AN INAUGURAL

DISSERTATION

ONTHE

INFLUENZA:

SUBMITTED TO THE EXAMINATION OF THE REV. JOHNEWING, S. T. P. Provolt;

The Truftees and Medical Professions of the University of Pennfylvania, in order to obtain the Degree of

DOCTOR OF MEDICINE,

On the Eighth Day of May A. D. 1793.

BY ROBERT JOHNSTON,

Of Philadelphie, Member of the American Medical Society.

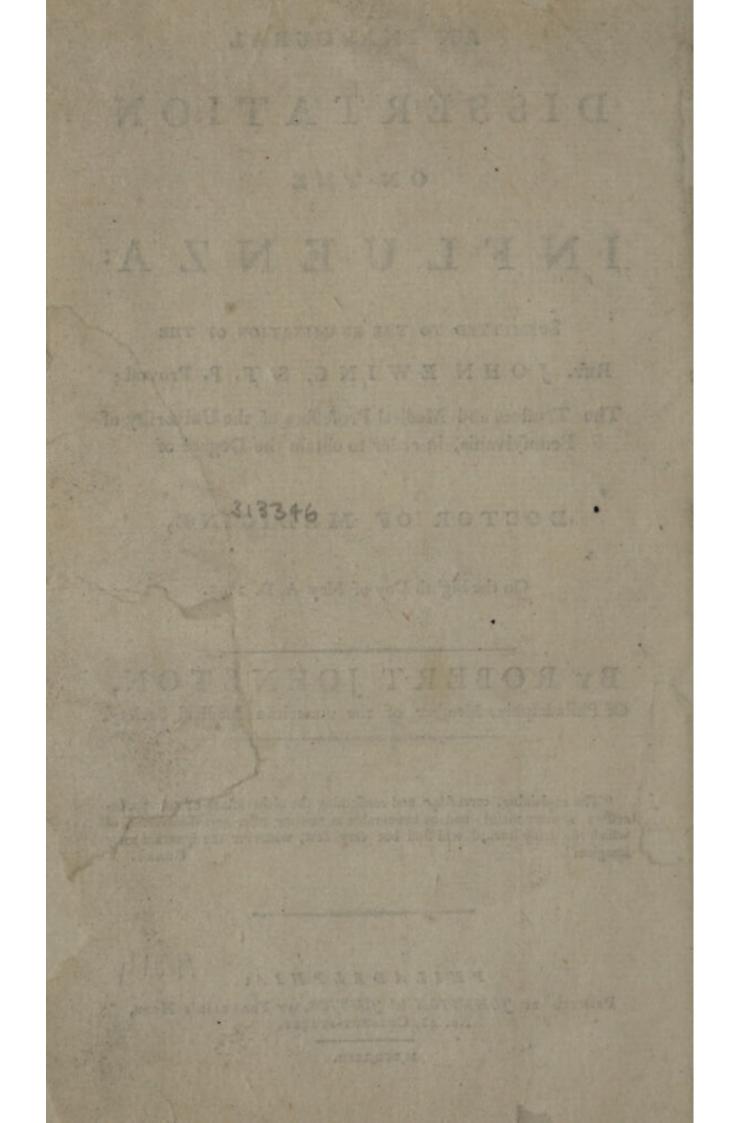

"The explaining, correcting and confirming the observations of our predeceffors is more useful and as honosrable as hunting after new differences, of which the truly learned will find but very few, whatever the ignorant may imagine."

PHILADELPHIA:

121

PRINTED BY JOHNSTON & JUSTICE, AT ERANKLIN'S HEAD, No. 41, CHESNUT-STREET.

M,DCC,XCIII.

INTRODUCTION.

THE Influenza feems to have been known to the earlieft medical writers whofe works we have an opportunity of confulting; yet, from a variety in fome of its most prominent fymptoms, it has received a great many different names, and fometimes, been confidered as a new difease. Among the writers from Hippocrates to Sydenham, it is generally called *Febris catarrhalis epidemica* (1); but in 1673, the latter fupposes it to be a *new fever*, and names it accordingly.

It is curious to remark the regular, and conftant pace which the fcience of health and philofophy have kept with each other. As long as philofophers imagined the elements of natural bodies to be four, phyficians fuppofed human bodies to confift of as many humours : but as foon as the corpufcular philofophy became pretty generally received, medicine difcovered her " acrimony, fpiculæ, and falts of various fizes (2)."

In like manner, when aftrology took the lead of true fcience, and people began to fancy all tereftrial things were governed by the heavens, fome Italian doctors found out that this diffemper proceeded from the *influence of the ftars*, and therefore gave it the name of INFLUENZA.

(1) Motherby's Med. Dict. under the word Influenza.
(2) Black's Hiftory of Medicine.

Some affert that the difeafe now known by the name of influenza cannot be the fame with that defcribed by Sydenham, as the influenza is manifeitly contagious, and the great Sydenham, a ftrict observer of nature, makes no mention of any fuch property belonging to that which he defcribes. Hippocrates was certainly as attentive, and as fagacious as Sydenham, yet he difcovered not (what was much more eafily difcoverable) the circulation of the blood; a circumftance at which we juftly wonder,-that it poffibly could have efcaped the obfervation of a perfon much lefs attentive, and enlightened than he who is with propriety flyled the Father of the healing art. The famenefs of the fymptoms, however, indubitably proves the identity of the Tuffis Epidemica and the modern influenza. Dr. Grant in a letter to Doctor de la Cour, fays that he has carefully attended to the beginning, progrefs, and termination of the influenza, and finds upon comparifor that the fame has been difcuffed by the English Hippocrates long before, "in as masterly a manner as the subject does admit of .??

History of the Difease.

As a defcription of this diffemper may be found in various publications, I shall content myfelf with a short account of it, as it appeared in the city of Philadelphia, in the year 1789.

The influenza made its appearance in the month of October, previous to which, and for fome weeks after, the weather was dry, cool, and pleafant. It commonly fet in with univerfal laffitude, with chills, and fever; an acute pain in the head, and eye-balls; not unfrequently a confiderable itching in the eye-lids; and fome had a fwelling and inflammation of the eyes. There were fome alfo who had abfceffes formed in the frontal finufes*.

* Rufh's Manufcript Lectures.

A fore throat, hoarfenefs, and a pain in one or both ears, in fome cafes ufhered in the difeafe; whilft in others it came on with a violent fneezing, followed by a difcharge of acrid matter from the nofe, which often excorated and inflamed the upper lip. In fome cafes the nofe dropped blood, nay, in fome it ran in ftreams; and in one cafe related by Dr. Rufh in his Lectures on the Theory and Practice of Phyfic (3) the difcharge in this way amounted to twenty ounces.

Most perfons had a bad taste in the mouth, attended with a want of appetite, though fome few had their appetite preternaturally encreased. A fore mouth was no uncommon attendant on this difease, and some lrad a fevere tooth-ach, swelled jaws, &c. nor did the tongue entirely escape; for in some it was so swelled as to occasion a considerable defect of speech-

The breaft was often affected with acute darting or flying pains; these fometimes became fixed, and fuddenly brought on, or were accompanied with a painful and laborious respiration. A cough universally attended this difease, which was fometimes convulsive, and extremely painful; in some it brought on a spitting of blood, and two persons died in the act of coughing*.

The ftomach was fometimes affected with naufea, and vomiting, and in fome the difeafe feemed to fall upon the bowels and was carried off with a diarrhœa—though in general the patients were either coffive or regular.

(3) Which commenced in November 1790, at the College of Philadelphia. It is with pleafure I embrace the prefent opporzunity of acknowledging my great obligation to his valuable lecture on the influenza, for feveral of the particulars of its hiftory of fymptoms here related.

* Rufh's Manufcript Lectures.

The violent pains which in many perfons affected the limbs, very much refembled the rheumatifm; but those which were felt in the loins and thighs, were remarkably fevere. Profuse fweats over the whole body very generally appeared at fome time or other during the course of the diforder, and fometimes with obvious advantage.

The pulfe was various; fometimes tenfe and quick, but feldom full. The fever remitted about the fourth or fifth day, but the cough often continued feveral weeks after every other fymptom had difappeared (4).

The moft remarkable circumftances refpecting this diftemper were the miliary and eryfipelatous eruptions which in fome inftances, accompanied it, and the great tendency which the fever manifefted to degenerate into Typhus. Although it affected perfons of both fexes, and of all ages, it was obferved that it feized few children below five years of age; and a phyfician of this city, whofe practice is very extensive, affures me that he remarked *old people* as well as *children*, were lefs fubject to the influenza than perfons in middle life.

Diagnofis.

The influenza is not likely to be confounded with any difeafe except the common catarrh, which [though it appears with nearly the fame fymptoms, and like it, often feems to come on in confequence of the application of cold] may be difcriminated from it, by coming on with more cold

(4) Hippocrates in his Book of Epidemics has this paffage, in which there is a firiking refemblance of circumftances, and fymptoms: "Thofe who have coughs in the winter, and efpecially with the foutherly winds, are fubject to fevers during their hawking up much thick matter; but then they commonly ceafe in five days. But coughs will extend to forty." Clifton's Hippocrates. Page 214. fhivering, by the febrile fymptoms appearing earlier, and being more confiderable in degree. It moreover gives a more fudden and violent flock to the ftrength, and in many inftances produces a perpetual watching, followed by a diforderly and uneafy ftate of the mind, materially different from the phrenetic delirium of the febris ardens incident to patients labouring under catarrhs from cold, or fuch like inflammatory difeafes.

It is likewife diftinguished by its affecting more perfons at once, fpreading over a greater extent of country in a given time, and in being [more] contagious. The influenza is fometimes accompanied with miliary and eryfipelatous eruptions, but the catarrh from cold is not. The latter is flow in its advances, feldom giving alarm until, perhaps, long after the existence of danger, whils the former, for the most part lefs dangerous, excites immediate terror, as well by the number of functions which it affects at the fame inftant, as by the rapidity of its progress; for in the influenza the transitions from apparently high health to fickness are often, as it were, inftantaneous.

Blood-letting, and other fuddenly debilitating remedies were feldom fo neceffary in this diforder as in the common catarrh, and fewer confumptions were the confequence of it, than might have been expected from a common cold among an equal number of perfons.

There is no difeafe to which the human body is liable, fo extensive in range, fo fudden in attack, fo furious at the beginning, fo rapid in its courfe, and at the fame time attended with fo little danger.

[8]

Of the Remote Caufe.

In a tract of this kind it will probably be expected that the author fhould enquire into the original caufe of the difeafe on which he writes, as fuch an effay is commonly fuppofed to exhibit the candidate's medical refearches, as well as his medical reading. With regard to this fubject, it may not be improper to obferve, that it is one which has been confidered as very abftrufe in every age, and country where medical fcience has been cultivated ; and on which it is not only difficult what to fay, but what to leave unfaid. Here I muft confefs my "knowledge dwells upon the furface of things(5)."

The prefent received opinion is, that this fpecies of catarrh arifes from contagion, which poffibly may be true; yet to my mind it appears no eafy matter to conceive how the difeafe can fpread fo far and wide in fo fhort a fpace of time as we perceive it does, or how it can affect perfons many miles a part, at the *fame time* where there had been no previous direct or indirect intercourfe—if *propagated only* by " a matter arifing from the body of a man labouring under it."

Hippocrates when fpeaking of epidemic difeafes in general, fays, "when many are feized with the fame difeafe at one time, the caufe is chiefly to be attributed to what is most common and made use of by all. This is certainly what we inhale in infpiration." Galen is of the fame opinion : "For we all neither are exposed at the fame time to other causes, nor are subject to them at all times; but the air alone furrounds us all abroad, and is taken in by all in respiration."

That the remote caufe of the influenza is chiefly to be fought for in the air, is rendered highly probable by the

(5) Woolafton.

following facts. Van Swieten in his comment on the 1407th aphorifm of the juftly admired Boerhaave, tells us upon the authority of Foreftus, that a diftemper, which he calls a *malignant catarrh*, "arole as it were from a certain vapour, fince thick clouds of an ill finell preceded it for fome days, breaking out fo fuddenly, that it feized almost instantly a thousand perfons."

About the latter end of the year 1732, and the beginning of 1733, when epidemic catarrhs raged throughout all Europe, we are informed that the like diffemper prevailed in Africa, and even perfons at fea, though at an immense diffance from land, were affected in the same manner(6).

The like has been obferved much later : For in the year 1780, when the ship Atlas left Malacca, there was no epidemic difease in that place; yet upon her arrival at Canton, it was found that at the very same time, that the crew on board the Atlas in the China Seas had the influenza, the same diforder raged at Canton.

"On the fecond of May 1782, the late Admiral Kempenfelt failed from Spithead with a fquadron under his command, of which the Goliah was one, whofe crew was attacked with the influenza on the 29th of that month; the reft were affected at different times; and fo many of the men were rendered incapable of duty by this prevailing ficknefs, that the whole fquadron was obliged to return into port about the fecond week in June, not having had communication with any fhore, and having cruized folely between Breft and the Lizard."

(6) Memoirs pour fervir a l'histoire des Insectes, par Reaumur, Page 435. About the fixth of May, Lord Howe failed for the Dutch coaft, with a large fleet under his command; all were in perfect health; towards the end of May the diforder first appeared in the Rippon, and in two days after in the Princess Amelia. Other ships of the same fleet were affected with it at different periods; some indeed not until their return to Portsmouth about the second week in June. This fleet also had no communication with the shore until their return to the Downs, on their way back to Portsmouth, towards the third or fourth of June(7).

To these facts the following passage from the late celebrated Doctor Cullen, feems fomewhat opposed: This difease "has feldom appeared in one country of Europe, without appearing *fucceffively* in every other part of it; and, in fome instances has been even (8) *transferred* to America, and has been spread over that continent, as far as we have had opportunities of being informed(9)."

From whence the doctor obtained his information I know not; but, as he has not mentioned a fingle circumftance whereby a perfon might be enabled to judge of the *accuracy* of it, and as there are objections to the probability of his information being fo accurate as to fatisfy us that the difeafe was transferred in the manner he fuppofes, I am obliged to confider this paffage as an affertion not fully fupported, either by concomitant circumftances, or fubfequent obfervations; though, at the fame time, I acknowledge it to be the affertion of a very refpectable, of a very eminent phyfician. But from the

(7) Lond. Med. Trans. Vol. 3. Page 61.

(8) In the year 1732, the influenza appeared at London between the 12th and 18th, at Oxford in the third week, and at Edinburgh on the 20th day of May. Could the difeafe have been *transferred* to these three cities in such quick fuccession, by things imbued with the contagion, or by perfons labouring under the complaint ! But more of this hereafter.

(9) Cullen's First Lines, Vol. 3. Page 104.

nature of things, his information in its full extent, could not have amounted to more than-that the difeafe was later in appearing in fome parts of Europe than in others ; and that it was not only later in appearing in America, than in fome parts of Europe, but that the inhabitants of that amazingly extensive continent were not affected with it all at once. Now what can this prove? That the difeafe is propagated only by contagion ?- Surely not. But granting all that the Doctor has afferted to be matter of fact, that the difease has appeared in every part of Europe fucceffively, and has been transferred to America; will this enable us to account for the appearing of it in the Island of Bourbon, fituate in Africa, at the identical time that it raged in Europe; or explain in what manner it broke out at the fame time among perfons at fea and on land, where those at fea had not even the fmalleft communication either with those on land, or with any other perfon whatever? We must either deny the truth of thefe facts (10), or admit that the difeafe is not

(10) The Author had not an opportunity of confulting the first volume of the Medical Communications on the fubject of the Influenza until feveral months after this offly had been prepared for the prefs; and his furprife was not a little upon reading it, as he there found an anticipation of feveral obfervations which he fuppofed had first occurred to himself. But notwithstanding he conceives that much gratitude is due the fociety for their generous exertions in favour of the healing art, that the defign of the work is laudable, and that the publication contains a vaft collection of valuable information respecting this wonderful epidemic;—yet cannot help observing that the following part of the "Account of the Epidemic Catarrh, of the year 17/2," appears exceptionable, in as much as it opposes opinion to matter of fact, and fublitutes affertion in the room of argument :

" It is credibly affirmed, that the crews of feveral flips were feized with the Influenza many miles diffant from land, and came into various ports of England labouring under it; the fame thing is faid to have happened to fhips in the Faft-Indies, and other parts. A want of precifion, or of authentication respecting the circumstances above alluded to, makes it improper to draw any inferences from them". (12)

That the facts are precife will immediately appear upon re-(12) Ibid. Page 65. ferring to them, and if credibly affirmed, wherefore is it improper to draw any inferences from them ! This may be a convenient way of getting over objections which militate againft pre-conceived and favourite opinions; but fortunately for fcience, this mode of barely denying fails, is very unfaccefsful in producing conviction or of eftablishing doctrines, in the prefent flate of medical philosophy. Before we were denied the privilege of inferring from them, it would have been proper to have *(hewn* that they were not precife, or authentic, or that they did not apply. But without even attempting to do this, the compiler endeavours to elude their force by fuggefting diffruft; not hy argument, but by telling us that " without pretending to deny the truth of them, the following Anecdote will ferve to fnew that great caution is requisite before they are admitted."

"Mr. Henry of Manchefter, informed the fociety, from what he thought good authority, that a fhip from the Weft-Indies to Liverpool, was by ftrefs of weather driven out of her proper courfe, into a higher north latitude, where her whole crew were feized with the influenza; but wifhing afterwards for more acurate information on the fubject, he wrote to Doctor Currie of Liverpool, defiring him to make every neceffary inquiry into the matter; that gentleman, who took great pains to inveftigate the affair, at laft met with the furgeon of the veffel, from whom he learnt that before the crew were feized with the diforder, they had been off the North of Ireland, and had fome communication with the inhabitants of thofe parts."

May we not ask if this anecdote proves any thing in point ? Is it precife ? At what time did this communication take place; in the winter, fpring, fummer, or autumn, and in what year? Were the perfons with whom the communication was had, then labouring under the difease; or was it then prevalent in that part of Ireland ? This anecdote, which was intended to excite in us a diftruft of the truth of the facts before alluded to, proves nothing except its own want of precision, and deficient authentication of circumstances. For unless it had been shewn that the difeafe prevailed among the inhabitants with whom the crew had this communication prior to, or at that time, the fact only goes to fhew that fuch a communication took place, and fubfequent to that the influenza appeared on board the veffel. Fut fuppoling that Mr. Henry was at first miltaken, and that the crew were infected by the inhabitants as the anecdote indirectly fuggelts, this supposition can in no wife affect the authenticity either of the facts before mentioned, or of any other facts whatever.

(11) "But the greatest number concurred in opinion, that

The foregoing fact respecting the co-incident appearance of the Epidemic Catarrh in Africa and Europe, first mentioned by Reaumur [who derived his information from the letters of Caffini] is quoted by Van Swieten, in his chapter on Epidemic difeafes, and must have been known to Doctor Cullen, who was unqueftionably, well acquainted with the writings of that great man. My own oblervations, as far as they have gone, are perfectly confonant with this fact; nor can I conceive why the influenza might not arife as fpontaneoully in America, as in Europe, and there as readily as in the illand of Bourbon. The Morbific matter exciting the difeafe must have originated at sometime, and somewhere; and a caufe like to that which gave rife to it in any one country, at any one point of time, might produce it in another country at the fame time, under fimilar circumstances.

It may be objected, that the difease could not have arifen from the air, because the countries here mentioned must experience at any particular time, very different states of that element. This argument may be allowed to have some weight against the supposition of its arising *entirely* from the *fensible qualities* of the air, but *extremely little* against the probability of its taking birth " from fome inexplicable variety of exhalations contained in it, which mixing with our fluids, or by their stimulus diforder our bodies (13)." This was the opinion of the defervedly celebrated Herman Boerhaave respecting epidemics in general, and, as far as I have been able to difcover, it has not been overturned by fair argument, or subfequent observation, at least as far it applies to the epidemic catarrh. This indeed was not the opinion of Boer-

the influenza was contagious, in the common acceptation of that word, that is to fay, that it was conveyed and propagated by the contact, or at leaft by the fufficiently near approach, of an affected perfor." Med. Commun. Vol. I. Page 46. (13) Aphorifm 1408. haave alone; but alfo of moft of those physicians who were famous for their affiduous attention to the true fource of medical knowledge, the operations of nature. The antients 'tis true, were fometimes mistaken, although they studied nature; and the moderns are not, perhaps, less frequently wrong in their opinions, notwithstanding the immensity of their discoveries; not because they do not study nature at all, and study books alone; but chiefly because they study her either too much through the medium of books and preconceived Hypothe. fes, or with a view to propagate *fomething new*.

And this is one great reafon why we fhould feldom, read the modern fystems of physic, unless well armed with " a great deal of fcepticifm on the fubject." We may, and indeed we ought to effeem fome few of the writings, and opinions of the modern authors, and, with no impropriety; entertain a modeft confidence in our own talents for obfervation; yet it would be well not to overlook or defpise the medical records of nature as handed down to us by the antients; for in thefe there are certainly many ufeful remarks which appear to be at prefent forgotten. Doctor Cullen made war upon the antients, and, unfortunately for our art, with too much fuccefs; for he not only delivered his pupils from the undue influence of great names, and fcrutinized the writings of his predeceffors with great freedom, but contributed much to render the reading as well as quoting the antient authors unfashionable. He exposed some of the errors of thehumoral pathology, but was perhaps not always equally happy in fubftituting truth in the room of them. The defire of being the difcoverer of fomething new, and of being thought wifer than our forefathers, has perhaps, in fome inftances led to the advancement of ufeful knowledge; but it has often proved the very hot-bed of error, and warped the judgment of perfons the most ingenuous and enlightened.

Many difeafes evidently owe their birth to the fenfible qualities of the air, " for with the feafons, the conflitutions of men likewife change (14);" and though fome of thefe do no not become epidemic, yet many of those which do, only become fo in confequence of fuch fenfible qualities. Ruffel in his learned treatife on the plague, fays, that without the concurrence of a peftilential flate of air, the contagion of that difeafe when imported, even in Turkey, does not fpread.

Did the influenza depend upon a *fpecific contagion* it must always exist, or we cannot possibly ascribe it to fuch a cause. The small pox, the venereal disease, &c. never intermit; but the influenza has become extinct, and again broke forth upon the world after a period of of more than four-score years (15).

I do not affert, nor do I wish to be understood to mean, that the influenza is not at all contagious: On the con-

(14) Clifton's Hippocrates, Page 3 .- Sydenham fays Epidemics are admitted or excluded as the fenfible qualities of the air favour or oppose them. On the same subject confult Fordyce on fevers, page 19, &c. Moilture with heat, and fudden changes from hot to cold, by raifing much putrid vapour affects the elafticity of the fibres, deftroys the fire and vivid circulation of the blood, and diffolves the humours beyond what a healthy flate admits. At the very time the furface of the body requires the freeft perfpiration, the heat of the air makes the proper quantity of cloathing irkfome to inconfiderate people; from whence it happens, that the molt putrid effluvia, which should pass through the pores of the fkin, are checked, grow cauffic, and mix with the blood, while due care is not taken to preferve the jaices from corruption by an antifeptic regimen; and, when they are corrupted, fufficient regulations are not observed for carrying of the diforder, with efficacy or difpatch, by either proper cloathing, detergent medicines, or a fuitable diet, &c."

(15) It is recorded that a fimilar difease appeared in 1510, 1557, 1580, 1587, 1591, 1675, 1709, in the latter end of 1732 and in the beginning of 1733, in 1743, 1762, 1767, 1775, 1782, and in 1789. See Lond. Med. Trans. Vol. 3. Page 77. trary, I am possessed of facts (16) which prove in the most incontestible manner, that it may be, and often is propagated from one perfon to another by means of contagion. But I mean, and the arguments which I have adduced, I trust, will warrant the conclusion, that the difease often does arise from "fome vicious quality of the air (17)" or exhalation in it, as well as from a matter arising from the body of a man labouring under difease (18).

Confidering the fubject in this light, we fhall be enabled to account for the progreffive virulence (19) fometimes obfervable in this epidemic, without any manifest alteration in the fensible qualities of the air. The "vi-

(16) The following communication I received of Doctor Leib my preceptor in medicine: "In the year 1782, when the influenza, ravaged the fea coafts of Europe, the fhip I was on board of captured a Spanish brig which had been taken by a privateer belonging to the British with whom we were then at war. All the crew on board the brig had the influenza, and we had fearcely caft anchor in the harbour of L'Orient, which was in a few days after the capture, before the greater part of the fhip's crew were feized with the difease, and myself among the number."

(17) Hildanus fuppofed the caufe of the Plague at Laufanne, and the neighbouring diffricts was not only contagion, but alfo fome vicious quality of the air. For, fays he, "the huts of the peafants and poor people were not exempt from the plague, though fituated on the higheft mountains, and at a diffance from each other, and the peafants kept not the leaft intercourfe with one another."

(18) "In fome inftances it was observed that the influenza did not fhew itfelf in certain places until fome one or more arrived at those places either actually labouring under the difcase, or coming immediately from other places, whose inhabitants had been affected by it for fome days: while, in other inftances, very attentive and intelligent observers could not trace any communication between the families first attacked in the towns in which they refided, and other places, where the difease had previously appeared." Lond. Med. Trans. Vol. 3. Page 60.

(19) "It was also remarked that those who were attacked later from the time of the appearance of the diforder, commonly had it more feverely, and were longer ill, &c. Med. Commun. Vol. I. Page 24. cious quality" of it confpires with, and greatly affifts the effluvia isluing from the fick, to encrease the malignancy of this diffemper.

which affied the human (pecises and) fromally, because

Of the Predifposing Cause.

The venerable Galen judicioully remarks, "that no caufe can affect without a predifposition of the body (20): otherwife all who are exposed to the rays of a summer fun would be seized with severs, as well as those who use too much exercise, are passionate, or grieved. Moreover, all would fall sick during the dog-days, or die of the plague." This is a circumstance which requires very little proof to be admitted as true, the observation of every body supplying innumerable facts in its support. I shall therefore adduce but a few, nor should these be mentioned, but to combat the only argument of any importance which has been advanced against the idea of the remote cause of the influenza reliding in the air.

Baron De Tott, in his Memoirs, informs us, that "the plague, which that year carried off a hundred and fifty thousand perfons, in Constantinople, was then at its height. Obliged (fays he) to direct the workmen myself, many of whom were attacked by the diftemper, I had nothing to preferve me from it, but the falubrious smell of the forges, and the precaution of giving directions with the end of my cane. But, perhaps, what most preferved me from the infection was my never giving myself up to fear, and the melancholy ideas of its ravages prefent(21)."

(20) See a note by Doctor Rotherham in Cullen's First lines, Vol. 1. Page 52. "The predifpoling is that which renders the body liable or capable of being affected by difease when the exciting cause is applied."

(21) Volume the fecond, Page the 83.

I have chosen this fact from amongst the multitude which might be brought forward, first, because the plague is the monarch of all difeafes, the moft highly contagious of any which afflict the human fpecies; and, fecondly, becaufe the Baron here relates a matter of fact, without regard to any particular theory in medicine. He was not preferved from the difease, as he supposes, by the falubrious *Imell of the forges*, for that was as common to the workmen who were feized with the plague as it was to him ; nor was he preferved by the precautions which he obferved in giving directions, fo fhort a diftance as the length of his cane (22) was certainly within the fphere of the activity of the infection. 'Tis true, Doctor Cullen is of opinion, that perfons may be preferved from the contagion of the plague, by avoiding all near communication with the fick, or their goods, and " that it is probable, a finall diftance will answer the purpose, if, at the fame time, there be no ftream of air to carry the effluvia of perfons, or their goods to fome diftance." It cannot, however, be imagined but that during the Baron's continuance at this place [which was a very confiderable time] the wind blew perhaps, in every direction; that, therefore, he must many times have been exposed to a "Aream of air" paffing over the bodies and goods of perfons tainted with the peftilence, and that he was not preferved from the infectious miafmata either by the fmell of the forges, or by giving directions with the end of his cane; but by, what is more probable, his active life in which body and mind were vigoroufly employed, by his ftrict observance of temperance, and, by his never giving himfelf up to the debilitating influence of fear.

(22) The effluvia arifing from the difeafed, received into the ambient air, form a peftiferous atmosphere, more or lefs impregnated with these effluvia, as it recedes from their source. That contagion is thus communicated in the chambers of the fick, appears from perfons being infected without touching the difeased body, or any thing in the room that may be supposed to harbour the infection." Russel on the Plague, Page 298.

In the fall of 1780, the influenza was very prevalent in the city of Philadelphia and its vicinity, and perhaps in many other parts of America. At that time I was feized with it myfelf, and was fo ill as to be confined to bed for two days, neverthelefs, the remainder of the family, which confifted of fix perfons of different ages, and of both fexes, entirely escaped every fymptom of the difeafe(23).

Patrick Ruffel, who refided many years at Aleppo, and who confequently had the beft opportunity of feeing, and knowing what he relates, fays, that " fome exposed every way to the infection [of the plague] as if invulnerable, remain found the whole feafon(24)." I am therefore decidedly of opinion with Doctor Cullen, that even "the most powerful contagions do not operate, but when the bodies of men exposed to the contagion are in certain circumftances, which render them more liable to be affected by it, or when certain caufes concur to excite the power of it(25)." May we not, then, fafely conclude that there is required a certain state of the system favourable to the action of the remote caufe, to render it capable of receiving the infection; and that this remote caufe of the influenza may exist in the air, and yet every perfon shall not be affected with this epidemic at the fame time, as the predifpoled flate of the fyftem may not be prefent in every perfon at this particular time(26)."

(23) "To others, and those numerous, it was so favourable as only to attack very few in each family." Lond. Med. Trans. Vol. 3. Page 59.

(24) Page 305.
(25) First Lines, Volume the fecond, Page 246.
(26) "If the cause lay in the air all must have been seized at once,"-but as this was not found to be the cafe, and as the dif-eafe appeared at different periods in different towns and villages, Doctor Hamilton infers that the caufe was contagion. But this is inferring too much ; for even from his own account of Harpenden, Luton, and St. Albans it appears that at the first

The ftate of the fystem which is necessary to the formation of the difease may be inferred from the fymptoms with

which it is accompanied, particularly that " profiration of ftrength, and impaired vigour in all the functions of the body (27)," which almost always attend it. The predifponent caufes of catarrhs in general tend likewife to defignate it as a flate of more or lefs debility. These caufes, according to Cullen, are weaknefs of the fyftem, and particularly the leffened vigour of the circulation, occafioned by falling, by evacuations, by fatigue, by a laft night's debauch, by excefs in venery, by long watching, by much fludy, &c. &c(28).

The influenza being contagious furnishes additional " The bodies of men [fays the laft mentioned proof. author] are especially liable to be affected by contagions, when they are any ways confiderably weakened by want of food, and even by a fcanty diet, or one of little nourithment; by intemperance in drinking, which, when the ftupor of intoxication is over, leaves the body in a weakened ftate, &c. &c. (29)

But the following cafes related by Doctor Hamilton, clearly develope this matter, and very fatisfactorily prove that previous debility is abfolutely neceffary to the admiffion and formation of the difeafc. "A boy of about

of these places, though it is half way between the two latter, and feveral miles nearer London than St. Albans, the influenza shewed itself later than in either of the other two places. The manner in which he accounts for this difference of attack in point of time in these villages, forcibly applies in support of the doctrine which he willes to explode. He informs us that Harpenden is on an eminence, the foil of a light dry nature, when compared to the others; and from hence, with great propriety concludes that the difference arifes from "it! lituation favouring lefs its exciting and predifpofing caufe."

(27) Currie's account of the difeafes of America, Page 102.
(28) First Lines, Volume the first, Page 134. And,
(29) At page 246, of the fecond Volume.

120 210

twelve years of age, of a ftirring difpcfition, fuffered feverely; yet efcaped the difeafe, though the reft of the family had been ill fome time, till after bathing with other boys in a river, and *remaining there longer than prudent*, when he was feized the next day with the influenza. We may add to this, that he was a valetudinarian for a long time before, but had lately overcome in a great meafure all his complaints."

"A young gentleman at Luton [continues the fame author], about twenty-three, of a volatile turn, and *lately a valetudinarian*, but who, for eight or ten weeks had fo far recovered, as to be able to follow his amufements, and who, for this purpofe, generally walked or rode, whether the weather was favourable or not, feveral hours a day, often at the fame time indulging himfelf freely in the glafs, was at laft feized with the epidemic, and fuffered feverely(30)."

Of the Exciting Caufe.

As truth is the object of which I am in fearch, and not the purfuit of fame for new difcoveries, permit me once more to quote a paffage from the great commentator of Hippocrates : "In our bodies, as it were prepared for difeafe, fome external adventitious circumstance kindles a fever, which of itself would not generate a violent difeafe, yet from the disposition of the body, every one of these is rendered, not the cause of the difeafe but the

(30) Doctor Hamilton after mentioning that foldiers fuffered much from the influenza, owing to their irregular living, light cloathing, &c. &c. adds—"The delicate alfo, and the valetudinarian, in all my obfervations were great fufferers, and ftill greater in proportion as they were expoled to the viciffitudes of the weather." See Lond. Med. Memoirs from Page 432 to 438. occafion(31)." The exciting or occafional caufe of the influenza muft therefore be that external circumftance which kindles the fever, to wit, the morbid miafma, or contagion which has been confidered under the general head of the *remote caufe*; though firicitly fpeaking, the remote caufe includes both the exciting and predifpofing caufes(32).

The Proximate Caufe

Of every difeafe is that which immediately produces it, and whofe removal effectuates the cure(33). The proximate caufe of the influenza is nearly the fame as that of a common catarrh from cold, as appears by the fimilarity of their fymptoms, which differ only in *degree*. According to Dr. Cullen, "the proximate caufe of catarrh (whether from cold or contagion) feems to be an increafed afflux of fluids to the mucous membrane of the nofe,fauces, and bronchiæ, along with *fome degree of inflammation affecting thefe parts*. The latter circumftance, fays he, is confirmed by the appearance of the blood;" and it is this latter circumftance, .viz. the degree of inflammation affecting thefe parts, which appears to me to be the proximate caufe itfelf, and the increafed afflux of fluids, a confequence of that inflammation(34).

(31) See a note by Doctor Rotherham quoted at page 17. "No difeafe can exift without an occafional caufe; yet it is neceffary, that at the fame time, the flate of the body be fuch as to admit that caufe to take effect, or act."

(32) "Remote caufes are of two kinds, viz. the predifpofing and exciting, or as it is fometimes called the occafional." ibid.

(33) See the note above quoted—and Van Swieten's Commentaries, Vol. 1. Page 21—" A difease as an adequate effect, is the same with its complete or proximate cause, the presence of which supposes the difease, and the absence its removal."

(34) At our meals the membrana pituitaria is frequently irritated by fharp multard, fo as to caufe the nofe to run water; yet who, in this cafe, would affert that the proximate caufe of this temporary complaint was an increased afflux of fluids to this membrane ? Is not the *irritation* of this membrane the It is unphilofophic to admit more caufes than are abfolutely neceffary to explain the phenomenon; and equally fo to affign that as a caufe which is only an effect. Is it not alfo, unphilofophic to combine a caufe and its effect, and affign the combination as a caufe?

How is a fecreting or exhaling furface induced to difcharge a preternatural quantity of a fluid? Is it not, either by fome power which determines to that furface, or by some affection of the furface itself ? What shall we then suppose to be the proximate cause of this preternatural fecretion or exhalation? Without doubt the power which determines to that furface, or fome affection of it, whereby it is compelled to fecrete, or pour out in unufual quantity, and not the afflux of fluids to it. Remove the caufe, and the effect ceafes, is an axiom as old as philosophy itself, and happily applies to the prefent cafe. If we remove the extra-power which determines an unufual flux to the fecreting or exhaling furface, it will perform its office in the ordinary manner; nor will the fame effect fail to take place upon removing the affection of this furface whereby it was conftrained to fecrete or exhale preternaturally. In the influenza, the power which conftrains or compels preternatural fecretion or exhalation [for it matters not which], is nothing elfe than an inflammatory affection of fuch a furface (35).

In that kind of gonorrhæa, which is brought on by venereal infection, Doctor Cullen observes, that the chief thing to be attended to is the *inflamed state of the ure-*

proximate caufe? This is what we first attempt to remove, and which we never fail to effect, by inhaling through the nostrils the grateful effluvia of a piece of wheaten bread. Is not this a cafe perfectly in point?

(35) "More fluid circulates through, and is fecreted, in a part that is inflamed, than when it is in a natural flate." Motherby's Medical Dictionary, under the word Inflammatio. thra," a circumstance which is not only inseparable from the difease, but "occasions all the troublesome symptoms that ever attend it.

Swiediaur, in his excellent treatife on the venereal difeafe, calls the gonorrhæa virulenta, a *local inflammation* of the urethra in men, and of the vagina in women, the difcharge being only the mucus ufually fecreted in preternatural quantity, fomewhat changed in colour and confiftence by the ftimulus applied to thefe parts ; and in exprefs terms, fays *it is like the difcharge from the nofe and lungs*, on taking cold, where the mucus affumes nearly the fame appearance.

It has already been remarked, that the proximate caufe and fymptoms in general of a catarrh from cold, and those of the influenza, were very nearly, if not altogether the fame [except in degree]; which may lead us to conclude, that as an inflammation of the lining of the urethra brings on a preternatural difcharge of mucus from thence, altered in colour and confistence; fo, in the influenza, a like affection of the membrane lining the nose, fauces, and bronchiæ [being a fimilar fecreting furface] will be productive of a refembling difcharge.

A certain degree of inflammation favours a copious flow of mucus from the urethra, and a yet higher inflammation will fupprefs the running entirely, bringing on fevere pains in different parts of the body, with an increafed action of the heart and arteries. The like is obfervable in catarrhs, where a certain degree of inflammation excites a free difcharge from the nofe, fauces, and bronchiæ; whilft an increafed inflammation of the internal furface of thefe parts not only fuppreffes fecretion there, but is followed by a fenfe of fullnefs in one or both noftrils, dyfpnœa ficca, and a quickened pulfe (36). This laft, viz. the febrile action of the arterial fyftem, is a natural confequence of inflammation in these parts; for, as F. Hoffman observes, and after him Doctor Fordyce, " any fuch impediment to the freer circulation of the blood, as deftroys its equilibrium, is the effential character of a fever(37)." That increased inflammation produces fuch effects, is confirmed by uniform experience, as may frequently be seen in the patients affected with gonorrhœa, who use too aftringent injections; for in this case they have the running checked, with an aggravation of every inflammatory fymptom, feldom failing to bring on inflammatio testium, cystitis, or both, and an immense accumulation of misery.

Sydenham remarks, when treating of the epidemic fever and cough of 1675, that it "frequently proved very fatal to abundance of the common people, who, whilft they unadvifedly endeavoured to check the cough by taking burnt brandy, and other hot liquors, occasioned pleuritic or peripneumonic diforders; and by this irrational procedure rendered this difeafe dangerous, and often mortal, which of its own nature is flight, and eafily curable." But it fometimes happened (continues he), not only when the difeafe had been unskilfully treated, in the manner above defcribed, but alfo fpontaneoufly, at the beginning of the illnefs, or in a day or two afterwards, efpecially in tender and weakly perfons, that the cough was fucceeded by alternate intervals of heat and cold, a pain in the head, back, and limbs, and fometimes a tendency to fweat, efpecially in the night; all which fymptoms generally followed the fever of this conftitution, as it were of the lungs, which occasioned a difficulty of breathing, stopped the cough, and increased the fever."

(36) "A fever accompanies every inflammation." Van Swieten's Comment. Vol. 5. Page 81.
(37) Fordyce on fevers, Page 14.

[26] The obvious tendency of "burnt brandy and other hot liquors," taken down in fuch cafes, would be to increase an inflammation already begun ; to ftop the cough, or at leaft the execretion of mucus from the lining of the bronchiæ; to produce difficult refpiration from the fwelling of the inflamed membrane ; and, an unavoidable effect the foregoing, increafed fever.

. The manner in which the difease must necessarily originate, will likewife fhew that these fymptoms arife from the proximate caufe here laid down; and that the degree of this accounts for every variety obfervable in the influenza. For, whether the morbid miasmata which conftitute the exciting caufe, be emitted from the body of one who has the difeafe, or be engendered in the atmosphere, or exhaled into it from putrifying fubftances, animal or vegetable, or in fhort, in whatever manner they may get there-it cannot be queftioned, but that they float in that element (38), and enter with it in infpiration and deglutition; and being retained by the tenacious mucus of the nofe, fauces, lungs, ftomach, and inteffines, irritate and inflame these parts, thereby producing in the first instance, or secondarily, the train of symptoms which

(38) "We have many examples to prove, that the air cannot hold, nor yet convey contagion to any diffance. If it be mixed with atmospheric air, it is soon diffipated, perhaps che-mically decomposed, if it be a compound body [possibly he would have been nearer the truth had he faid recompounded, or neutralized], and its nature altogether changed." Lond. Med. Mem. Vol. 2. Page 439. Upon first reading this paffage, I doubted whether the author meant ferioufly, as it appeared to me to be trifling, if not with common fenfe, at least with common experience, and with the teftimony of fome of the greateft authorities in medicine. See the quotations from Hildanus, Ruffel, &c.at pages 16 and 18-" It is well known, the stench of putrid carcafes, gangrened limbs, the polluted stinking air of jails, &c. bring on malignant pestilential fevers, just as the putrid fanies of a gangrened limb, abforbed into the blood, brings on a fever of the fame kind." Huxham on fevers, page 243. See likewife on the fame subject, Ferriar's Med. Effays, p. 236.

take place in this difeafe. Doctor Houlfton of Liverpool, goes fo far as to affure us, " that in fitting near an infected perfon, an irritation of the mucous membrane of the nole, was fenfible, fuch as is produced by the duft of pepper, and which fneezing tended to remove.(39)."

[27]

Now, though it feems almost certain that the virus of every difeafe which is contagious, affects the part on which it has first fastened, before it diffurbs the rest of the body, and affimilates to itself more or less of the humours which it there meets with; yet it would feem *poffible* that fome of it might be absorbed, and immediately taken into the circulation [in persons of lax habits], and there excite or increase a fever by its own ftimulus, or by the ftimulus of fuch part of the blood as it affimilates to its own nature(40). But, for my own part, I should suppose it a rare occurrence in the influenza, that the materies morbi," in the first instance, enters the mass of blood

(29) Med. Commun. Vol. I. Page 57. See alfo James's Med. Dictionary under the word Catarrh. "But it is not to be doubted, that there is fometimes in the air fuch a fubtile cauffic matter which, being received in infpiration, infinuates itfelf into the glandulous parts, through which it paffes, excites pain, tumor, and rednefs, and brings on a catarrhous fever." What this subtile caustic matter is effentially, may no doubt be very difficult to explain ; but from analogy it would feem probable that it is the fame with that which produces the plague, the jail or hospital fever, and, peradventure, an intermittent : and that the various appearances of these (seemingly different) difeases arife from the greater or lefs concentration of this matter, together with the accidental, though greatly diverfifying circumftances of feafon, foil, cultivation. climate, &c. and alfo the manner of living, food, raiment, &c. &c. According to Dr. William Fordyce, "if animal bodies are in a decaying flate, and the air be filled with their freams, they fometimes produce pestilential fevers; the fleams of fome decayed vegetables have the fame effect. The effluvia of human bodies are likewife very hurtful to the air. Three thousand men living within the compass of an acre of ground would make an atmosphere of their own steams feventy-one feet high, which would foon become pestilential, without the winds to difpel it. The air of prifons for this reason produces mortal fevers." See his Inquiry into the caufes, &c. of fevers, page 16.

(40) See Ferriar's Med. Effays, page 235.

without exciting a *local affection*; but as there are faid to be fome cafes where the patients are inflantaneoufly feized with, and exhibit all the other fymptoms of the difeafe, we may, perhaps admit that in those cafes, the local affection may not be prefent. However, fuch cafes have *never* fallen under my observation(41).

Upon the whole, therefore, the proximate caufe of the influenza appears to be a local inflammation of one, or more of the parts before mentioned, viz. of the mucous membrane lining the nofe, fauces, afpera arteria, æfophagrus, &c. &c.(42)

Of the Cure.

So moderate is the influenza in many inflances, as to require but a few days refraining from the use of animal food, to lay in bed or keep within doors, taking at the fame time fome warm diluent drink, and to return gradually to the usual manner of living; whils in others, again, great attention is abfolutely neceffary, and the cure difficult.

The treatment of this diforder must be either *local*, or general, or both; as will appear by attending to its hiftory of fymptoms, and its remote and proximate caufes: But as most local remedies produce general effects.

(41) "I believe contagious miafmata feldom, if ever, produce their effects by entering the vafa inhalantia on the furface of the body where the cuticle is not removed. I apprehend they more commonly make their way by the prime vize, the lungs, or other external paffages; &c. &c."

Dr. Kirkland.

(42) "Some inflammation I will allow, fays Doctor Hamilton, the flate of the mucous membrane proved that there was a degree of it prefent." Lond. Med. Mem. Vol. 2. page 456. After enumerating certain remedies which he used, adds—" with a linctus to mitigate the burning heat and pain I felt in my throat;" from which one would think the degree of inflammation in his own cafe was not very inconfiderable. and general ones often relieve particular parts, it may be most proper to omit distinctions of this kind, and premise one universal rule by which the indications of cure are to be governed, viz. The season of the year, the state of the system, and the symptoms present.

1. BLOOD-LETTING is a proper and fpeedy remedy to take down the phlogiftic diathefis, and may be either partial or general, according as the fymptoms indicate. The pulfe, though it may affift in determining the quantity of blood which fhould be drawn, and the *frequen*cy of the operation, it can by no means be allowed to direct us altogether in the ufe of this valuable remedy(43). From the great difpofition which this fever difcovered to degenerate into Typhus(44), we fhould be cautious in the ufe of the lancet, and all things elfe being equal, bleed lefs freely in the fpring than in the fall of the year.

2. CATHARTICS, or purging medicines, are no doubt neceffary, particularly if the patient be afflicted with a violent head-ach, a throbbing of the temporal arteries, much cough, conftipation of the bowels, accompanied with a tenfe pulfe : but as medicines of this kind debilitate the fyftem confiderably by a *fingle operation*, if

(43) "Where there is just reason to fear a contagious malignity in a fever, we should proceed with the utmost caution as to repeated bleeding." Huxham on fevers, page 238. See the ift vol. of the Med. Commun. p. 75. Notwithstanding this epidemic [the influenza of 1789] was visibly of an inflammatory kind, it would not with us, admit of what is called the antiphlogistic plan." Currie on the Difeases of America, page 323: and at page 103, "Several were benefited by bleeding; but in general the patients recovered sooner when it was omitted, except when pneumonic symptoms; such as acute pain, and a full or hard pulse indicated it."

(44) "In the course of the difease there frequently appeared unequivocal figns of a putrid tendency." Med. Commun. Vol. I. page 80. given in full dofe, it would feem fafer [for the reafon fuggested under the preceding head] to administer them fo as to keep the body regular, or gently lax(45); or to fupply their place either by clysters(46), or emetics in the manner next to be mentioned.

3. VOMITS. Whenever there appears to be an inflammation of the lungs, which may be known by flitches or acute pains about the cheft, thefe would be improper, as tending to give exquifite and unneceffary pain; and would endanger the rupture of a blood veffel in the lungs, with all its bad confequences,—without any probability of their proving ferviceable. An *early exhibition* of full vomiting is very proper, in order to bring on a determination of the fluids to the furface of the body (47), which not only contributes to the *expulsion of the exciting caufe* (48), and thereby preventive of an inflammation of the

(45) "Gentle laxatives were frequently used with advantage in the beginning of the complaint, especially where there was a disposition to colliveness, firong purges do not appear to have been often given; and from general observation respecting the effects of bleeding, there is reason to think, they would in most cafes have been prejudicial." Med. Commun. Vol. I. p. 38.

(46) Wallis's Sydenham, Vol. II. page 337.

(47) Emetics exhibited upon the *firft attack* [of the influenza] were evidently of ufe in relieving the head and breaft." Lond. Med. Trans. Vol. 3. page 73. "They do not appear to have been very generally ufed [in the epidemical catarrh of 1782], but all who did employ them, concur in opinion, that they were of great fervice, not only where there was reafon to fufpect an accumulation of mucus in the bronchial ramifications, but alfo where they were given chiefly with a view to affift in producing a fpeedy and copious perfpiration." Med. Communications, Vol. 1. page 25.

(48) "Before the miasma was fixed and propagated in the body, it was wholly carried off in several patients who kept in bed immediately after seeling the first attack, by a large perspiration. Other spontaneous evacuations, by vomiting, looseness or urine were less frequent, and did not seem to procure fuch immediate, and great relief, unless they were followed by a fweat."

Dr. Reimarus, Hamburgh. See Med. Commun. vol. I. p. 39.

To shall a state of

lungs, &c. but often brings on a falutary perfpiration over the whole body; a copious fecretion of mucus in the bronchiæ, fauces and nofe; and in this, anticipating or affifting nature in her own way in bringing on a mild folution of the difeafe. It will therefore be best to limit full vomiting to the first stage of the complaint, and afterwards to fupply its place by emetic medicines in fmall dofes, frequently repeated, fo as to keep up a pretty conftant naufea : for which purpole the gum ammoniac, antimonial wine, or emetic tartar is ufually prefcribed; and, though any one of them will answer tolerably well, the latter being copioufly diluted, and frequently given in fmall quantity, feems to have been attended with the happieft effects, by rendering the bowels moderately open, and keeping up a gentle diaphorefis(49). " This medicine administred in this manner [in the opinion of Doctor James Carmichael Smyth7, had alfo a very remarkable effect in bringing on a remiffion of the febrile fymptoms, and in accelerating the termination of the difease."

However the long continued use of antimonials (50), or of nauseating medicines of any kind, is apt at length, to debilitate the flomach fo much as to render it in a good measure, incapable of retaining food, drink, or medicine; and this, perhaps, at a time when they are most needful. These medicines likewise foon loose their sudorific power over the system, and, as Dr Donald Monro assures us, even James's celebrated febrifuge powders have occasioned such a purging as to hasten the patients to their graves.

(49) "All attempts to force five at appear to have done more harm than good." Lond. Med. Trans. Vol. 3. page 72.

(50) "Large dofes of antimonials, or even finaller ones too frequently repeated, have fometimes brought on evacuations, which entirely funk the patient." Lind on hot climates, page 261. And,

On the fame fubject, fee Dr. D. Monro's Observ. vol. 2. p. 13 and 15-also Dickinson on fevers p. 115.

The MISTURA MUCILAGINOSA (51) which is very frequently used in the Philadelphia Dispensary, is an agreeable and efficacious medicine in moft catarrhal complaints; particularly where the cough is very diftreffing, and the neceffary evacuations have been previously made. A table fpoonful every two or three hours, according as the cough, anxiety, morbid watchfulnefs, &c. are urgent, is the manner in which this excellent remedy is ufually prescribed. This mixture possesses feveral advantages, as well from the medicines which it contains, as the due proportion in which they enter into its composition, and the facility with which its powers may be increased without becoming much [if at all] lefs agreeable to the patient. The tincture of opium will render it more anodyne in a given quantity, a few grains of tartar emetic will correct the conflipating qualities of this, and the whole mixture is thereby more or lefs laxative ; whilft their joint efficacy renders it more powerfully diaphoretic, with fcarcely any alteration in its tafte, or diminution of its demulcent quality. But I have feldom feen it neceffary either to vary the form of the prefcription, or give any other opiate (52); and I have observed at least a thousand instances fince I attended the practice of the above inftitution,-where the use of it was attended not only with evident relief, but [as the patients fometimes emphatically expressed it] with " bleffed effects."

4. LOW DIET. Animal food feems to be very hurtful, efpecially in the beginning of the difeafe; it ought therefore to be immediately laid afide, and a light vegeta-

(51) R. Elixir: Paregoric: Zj Vini Antimonial: Zfs Mucilag: Gum: Arabic Zj:—Succ: Glycirrh: aa Zis—Aquæ Fontis Zviij M.

(52) "Opiates were a common remedy with most physicians, and they all agree in testifying their great use; particularly in mitigating the cough, which was in many cases the most troublefome and tedious symptom of the disease." Med. Commun. Vol. I. page 38. Unable to display this page

be fafeft, as cold ones fometimes do injury in inflammations of the lungs, and in fome inftances, might check or prevent a falutary perfpiration: but as there are certainly fome exceptions to this rule, much muft be left to the fagacity of the phyfician (57).

Pure water, whey, barley-water, water acidulated with currant-jelly, vinegar, lime-juice, &c. with or without fweetening, are all very proper drinks in this difeafe. Whilft an inflammatory diathefis prevails in the fyftem, a little nitre or fome fuch neutral falt may be diffolved in one or other of thefe drinks, and given with fafety and advantage. Typhus, and typhoid cafes require diluents alfo; but occafionally, the patients may be allowed wine-whey, wine and water, veal-broth, chicken broth, and pure unmixed wine, according to circumftances (58).

6. BLISTERS are frequently neceffary in this complaint, and peculiarly fo when pleuritic or peripneumonic fymptoms become violent; in which cafe, they are to be placed as directly over the part affected as poffible(59). When the influenza is attended with ophthalmies, head-ache, or acute pains in the eye-balls, blifters applied over the temporal arteries, to the nape of the neck, or behind the ears, are of eminent fervice (60).

(57) Brydone fays the Italians use ice and ice-water with great advantage in inflammations of the lungs; but I have not learnt that this practice has been imitated in America, and until experience shall have demonstrated more generally its fastery, we should venture on it with some hesitation.

(58) "Proper dilution is unquestionably useful in all fevers, but certainly fome require more than barley-water, and lemonade." Huxham on fevers, page 245. See alfo Lond. Med. Mem. vol. 2. page 459.

(59) "Bliffers feldom failed to relieve the head, and to prevent too great a defluxion on the lungs." Lond. Med. Transact: vol. 3. page 73.

(60) There has been much contrariety of opinion with regard to blifters: fome exclaim against frequent, and, as they 7. The PEDILUVIUM should never be omitted in the incipient ftage of this, or of any other catarrhous affection. The patient may fit in water of a temperature fomewhat higher than that of his own body (61), from five to thirty or forty minutes; taking, at the fame time, or very fhortly after, a few drops of antimonial wine in a little weak tea. The eafe with which this remedy may be procured, being within the reach of every body, the fuddennefs of its effects, and the little danger attendant on its application, are no fmall recommendations in its favour. According to Dr. Hamilton, " it determines to the furface, encourages a larger fhare of blood from the head and fuperior parts, to the lower; is generally followed by fleep, relieves delirium, moderates the cough, and removes fickness at the ftomach, from the great fympathy between this organ, and all the parts of the body ; but efpecially with the furface(62)."

8. WARM AQUEOUS VAPOURS frequently received into the lungs by the breath, conftitute a remedy of immenfe confequence in this difeafe. Many perfons fancy that a little vinegar added to the warm water, improves its virtues confiderably, the truth of which however has beenquestioned; nevertheles, asthe vapour, in confequence of this addition, feels more grateful to the lungs and fauces of fome people, as it can do no injury, and as it may coincide with the wilhes of the patients, it will

term it, indifcriminate use; others forbid the application of them where there is a putrid tendency only; others admit them, but object to certain kinds in certain kinds of fevers, -as for inftance cantharides in the jail fever, where they would prefer bliftering with the fteams of hot-water, or finapifins of vinegar, leaven, &c. Whilft others again, the most celebrated of whom is the late Doctor Brown, condemn their use in all cases whatever.

(51) See Huxham on fevers, at page 12. (62) See his remarks on the influenza of 1782, in the fecond volume of the Lond. Med. Memoirs.

fometimes become a duty to prefcribe in this way. The method of using or of applying the vapour, is of very little importance; a bason filled with hot water, and the face placed over it, or the steam received through an inverted funnel, will answer as well as, and perhaps better than Mudge's inhaler.

Directions to Nurfes, and attendants of the fick.

in the second second

As the influenza is a febrile difeafe, and a contagious one alfo, it will be proper to pay attention to the air of the patient's chamber; as the falubrity of this, which depends no lefs on frequent ventilation, than upon univerfal cleanlinefs, accelerates the cure, and is preventive of relapfes. Nor is the temperature of it to be neglected; for although cool air is undoubtedly useful in fevers, yet it is not lefs fo in many cafes, to fupport that degree of warmth which may promote a proper quantity of perfpiration. A fire-place is of great use in purifying the air, and in fome measure regulating the temperature of it, and where a choice can be had, the fick ought never to be put in a room in which there is not fuch a ventilator. Let me repeat it, every thing about the patient fhould be kept clean, and his linen frequently changed; his bed placed fome feet from the wall, and no curtains fuffered to invelope it ; all unneceffary furniture fhould be removed, and no wearing apparel permitted to hang round the room. If at any time it should be found unadvifeable to change the air of his apartment by opening the windows, doors, &c. it will be right to impregnate it with the fleams of vinegar(63), or with the fumes which arife from brown fugar when thrown on a few coals. The prefent ftate of philosophy will not enable us to explain fatisfactorily how the healthy change is produced ;-whe-

(62) "Steams of vinegar relift putrefaction by inpregnating the air with it's powers." Fordyce on fevers, page 18. ther the fleams of the vinegar, or the fumes of the fugar neutralize, or decompose the morbid impurities issuing from the fick,—or in short how it is effectuated: but it is well we are certain of the fact, though we should forever be ignorant how it obtains.

Of Prophylactics

in the influenza little can be faid with certainty, as we are yet fo totally ignorant of the true nature of the materies morbi; but it may perhaps be proper to obferve that equanimity, and temperance in eating and drinking, are amongst the best preventatives of all diforders. Temperance is too indefinite a term, however, as that which is no more than strictly necessary to one perfon, might to another be a very dangerous excels; for which reafon more ought to be left to the feelings of the perfon than to the judgment of the physician. When an epidemic rages, and indeed at all times, changes in the manner of living are dangerous; but especially fo, if they be not gradually made, " left by the change fome innovation fhould happen in the body," as faith the great Hippocrates. or ne liy.

Of the Prognofis.

The influenza has brought on death in perfons previoufly very much debilitated, and paved the way for it in fome inftances by difpofing to dropfy, confumption of the lungs, &c. Yet the united teftimony of all the writers upon this fubject proves that it is feldom either obflinate or fatal(64): and as death or recovery in this difeafe is marked by no peculiar fymptom (that I know of) it has

(64) See Med. Commun. vol. 1. page 40. The termination or confequences of this diforder were like every other part of it, extremely various." appeared to be useles to enter into a detail of doubtful circumstances. There is no part of our medical refearches accompanied with fo much uncertainty as is the prognosis of difease; for, in the language of the poet, "fhadows, clouds, and darkness rest upon it."

I fhall conclude this effay with remarking that, although the influenza is, as mentioned above, for the most part a mild disease, still it is not always without danger; that if there be a rilk in leaving our conftitutions to ftruggle with the complaint, there is as much-nay, more to be apprehended from injudicious treatment; that while in fome cafes we fancy we are affifting nature, we should be careful left we be found contending with her to the great hazard of the patient ; that although medicines become the props of finking life when judicioully administred, yet if dealt out by the rash and the unfkilful it is justly to be feared they will be used improperly, in which cafe they are as dreadful as the fword of the destroying angel. By this I mean not to infinuate, that the faculty alone are to difpense medicines,-far from it; but would wish to fuggest, in the caufe of humanity, the necessity of caution, as " bold practice" borders upon cruelty.

FINIS.

Of the Prognolis.
