionally high incidence of sharing of dwellings. The high incidence of sharing indicated by the figure of 21.7 per cent for the conurbation aggregate is seen to be due entirely to the exceptional proportion of 34.2 per cent for Greater London; the incidence in each of the other conurbations was below that for the aggregate of the largest urban areas outside conurbations. The density aggregate section of Table AH shows a steep gradient, however, in the incidence of sharing outside the conurbations, from 16.9 per cent for urban areas with more than 100,000 population, to 3.9 per cent for rural areas.

(a) See notes on p.xii.

The regional differences show the higher incidence of sharing in the south of England and in Wales as compared with the north. Some of this difference will be due to the generally larger dwellings in the south than in the north, but regional variations in size of household probably account for part of it. The smaller incidence of sharing in the most central divisions of three of the conurbations as compared with the divisions adjacent to them is probably due largely to the fact that the expansion of the commercial and industrial centres of large urban areas involves the replacement of residential by non-residential building and the transfer to non-residential uses of buildings designed as residences. Both these processes are likely to reduce the volume and proportion of dwellings of obsolete size.

Further characteristics of sharing of dwellings

Special study of selected areas

The discussion in this chapter has demonstrated the difference between the accommodation of households sharing dwellings, and that of households in undivided occupations. It still remains to answer such questions as the following: Are the one person households in shared dwellings sharing with other small households or are they living as lodgers in dwellings containing larger family households? Are the sets of rooms occupied by two households sharing the same dwelling reasonably equal in size or does one household occupy most of the rooms, the other being in a subsidiary position and occupying only one or two rooms? To what extent are elderly persons, living alone, living in shared dwellings? To what extent do

different types of combination of sharing households provide for each to have exclusive use of domestic arrangements? A special study of the 1951 census records, covering six areas in four of which the incidence of sharing was high, has been made to throw light on these questions and is described below. It is based on the fact that the arrangements made to analyse the census record so as to provide the tabulations of dwellings by numbers of households contained in them, and of households according to whether they occupied the whole or a part of a dwelling, enabled the census schedules of households occupying the same dwelling to be grouped together. The tabulations in Appendix D give the main results of this study.

The areas covered in this special study

The enquiry was limited to six areas chosen arbitrarily with the object of illustrating different types of sharing. No attempt has been made to obtain inferences applicable to the country as a whole, nor was any preliminary examination made to test directly whether the incidence of sharing which has been found in these areas is in any sense representative. The six areas chosen are wards or groups of wards which each contained about 500 dwellings shared by more than one household. They are identified in the following notes which also set out briefly the reasons for their choice:-

1. **Burton upon Trent C.B., Staffordshire - entire.**

Chosen to illustrate conditions in a medium sized fairly self-contained industrial town. The incidence of shared dwellings was not very high and was spread fairly evenly over its eight wards. Conditions contrast with those of Slough.

2. **Ruislip Northwood U.D., Middlesex - entire.**

Chosen to illustrate sharing in a modern suburban area. Ruislip Northwood is the local authority area wholly in Division V of the Greater London conurbation with the lowest average number of households per occupied dwelling.

3. **Paddington Met. B. - part of Westbourne Ward**

Chosen to illustrate conditions in an old densely populated area with a high average number of households per dwelling, and with a high proportion of one person households. The area selected was part of the ward with the highest ratio of households to occupied dwellings (2.67) in the Metropolitan Borough with the highest such ratio (1.91). Paddington is also the only Metropolitan Borough (apart from Westminster) with more than twice as many dwellings with three or more households as with two households.

4. **Poplar Met. B. - group of wards with average number of households per occupied dwelling less than 1.1.**

Chosen to illustrate conditions in central London contrasting with those in Westbourne Ward, Paddington. Poplar is the Metropolitan Borough with the lowest proportion of dwellings with three or more households, among dwellings with two or more. It had a comparatively low average number of households per occupied dwelling in 1951. The proportion of one person households in Poplar was close to the national figure.

5. **Richmond M.B., Surrey - Wards No. 2 St. Lukes, No. 5 Town and No. 8 Park.**

Chosen to illustrate sharing in a residential area which contains a high proportion of retired persons. Richmond is the local authority area in Division V of the Greater London conurbation with the highest proportion of one person households. It also had a high average number of households per dwelling as compared with most areas wholly within Division V.

6. Slough M.B., Buckinghamshire - every second ward chosen from an alphabetical list.

Chosen to illustrate conditions in an expanding industrial area.

In this study of sharing households in combination, rooms shared by more than one household are shown specifically in Table D.1 by the device of attributing equal proportions of any shared room to each of the households recorded as sharing it; and in Tables D.2 - D.5 such rooms have been attributed, by a convention, to one of the sharing households. This treatment is not in accordance with the treatment of shared rooms in the main census tabulations (see explanatory note on p.xvi), which are concerned with the aggregates of households sharing dwellings irrespective of the combinations sharing the same dwelling. For the purpose of the main tabulations the general view was taken that such rooms, though qualifying to be counted as habitable rooms on the census definition, were probably used less fully by each household than the rooms they occupied exclusively (except in the comparatively small numbers of cases of two or more households with only one room among them). No attempt was made to measure the effect of using the conventions adopted since an overall measure of a characteristic affecting certain types of area only would be of little value.

Table D.1 shows that, except in Paddington and Richmond, almost all the shared dwellings in the specified areas contained 2 households. In the Richmond wards, however, the number with 3 or more households constituted over 40 per cent of the shared dwellings, and in the Paddington ward it constituted over 80 per cent.

In the selected areas of Burton upon Trent, Slough and Ruislip Northwood the most common combination was of a two room occupation and a three room occupation in a five room dwelling: the dwellings divided in this way constituted 35, 29 and 24 per cent of all shared dwellings in these three areas respectively. In the Poplar area the most common combinations were found in six room dwellings, 36 per cent of shared dwellings containing two three room occupations and a further 22 per cent containing one four room occupation and one two room occupation. In the Richmond area there was less concentration of sharing in dwellings of 5 and 6 rooms although the most common types in a wide range of combinations were in fact of a three and a two room occupation in a five room dwelling and two three room occupations in a six room dwelling. These types of combination constituted only 8 and 9 per cent respectively of all shared dwellings in the Richmond area. The dominant feature in this area is that the dwellings shared were large; 45 per cent were of 8 or more rooms; about a quarter of the latter each contained 3 households occupying 2, 3 or 4 rooms apiece. Among dwellings containing two households, in three of the areas, considerable numbers contained households sharing a room: at least 156 (29 per cent) in the Slough area, at least 103 (19 per cent) in Ruislip Northwood and at least 89 (20 per cent) in Burton. Such sharing of rooms (possibly in most cases the kitchen) is evidently a not inconsiderable feature of the sharing of dwellings in some areas.

Among dwellings containing two households the rooms available were divided fairly equally between the constituent households in the majority of cases: in each of the five areas differences of more than one room were found in fewer than half of these combinations.

Table D.1 illustrates the very different conditions of sharing in the selected area of Paddington, where the most commonly occurring combination of households was of three three room occupations in a nine room dwelling. 13 per cent of all the shared dwellings in this area were of this type. Also in this area there were considerable numbers of one and two room occupations in dwellings containing three or more households. A high degree of multiplicity of occupation is illustrated by the fact that 13 per cent of all shared dwellings each contained at least five one room occupations.

For ease of presentation of the material Tables D.2 and D.3 cover the five areas other than the Paddington area and treat only the dwellings containing two households. The Paddington area was specially chosen to provide information about dwellings containing 3 or more households and Tables D.4 and D.5 illustrate the conditions found in these dwellings.

Households in Dwellings containing Two Households

Table D.2 shows the number of pairs of sharing households in combination according to five characteristics, viz. (1) number of rooms occupied, (2) age and marital condition of head of household, (3) size of household, (4) social class of head of household, (5) number of children in household. The first relates only to the dwelling space occupied while the others are concerned with the persons contained in the household. The factors affecting the distributions by the first relating to dwelling space (rooms) are different in some respects from those determining the distributions by the remaining four household characteristics. The total of the dwelling spaces available for individual sharing households within a given dwelling must equal the number of rooms in the dwelling and only the relative numbers of rooms in each part can vary. Constraints of this sort do not operate so rigidly on the occupying households, since households of a given type may occupy varying types of habitation, and a given household may not remain in a particular habitation for a long period, especially if this is part of a shared dwelling. Moreover a household occupying accommodation in a shared dwelling may have chosen it by consideration of its other occupants as well as of its structural and other attributes, and a landlord considering a prospective tenant for accommodation in a shared dwelling may take into account the nature of his household in relation to households already living there. It may also be remarked that the general amenities and character of localities containing shared dwellings will indirectly influence the pairing of households of different types, since particular districts attract certain types of household more than others. The method of analysis of the material, however, has been designed in such a way as to separate the effects of factors which determine these characteristics of sharing as distinct from non-sharing households, from factors (with which this examination is primarily concerned) which determine their combinations in pairs of sharing households. It should be stressed that the five characteristics which are discussed in the following sections are not independent, but it has nevertheless been thought useful to show the actual patterns of combination without attempting to demonstrate the separate influences of each.

The distribution of rooms. In the first section of Table D.2 the pairs of sharing households in combination are analysed by the numbers of rooms each occupied. This section of the table represents a re-statement in a different form of those parts of Table D.1 which show dwellings containing two households. Table AJ analyses these classes to exhibit the differences between the areas in this respect.

The figures in column (a) of Table AJ represent for each area the total numbers of paired households, and these are expressed as percentage distributions along the "All sizes" lines. The percentage in columns (c) and (d) of the "All sizes" lines show that the majority of households sharing dwellings in pairs were living in either 2 or 3 rooms: 79 per cent for Burton upon Trent, 75 per cent both for the Poplar and the Slough area, 74 per cent for Ruislip Northwood and 57 per cent for the Richmond area. Looking along the lines of the table which relate to two room and three room occupations as one part of the combination, relatively high figures are seen in columns (c) and (d), i.e., for two or three rooms in the other occupation. Thus a large proportion of sharing households in each of these areas were in dwellings of 4, 5 or 6 rooms, the available rooms being fairly evenly divided between the constituent households; the proportion of four room occupations combined with three room occupations, however, was small, this being probably due to the relatively small numbers of seven room dwellings in the areas. Many of the exceptional figures in these distributions, for example 48 per cent of two room occupations combined

All sizes	1,094	10	39	36	12	3

with four room occupations in the Poplar area, and the relative size of the figures for columns (c) and (d), are probably due to differences between the areas in the size distribution of the stock of dwellings in which sharing is likely to occur. The higher figures for the Richmond area for combinations of 2 - 4 rooms with 4 or more rooms reflect the higher incidence of larger houses in such a residential area and the fact that a significant number were split between only two households.

Age and Marital Condition of Heads of Sharing Households. The second section of Table D.2 analyses pairs of sharing households in combination according to the age and marital condition of their heads. In all except the Richmond area between a third and a half of all the households sharing dwellings in pairs had a married head under 40 years old. Such households were most commonly found sharing with a household with a married head in the under 40 or 40-59 age-group. About half of them were in these types of combination in each of the areas, as Table AK shows. This table also shows that comparatively few of these households with young married heads were sharing with households with single heads, the proportions being no higher than 5 per cent in Burton upon Trent and in the Poplar and Slough areas. The corresponding percentage for the Richmond area, however, is 19, and is doubtless associated with the high proportion of one person households in Richmond M.B. taken as a whole. The proportion of households

Table AK. - Sharing households with head married
under 40 by type of household
sharing the same dwelling

(Five
Selected
Areas

	Total number of households	Percentage of households with head married and under 40 sharing with households with head:					
		Married			Widowed and divorced		Single
		under 40	40-59	60 and over	under 60	60 and over	
	a	b	c	d	e	f	g
Burton upon Trent	457	31	26	15	8	15	5
Ruislip Northwood	403	24	26	15	9	15	11
Poplar - selected wards	436	22	25	20	8	21	4
Richmond - " "	124	19	28	15	7	12	19
Slough - " "	494	35	27	12	9	12	5

with married or widowed and divorced heads aged 60 and over sharing with households with young (under 40) married heads was comparatively high in the Poplar area, and the proportion of households with a young married head sharing with another in the same class was high in Burton upon Trent and in the Slough area.

In spite of these differences between the 5 areas, and the very different levels of sharing, the pattern of sharing shows many common features, especially for the four areas other than Richmond. Further aspects in this pattern are illustrated by Table AL in which the figures for these four areas are aggregated.

Table AL. - Households in combination by Ages
and Marital Conditions of Heads

(Aggregate of
four Selected Areas

	Percentage distributions of households with heads as in col. (a) according to households sharing the same dwelling with heads as follows:-							
	Total	Married			Widowed and divorced		Single	
		under 40	40-59	60 and over	under 60	60 and over	under 60	60 and over
a	b	c	d	e	f	g	h	j
Total	100	41	22	10	6	13	5	3
Married and aged under 40	100	29	26	15	8	16	4	2
40-59	100	50	17	7	5	13	6	2
60 and over	100	61	14	6	5	8	3	3
Widowed and divorced and aged under 60	100	54	16	8	7	5	8	2
60 and over	100	50	23	6	3	9	6	3
Single and aged under 60	100	33	27	6	10	14	6	4
60 and over	100	33	15	12	5	18	8	9

In this group of areas two fifths of all sharing households were households with married heads under 40 years of age. Among them, 29 per cent were sharing with another household with a married head under 40, 26 per cent with a household with a married head in the 40-59 age-group, and 15 per cent with a household with a married head in the 60 and over age-group; 16 per cent were sharing with a household with a widowed or divorced head aged 60 or over. It is noteworthy that among households with married heads in each of the two older age-groups and among those with widowed and divorced heads, both in the under 60 and in the 60 and over group, at least half were sharing with households with young married heads (the percentages were 50, 61, 54 and 50 respectively). The distributions call to mind the analysis of primary family unit and family nucleus sections of the same household discussed in Chapter III, where it was shown that a high proportion of family nuclei contained a married son or daughter of the head of household. Table AL is consistent with the hypothesis that an appreciable amount of sharing of dwellings is by pairs of

households of which one contains a married son or daughter of the head of the other. A perusal of a number of enumeration books supports this hypothesis in that the same surname sometimes occurs in each of two households occupying the same dwelling.

The Size of Sharing Households. The third section of Table D.2 analyses pairs of sharing households in combination according to size of household. Among households of each size in each area Table AM gives percentage distributions by the size of the other household in the combination. This arrangement of the data demonstrates that in all five areas the general pattern was naturally governed largely by the size distribution of the whole group of households choosing or compelled to share dwellings in pairs in each area, and correlation between size of household and number of rooms sought; though, correlation being less than complete, there is less rigidity than in the room allocations of the first section of the table. In all five areas more of the sharing households were of two persons than of any other size, the proportion being lowest for the Poplar area (32 per cent) and highest for Ruislip Northwood (42 per cent). In all the areas about six out of every ten of the two person households were sharing with a household of either two or three persons. The high proportion of 29 per cent of one person households in Richmond, nearly half of which (47 per cent) were sharing with another one person household, is outstanding. In Ruislip Northwood there was a tendency for three person households to share with another household of the same size or of two persons rather than with a small household of one person or a large household of 4 or more persons. In the Slough area there was a tendency for two person and three person households to be associated. In both these latter cases, however, the variations from the general pattern were comparatively small.

Social Class of Heads of Sharing Households. The fourth section of Table D.2 analyses pairs of sharing households in combination according to the Social Class of their heads and Table AN sets out this data in the form of distributions of each Social Class group according to the Social Class of the head of the household with which each was sharing. It might be expected that households in shared dwellings would include lower than average proportions of persons in the higher Social Classes. Richmond, however, contains many dwellings which attract retired people and Ruislip Northwood is a modern residential area in the outer part of Greater London. In the local authority areas which contain the sharing households of this present examination the percentages of occupied and retired males in Social Classes I and II were: Burton upon Trent 12.5, Ruislip Northwood 32.6, Poplar 7.5, Richmond 30.7, Slough 16.5. These figures compare with 17.8 for England and Wales. Although the shared dwellings in the selected parts of these areas comprise only a proportion of their total dwelling accommodation these figures provide a background for the more limited data for the selected parts which provides comparisons in terms of the Social Class of the head of household. Among the paired households sharing dwellings in the selected areas the percentages with heads in Social Class I or II were Burton upon Trent 9, Ruislip Northwood 18, Poplar area 5, Richmond area 25, Slough area 11, and they compare with 19 per cent for all private households of England and Wales. In each of the areas the pattern of distribution in columns (b) to (f) of Table AN for each line of the table, suggests that social class is not by any means the sole determinant of combinations of households sharing the same dwelling although among households with heads in Social Class I or II the proportions sharing with another household of the same type were considerably higher than those sharing with households having heads in Social Class V (except in Poplar). Conversely among households with heads in Social Class V the proportions sharing with a household with a head also in Social Class V were considerably greater than those sharing with heads in Social Class I (except in Richmond). It is to be noted that no casual relationships are to be inferred from these associations since there will be some tendency for households living near together to be in similar social classes whether or not they share the same dwelling*.

* A test carried out by a rearrangement of the households sharing dwellings in the Poplar area suggests that the strength of the association for pairs of households living near together but not in the same dwelling is very similar to that for the pairs sharing the same dwelling.

The data in this section of Table D.2 can be rearranged to show the relative numbers of pairs of sharing households with heads in the same Social Class, in adjacent classes, or differing by 2, 3 or 4 classes. Since the relative frequencies with which the possible combinations occur are limited by the relative numbers of households in total in the different Social Class groups, Table AO compares the actual distribution for each area with a hypothetical distribution obtained by assuming that for the households in each Social Class (irrespective of that class), the households with which they share are distributed by Social Class in the same manner as the total households in the area selected - i.e. by assuming that for each area the percentage distributions in Table AN for each line are the same as that for the total line. Only to the extent that these actual and hypothetical distributions differ does the data indicate correlation between the social classes of the heads of sharing households.

Table AO. - Differences in Social Class of heads of paired sharing households

(Five
Selected
Areas)

Type of combination of heads of sharing households	Percentage of pairs of households sharing the same dwelling with heads in Social Classes as specified in column (a) - (i) actual, (ii) hypothetical (see text)									
	Burton upon Trent		Ruislip Northwood		Poplar area		Richmond area		Slough area	
	1	11	1	11	1	11	1	11	1	11
a	b	c	d	e	f	g	h	j	k	l
All	100	100	100	100	100	100	100	100	100	100
In the same Social Class	39	35	43	40	38	33	40	33	45	41
Differing by 1 Social Class	36	33	36	36	29	31	39	41	33	33
" " 2 " Classes	22	27	18	19	30	32	18	19	20	23
" " 3 " "	3	4	3	4	3	4	4	6	2	3
" " 4 " "	0	1	-	1	-	0	1	1	0	0

The proportion of pairs of households with heads in the same Social Class or in social classes differing only by one was slightly above expectation (as represented by the hypothetical figures) in all areas. In the Richmond area there was a rather greater tendency for sharing households to be of identical Social Classes. None of the differences is large however and this presentation confirms the impression that social class discrimination is only one of several factors including the availability of suitable accommodation and family relationships. With regard to the latter, mere differences in age and length of career would operate to promote differences in occupational grading between the older head of one household and a son or son-in-law head of another sharing the same dwelling.

It is necessary to emphasise again that some degree of association between the social classes of sharing households will arise from their living in the same locality quite apart from their occupying the same dwelling.

Numbers of children in Sharing Households. The last section of Table D.2 analyses pairs of sharing households in combination according to the numbers of children (of all ages) of the head of household. Table AP analyses this data in a manner similar to that of the previous sections. In Burton upon Trent, the Poplar area and the Slough area about 50 per cent of all the sharing households were households containing no children of the head; in the Richmond area and Ruislip Northwood the corresponding proportions were 67 and 63 per cent respectively. The proportions with two or more children were comparatively small, the highest being 23 per cent for Burton upon Trent. The figures do not suggest much tendency for households with children (of head) to share with other households with children, or for childless households to pair, except as may be determined by the relative availability of households of the two types as indicated by the last line

Table AP. - Households sharing dwellings in

of each area section in the table. In Burton upon Trent the proportion of 54 per cent of households with no children sharing with another similar household was appreciably higher than that of 44 per cent of households with 2 or more children sharing with households with no children; but the differences in the other areas were much smaller.

Density of Occupation and Household Arrangements. In Table D.3 households in the five areas are analysed according to household size, density of occupation and availability of household arrangements, separate figures being given for combinations by size of occupation (rooms) and for combinations by age and marital condition of heads. Tables AQ and AR, derived from Table D.3, show indices relating to these characteristics. The object of Table AQ is to test whether in a specified area the indices for a given sized occupation varied according to the size of the other occupation in the same dwelling. The figures show such variations to have been small. They provide no evidence that the number of persons in, or the density of occupation (persons per room) of, households occupying a given number of rooms is higher (or lower) according to the number of rooms occupied in the rest of the shared dwelling by the other household. Some differences in the indices relating to the availability of the household arrangements were, however, appreciable. Households living in three rooms were more commonly found without exclusive use of the arrangements when the other household was living in one or two rooms than when the other household was in a larger occupation. These differences indicate the greater extent to which large dwellings will have been built with or have been modified to provide sufficient taps and waterclosets for two households to have exclusive use of such facilities. Such differences were particularly large in respect of cooking stoves. In Richmond and Poplar the proportions without exclusive use of a cooking stove among households in three or more rooms sharing with households in equally large occupations, were comparatively small.

Table AR provides an analysis comparable with that of Table AQ in a classification of households by the age and marital condition of their heads. There is some suggestion in Burton upon Trent and the Richmond and Slough areas that households with married heads (especially younger ones) tended to be slightly larger when sharing with a household with a married head in the under 40 age-group than when in combination with other classes of household. Among households with heads in a given marital condition class there were no appreciable differences between persons per room ratios according to the class of household in the remainder of the shared dwelling. As in the classification of Table AQ the most noticeable variations were in the indices representing availability of household arrangements. Households with married heads under 40 evidently claimed a less than equal share of the arrangements available in the dwelling when sharing with a household with an older married head. The differences in this respect were appreciable for Burton upon Trent, Ruislip Northwood and the Slough area. The figures for the other two areas were not reliable enough to show whether the same differentials also pertained there. Since the distribution of households in this classification gives comparatively small numbers in many of the classes in individual areas, Table AS provides indices based on the amalgamated figures for the four areas exclusive of the Richmond area to show relative differences, between the different classes of combination of household, in the availability of piped water and waterclosets. (The Richmond area has been omitted from this aggregation on account of its

considerably higher absolute level of provision of these arrangements.) It also shows some appreciable differences in the size of dwelling occupied by different combinations of household types.

Table AS. - Indices of relative non-availability of piped water and waterclosets, in different classes of sharing household, and comparison with size of dwelling

(Aggregate of four selected areas)

Notes:- (1) The figures are derived from those for Burton upon Trent, Ruislip Northwood, and the selected areas of Poplar and Slough.
(2) The indices were constructed as follows: (1) for each of the four areas the percentage "without exclusive use" for each group of households specified in col. (b) was expressed as a ratio of the corresponding percentage for all sharing households, (2) the ratios obtained in (1) for each were weighted by the number of households in the specified group in that area to give an average ratio for that group for all four areas combined.

Number of pairs of households in combinations shown in col. (c)	Average number of rooms per dwelling	Type of head of households in each pair sharing the same dwelling	Index of relative non-availability	
			Piped Water	Water-closet
a	b	c	d	e
2,167	5.46	All types	1.00	1.00
256	5.46	(Married aged under 40) (Married aged under 40)	0.95	1.00
737	5.45	(Married aged under 40) (Married aged 40 and over)	1.06 1.01	1.09 0.99
158	5.73	(Married aged 40 and over) (Married aged 40 and over)	0.86	0.83
224	5.23	(Married aged under 40) (Non-married aged under 60)	1.07 1.09	1.09 1.08
317	5.42	(Married aged under 40) (Non-married aged 60 and over)	1.04 1.00	1.08 0.99
140	5.76	(Married aged 40 and over) (Non-married aged under 60)	0.96 1.04	0.89 0.96
191	5.70	(Married aged 40 and over) (Non-married aged 60 and over)	0.86 0.91	0.89 0.96
36	4.97	(Non-married aged under 60) (Non-married aged under 60)	0.98	0.86
60	5.05	(Non-married aged under 60) (Non-married aged 60 and over)	1.09 0.99	1.08 1.04
48	5.21	(Non-married aged 60 and over) (Non-married aged 60 and over)	1.04	0.91

Table AS does not show any appreciable differences on the average, in availability of piped water or waterclosets, between the two component households in any given combination by class of head; but by differences in levels of availability more or less common to both component households indicates that there must be some appreciable differences in the amount of equipment in the types of dwelling shared by different types of combination: for instance the dwellings shared by a household with a married head aged 40 or over and one with a non-married head aged 60 or over evidently had more taps and waterclosets than dwellings shared by a household with a younger married head and one with a non-married head aged under 60; and the dwellings containing one household with a married head aged 40 or over and one with a non-married head aged 60 or over evidently had more taps and waterclosets than those shared by a household with a married head aged 40 and over and one with a married head in the under 40 age-group. Comparison between the figures for piped water and waterclosets in this table on the one hand, and the column which indicates size of dwelling, indicates that, as might be expected, the dwellings which had more taps and waterclosets were in general the larger dwellings.

Households in Dwellings containing Three or more Households

Table D.4 contains a rearrangement of the data of Table D.1 for dwellings containing three or more households in part of Westbourne Ward of Paddington. It also shows the numbers of non-married persons living alone, distinguishing persons under age 60 from those aged 60 or over, in the classes of dwelling by size and numbers of households contained.

There were 548 dwellings in this area containing at least three households. They contained altogether 2,567 households, more than a third of which were each occupying one room. Most of the remainder were each occupying 2 or 3 rooms. Nearly 900 non-married persons living alone were included among these households, nearly two thirds of them being aged under 60 and nearly a third males. 28 per cent of all these dwellings contained more households than could be given 2 rooms apiece if the accommodation were divided among them as equally as possible in terms of numbers of rooms; 42 per cent of the 2,567 households were contained in these dwellings; 78 per cent of the households comprising one person aged under 60 and 53 per cent of those comprising one aged 60 or over were contained in them.

Table AT. - Housing indices for households in dwellings containing three or more households (Part of Westbourne Ward of Paddington Met. B.)

Note:- Indices based on households numbering 20 but under 50 are printed in italics. Indices based on fewer than 20 households are omitted.

Rooms in dwelling	Households in dwelling	Number of households	Persons per Room among households occupying rooms as follows:-					Piped water - percentage of households without exclusive use, among households occupying rooms as follows:-					Watercloset - percentage of households without exclusive use, among households occupying rooms as follows:-

Table D.5 analyses the households in dwellings containing three or more households to show five of the six items of information given in Table D.3 for households in dwellings containing two households. Table AT gives indices relating to these characteristics similar to those given in Table AQ. For occupations of a given number of rooms there were no differences of consequence in the persons per room ratios as between the various types of clusters of households in different sizes of dwelling. In regard to the two household arrangements specified in this table the proportions "without exclusive use" were considerably higher for households in those dwellings shared so as to give, on average, 2 or fewer rooms per household, than in dwellings less densely occupied. In so far as the figures for households occupying each specified number of rooms have significance they indicate the same tendency. Generally speaking the households which most commonly had exclusive use of piped water and watercloset were households occupying 3 or more rooms in dwellings of 8 or more rooms. These constituted about one third of the total of 2,567 households in dwellings containing three or more households.

CHAPTER VIII: HOUSEHOLD ARRANGEMENTS

The 1951 census schedule contained questions about certain domestic arrangements of the dwelling accommodation of private households. The following extracts from the schedule show the form in which the questions were put to the head of household.

T	Household Arrangements for Water Supply, Cooking, etc. In each space below (see Instructions 8 to 12) write "E" if in the exclusive use of this household; write "S" if shared with another household; or write "None", as the case may be.			
Piped water supply within the house	Cooking Stove or Range	Kitchen Sink	Water Closet	Fixed Bath

Extract from Instructions to heads of households:

Household Arrangements: Panel T

8. **Piped water supply within the house** means water laid on either from the mains or from a storage tank, if the tap can be reached without leaving the shelter of the building or an attached covered structure. It does not include a tap in the open yard or a public standpipe.

9. **Cooking Stove or Range** means any cooking stove, kitchen range, or other fixed grate using gas, electricity or any other fuel, provided there is an oven. One or more gas-rings, hotplates or portable electric ovens are not by themselves enough to be called a cooking stove or range.

10. **Kitchen Sink** means a sink inside the building, whether in a kitchen or not, with a drain pipe leading outside the building, and normally used for washing up, etc. It need not have water piped to it. It does not include a wash basin designed for personal toilet.

11. **Watercloset** here means a watercloset flushed by water, either from a cistern or by hand, and emptying into a main sewer, septic tank or cesspool. It does not include a chemical closet or earth closet.

12. **Fixed Bath** means a bath permanently installed and connected with a waste pipe leading outside the building. It does not matter for this purpose whether there is water piped to it, or whether the room where it is installed is used only as a bathroom or not.

EXAMPLE

For a household with the exclusive use of a gas cooker, a kitchen sink without a tap, and a watercloset, but drawing water from an inside tap used also by another household, and having no fixed bath, the entries would be:-

Piped water supply within the house	Cooking Stove or Range	Kitchen Sink	Water Closet	Fixed Bath
S	E	E	E	None

This is the first occasion on which a question of this kind has been asked in this country in a census and in framing it two alternative types of enquiry were considered, viz., (i) to examine the extent to which dwellings were fitted with the specified arrangements and (ii) to examine the availability of these arrangements to households. The data for the first type of examination would have been obtained and entered in the enumeration book by the census enumerator as a result of questions put by him to the household, and would have yielded tabulations in the form "Dwellings containing fixed bath(s)". Data for the second type of examination, on the other hand, could be derived from answers given on the schedules by the head of household (without necessarily requiring assistance from the enumerator) and would yield tabulations in the form "Households having exclusive use of, or sharing, or entirely without access to, a fixed bath".

It will be readily appreciated that these two forms of enquiry yield quite different results in respect of households sharing dwellings.

The decision to use the second form of enquiry was made mainly on the ground that in a population census the household, rather than the dwelling or household occupation, is the more fundamental unit to which housing conditions must be related. On grounds of economy the head of the household rather than the enumerator was required to supply the information: the inclusion of extra questions to be dealt with by the enumerator would have been a costly increase in the load of work which he was required to do in addition to his main job of delivering schedules to households and collecting them when completed. In the event the question asked has proved a difficult one for heads of households to answer and there is evidence to suggest that on occasion genuine misunderstanding gave rise to misstatement.

The difficulties encountered in completing this part of the census schedule appear to fall under two heads: on the one hand, the evidence suggests that there was a not unexpected element of uncertainty as to the precise application to individual circumstances of the necessarily rigid definitions of the arrangements; on the other hand, there was some inconsistency among the heads of households sharing the same dwelling as to the extent to which they claimed to share a household arrangement. Since much of the evidence is indirect, i.e., of internal inconsistency in related census schedules, it is not possible to identify all the types of errors of interpretation which may have occurred, nor to measure their incidence. Some discussion of this question will be included in the *Census 1951. England and Wales, General Report*. The general view is taken that the tabulations of the availability of household arrangements give a broadly accurate picture of the conditions in different types of household living in different types of household occupation, and of areal variations. Where arrangements were entirely lacking the census records are probably comparatively free from misinterpretation. Figures for areas with little sharing of dwellings by more than one household are probably more reliable than those for areas in which shared dwellings were more common. Figures relating to infrequently occurring combinations of the availability of one arrangement and the lack of another should perhaps be treated as having an additional element of unreliability apart from their being subject to the chance fluctuations of small numbers.

It is perhaps worth emphasizing that the question about piped water relates to the existence of a tap (connected to the mains or to a storage tank) which could be reached by the household without leaving the shelter of the building containing the rooms occupied by it or of an attached covered structure. If such a tap was for the exclusive use of a household, then that household should have reported "exclusive use of piped water"; if such a tap was in the building (or in an attached covered structure) and was shared by more than one household, each of the households so sharing it (and not having access to another tap which was for their exclusive use) should have reported "sharing piped water" whether or not the tap was in their part of the building. The sharing of piped water in this sense may thus occur not only where several households share the same dwelling but where several structurally separate dwellings are contained in the same building. The definitions of cooking stove, kitchen sink, water-closet and fixed bath likewise do not specify that these items of equipment must be within the structurally separate dwelling (though the kitchen sink must be in the building). This lack of restriction to the dwelling as distinct from the building may account for a certain number of households recorded as occupying a whole dwelling but sharing these arrangements - conditions which can be envisaged in certain types of "converted" dwellings and in certain modern blocks containing small flats.

It should be noted also that the definition of a cooking stove required an oven to be comprised within it. It was intended to exclude mere gas rings and similar devices.

The distribution of private households in 1951, according to the availability to them of the specified household arrangements, is affected by the varying standards of house building which have existed at different periods since the early part of the nineteenth century, and by the social and economic circumstances in which standards have not only been rising but in which also many houses have been converted and adapted for uses other than those for which they were originally built. Many of the dwellings built in the early days of industrial expansion are still inhabited, being concentrated in the older centres of industrial towns. Such houses were built before modern ideas of sanitation had been accepted. Although numerous non-legislative arrangements were in force during the first half of the century, it was not until the Public Health Act of 1848 and the Metropolitan Commission of Sewers Act of the same year were passed that it became unlawful throughout England and Wales to erect a house without drains, or without either a water closet or a privy or an ashpit conforming to specific requirements as to doors, etc. The Sanitary Acts passed during the following twenty five years enabled local authorities to construct sewers and make provision for water supplies and much progress was made in implementing this legislation before the end of the century. Development of new water supplies to meet the needs of the expanding populations of many urban areas also took place during this period. The provision of bathrooms in newly built houses became customary during the early part of the present century, and most of the houses which have been built by local authorities since the end of the first world war contain bathrooms. The very wide areal variations in the availability to households of the domestic arrangements specified in the questions on the 1951 census schedule reflect in part the standards current at the times when different areas were developed, in part the effects of later modernisation of dwellings, and in part the effects of conversion or adaptation of dwellings built for a single household to use by two or more households.

Table 11 summarises the answers to this part of the 1951 Census enquiry. The table distinguishes households of different sizes and households occupying different numbers of rooms and shows separate figures for households in undivided occupations and for households in shared dwellings. The latter distinction is clearly very relevant to this subject but introduces an extra element of uncertainty into the meaning of the figures for certain classes of household owing to the difficulties, referred to in a previous chapter, of determining in marginal cases whether or not the dwelling accommodation inhabited by a household constituted the whole or only a part of a structurally separate dwelling. The figures for one room occupations in single household dwellings are most vulnerable since these households are a relatively small group and comprise only a small proportion of all one room occupations. Those for households in 6 or more rooms in shared dwellings may likewise be unreliable. Nevertheless hazards of this kind which are inevitably incurred by all census innovations do not prevent the statistics from demonstrating very large differences between the different classes of household both in the incidence of sharing and in the incidence of being entirely without the specified arrangements.

In England and Wales as a whole 52 per cent of households were recorded as having exclusive use of all five arrangements and a further 19 per cent had all except a fixed bath. 86 per cent of households had exclusive use of both a cooking stove and a kitchen sink, i.e. of the main items of equipment of a kitchen or scullery. The combination "sink S or N and watercloset S or N", which was made a unit of tabulation to provide an index of serious deficiency in domestic arrangements concerned with hygiene, was found in as many as 11 per cent of households. Considering the arrangements separately the percentages of households "without exclusive use" were: piped water 20, cooking stove 7, kitchen sink 12, watercloset 21, fixed bath 45. Comparatively few of those without exclusive use of a bath shared one with another household. The high figures for households entirely without baths reflect the fact that a large number of the present stock of houses in the country were built before it was customary to instal this amenity.

The larger the number of rooms in the unit of accommodation the more complete was the provision of all the arrangements: among households in undivided occupations 61 per cent of those occupying 4-5 rooms as compared with 16 per cent of those occupying one room had exclusive use of all five arrangements; among households in shared dwellings 18 per cent of those occupying 4-5 rooms as compared with 3 per cent of those occupying one room had exclusive use of all five arrangements. Since the larger units of accommodation are in general occupied by the larger households this implies that lack of availability of arrangements, for both sharing and non-sharing households, was more concentrated among the smaller households and therefore affected a slightly smaller proportion of population than of households. For sharing and non-sharing households combined the tables show the availability of arrangements to households containing different numbers of persons: 60 per cent of households of 4 or more persons as compared with only 30 per cent of those of one person had exclusive use of all the specified arrangements; about 55 per cent of population, as compared with 52 per cent of households, were in households with exclusive use of all the arrangements.

Table AU shows the very large differences between the provision of domestic arrangements in households in single occupations and those in shared dwellings. As is to be expected the incidence of sharing of arrangements was concentrated among households sharing dwellings. 59 per cent of households in undivided dwellings as compared with only 10 per cent of those in shared dwellings had exclusive use of all five arrangements; for the four arrangements other than bath these percentages were 80 and 21 respectively. Nearly all the households in undivided dwellings (97 per cent) had their own cooking stoves as compared with less than two thirds (63 per cent) of those in shared dwellings. Very few households in undivided occupations were without exclusive use both of a sink and of a water-closet, as compared with nearly half (45 per cent) of the households in shared dwellings.

Table AU. - Household Arrangements

England and Wales

	Percentage of households with arrangements as specified among:						
	Households in single household dwellings	Households in shared dwellings	Households in single household dwellings with rooms as follows				
			1	2	3	4-5	6 or more
	a	b	c	d	e	f	g

Watercloset S	5	65	41	29	13	2	1
N	9	2	29	15	13	8	7
Fixed Bath S	1	46	23	7	3	1	1
N	37	40	56	64	53	35	23

The proportion entirely without piped water was lower for households in shared dwellings (2 per cent) than for households in undivided occupations (6 per cent). This is largely because of the lower incidence of households in shared dwellings in the rural areas, where piped water supplies are relatively more deficient. The proportion entirely without waterclosets was also relatively lower among shared dwellings, for a similar reason.

Table AU also shows the steep gradients by size of household occupation, among households in undivided occupations. As has been explained, the figures for one room occupations in undivided dwellings are less reliable than those for the numerically larger classes of occupation and it may be that the figures in column (c) over-estimate the lack of household arrangements. The very small proportions without separate provision of arrangements among 4-5 room occupations, except in the case of baths, indicate that in the majority of normal family-type dwellings occupied each by a single household, the specified domestic arrangements were available. The comparatively high figure of 8 per cent of 4-5 room undivided occupations which were entirely without waterclosets is due largely to the relative lack of this type of sanitary equipment in rural areas.

The gradients by size of occupation among households in shared dwellings were smaller than among those in single occupation.

An important aspect of the census tabulations of household domestic arrangements is their demonstration of areal variations. The following paragraphs deal with each of the five arrangements in turn and discuss variations between the regions on the one hand and the aggregates summary on the other.

Piped Water

Table AV relates to the availability of a piped water supply to private households.

Among households in undivided dwellings the proportion of households without exclusive use of piped water (S and N) varied among the regions from 6 per cent in the East and West Ridings and in the North Western Region to 21 per cent in Wales and 22 per cent in the Eastern Region; the aggregates summary figures show the relatively inferior position of the rural aggregate as compared with the conurbations and the towns. These areal variations are almost entirely due to differences in proportions of households entirely without piped water, the proportions of households in undivided dwellings recorded as sharing piped water being small and varying only from 4 per cent to 8 per cent. In the London and South Eastern Region, in the two northern regions referred to, in the conurbation aggregate and the towns of 50,000 to 100,000 population, the proportion of households entirely without piped water, whether in undivided or shared occupations, was trivial (0 to 2 per cent). Among undivided occupations the highest incidence of households entirely without piped water was 22 per cent for the rural aggregate; the Eastern Region, Wales and the South Western Region had the highest figures among the regions.

Among households in undivided occupations the incidence of sharing piped water, though low in all the areas shown in Table AV for households in dwellings of 4 or more rooms, was appreciable in the smaller dwellings. The figures for one room occupations in undivided dwellings may overestimate the condition but proportions sharing piped water of 38, 43 and 37 per cent for the conurbations, other urban areas of over 100,000 population, and other urban areas of over 50,000 population respectively, are characteristic of households living in one room dwellings.

Among households in shared dwellings the proportion sharing piped water varied among the regions from 52 per cent for London and South Eastern to 78 per cent for North Western. Very small proportions of such households entirely without piped water were shown for regions except in the Northern Region where the figure was 19 per cent. As with households in undivided occupations, the proportion entirely without piped water among households in shared dwellings was high for the rural aggregate (13 per cent).

Cooking Stove

Table AW relates to the availability of cooking stoves to private households.

Among households in undivided occupations there was hardly any sharing of cooking stoves, except in the smallest sized occupations: for occupations of 4 or more rooms the proportion sharing was trivial in all the areas shown in Table AW but the very much reduced availability of cooking stoves in one room occupations is indicated by proportions sharing varying among the regions from 20 per cent for the North Western down to 5 per cent for the North Midland; in the aggregates summary classification the proportion sharing was only 2 per cent for the rural areas as compared with 19 per cent for the largest towns outside the conurbations. A third of all households sharing dwellings were recorded as sharing a cooking stove, the proportion being 40 per cent or over in all the areas in the table except London and South Eastern Region (16 per cent), South Western Region (29 per cent) and the conurbation aggregate (24 per cent).

The proportions of households entirely without cooking stoves were small in all the areas shown, both for households in separate dwellings and for those sharing dwellings. The absence of cooking stoves was more common in the rural areas than in the towns, and more common in Wales than in any of the regions of England. The proportions were considerable, however, in the smallest room occupations, and among households in undivided occupations of 1 room varied among the regions from 13 per cent for the East and West Ridings to 29 per cent for Wales.

The proportions of households without exclusive use of a cooking stove were smaller than the corresponding proportions for any of the four other specified arrangements; and the areal variations were smaller. This is probably due largely to the fact that cooking arrangements which meet the census definition were in common use before any of the other arrangements were invented and, in the case of houses converted or adapted for use by more than one household, to the relative ease with which new stoves can be installed. Moreover a gas or electric stove can be installed in a living room without making an appreciable change in the way in which the room is lived in - the installation is not dependent on there being a spare room for its accommodation in the same way as in the case of a fixed bath, and not dependent on plumbing and such interference with bricks and mortar as is involved in the case of all the specified arrangements except the cooking stove. Thus it is probable that more household occupations in converted buildings have access to cooking stoves than to the other arrangements, although probably the cooking arrangements on which an appreciable number of such households depend do not contain an oven and will not have been counted as cooking stoves.

Kitchen Sink

Table AX relates to the availability of kitchen sinks to private households.

Among households in undivided dwellings the sharing of kitchen sinks was insignificant in occupations of 4 or more rooms but considerable among one and two room occupations - for one room occupations the proportions sharing varied among the regions from 7 per cent for North Midland to 22 per cent for London and South Eastern and 27 per cent for North Western. Although less reliable than the figures for larger occupations they indicate the substantially smaller scale of provision of sinks in small occupations. Very few one room occupations in undivided dwellings in rural areas were sharing a sink - but in a high proportion of such cases a sink was entirely lacking. It is likely that the sharing of sinks in small undivided occupations is more characteristic of urban areas which contain housing accommodation in small flats in blocks built with communal kitchen facilities. The sharing of sinks among households in shared dwellings was very common, the proportion being over 50 per cent in all except three regions, viz., 23 per cent for

London and South Eastern, 35 per cent for South Western and 42 per cent for Northern. In the Northern Region, however, the low proportion sharing was counterbalanced by the exceptionally high proportion of 28 per cent (among households in shared dwellings) entirely without a kitchen sink.

Watercloset

Table AY relates to the availability of waterclosets to private households.

The proportion of households without exclusive use of a watercloset varied widely among the regions from 6 per cent for London and South Eastern and 7 per cent for North Western to 25 per cent for Eastern; among the aggregates from 4 per cent for the largest towns outside the conurbations to 37 per cent for the rural areas. Among households in undivided dwellings the majority of households without exclusive use of a watercloset were entirely without access to this kind of sanitation and the areal variation in the proportion entirely without a watercloset was substantial: among the regions the low proportion of 2 per cent was recorded for the London and South Eastern and 4 and 5 per cent for the North Western and the East and West Ridings respectively: the highest regional figure was 23 per cent for the Eastern. Among the aggregates there was a high proportion of 35 per cent in the rural areas, and low proportions in all classes of urban areas.

The East and West Ridings Region was exceptional with 12 per cent of households in undivided dwellings sharing a watercloset - in no other region was this proportion higher than 6 per cent: the proportion was 8 per cent for the conurbations, the aggregates summary figures indicating this to be a characteristic of dense urban areas rather than of rural areas, lack of provision in the latter being due to the use of alternative forms of sanitation (e.g. earth or chemical), rather than to sharing of waterclosets.

The figures for the smallest household occupations - those of one and two rooms - indicate the high proportions without separate waterclosets; for one room occupations the proportions varied among the regions from 60 per cent for London and South Eastern Region to 86 per cent for the Southern Region and among the aggregates from 60 per cent for the conurbations to 89 per cent for the rural areas.

Among households in shared dwellings the proportion sharing waterclosets was at least 60 per cent in every region, the highest proportion being 78 per cent for North Western. Among the aggregates such sharing had its lowest incidence in the rural areas (54 per cent). The exceptionally high proportion entirely without waterclosets in the rural areas (22 per cent), however, gave them the highest proportion without exclusive use of waterclosets. The proportions of households in shared dwellings entirely without waterclosets were trivial for the conurbations and larger urban areas and the proportion was only 3 per cent for the aggregate of towns outside the conurbations and with under 50,000 population.

Fixed Bath

Table AZ relates to the availability of fixed baths to private households.

The proportions of households without exclusive use of fixed baths were much higher than for any of the other specified arrangements, the lack of provision evidently being very largely due to the existence of many houses or converted dwellings which did not contain a fixed bath at all. Among households in undivided dwellings the lowest regional proportion of households entirely without a fixed bath was 24 per cent for the London and South Eastern Region and the highest was 49 per cent for Wales. The proportion for rural areas was considerably higher (48 per cent) than for

the conurbations (30 per cent). In contrast to the other specified arrangements this proportion was substantial even for the largest room occupations, although the descending gradient as size of occupation increased still persisted. Among the numerically large class of 4-5 room occupations in undivided dwellings the proportions entirely without fixed baths varied among the regions from 24 per cent for London and South Eastern to 49 per cent for Wales and among the aggregates from 28 per cent for the conurbations to 46 per cent for the rural areas. As is to be expected comparatively few one room occupations had exclusive use of a fixed bath (21 per cent). A higher proportion, 32 per cent, was, however, recorded for the London and South Eastern Region, and the corresponding figure for the conurbations aggregate was 30 per cent.

Among households in undivided occupations only those in one and two rooms had considerable proportions sharing fixed baths, the regional variation being substantial, from 8 per cent in Northern Region to 34 per cent for North Western for one room occupations, and from 1 per cent for Northern to 13 per cent for London and South Eastern for two room occupations. The aggregates summary figures show that such sharing was largely concentrated in the conurbations and larger urban areas.

Among households in shared dwellings there was comparatively little regional variation from the national figure of 86 per cent without exclusive use of a fixed bath. In most areas the proportion sharing a bath was considerably higher than the proportion entirely without a bath but in the Northern Region, Wales and the London and South Eastern Region the reverse was the case, the excess numbers of households entirely without fixed baths for the first two of these regions being indicated by a proportion of 50 per cent entirely without as compared with 38 per cent sharing. The high percentages of households in shared dwellings and entirely without fixed baths are a feature of the provision of baths as distinct from the other specified arrangements.

Variations within Conurbations

The discussion above relating to the five household arrangements specified on the census schedule has demonstrated some major differences between urban and rural areas in the extent of the availability of the arrangements to private households. Attention has been called to the different standards of building and equipment of dwellings which have prevailed at different periods during the lifetime of existing dwellings, and the consequential areal variations in the census figures. Since the conurbations which have been defined for statistical purposes have also been divided into areal divisions according to criteria which include the periods of their main development, it is natural to find important variations between these divisions in the provision of the specified domestic arrangements. These have been discussed in more detail in the *Report on Greater London and Five Other Conurbations*, but Table BA sets out their main features to add meaning to the aggregates summary variations already discussed.

The basis of this areal division of the conurbations is described in outline in the General Explanatory Notes on p.xii and in detail in the *Report on Greater London and Five Other Conurbations* (p.xviii). Broadly speaking Divisions I represent the commercial and industrial centres of the conurbations; Divisions II contain many habitations and other buildings dating from before the first world war and not used now for their original purposes; and the other divisions represent areas developed later and containing relatively more modern dwellings. The highest numbered division in each conurbation represents its most recently developed parts except in South East Lancashire and West Yorkshire in which Division III covers the areas developed most recently. These different circumstances of development and redevelopment are reflected in the figures for the domestic arrangements specified in the census enquiry.

(a) See notes on p.xii.

Table BA shows the generally less complete provision of arrangements in the central parts of the conurbations, as compared with their peripheral areas where very few households were incompletely provided for. Within each conurbation the differences are very great and much larger for some than for other conurbations. It is of interest to note that the variations between the most recently developed divisions of each conurbation are comparatively small. The areas with substantial proportions without exclusive use of arrangements among households in undivided dwellings are

those central areas which contain much obsolete property and many properties which have been converted and adapted for uses other than those for which they were originally designed. An important difference between the rural areas in the aggregates summary classification and the inner conurbation divisions lies in the fact that lack of domestic arrangements in the former is largely due to the age of residential buildings whereas in the latter it is due to conversions and changes of use as well.

CHAPTER IX: LOCAL VARIATIONS

Some consideration has been given in previous chapters to broad differences in housing conditions between different parts of the country and different classes of area, as reflected in tabulations given for the regions, for the national aggregates and for the conurbations. Some aspects of housing conditions have, in addition, been treated in terms of the conurbation divisions, to emphasise differences between the patterns of house building of the nineteenth century and those of today.

The present chapter is designed further to illustrate geographical variations, by reference to Tables 5 and 7 for Counties (A.Cs. with associated C.Bs.), and Table 13 for local authority areas. The discussion is in two parts: in the first place Tables 5 and 7 enable certain comparisons between 1931 and 1951 to be made which cannot be made either for the larger areas already considered or for individual local authority areas, because of boundary changes; in the second place Table 13 enables more detailed examination to be made of local variations existing in 1951.

County Changes 1931-1951

Table BB, derived from Tables 5 and 7, illustrates the changes that have taken place between 1931 and 1951 in the size distribution of dwellings, household occupations and households, and in the numbers of households sharing dwellings in the counties of England and Wales*, by comparing and contrasting the counties which increased most in numbers of occupied dwellings with those which increased least in this period. The former group contains counties which have been affected by industrial expansion in the Greater London and Birmingham areas during the present century; the latter group contains older industrial areas in the north of England, Wales, London A.C., and some counties with relatively large numbers of persons living in rural areas.

The change in numbers of occupied dwellings in 1931-51, for counties (or groups), varied from an increase of 74 per cent for Hertfordshire to one of 7 per cent for the Merionethshire, Montgomeryshire and Radnorshire group. Without exception, every area shown in Table BB, whether in the first or the second group, experienced a considerable increase in the proportion of dwellings of 4 or 5 rooms. More than half the occupied dwellings, in all except two of the areas shown in this Table, were of 4 or 5 rooms in 1951; only in London was the proportion considerably smaller. The high proportion of 73.8 per cent obtained for Lancashire but on the whole the areas in the first group (those with over 40 per cent increase in dwellings 1931-51) had slightly higher proportions with 4 - 5 rooms than those in the second group. The proportions of dwellings of 4 - 5 rooms in 1931 also were on the whole a little larger in the first group than in the second. In most of the first group of areas the proportions of dwellings of 1 - 3 rooms increased between 1931 and 1951. Corresponding to the increases in numbers of dwellings of smaller size the proportions of dwellings of 6 or more rooms in most areas in the first group decreased

*Some of the smaller counties have been grouped on the same basis as that used in the presentation of census data in the County Reports.

Table BB.- Distributions of DWELLINGS and HOUSEHOLD OCCUPATIONS by numbers of ROOMS, and HOUSEHOLDS by numbers of PERSONS, in 1931 and 1951
(England and Wales and selected Counties (A.Cs. with associated C.Bs.))

substantially. In most areas in the second group, however, the proportions of 1 - 3 room dwellings decreased, and the reductions in the proportions of dwellings of 6 or more rooms were in general smaller than for the first group. London was quite exceptional with 31.3 per cent of 1 - 3 room dwellings in 1951 (a proportion nearly twice as high as in 1931) and with only 33.5 per cent of 4 - 5 room dwellings. London, Middlesex and Glamorganshire, all of which had comparatively high proportions of dwellings of 6 or more rooms in 1931, also had comparatively high, though considerably reduced, proportions in 1951.

Nationally the changes in the 1931-51 period in the size distribution of household occupations were somewhat similar to those of occupied dwellings, in the sense that proportions of those comprising 1 - 3 rooms changed little, proportions comprising 4 - 5 rooms increased considerably while those comprising 6 or more rooms decreased, but this similarity did not extend to every county. London and Middlesex were outstanding in that their proportions of dwellings of 6 or more rooms decreased very much more than the corresponding proportions of household occupations. To a lesser extent this was also true of Sussex, Essex, Glamorganshire and Monmouthshire. London was also outstanding in that the proportion of dwellings of 1 - 3 rooms increased from 17.5 per cent in 1931 to 31.3 per cent in 1951 while the proportion of household occupations of this size remained virtually unchanged.

The distributions of household occupations are affected by changes in the extent to which dwellings are occupied by one or more households, as well as by the factors of new building, conversion, etc., which affect both dwellings and household occupations. An appreciable part of the change in the London figures, for example, will have been due to the demolition or transfer to non-residential use of large houses containing more than one household, to increased sharing by more than one household of the remaining large houses without any structural alteration, and to the structural sub-division of houses which previously contained more than one household. No close associations are to be expected in figures representing net changes in numbers of dwellings and household occupations respectively, in areas which contain considerable amounts of residential property of obsolete size.

Although Table BB shows some considerable differences between counties in the distributions of households by size, the only feature which calls for mention in the context of 1931-51 changes is the high proportion (13 per cent) of one person households in London in 1931, which had risen to 20 per cent in 1951. National changes in household size are reflected in the figures of every county.

The proportions of households in shared dwellings, which nationally fell from 19 per cent in 1931 to 14 per cent in 1951, fell considerably in all the areas shown with high incidence of sharing in 1931, but some counties with comparatively low incidence showed small increases. Most of the areas shown, whether in the group with increases of over 40 per cent in numbers of dwellings or in that with increases under 25 per cent experienced increases in actual numbers of households in shared dwellings, London again being the outstanding exception.

Local Authority Area Variations 1951

Table BC has been derived from the local authority area Table 13 and provides some indication of the very much larger variations than are indicated in figures for the larger areal aggregates which exist between individual local authority areas. It also demonstrates some differences not hitherto noted. The ten groups of local authority areas shown in Table BC represent the areas with the highest and those with the lowest values of each of five statistics (named in column (a)) chosen from those given in Table 13. Columns (c) and (e) to (o) of Table BC include these five main statistics in a larger list selected from among the columns of Table 13; column (d) provides an additional population characteristic, not given in Table 13, to supplement column (c).

Table BC. - Variations between areas in POPULATION
and HOUSING CHARACTERISTICS

Local Authority Areas

England and Wales			17.8	11.0	12,389,448	32	16	26	3.19	14.3	65	12	14	59

It is convenient to consider each of the five sections of Table BC in turn.

Percentage of occupied and retired males in Social Classes I and II

Half of the areas in the group with the highest proportions of occupied and retired males in Social Classes I and II (group (i)) were rural districts in Wales in which farming was a predominant occupation. A comparatively small number of larger areas, however, which accounted for about half the total population of the group, were residential areas containing comparatively large numbers of modern dwellings, for example Coulsdon and Purley, Banstead, Beckenham in the Greater London area, and Cheadle and Gatley and Hazel Grove and Bramhall adjacent to Stockport C.B.

With the important exceptions of the Metropolitan Boroughs of Bethnal Green, Shoreditch and Southwark almost all the areas in the group with the lowest proportions of occupied and retired males in Social Classes I and II (group (ii)) are mining areas.

This section of Table BC shows, in column (d), a comparatively high proportion of elderly persons for group (i) - 12.8 per cent, as compared with 8.9 per cent for group (ii). Small differences in household size are reflected in the figures of 3.16 persons per household for group (i) and 3.38 for group (ii). This difference is, however, very much smaller than the corresponding difference shown in section 4 of the table, suggesting that there are other important factors which affect size of household.

The main differences between group (i) and group (ii) relate to the dwellings which contain these households: those in group (i) include much higher proportions of modern dwellings than those in group (ii). This is implied by the fact that the percentage increase in the 1931-51 period in numbers of dwellings was 46 for group (i) as compared with only 13 for group (ii). Most of the recent expansion in group (i) has been concentrated in a few areas on the outskirts of expanding built-up areas. The difference in the percentages of occupied dwellings with 1 - 3 rooms, viz. 10 for group (i) and 32 for group (ii), and the corresponding differences in occupation size distributions, reflect the generally larger room occupations of the households of persons in the higher social classes, especially in suburban areas, and the comparatively small room occupations which characterise many mining areas and areas with relatively large numbers of households in shared dwellings - the high figure of 16.4 per cent of households sharing dwellings in group (ii) conceals exceptionally high proportions for the three Metropolitan Boroughs: 46.7 per cent for Southwark, 44.1 per cent for Shoreditch and 38.9 per cent for Bethnal Green. The mining areas in this group had comparatively few households in shared dwellings. The proportion of 7 per cent of households in shared dwellings for group (i) is less than half the figure for the country as a whole. Nearly 80 per cent of households in group (i) were housed at a density below one person per room as compared with below 50 per cent for group (ii). The proportion of households with exclusive use of all the specified household domestic arrangements was higher for group (i) than group (ii), though the proportion sharing or without piped water, and the proportion sharing or without watercloset, were higher for group (i).

Percentage increase in numbers of dwellings in the period 1931-1951

20 of the 30 areas in group (iii), which covers the areas with the highest increases in numbers of dwellings, are areas in the outer parts of one of the six conurbations, most of them in the Greater London area. The remainder include the expanding industrial towns of Slough and Corby (the latter being in 1951 broadly co-extensive with the new town of that name), Worthing R.D., adjacent to Worthing M.B., and some areas just outside the boundaries of a conurbation. The increase in numbers of dwellings in group (iii) in the 1931-51 period amounted to 188 per cent, and indicates that most of the dwellings in this group were less than 20 years old in

1951. The contrast in this respect with group (iv), which suffered a decrease in dwellings of 9 per cent is very great.

The group of areas with the lowest percentage increases in numbers of dwellings (group (iv)) includes the City of London and nine of the Metropolitan Boroughs, West Ham C.B. in Essex, Salford C.B. in Lancashire and Jarrow M.B. in Durham. These are all areas which in the early part of the nineteenth century had already been substantially developed; except for Jarrow all suffered severe damage to house property during the 1939-45 war. A number of small rural districts, mostly in Wales, are also included in this group, but they contain less than 10 per cent of the total population of the group.

The attraction of the newer residential areas to persons in the higher Social Classes is indicated by the fact that the proportion of occupied and retired males in Social Classes I and II was more than twice as high in group (iii) as in group (iv). The larger average size of household and slightly smaller proportion of elderly persons in group (iii) as compared with group (iv) probably reflects mainly the attraction of the more spacious housing conditions available in the newer suburban areas to families with young children. The proportion of small dwellings was much lower in group (iii) than group (iv) - 11 as compared with 26 per cent respectively with 3 or less rooms; the corresponding percentages of household occupations with 1 - 3 rooms were 19 and 50 respectively; only 10 per cent of households in the former group lived in shared dwellings as compared with nearly 40 per cent in the latter; the very marked contrast that is to be expected in the availability of household arrangements in these two groups is indicated by a figure of 88 per cent of households in group (iii) having exclusive use of all the specified arrangements as compared with only 40 per cent of those in group (iv).

Proportion of household occupations of 1 - 3 rooms

The group of areas with the highest proportions of household occupations with 1 - 3 rooms (group (v)) includes the City of London and 22 of the Metropolitan Boroughs. It also includes Willesden M.B. in Middlesex and the County Boroughs of Gateshead and Sunderland in Durham. Eight of the areas in this group (the City and seven Metropolitan Boroughs) are areas which are also in group (iv). Most of them suffered serious damage to property in the 1939-45 war.

The areas in the group with large household occupations, i.e. with the lowest proportions containing only 1 - 3 rooms (group (vi)) are nearly all small urban areas with populations under 15,000, eleven of them each containing under 5,000 persons. Norfolk and Suffolk and surrounding counties contained a number of the areas in this list, a few were in Lancashire and Cheshire, but, except for Scalby U.D. in the North Riding, none were in the East or West Ridings of Yorkshire or counties further to the north.

The two groups in this section of the table show bigger differences than in any of the other four sections, not only in the proportions of small occupations but also in the proportions of households sharing dwellings. These two groups illustrate the very large differences in the housing characteristics, on the one hand of large densely built up areas containing property which has been adapted to form multiple household occupations, and on the other hand areas in which relatively more of the older house property is still in single occupation by households. Nearly two thirds of the households in group (v) were living in occupations of 1, 2 or 3 rooms only, 45 per cent were living at density less than one person per room, and almost half of them were in shared dwellings. The corresponding figures for group (vi) were 7 per cent of 1, 2 or 3 room occupations, 80 per cent of households at density less than 1 person per room, and only 3 per cent in shared dwellings. The contrast between these two groups in the availability of household arrangements was, however, not very marked.

Average number of persons per household

Most of the areas in the group with the highest numbers of persons per household are mining areas, the list overlapping considerably with that of the group with the lowest proportions of occupied and retired males in Social Classes I and II. The list also includes Huyton with Roby and Corby U.D. both of which have largely grown up within the last 20 years.

The group of areas with the lowest numbers of persons per household includes the City of London and eleven of the Metropolitan Boroughs. It also includes a number of holiday towns, e.g., Hove, Herne Bay, Paignton and Worthing.

The average number of persons per household for group (vii) was 3.74 as compared with 2.61 for group (viii). Large households are typical of mining communities while small households typify both the central districts of large built-up areas, and many holiday towns which are often also residential areas attractive to retired people. As in all the other sections of Table BC there is a striking contrast between groups (vii) and (viii) both in size of dwelling and size of household occupation, as reflected in the proportions with 1 - 3 rooms, and a marked contrast between them in the incidence of sharing of dwellings. There was little difference between them, however, in the proportion of households with density under one person per room, and not much difference between them in the availability to households of the domestic arrangements specified in the census enquiry.

Percentage of households at a density below one person per room

Most of the areas in group (ix), which contains those with the highest proportions of households at less than one person per room, had small populations, Cheadle with Gatley and Hoyle, both in Cheshire, having the largest populations, viz., 31,511 and 30,936 respectively. A number of small seaside holiday areas are included in this group, and a number of areas containing a high proportion of modern residential development.

The areas in group (x), which contains those with the lowest proportions of households at less than one person per room, are mostly old established and thickly populated urban areas in the older industrial centres and with relatively large amounts of residential property of obsolescent size. Many of them have been seriously affected by damage to property during the 1939-45 war. The list overlaps considerably with that for areas with the lowest proportions of occupied and retired males in Social Classes I and II. It contains 13 Metropolitan Boroughs and 17 local authority areas in Durham or Northumberland. Among the latter are the County Boroughs of Sunderland and Gateshead and a number of coal mining areas.

As would be expected, comparatively large numbers of persons in Social Classes I and II were living in the more spacious dwellings of group (ix), and the proportion of persons aged 65 and over was exceptionally high for this group, indicating the attraction of these areas to retired people. The contrast between the two groups in the size of their dwellings and household occupations and in the incidence of sharing of dwellings is very marked; the high figure of 37.6 per cent of sharing households for group (x) was, however, almost entirely due to the exceptionally high incidence of sharing in the metropolitan boroughs contained in this group. 79 per cent of the households in group (ix) had exclusive use of all the household arrangements as compared with only 52 per cent of those of group (x). There was no appreciable difference between these groups in the average size of household.

Ward Variations in Birmingham C.B.

Most urban local authority areas represent the aggregation of a number of districts differing in their predominant characteristics - for

example some districts are predominantly residential, some are predominantly industrial or commercial. Superimposed on such a classification by function is a distinction between areas of modern building development at the one extreme, and at the other the oldest parts of a town which in many cases contain houses built as family residences which have been adapted or converted into flats or into shops, offices, or premises in which industrial activities now take place. In some towns the process of development has gone further than this and obsolete houses have been demolished and replaced by more modern buildings, changing the character of whole districts.

The process of development of the larger urban concentrations in England and Wales, as reflected in population census statistics has been discussed in the *Census 1951, Report on Greater London and Five Other Conurbations* in terms of the areal sub-divisions which were constructed to show differences due to this type of factor. Appendix Table E.1 in the present report analyses the 38 wards of Birmingham C.B. to illustrate the extent of differences in housing conditions between much smaller units of area than were, in general, discussed for the conurbations. Although Birmingham is part of the West Midlands conurbation and although it is the County Borough in England and Wales with the largest population, these ward figures supplement the conurbation analyses, particularly in demonstrating how large can be the differences between areas which are very close together. They suggest the sort of variations which may well exist within very much smaller cities and towns, and serve as a corrective to any tendency to assume an undue degree of homogeneity within local authority areas.

The oldest part of Birmingham is fairly centrally situated within the whole area of the County Borough, but stretches as far as the western boundary where this adjoins Smethwick.

The census figures relating to the availability of household arrangements show very extreme differences between the wards containing the earliest building and those in the outer suburbs: fewer than 10 per cent of households had exclusive use of a fixed bath in All Saints, Aston, Deritend, Ladywood and St. Paul's wards; but the proportion was over 90 per cent in Brandwood, Hall Green, Kingstanding, Northfield, Perry Barr, Sheldon, Springfield, Stechford, Stockland Green and Weoley wards. The latter group comprises wards on the periphery of the City in areas where much of the most recent development has taken place. Differences in the availability of waterclosets show a somewhat similar pattern.

The incidence of sharing of dwellings was highest in a number of the more central wards but there was appreciable variation which could not be fitted into any clear-cut gradients. For example, of the three wards with the highest proportion of sharing households (28 per cent), Handsworth is geographically quite separate from Edgbaston and Market Hall, and none of these three wards is as centrally situated as the areas with the highest proportions of households without (or sharing) the specified household arrangements.

On the whole the wards with the oldest types of house property were those which housed relatively small proportions of persons in the higher social classes. The wards with the highest proportions of occupied males in Social Classes I and II were Edgbaston (39.8 per cent), Sandwell (29.5), Moseley and Kings Heath (26.6), Harborne (24.6), Hall Green (23.5) and Springfield (21.3). Except for Sandwell these areas represent a band to the south of the old central areas separating the latter from the more recently developed peripheral areas on the south side of the city. The incidence of sharing of dwellings in two of these areas, viz. Edgbaston and Moseley and Kings Heath, was comparatively high.

The higher incidence of small households in the central districts and the generally much lower incidence in the peripheral areas is noteworthy. The highest percentage of one person households was, however, that for Edgbaston (19.2). In a number of peripheral areas the percentage was below 5.

Another useful index of variation in the characteristics of housing is provided by the distribution of dwellings and household occupations by size. The proportion of dwellings of 1 - 3 rooms varied from 61 per cent for St. Paul's ward and 59 per cent for Ladywood ward, these being wards in the older industrial and commercial centre of Birmingham, to less than 5 per cent in many of the peripheral areas. There were differences on a similar scale in the incidence of small household occupations.

CHAPTER X: SUMMARY

The housing information which the population census record provides derives from the requirement that the census enumerator should list each household which each dwelling in his area contained on the night of the census, giving particulars to enable dwellings occupied by private households to be distinguished from hotels, institutions, etc.; that he should obtain a completed census schedule from the head of each household or his representative; and that he should record the number of rooms occupied by each household, whether any were shared, and how many in the dwelling were vacant. The particulars to be furnished by the head of each private household at the 1951 Census included the following items of information about each person enumerated in his household:

- (1) Sex, age, marital condition
- (2) Relationship to head of household
- (3) Whether usually resident at the address to which the schedule related
- (4) Particulars of gainful occupation.

He also gave information about five specified domestic arrangements available to his household, viz., piped water, cooking stove, kitchen sink, watercloset, fixed bath.

The duties of enumerators in the above respects were the same in 1951 as at the two previous censuses in 1931 and 1921, and the information provided by the head of household about the members of his household under the four heads listed above was also the same. The particulars about domestic arrangements, however, were obtained in 1951 for the first time.

The tabulation of this material for 1921 and 1931, on a comprehensive basis, was limited to the production, for the country as a whole and for the usual geographical sub-divisions down to local authority areas, of two main tables: (1) dwellings analysed by number of rooms and by the number of households each contained, and (2) households analysed by number of persons and by number of rooms each occupied. Tables in this form have also been constructed for 1951. They provide basic data from which to derive indices of density in terms of persons per room as well as distributions by size of dwellings, household occupations, and households, on a comparable basis for these three census dates.

New comprehensive tabulations for 1951 for which there is no counterpart in 1921 or 1931 supplement the customary tabulations to show

- (i) households in shared dwellings analysed by size and by numbers of rooms occupied;
- (ii) households analysed by the sex, age and marital condition of their heads;

- (iii) households analysed by the number of earners and the number of children they contained (One per cent Sample basis);
- (iv) household composition in terms of relationships to head of household (One per cent Sample basis);
- (v) social and economic characteristics of private households in terms of the gainful occupation of the head of household (One per cent Sample basis);
- (vi) the availability to households of the specified domestic arrangements.

In addition, some tabulations have been prepared illustrating types of household sharing the same dwelling in a small number of selected areas.

The statistics published in this report enable some answer to be given to the following questions: How many dwellings of different kinds for private households were there in England and Wales in 1951? How many households of different types were living in them and under what density conditions (persons in relation to rooms)? To what extent were households living in crowded conditions, and to what extent, if any, was accommodation for additional households potentially available by the rearrangement of households within existing dwellings? How many and what kind of households were living in shared dwellings and how many of them had to share domestic household arrangements? How many households were composite in the sense that they contained within them family nuclei, other relatives, or boarders, some of which might have formed separate households in different social and economic circumstances? What differences were there between the conditions under which different sections of the population were housed? To what extent did variations in household composition affect density (persons per room) and to what extent, if any, might such variations in density have been a reflection of the differing claims on rooms of the several members of differently constituted households (for example the smaller claim per person on bedrooms of married couples and small children as compared with other persons)? To what extent were there variations in the types of households living in different social and economic circumstances? To what extent do the national figures conceal a high incidence of certain housing characteristics in some areas offset by a low incidence elsewhere (for example the wide range of persons per room ratios that is concealed in the national figure)? To what extent have housing conditions changed in recent years, in particular in the 1931-51 period? Can any future trends be inferred from census figures?

The foregoing chapters of this report have set out some of the facts which a population census can contribute towards answering these questions. It must be remembered, however, that between April, 1951, and March, 1956, about a million and a quarter new permanent houses and flats were built, and improvements in the supply of piped water to dwellings and in other household arrangements, together with other changes in the supply and quality of dwellings, have been made. Changes in population and household composition have also occurred. The following paragraphs recapitulate the salient points which have been made about the situation as it existed at the date of the 1951 Census.

The Stock of Dwellings

There were 12,389,448 dwellings for the occupation of private households in England and Wales in 1951. This was more than three times the number which existed in 1851 and nearly twice as large as the number at the turn of the century, as recorded in the 1901 Census.

The secular changes in numbers of dwellings existing at specific points of time provide very limited evidence on which to judge the age of the dwellings which formed the stock in 1951, on account of the considerable amounts of demolition or conversion to non-residential use of house

property located in areas, once residential, which had become commercial or industrial districts; on account also of the conversion of large houses into several smaller dwellings; and on account of demolition (including destruction by bombing) of houses which had been replaced before 1951 by new residential accommodation. On the assumption that almost all of this demolition and change of use related to houses built before the first world war, however, about five million or 40 per cent of the 1951 stock of dwellings were at that date less than 30 years old.

The changes in numbers of dwellings in the 1921-51 period, from 7,979 thousand in 1921 to 9,400 thousand in 1931 and 12,389 thousand in 1951, have considerably affected their size distribution, and have brought them more into line with the smaller families of recent generations. In 1951 15 per cent of dwellings were of one to three rooms, 63 per cent of 4 or 5 rooms and 21 per cent of over 5 rooms. Most of the changes took place after 1931, the proportion of 4 - 5 room dwellings having increased in the 1931-51 period from 53 to 63 per cent while that of larger dwellings decreased from 32 to 21 per cent.

Household occupations

Some 86 per cent of private households were occupying a dwelling to themselves in 1951, the remainder sharing a dwelling with one or more other households. 7 per cent of dwellings contained more than one household. The distributions by size of the room occupations of individual households were therefore different from those of dwellings. In 1951 26 per cent of households were living in 3 or fewer rooms, 59 per cent in 4 or 5 rooms, and 15 per cent in more than 5 rooms. Although the proportion of households sharing dwellings fell from 20 per cent in 1921 to 14 per cent in 1951 the pattern of change between 1931 and 1951 in the distribution of household occupations by size was similar to that of dwellings, viz., considerable increase in the proportion of 4 - 5 room occupations and compensating decrease in larger occupations.

Households

In 1951 11 per cent of households contained 1 person, 28 per cent contained 2 persons, 25 per cent 3 persons, 19 per cent 4 persons and 17 per cent 5 or more persons. Comparison with earlier figures illustrates the secular changes that have been taking place, the proportion of households of 1 - 3 persons having increased from 45 per cent in 1921 to 64 per cent in 1951. The cross-classification of households exclusive of visitors for Great Britain* for 1951, by size and by household composition, shows a very considerable amount of homogeneity within the size classes. Disregarding the absence of the spouse of head of household the main features are as follows: among 1.6 million one person households in Great Britain 1 million were single, widowed or divorced women aged 40 or over (representing about a quarter of all such persons enumerated) and 0.3 million were males in the same category; among 4.1 million two person households more than two thirds consisted of married couples with no children (representing about 60 per cent of all married couples without children) - moreover more than half of all households with married heads in the 60 and over age-group were in this size class, representing nearly a third of all households of two persons; among 3.6 million households of three persons about three quarters were married couples with one child who represented nearly three quarters of all married couples with one child; among 2.7 million households of four persons about two thirds were married couples with two children, and among 2.4 million larger households nearly two thirds were married couples with three or more children. To a considerable extent the classification of households by size effects a grouping of households of similar compositions.

* Corresponding figures for England and Wales are not available.

The household composition tables for Great Britain also show that out of a total of 14½ million households 11½ million consisted solely of married couples or widowed or divorced persons, with their children if any, or single persons living alone; and 2 million were of a composite type containing one or more of the following: a family nucleus; a married brother or child of the head (without spouse or children); a remainder element consisting of a person or persons unrelated or only distantly related to the head of household.

More than 900 thousand composite households contained a married couple or person in a family nucleus, including about 500 thousand in which both the head of the household and the head of the family nucleus were married. Over 80 per cent of the heads of all family nuclei consisted of sons or daughters of the head of the composite household or of his spouse. 37 thousand households contained a married couple in the status of parents of the head of household, 28 thousand of them being primary family unit households with married heads. The number of households containing two married couples, apart from those included among the above categories, cannot have exceeded 20 thousand, but it needs to be borne in mind that nearly 300 thousand married persons, not being heads of household or ancestors of heads, were enumerated in private households without either spouse or children and therefore came outside the family nucleus class, into which some of them would have been classified but for the temporary absence from home of spouse or children on census night. The enumeration of married persons without their spouses is a factor to be taken into account in assessing all these figures but it seems clear that the total number of households in Great Britain whose usual residents included two married couples was at least half a million and probably appreciably more.

Density and persons in relation to rooms

Density statistics in the form of persons per room ratios, and other indices derived from the customary distributions of households by numbers of persons and numbers of rooms, are of necessity limited in their value as indicators of housing conditions by the fact that the several members of most households do not lay equal claim to the rooms in the dwelling occupation - married couples often share a bedroom and young children often do not have a bedroom each, and such sharing of rooms is not indicative of crowding in any important sense of the term. The density analysis made possible for 1951 by the household composition tables therefore adds considerably to the contribution of the population census to this aspect of housing conditions. It enables the size distributions of the dwelling occupations inhabited by households of given compositions to be compared with those based on a series of hypothetical room allocations. The latter have been constructed with the primary object of showing whether some types of household were more heavily pressed for rooms than others, irrespective of any absolute standard which might be thought desirable.

The 1951 Census household composition data indicates that the private households of Great Britain were much more heavily pressed for rooms in their dwellings the larger the number of children they contained. The figures on hypothesis D for households with married heads in the 40-59 age-group and containing only close relatives indicate the size of this gradient in an important group of households; among those with no children, rooms actually occupied exceeded those calculated on the hypothesis by 36 per cent, but among those with 3 or more children there was a 14 per cent deficiency. A similar gradient occurred in the corresponding class with heads aged 60 or over, but among households with younger married heads (under 40), and those with non-married heads this gradient was not so steep. For households with the same number of children (of head) those with heads in the older age-groups appeared to be more spaciouly housed (in the sense of these hypotheses) than those with heads under age 40; and those with married heads were more spaciouly housed than those with single, widowed or divorced heads.

There were 524 thousand households with married heads which contained one or more family nuclei and only 68 thousand family nuclei with non-married heads.

As would be expected composite households were found to be less spaciouly housed than primary family unit households. The figures indicate, however, that among composite households with heads in the older age-groups the presence of family nuclei within the household was largely responsible for the lower than average ratios of actual to hypothetical numbers of rooms; among those with heads aged under 40, comparatively few of which contained family nuclei, the presence of boarders or other persons not closely related to the head accounted for much of the corresponding difference.

The census household composition analysis provides no direct evidence of the extent to which composite households contain persons who would form separate household groups if circumstances permitted. Neither is any claim made that any of the hypotheses about room allocations used in this report relate to desirable or attainable standards of accommodation. It is, however, of interest to note how many dwellings of different sizes would be required if all the family nuclei were taken out of the composite households which contained them and were housed as separate households, and if the resulting households were each provided with a dwelling containing either one or two living rooms, a bedroom for each married couple, a bedroom for each two children of the head (except that two aged 5 or over of opposite sexes should not be required to share), and a bedroom each for other persons.

Table BD sets out the results of applying such hypotheses, and compares them with the actual 1951 distribution of household occupations.

Table BD. - SIZE of HOUSEHOLD OCCUPATIONS
compared with hypothetical room
allocations to allow for family
nuclei to be housed separately } Great Britain

Rooms	Hypothetical household occupations (<i>hundreds</i>) allowing habitable rooms per household in addition to bedrooms as follows:-				Actual Household Occupations (<i>hundreds</i>)
	TWO for each household*	ONE for each household of one person; TWO for each larger household*	ONE for each household of one person and for 50 per cent of larger households* TWO for remainder	ONE for each household*	
	Hypothesis D	Hypothesis D(i)	Hypothesis D(ii)	Hypothesis C	
	a	b	c	d	e
1					470,1
2		1,906,2	3,691,5	5,476,9	1,447,7
3	5,476,9	3,570,7	5,040,1	6,509,5	2,355,7
4	6,509,5	6,509,5	4,590,8	2,672,1	3,849,2
5	2,672,1	2,672,1	1,660,3	648,4	4,242,3
6	648,4	648,4	385,1	121,9	1,375,3
7 or more	156,8	156,8	95,9	34,9	741,2
Total	15,463,7	15,463,7	15,463,7	15,463,7	14,481,5

* Or family nucleus

The deficiency of three room occupations, as compared with the hypothetical numbers shown in Table BD on any of the bases postulated, is very great; and the excess of occupations of 5 or more rooms is likewise considerable. The hypothetical numbers of two room occupations on the basis represented in column (b) are, however, broadly comparable with the numbers existing in the country, and the hypothetical numbers of four room

occupations on the basis represented in column (c) are broadly comparable with actuality. If it is justifiable to think that most opinions about housing adequacy lie somewhere between the extremes represented in columns (a) and (d) of Table BD, it would appear that in 1951 there were too few two and three room units of accommodation for one and two person households, particularly when it is remembered that the very great majority of these small households are composed of middle-aged and elderly persons and few comprise married couples whose family building is in front of them (only 13 per cent of all one and two person households had married heads aged under 40).

The extent of the excess in numbers of occupations of 5 or more rooms, as compared with the hypothetical figures mainly relates to households with heads aged 40 or over and is not therefore to be discounted to any great extent to allow for households in the family building stages of their lives to have extra rooms in anticipation of larger subsequent requirements.

The comparison between actuality and hypotheses in terms such as those of Table BD cannot, of course, be applied to any assessment of housing conditions without considering the extent to which, and the reasons why, people fail to move house as their requirements of house-room change. While some of the reasons are doubtless related to conditions which could be affected by changes in policy, there is little doubt that many families build up associations with dwellings in which they have lived for a long time. Some of these may take in boarders or subtenants when their own children have grown up and left home rather than move into a smaller dwelling but some will doubtless keep the house to themselves and leave room for their grown-up children to visit them. It is possible, however, that a considerable amount of movement by particular households, from one dwelling to another in the same district, is desired or desirable, when households contract in size because the children grow up and leave the home, or when the head of household retires and his financial circumstances change. If this is, in fact, the case to any considerable extent, the demonstration of Table BD suggests that there were too few small occupations in the country in 1951, particularly such as are suitable for older people. In view of the concentration of small household occupations in areas in which redevelopment has taken place and where the incidence of sharing of dwellings is high, the deficiencies in numbers of small occupations will have been relatively smaller in many older urban areas than the overall figures indicate and relatively greater in many small towns and rural districts and perhaps also in some modern suburban areas where comparatively little redevelopment has taken place. To the extent that many of the smaller units of accommodation which existed in 1951 were in shared dwellings which did not provide domestic arrangements for the exclusive use of each household, the deficiency in numbers of adequately equipped small occupations will have been even higher.

It is no part of the purpose of this report to suggest whether any major redistribution of existing and potentially existing households within the existing stock of dwellings is either practicable or desirable. In fact, however, present house building activities are directed only in part towards the provision of dwellings for new families being currently formed. They are also directed towards the alleviation of crowding which the present generation has inherited from the past, towards the conversion or adaptation of structurally sound residential properties of obsolete design into units of accommodation more in line with modern standards, and towards the demolition of worn out residential buildings and the conversion of others to non-residential uses. The relative importance of these factors is different in different parts of the country and in different types of area, but the existence of such a variety of factors makes possible a certain amount of gradual redistribution of some types of household at present living in dwellings which are either too small or too large for them. The extent to which such redistribution takes place affects the size and type of new houses and flats to be built, which will be more satisfactorily assessed if some account is taken of the housing conditions of the whole population, as well as of the contemporary demands of those seeking to acquire or change a dwelling. It is therefore relevant to know

that the households with heads in the younger age range and those with the largest numbers of children were in 1951 the classes most seriously below average in the size (in relation to household composition) of the occupations they inhabited, that the households composed of elderly persons with no children were the most spaciouly housed, and that but for the presence of family nuclei many composite households would have had as much accommodation in their dwellings, in relation to their size and compositions, as other classes of household.

The census analysis of housing density in terms of household composition provides no direct estimates of numbers of households inhabiting dwellings at space levels below any of the hypothetical standards considered. The cross-tabulations of households by numbers of persons and numbers of rooms, however, enable some maximum figures to be worked out. On the hypothesis that, apart from one person households, the accommodation in a dwelling is inadequate for its inmates unless it contains one habitable room in addition to a bedroom for each married couple, for each pair of children of the head, and for each other person, it is possible to say that in England and Wales at least 650 thousand households had inadequate numbers of rooms in their dwellings in 1951. If the one person households enumerated in one room are included the number is increased to 850 thousand.

Households sharing dwellings

Nearly two million (1,871,923) private households of England and Wales were enumerated in shared dwellings. As is to be expected, the proportion of small households was larger among sharing than among non-sharing households; 80 per cent of sharing households were of 1, 2 or 3 persons. It is also not surprising to find that the majority of them were living in small occupations; nearly 80 per cent were found inhabiting 1, 2 or 3 rooms; over half the dwellings occupied by more than one household were of 5 or 6 rooms and only a third were larger than this. A special analysis, made in a few selected areas of very different types, indicates a wide range of types of combination of households sharing dwellings in pairs as regards size of household and number of rooms occupied and some other characteristics. Although this evidence is of very limited scope it disposes fairly conclusively of the idea that a relatively large proportion of sharing household combinations included one household in a position subsidiary to that of a "main" household, the former being considerably smaller in numbers of persons and occupying only a small proportion of the rooms contained in the dwelling (e.g. a lodger with a 'family' household). In most cases of sharing the rooms available were divided fairly evenly between the constituent households.

Among households in shared dwellings were 150 thousand of one person living in one room and probably about 350 thousand larger households living in occupations smaller (in terms of numbers of rooms) than would allow for a living room for each household in addition to a bedroom for each married couple and each pair of children and each other person. Thus it would appear that, on a modest standard of accommodation, the remainder (about three quarters) of all sharing households, that is nearly one and a half million, were not seriously deficient in numbers of rooms in relation to the households contained in them. This number includes 280 thousand one person households living in occupations of at least two rooms.

Among households in shared dwellings high proportions were found to be without exclusive use of the household domestic arrangements covered in the census enquiry. As is also the case for unshared dwellings the proportions were considerably higher the smaller the number of rooms in the occupation. In the majority of such cases these arrangements were, of course, shared between two or more households in the dwelling. Among households sharing dwellings taken as a whole the proportions with exclusive use of all the specified arrangements were 6, 10, 18 and 34 per cent for occupations of 2, 3, 4 - 5, and 6 or more rooms respectively. If

these proportions are assumed applicable irrespective of the numbers of persons living in these occupations, it may be estimated that only about 150 thousand of the one and a half million sharing households which were not deficient in numbers of rooms were fully equipped with domestic arrangements (in the sense of having exclusive use of those specified for the census enquiry); about 800 thousand of them would, on the same assumption, have had exclusive use of both a kitchen sink and a cooking stove, rather over 500 thousand would have had exclusive use of piped water, and about 500 thousand would have had exclusive use of a water-closet. Under 200 thousand would have had exclusive use of all the arrangements except a fixed bath.

Composite households

Apart from any deficiencies in the housing accommodation of households in shared dwellings there were family units which did not possess separate accommodation at all. The census household composition analysis of households throws indirect light on this question by identifying family units and boarders within the 'main' household. How many such sub-units should be provided with separate housing accommodation is not a question to be answered from population census data, but it is relevant to its consideration to know how many such units existed.

In Great Britain in 1951 nearly 2 million (1,980,000) private households were of a composite type containing persons other than those in the primary family unit. Almost half of them (952,000) contained, apart from the head of household, a family nucleus composed either of a married couple and their children, if any, or of one parent with one or more children; among the main class of households which were not composite in this sense, nearly a million (968,000) contained a close relative (parent or brother or sister of head or spouse not being part of a family nucleus) in addition to the head, his spouse and children. Among these were 37 thousand households which contained both parents of the head of household or his spouse. Only 130,000 composite households contained close relatives of these types.

Household Arrangements

The tabulations covering the availability to private households of a piped water supply, a cooking stove, a kitchen sink, a watercloset, and a fixed bath show that just over half the households of England and Wales were recorded in 1951 as having exclusive use of all these arrangements. This proportion was much higher for households in undivided dwellings (59 per cent) than for households sharing dwellings (10 per cent). In addition the numbers of households with exclusive use of the four specified arrangements other than fixed bath were considerable - 21 per cent of households in undivided dwellings and 11 per cent of households in shared dwellings.

In 1951 altogether 6.8 million households had exclusive use of all five arrangements, 11.3 million had exclusive use of both sink and stove, 10.6 million had exclusive use of a piped water supply and 10.3 million had exclusive use of a watercloset. There were 1.4 million households without exclusive use of both a kitchen sink and a watercloset. As has been shown in the previous section, disproportionately large numbers of households in shared dwellings were without separate provision of the domestic arrangements.

Local Variations

Reference has been made throughout this report, but particularly in Chapter IX, to some considerable differences in the housing conditions of different parts of the country and different kinds of town, which render deficiencies more acute in some areas, and less acute in others, than the figures for the country as a whole imply. The main patterns of difference derive from the historical factors responsible for the growth of the population during the last two centuries and the changes that have taken

place in its distribution. Certain parts of the country, and certain parts of many towns which exist today, were already urbanised during the eighteenth century, and many houses which were built in those days and in the early part of the nineteenth century still exist. They were built for larger families than those of today, and most of them are obsolete in size even if not also obsolete in interior arrangements.

The large volume of internal migration which has been taking place in recent years is also a factor to be noted in relation to areal differences in housing conditions. The restricted volume of accommodation available discourages families from moving house as their requirements change, unless they are moving for other reasons into new districts. Thus the households living in districts whose populations are growing as a result of migration movements may be housed in dwellings more suited to their composition than households whose population consists primarily of families which have grown up in the same district.

Pointers to the future

It may be profitable to consider the prospect of changes in numbers of households and in the pattern of their distribution which may occur as a result of future changes in the numbers of persons of different ages and marital condition in the population. In Table BE estimated numbers in England and Wales in the classes of the population which form the heads of different kinds of private households are given to provide on the one hand a comparison between 1931 and 1951, and on the other hand a comparison between 1951, 1955, and two future dates. The proportions of the population of these classes which formed heads of private households in 1951 have been applied to the population figures for 1931 to give hypothetical numbers of private households in 1931. These proportions have also been applied to 1955 and subsequent years except that there has been some progressive writing up of the proportion of heads of households among married men aged under 40 to allow for greater separation of family nuclei as a result of the post-censal expansion of building programme. This presentation provides a basis on which to compare the extent to which similar types of family groups formed separate households in 1931 and 1951, and to derive broad inferences about the growth in numbers of private households which may take place in the next twenty years on the assumption of no external migration.

No comprehensive analysis of the heads of private households by age and marital condition has been made in England and Wales in a population census prior to that of 1951. The proportions of married persons in the 1931 population were much lower than in 1951, and the proportion of single persons in the 15-39 age-group was considerably higher. Direct comparison with 1931 in numbers of households can only be made in terms of overall total numbers. The hypothetical figure of 10,265 thousand in Table BE compares with an actual figure of 10,233,139 private households in England and Wales in 1931. A slight difference between 1931 and 1951 in the dividing line drawn between private and non-private households affects this comparison, but it is clear that the proportions of heads of private households, in the classes of population identified in the 1951 classification of households by composition, may well have been very similar in 1931 and 1951. It is, of course, possible that larger proportions for some classes counterbalanced smaller proportions for others, but the comparison, supported by general knowledge of housing conditions, suggests no very large changes in this respect in this period.

The comparison between 1951 and subsequent dates shown in Table BE suggests that the number of elderly married couples (with husband aged 60 or over) is likely to have increased by more than a million by 1975 and the number of widowed or divorced persons aged 60 or over is likely to have increased by nearly 700 thousand. By contrast numbers of non-married persons in the 40-59 age-group are likely to have declined, especially so for single women who numbered 922 thousand in 1951 as compared with the projected figure of 406 thousand in 1975.

Table BE. - POPULATION and HOUSEHOLDS in 1951, and comparison with 1931, 1955, and projected figures for 1965 and 1975, on the hypothetical assumption of constant (1951) proportions of heads of households in sex, age, marital condition classes of the population

England and Wales

Class of population	Estimated total population (thousands) (including Armed Forces stationed abroad)					Percentage in status of head of private household 1951	Heads of private households (thousands) (hypothetical except for 1951)

Private households							10,265	13,118	13,575	14,357	15,159

* For the purpose of this table the husband of a married couple was conventionally counted as the head in the small number of cases (mostly where the spouse was absent) in which the wife was reported as head: married heads who were enumerated without their spouses were treated as if the spouse were present: and the ages of spouses of female heads, whether present or absent, were estimated.

+ This proportion has been increased arbitrarily to 80 in 1955, 85 in 1965 and 90 in 1975.

++ Projections of the estimated June, 1955, population by sex and age were published in the Registrar General's Quarterly Return No.428 for the December Quarter, 1955. In the above table these projections have been distributed by marital condition in proportions consistent with those given in the Government Actuary's Report on the First Quinquennial Review of the National Insurance Scheme.

The net result of these postulated changes in the size and composition of the population is that, if proportions of heads of private households to total persons remain the same as in 1951 for the classes of population shown in Table BE (except for the assumed rise in the proportion for married men under 40), there would be about 15.2 million private households in England and Wales in 1975 as compared with 13.1 million in 1951, about three quarters of the difference being accounted for by increases in numbers of elderly married couples and elderly widowed or divorced persons and about one quarter by the assumed increase in young married heads. If by 1975 all married couples have separate accommodation but the 1951 proportions of heads are applied to the non-married classes the number of private households in 1975 might be nearly 16 million.

Table 1. - DWELLINGS, ROOMS and HOUSEHOLDS

England and Wales, Regions of England, Wales, Aggregates
Summary, Conurbations, London A.C. and County
Boroughs with 500,000 Population or more

Notes: - (1) For definitions of dwellings, households, rooms, etc. see p.xvi.
(2) Dwellings partly occupied by one household and partly vacant are treated in this Table as occupied by one household (see note on p.xvii).

Table 2. - PRIVATE HOUSEHOLDS by SIZE, ROOMS OCCUPIED and DENSITY
OF OCCUPATION in (a) All dwellings (b) Shared dwellings

(England and Wales, Regions of England, Wales, Aggregates
Summary, Conurbations, London A.C. and County
Boroughs with 500,000 Population or more

Notes:- (1) For definitions of dwellings, households, rooms, etc., see p.xvi.
(2) In this Table households sharing dwellings are classified according to the number of rooms occupied by each, regardless of whether the remainder of the dwelling is occupied or vacant (see note on p.xvii).
(3) Households occupying part of a dwelling, the remainder being vacant, are treated in this Table as households sharing dwellings (see note on p.xvii).

Table 4. - UNITS OF OCCUPATION INHABITED BY INDIVIDUAL HOUSEHOLDS
by number of ROOMS, and CHANGES 1931-1951

England and Wales, Regions of England, Wales

Notes: - (1) For definitions of dwellings, households, rooms, notes on comparability with 1931 figures, etc., see p. ix.
(2) See notes 2 and 3 to Table 2 for the treatment of households sharing dwellings.
(3) The figures in columns (j) and (k) give only an approximate comparison with columns (e) and (f), since in 1931 Table 6 did not distinguish sharing and non-sharing households. The figures for the larger occupation sizes are particularly unreliable.

Table 8B.- PRIVATE HOUSEHOLDS by DENSITY OF OCCUPATION (Persons per Room); Percentage Distribution

England and Wales, Regions of England, Wales,
Aggregates Summary, Conurbations,
London A.C. and County Boroughs with 500,000
Population or more

Notes:- (1) For definitions of dwellings, households, rooms, etc., see P. xvi.

(2) See notes 2 and 3 to Table 2 for the treatment of households sharing dwellings.

(3) The percentages entered in column (r) relate to areas as constituted at the date of the 1931 Census. Areas affected by subsequent boundary changes, for which as a result only approximate figures can be given, have been marked with an asterisk.*
For the two aggregates marked † figures have been calculated according to the urban or rural status of the areas in 1931.

Area	Households at successive densities (persons per room)										Households sharing dwellings										Population in all households at successive densities (persons per room)										Percentage of persons living at more than 2 per room, 1931
	All households					Households in single household dwellings					Households sharing dwellings					Population in all households at successive densities (persons per room)															
	Over 2					Over 2					Over 2					Over 2

Table 12A. - PRIVATE HOUSEHOLDS by MARITAL CONDITION, AGE and SEX of HEAD

{ England and Wales, Regions of England, Wales, and }
 { Aggregates Summary, Conurbations, London A.C. and }
 { County Boroughs with 500,000 Population or more }

Notes: - (1) For definitions, etc., see p. ix.
 (2) The figures in columns (g) to (o) for London A.C. are estimates based on One per cent Sample data; they have been used in the figures for the larger areas which contain London A.C. The full figures are not available owing to a late change in tabulation design (see Census 1951, County Report, London, p. xix, for details).

Numbers of Households with Heads as follows:-																
Total Households			Married (either sex) and aged				Non-Married Males aged			Non-Married Females aged						
							40-59			40-59			40-59		60 and over	
							Single	Widowed and Divorced	Single	Widowed and Divorced	Single	Widowed and Divorced	Single	Widowed and Divorced

Table 12B. - PRIVATE HOUSEHOLDS BY MARITAL CONDITION, AGE and SEX OF HEAD;
Distribution per 1,000

Notes:- (1) For definitions, etc., see p. ix.
(2) The figures in columns (g) to (o) for London A.C. are estimates based on One per cent Sample data; they have been used in the figures for the larger areas which contain London A.C. The full figures are not available owing to a late change in tabulation design (see Census 1951, County Report, London, p. xxx, for details).

(England and Wales, Regions of England, Wales, Aggregates Summary, Conurbations, London A.C. County Boroughs with 500,000 Population or more)

Table 13. - CHARACTERISTICS OF HOUSEHOLDS and DWELLINGS OF LOCAL AREAS

(England and Wales, Regions of England, Wales, Aggregates Summary, Conurbations with their Divisions and Sub-divisions, Administrative Counties, County Boroughs, Metropolitan Boroughs, Municipal Boroughs, Urban and Rural Districts and New Towns)

Notes: - (1) For definitions of dwellings, households, rooms, etc., see p. vii.
 (2) In the Household Arrangements columns E = having exclusive use; S = sharing with another household; N = entirely without.
 (3) Areas for which, as a result of boundary changes, only an approximate figure or no worthwhile figure, can be given in column (e).
 (4) The constitution of the Divisions and Sub-divisions of Conurbations has been set out in full in the Census 1951, Great Britain, One per cent Sample Tables and in the Census 1951, Report on Greater London and Five Other Conurbations.

Table 13. - CHARACTERISTICS OF HOUSEHOLDS and DWELLINGS OF LOCAL AREAS - continued

Area	Occupational Grading of Area				Dwellings				Households										Density of Occupation				Household Arrangements										Heads of Household																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																															
	Percentage of occupied and vacant dwellings in Social Classes				Percentage of occupied dwellings with 1-5 rooms				Percentage of occupied dwellings with 6-7 rooms				Percentage of occupied dwellings with 8-9 rooms				Percentage of occupied dwellings with 10-11 rooms				Percentage of occupied dwellings with 12-13 rooms				Percentage of occupied dwellings with 14-15 rooms				Percentage of occupied dwellings with 16-17 rooms				Percentage of occupied dwellings with 18-19 rooms				Percentage of occupied dwellings with 20-21 rooms				Percentage of occupied dwellings with 22-23 rooms				Percentage of occupied dwellings with 24-25 rooms				Percentage of occupied dwellings with 26-27 rooms				Percentage of occupied dwellings with 28-29 rooms				Percentage of occupied dwellings with 30-31 rooms				Percentage of occupied dwellings with 32-33 rooms				Percentage of occupied dwellings with 34-35 rooms				Percentage of occupied dwellings with 36-37 rooms				Percentage of occupied dwellings with 38-39 rooms				Percentage of occupied dwellings with 40-41 rooms				Percentage of occupied dwellings with 42-43 rooms				Percentage of occupied dwellings with 44-45 rooms				Percentage of occupied dwellings with 46-47 rooms				Percentage of occupied dwellings with 48-49 rooms				Percentage of occupied dwellings with 50-51 rooms				Percentage of occupied dwellings with 52-53 rooms				Percentage of occupied dwellings with 54-55 rooms				Percentage of occupied dwellings with 56-57 rooms				Percentage of occupied dwellings with 58-59 rooms				Percentage of occupied dwellings with 60-61 rooms				Percentage of occupied dwellings with 62-63 rooms				Percentage of occupied dwellings with 64-65 rooms				Percentage of occupied dwellings with 66-67 rooms				Percentage of occupied dwellings with 68-69 rooms				Percentage of occupied dwellings with 70-71 rooms				Percentage of occupied dwellings with 72-73 rooms				Percentage of occupied dwellings with 74-75 rooms				Percentage of occupied dwellings with 76-77 rooms				Percentage of occupied dwellings with 78-79 rooms				Percentage of occupied dwellings with 80-81 rooms				Percentage of occupied dwellings with 82-83 rooms				Percentage of occupied dwellings with 84-85 rooms				Percentage of occupied dwellings with 86-87 rooms				Percentage of occupied dwellings with 88-89 rooms				Percentage of occupied dwellings with 90-91 rooms				Percentage of occupied dwellings with 92-93 rooms				Percentage of occupied dwellings with 94-95 rooms				Percentage of occupied dwellings with 96-97 rooms				Percentage of occupied dwellings with 98-99 rooms				Percentage of occupied dwellings with 100-101 rooms				Percentage of occupied dwellings with 102-103 rooms				Percentage of occupied dwellings with 104-105 rooms				Percentage of occupied dwellings with 106-107 rooms				Percentage of occupied dwellings with 108-109 rooms				Percentage of occupied dwellings with 110-111 rooms				Percentage of occupied dwellings with 112-113 rooms				Percentage of occupied dwellings with 114-115 rooms				Percentage of occupied dwellings with 116-117 rooms				Percentage of occupied dwellings with 118-119 rooms				Percentage of occupied dwellings with 120-121 rooms				Percentage of occupied dwellings with 122-123 rooms				Percentage of occupied dwellings with 124-125 rooms				Percentage of occupied dwellings with 126-127 rooms				Percentage of occupied dwellings with 128-129 rooms				Percentage of occupied dwellings with 130-131 rooms				Percentage of occupied dwellings with 132-133 rooms				Percentage of occupied dwellings with 134-135 rooms				Percentage of occupied dwellings with 136-137 rooms				Percentage of occupied dwellings with 138-139 rooms				Percentage of occupied dwellings with 140-141 rooms				Percentage of occupied dwellings with 142-143 rooms				Percentage of occupied dwellings with 144-145 rooms				Percentage of occupied dwellings with 146-147 rooms				Percentage of occupied dwellings with 148-149 rooms				Percentage of occupied dwellings with 150-151 rooms				Percentage of occupied dwellings with 152-153 rooms				Percentage of occupied dwellings with 154-155 rooms				Percentage of occupied dwellings with 156-157 rooms				Percentage of occupied dwellings with 158-159 rooms				Percentage of occupied dwellings with 160-161 rooms				Percentage of occupied dwellings with 162-163 rooms				Percentage of occupied dwellings with 164-165 rooms				Percentage of occupied dwellings with 166-167 rooms				Percentage of occupied dwellings with 168-169 rooms				Percentage of occupied dwellings with 170-171 rooms				Percentage of occupied dwellings with 172-173 rooms				Percentage of occupied dwellings with 174-175 rooms				Percentage of occupied dwellings with 176-177 rooms				Percentage of occupied dwellings with 178-179 rooms				Percentage of occupied dwellings with 180-181 rooms				Percentage of occupied dwellings with 182-183 rooms				Percentage of occupied dwellings with 184-185 rooms				Percentage of occupied dwellings with 186-187 rooms				Percentage of occupied dwellings with 188-189 rooms				Percentage of occupied dwellings with 190-191 rooms				Percentage of occupied dwellings with 192-193 rooms				Percentage of occupied dwellings with 194-195 rooms				Percentage of occupied dwellings with 196-197 rooms				Percentage of occupied dwellings with 198-199 rooms				Percentage of occupied dwellings with 200-201 rooms				Percentage of occupied dwellings with 202-203 rooms				Percentage of occupied dwellings with 204-205 rooms				Percentage of occupied dwellings with 206-207 rooms				Percentage of occupied dwellings with 208-209 rooms				Percentage of occupied dwellings with 210-211 rooms				Percentage of occupied dwellings with 212-213 rooms				Percentage of occupied dwellings with 214-215 rooms				Percentage of occupied dwellings with 216-217 rooms				Percentage of occupied dwellings with 218-219 rooms				Percentage of occupied dwellings with 220-221 rooms				Percentage of occupied dwellings with 222-223 rooms				Percentage of occupied dwellings with 224-225 rooms				Percentage of occupied dwellings with 226-227 rooms				Percentage of occupied dwellings with 228-229 rooms				Percentage of occupied dwellings with 230-231 rooms				Percentage of occupied dwellings with 232-233 rooms				Percentage of occupied dwellings with 234-235 rooms				Percentage of occupied dwellings with 236-237 rooms				Percentage of occupied dwellings with 238-239 rooms				Percentage of occupied dwellings with 240-241 rooms				Percentage of occupied dwellings with 242-243 rooms				Percentage of occupied dwellings with 244-245 rooms				Percentage of occupied dwellings with 246-247 rooms				Percentage of occupied dwellings with 248-249 rooms				Percentage of occupied dwellings with 250-251 rooms				Percentage of occupied dwellings with 252-253 rooms				Percentage of occupied dwellings with 254-255 rooms				Percentage of occupied dwellings with 256-257 rooms				Percentage of occupied dwellings with 258-259 rooms				Percentage of occupied dwellings with 260-261 rooms				Percentage of occupied dwellings with 262-263 rooms				Percentage of occupied dwellings with 264-265 rooms				Percentage of occupied dwellings with 266-267 rooms				Percentage of occupied dwellings with 268-269 rooms				Percentage of occupied dwellings with 270-271 rooms				Percentage of occupied dwellings with 272-273 rooms				Percentage of occupied dwellings with 274-275 rooms				Percentage of occupied dwellings with 276-277 rooms				Percentage of occupied dwellings with 278-279 rooms				Percentage of occupied dwellings with 280-281 rooms				Percentage of occupied dwellings with 282-283 rooms				Percentage of occupied dwellings with 284-285 rooms				Percentage of occupied dwellings with 286-287 rooms				Percentage of occupied dwellings with 288-289 rooms				Percentage of occupied dwellings with 290-291 rooms				Percentage of occupied dwellings with 292-293 rooms				Percentage of occupied dwellings with 294-295 rooms				Percentage of occupied dwellings with 296-297 rooms				Percentage of occupied dwellings with 298-299 rooms				Percentage of occupied dwellings with 300-301 rooms				Percentage of occupied dwellings with 302-303 rooms				Percentage of occupied dwellings with 304-305 rooms				Percentage of occupied dwellings with 306-307 rooms				Percentage of occupied dwellings with 308-309 rooms				Percentage of occupied dwellings with 310-311 rooms				Percentage of occupied dwellings with 312-313 rooms				Percentage of occupied dwellings with 314-315 rooms				Percentage of occupied dwellings with 316-317 rooms				Percentage of occupied dwellings with 318-319 rooms				Percentage of occupied dwellings with 320-321 rooms				Percentage of occupied dwellings with 322-323 rooms				Percentage of occupied dwellings with 324-325 rooms				Percentage of occupied dwellings with 326-327 rooms				Percentage of occupied dwellings with 328-329 rooms				Percentage of occupied dwellings with 330-331 rooms				Percentage of occupied dwellings with 332-333 rooms				Percentage of occupied dwellings with 334-335 rooms				Percentage of occupied dwellings with 336-337 rooms				Percentage of occupied dwellings with 338-339 rooms				Percentage of occupied dwellings with 340-341 rooms				Percentage of occupied dwellings with 342-343 rooms				Percentage of occupied dwellings with 344-345 rooms				Percentage of occupied dwellings with 346-347 rooms				Percentage of occupied dwellings with 348-349 rooms				Percentage of occupied dwellings with 350-351 rooms				Percentage of occupied dwellings with 352-353 rooms				Percentage of occupied dwellings with 354-355 rooms				Percentage of occupied dwellings with 356-357 rooms				Percentage of occupied dwellings with 358-359 rooms				Percentage of occupied dwellings with 360-361 rooms				Percentage of occupied dwellings with 362-363 rooms				Percentage of occupied dwellings with 364-365 rooms				Percentage of occupied dwellings with 366-367 rooms				Percentage of occupied dwellings with 368-369 rooms				Percentage of occupied dwellings with 370-371 rooms				Percentage of occupied dwellings with 372-373 rooms				Percentage of occupied dwellings with 374-375 rooms				Percentage of occupied dwellings with 376-377 rooms				Percentage of occupied dwellings with 378-379 rooms				Percentage of occupied dwellings with 380-381 rooms				Percentage of occupied dwellings with 382-383 rooms				Percentage of occupied APPENDIX A

COMPOSITION OF PRIVATE HOUSEHOLDS

An analysis of the 1951 Census One per cent Sample of private households of Great Britain, mainly reproduced from the tables published in the One per cent Sample Tables

Explanatory Notes

1. The primary information on which the household composition analysis has been based is that provided by column B of the Census Schedule, in which was given the relationship of each person to the head of the household, in response to the following schedule direction:-

State whether "Head" or "Wife" "Son" "Mother" or other relative, "Visitor" "Boarder" "Employee" etc.

These answers, being in terms of relationship to the head, were not always sufficient to establish the relationships between component members themselves, and where this was the case the tabulating staff were directed conventionally to assume a relationship in certain circumstances as follows:-

Spouse Relationship

- (a) *Ancestors or Descendants of Head.* To be regarded as married to any person of opposite sex and equivalent affinity or "in law" rank, provided both are married and have the same surname. If alternative combinations are possible under this rule, pair in order of schedule entry. Step parents or step or adopted children to be treated similarly as far as possible.
- (b) *All other married persons.* Pair any married man and married woman of the same surname, provided (a) they are not separated on the schedule by a person with a different surname, (b) that their ages do not differ by more than 30 years, and (c) there does not appear to be any evidence of an opposing nature. If alternative combinations are possible here, choose the most likely or pair in order of schedule entry.

Child-Parent Relationship

Any married, widowed or divorced person with a child's surname and of suitable age difference is to be deemed to be the parent in the absence of conflicting evidence.

2. For the purpose of the tabulations the enumerated members of each household (other than visitors, who were excluded) were first arranged in a series of groups intended to represent a rough grading of successive degrees of household affinity or cohesion, stemming from the head, as follows:-

- I. **Head of Household**
- II. **Spouse of Head**
- III. **Designated Children of the Household**, comprising all the children of the head or head's spouse, whatever their age, and including step and adopted children, with the exception of such as were married, or if widowed or divorced were accompanied by children of their own. Children under age 16 of the following types were also included amongst the designated children in the occasional circumstances in which such were found, viz:-
 - (i) brothers or sisters of head or head's spouse,
 - (ii) children apparently without any parent present,
 - (iii) children of resident domestic servants.

- IV. **Near Relatives of Head or Head's Spouse**, comprising (i) ancestors (all types) and (ii) brothers or sisters aged 16 or over, with the exception of such as were married, or if widowed or divorced were accompanied by children of their own.
- V. **Resident Domestic Servants**.
- VI. **The Remainder**, comprising all persons enumerated in the household other than those assigned to grades I to V; whether kin to the head or not and including those of near kinship specifically excepted from grades III and IV.

3. Definitions

(a) Primary Family Unit (P.F.U.)

Those members of a private household which fall into the affinity gradings (I) to (V) described in 2 above.

On this definition every household contains one but only one P.F.U., and many households are composed entirely of the P.F.U.

(b) Remainder Section

Those members of a private household, if any, who are not part of the P.F.U. They include relatives of the head of household other than those identified in affinity gradings (I) to (V), and persons unrelated to the head. In some cases they will comprise groups of related persons (see below).

(c) Family Nucleus (F.N.)

Within the remainder section defined above the following groups are separately identified as family nuclei:

- (i) A married couple and their child(ren) if any (excluding from the latter any that are married or are accompanied by children of their own).
- (ii) A lone parent (married, widowed or divorced) provided that he or she is accompanied by child(ren) as in (i) in which case the parent and child(ren) constitute the F.N.

It is to be noted that on this definition an F.N. must contain at least two persons. Also married ancestors (of head or head's spouse) are included in the P.F.U. and are not shown as family nuclei.

(d) P.F.U. household

This is a household containing no persons other than those in the P.F.U.

(e) Composite household

This is a household containing other persons in addition to those in the P.F.U.

4. Tabulations

The tabulations are based on the scheme of definitions described above. The following points relating to their interpretation should be noted:

- (i) "Visitors", i.e. persons for whom a usual residence was recorded other than the address given on the schedule, are excluded from all the tables except Table A.6 in which they are separately analysed.
- (ii) the tables are on a one per cent sample basis and relate to Great Britain and not to England and Wales.

(iii) Part II of the *One per cent Sample Tables* contains six tables similar in form to Table 1 in this appendix distinguishing

-	P.F.U.	households with no near relative			
-	"	"	"	one	"
-	"	"	"	two or more	near relatives
-	Composite	"	"	no near relative	
-	"	"	"	one	"
-	"	"	"	two or more	near relatives

(iv) **Punctuation in Sample Figures.** All sample figures have been printed with the comma divisions in the place they would occupy in their grossed-up counterparts (e.g. 1,000,0 for 1,000,000 or 1,0 for 1,000). This convention was used in the *Census 1951, Great Britain, One per cent Sample Tables*, where it was explained (p. vii) that it was felt that it would more readily convey the implicit meaning of the figures than would the ordinary arrangement. For example, for the total population of Great Britain, 48,840,7 gives a more immediate appreciation of the dimensions implied than does 488,407. At the same time this device should help to prevent any accidental confusion between the sample figures and the full census figures.

Table A.1. - COMPOSITION OF PRIVATE HOUSEHOLDS by AGE and MARITAL CONDITION of HEAD and NUMBER of DESIGNATED CHILDREN

Designation of P.F.U.	Type of house or building	Total number of households	P.F.U. households				Composite households				Number of households with occupation (persons in room) of		Children aged under 5				Children aged under 16				P.F.U.s containing				Number of households comprising the following number of persons				Households containing family nuclei (P.F.U.)			
			Persons in house-holds		Persons in rooms occupied		Persons in house-holds		Persons in rooms occupied		Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s	Number of P.F.U.s	Number of children P.F.U.s

APPENDIX D

SPECIAL ANALYSIS OF HOUSEHOLDS
SHARING DWELLINGS IN SIX SELECTED AREAS

See p.lxxxv for a note on the areas selected for this examination. The tables are not to be regarded as representative of any other areas in the country. The chief value of the statistics lies in the differences exhibited between types of combination of sharing households within each area.

Table D.1. - Combinations of HOUSEHOLDS IN SHARED
DWELLINGS by SIZE OF DWELLING
and SIZE OF OCCUPATION

{ Six Selected
Areas

Note:- see notes on p.ix and special note above.

* It is to be noted that the figures in the cells on the diagonals of the sections (for identical pairs) have been doubled in deriving figures of the individual households.

¶ Home Duties - see headnote 3.

- Notes:- (1) See notes on p. ix., and special note at head of p.139.
 (2) Where any room in the dwelling was recorded as shared between the two households it has been allocated, in this Table and in Table D.3, to the household listed first by the enumerator.
 (3) "Home Duties" includes all persons not stating a gainful occupation but inserting "home duties" or other words of similar meaning.
 (4) "Children of Head" means children of any age, including step and adopted children, but excludes those stated to be married.

Table D.4.- HOUSEHOLDS in DWELLINGS CONTAINING
THREE OR MORE HOUSEHOLDS: Sizes of
Household Occupations and numbers
of non-married persons living alone

(Part of Westbourne Ward
of Paddington Met. B.

Notes:- (1) See notes on p. ix and special note at head of p. 139.
(2) Where one room in the dwelling was recorded as shared between two households it has been allocated, in this Table and in Table D.5., to the household listed first by the enumerator. Two dwellings in which several households each occupied only a share of a room have been excluded from both Tables. These comprised a dwelling of 9 rooms housing 10 households with room allocations 3,1,1,1,1,1,1,1,1 and a dwelling of 14 rooms housing 13 households with room allocations 3,3,3,1,1,1,1,1,1,1,1,1,1,1.

* The figures relate to the occupied population only in contrast to those given in Table 13 which include the retired. Ward figures on the latter basis are not available, but for Birmingham C.B. as a whole the proportion in Social Classes I and II was the same (13.7) among occupied males as among occupied and retired males.
