## OF FEVERS IN GENERAL.

**W**E choose to begin with the consideration of Fever, because it is the most frequent of all diseases, the most general in its effects, and lays the foundation of most acute and chronic diseases.

In treating of any disease, it is first necessary that we ascertain those symptoms which serve to distinguish it from every other; because it is only from a knowledge of these, that we can reason with regard to their causes, or proceed properly in the cure.

In every Fever there is in the beginning a sensation of cold, called horripulatio, attended with a quick pulse, succeeded by an increased heat, with prostration of strength, and these are called pathognomonic symptoms.

A

Those

## 2 OF FEVERS IN GENERAL.

Those who imagine that a quick pulse alone with a heat greater than natural indicate the presence of Fever are mistaken. Though the above symptoms always take place, yet there are some others in common to all Fevers, which according to the nature or violence of the disease are more or less frequent and obvious.

They may be considered under three different stages :

Stage I. Lassitude, weakness, horripulatio, rigor, tremor, paleness of the extremities, difficult breathing, anxiety of the præcordia, nausea, vomiting, small quick pulse, prostration of strength, urine crude and thin.

Stage II. These symptoms are succeeded by heat, the paleness disappears, thirst is considerable, attended with headach.

Stage III. These symptoms are relieved by a gentle sweat, the pulse becomes more full and soft, which shews a freer circulation; the urine frequently deposits a sediment.

In some Fevers the symptoms of cold are so transitory in their duration as not to be obvious; but on the whole these are the symptoms that are in common to all Fevers, and what will enable us to trace their causes and lay down proper indications of cure. Theree

There are other symptoms which frequently occur and which deserve a separate consideration; vomiting, diarrhæa, delirium, coma, watchings, convulsions, symptomatical and profuse sweatings.

The causes of Fever are various, and they operate differently on different constitutions. The most frequent are external cold with moisture, especially if suddenly applied, which by stopping perspiration, and occasioning a retention of other secretions, stimulate from their acrimony, and excite Fever.

Myasmata and putrid effluvia in the atmosphere give Fevers which affect whole countries or cities.

Too large a quantity of acrid food, spirituous liquors, or condiments, especially if they are such as are of difficult digestion, and are therefore not readily thrown out of the body.

A collection of putrid fordes in the stomach is a more frequent cause than commonly imagined.

Affections of the mind, such as fear and anger, which by stopping perspiration, and favouring the retropulsion of eruptions, produce Fever.

The external application of corrosive caustic substances, whatever wounds or occasions lacerations

rations of any kind, whatever irritates the nerves, and excites inflammation.

These are all the occasional causes that produce Fever, and are therefore to be avoided.

The proximate cause of Fever seems to be a constriction on the surface of the body, or spasm of the nervous kind, produced by stimulus, occasioning a resistance to a free circulation, and therefore productive of such symptoms as have been enumerated.

Fevers are of different kinds, according as these causes have more or less taken effect, and according to their duration and frequency of their return, and these all depending very much on the predisposition or temperament of the body.

The cold and other symptoms of weakness in Fevers arise from an impeded circulation on the surface of the body.

The quick pulse and anxiety of the præcordia are owing to an accumulation of blood about the heart, and the increased heat, and action of the vessels are owing to the heart in some measure getting the better of the former resistance, and therefore from the blood flowing with more velocity, and likewise from its tending somewhat to acrimony, more heat is generated.

The

## OF FEVERS IN GENERAL. 5

The pain of the head and back is owing to spasmodic contractions of the small vessels and nervous fibrillæ of these parts.

In the cure of Fevers we are to attend to such occasional causes as we have mentioned, if possible they are to be expelled, and nature is to be assisted afterwards in conquering the proximate cause, by producing a free and easy circulation on the surface of the body, and restoring perspiration.

And the cure will depend likewise on a proper management and regulation of the powers of nature, that the febrile impetus should not prevail beyond due bounds, or that the efforts of nature should not be too violent.

The first general indication in the cure of Fevers is to evacuate from the primæ viæ; by doing this we remove sordes collected there and likewise promote perspiration.

rected by allowing the patient to drink freely of decoctions of rice or barley, sufficiently acidulated with vegetable acids, as the juice of lemons, apples, and the like; but during the operation of an antimonial they are apt to occasion griping.

If the anxiety continue, which is always owing to an impeded circulation through the lungs, it may arise from a weakness of the heart, or a spasmodical affection of it, especially if the pulse is quick and small, and the heat not equally diffused thro' the whole body.

The warm cordial and antispasmodic medicines must be had recourse to.

The symptoms which occur in Fevers and are the most troublesome, deserve our attention,  
B such

to OF FEVERS IN GENERAL.

such as diarrhæa, profuse sweatings, coma, delirium and convulsions.

Diarrhæa in Fevers takes its rise from a variety of causes; first acrid and putrid fordes collected in the intestines, or putrid or acrid matter taking its course that way rather than by the kidneys or skin; and therefore this discharge when moderate, and not such as weakens the patient, proves salutary, and ought not to be stopt, and when very urgent ought only to be moderated by small doses of Ipecacuan, of two or three grains each; on the other hand when it has continued for some time without any relief to the patient, attended with griping, rendering the patient's pulse weaker and quicker, and increasing every symptom of weakness, it is to be stopped by opiates, astringent, cordial, and diaphoretic remedies; so that the irritation may be allayed, and the flow of humours determined to the surface of the body; these may be either taken by the mouth, or injected by the anus.

Petechiæ very frequently appear in Fevers, which are never to be considered as critical, they are always symptomatical and are to be removed by abating the violence of the Fever, and by the use of antiseptic medicines, of which the Peruvian bark may be considered as the best.

℥iij. ad ℥ij. cochlear. singulis  
adde spt. vitriol. tenuis gutt. iv.  
dos. ℥ij.

Eruptions of other kinds frequently take place in Fevers that are truly critical, as the small-pox, measles, miliary Fever; of these in their proper place.

Profuse sweatings, if not critical and affording relief, are for the most part injurious, by weakening the powers of nature, and depriving the blood of its aqueous part.

They are frequently owing to a putrescent state of the fluids, and a considerable laxity or weakness of the habit, which tend greatly to sink the patient and impede his recovery; they are to be relieved by N<sup>o</sup> 19. or N<sup>o</sup> 20. to which may be added alum whey, taking from three to four ounces of it as it agrees with the stomach.

Watching in Fevers is frequently owing to slight inflammations of the brain, from spasms and increased irritability of these parts; it is to be moderated by keeping the body quiet, by excluding light, and all external impressions, from the patient, by the use of sedative medicines that act on the nerves without increasing inflammation.

A coma or constant drowsiness and inclination to sleep without being relieved by it, indicates a compression on the brain, and if attended with inflammation of the eyes, or violent pulsation of the temporal arteries, will be most readily relieved by the application of leeches to the temples, even when a more general evacuation by bleeding would prove hurtful.

This symptom likewise arises frequently from a spasmodic contraction in the small vessels of the brain and dura mater, and in this case the patient is relieved by the external application of volatile stimulating salts, sinapisms, and blisters.

Delirium in Fevers is owing to an unequal and irregular distribution of nervous power, sometimes to inflammation in the beginning of Fever, but when occurring in the end of Fever indicates a weakness and languor; when from inflammation, leeches or V. S. when from weakness, antispasmodic and cordial medicines, as N<sup>o</sup> 13 and 14. are to be employed.

Acet. opt. q. f. f. cataplasma.

If during the delirium the stomach is much affected with great nausea, vomiting should be encouraged.

And opiates in delirium without stupor is frequently attended with advantage.

Convulsions and subsultus tendinum, frequently attend the last stage of a slow Fever, which always indicate some injury in the brain, and are therefore commonly attended with danger.

They always indicate extreme weakness and that nature is oppressed, therefore they are removed by musk, castor, assa fætida, cordial and stimulating medicines, Madeira, port wine, and the like.

A blister to the head in these cases is attended with advantage.

The

The diet of our patients in Fevers should be light and easy of digestion.

And when the Fever is gone, strength is to be acquired by gentle and moderate exercise, the Peruvian bark, and other tonic medicines.

Fevers are divided into those which arise from a general affection, and into those which arise from inflammation in a particular part.

Fevers are distinguished into continued, remittent, and intermittent; and this is a much better division than into such as continue for a certain time, as the ephemera of one day and the like.

The continued Fevers, are either the inflammatory, the low nervous, or the putrid malignant or jail Fever, so called though they have remissions.

The remittent more strictly speaking are regular in their remissions, and correspond to intermittents in the return of their paroxysms. The hectic may be reduced to this head.

The intermittents are such as when the paroxysm abates altogether, gives the patient more or less interval of health, until it returns again.

O F T H E  
A C U T E I N F L A M M A T O R Y F E V E R .

**I**T first shews its self by lassitude and oppression, weakness, cold and heat alternately succeeding each other, tremors, universal pain, especially in the back, shoulders, and head.

Then a most intense and burning heat succeeds, a thirst unextinguishable, inflammation of the eyes, redness and swelling of the face, nausea, vomiting, inquietude, anxiety, pulse full and strong, skin dry, the urine high coloured, and sometimes pale; the tongue covered over with a rough, dry, brownish, and blackish crust; the blood from the arm showing the inflammatory crust; difficult breathing, costiveness, watching, delirium, stupor, coma, subsultus tendinum, hiccup, involuntary discharge of faeces, and urine, succeeded by death.

Youth is more subject to this Fever than old age, and strong fibres and dense fluids prædispose to it.

And the most frequent occasional cause is the sudden application of cold; sometimes the drinking of too much spirituous liquors.

*[The page contains extremely faint, illegible text, likely bleed-through from the reverse side of the document. The text is too light to transcribe accurately.]*

The prognosis depends on the violence of the symptoms.

This is a less dangerous Fever than the putrid or nervous.

If watching, delirium, coma, cold extremities, partial and cold sweating come on, the patient is in danger.

The first indication is to weaken the force of the circulation, by bleeding, according to the strength of the patient, suddenly and from a large orifice.

If the nausea is considerable, N<sup>o</sup> 1, ought to be given; the diaphoretic course, N<sup>o</sup> 8, &c. ought to be pursued, and costiveness to be avoided by N<sup>o</sup> 3, &c. large quantities of warm acidulated liquors ought to be taken.

And if the symptoms mentioned as dangerous come on, and the patient's pulse and strength sink under them, blisters and sinapisms ought to be applied to the feet, and the cordial antispasmodics should be taken.

A delirium in this Fever is commonly taken off by leeches, and the application of the pediluvium.

The hiccup and subsultus tendinum to be removed by musk.

If this Fever degenerates into a remittent Fever, with evident remissions, and the urine deposits a sediment, the bark is to be taken in large quantities.

---

O F T H E

### SLOW NERVOUS FEVER.

**T**HIS Fever in its nature is in every respect opposite to the former.

It begins with a loathing of all kinds of food, slight cold fits, transitory flushing of the face, universal lassitude, such as is felt after fatigue, low spirits, headach, and drowsiness.

These are succeeded with nausea and vomiting, and towards the evening the patient becomes much worse. Heat, and headach become more violent, the pulse more frequent but weaker, breathing less free, pain along the  
CORO-

## THE SLOW NERVOUS FEVER. 19

coronary future, with a sense of cold and stupor in the back part of the head, frequently succeeded by delirium. The patient for five or six days remains pale, drowsy, and restless, and cannot obtain sleep, the pulse frequent, unequal, sometimes intermittent, urine like whey without sediment, a white dry mucus covers the tongue, and there is little or no thirst.

The tongue frequently is dry in the middle, and surrounded by a yellow coloured margin.

About the seventh day the giddiness and pain of head becomes greater. Tinnitus aurium, vomiting, deliquium on sitting up, delirium, or rather confused dreams, and subsultus tendinum arise.

On the ninth, tenth, and eleventh days cold and general sweats frequently appear, and the strength frequently is exhausted by violent diarrhæa, while a moderate one sometimes carries off the delirium.

When the strength is exhausted the pulse is very quick, and may be said to tremble and flutter, rather than to beat. The sick become insensible and stupid.

The delirium terminates in a profound coma, and that in death.

## 20 THE SLOW NERVOUS FEVER.

If the deafness which occurs at the end of the fever ends in an imposthume of the ear, it is a good sign. This fever attacks people of weak nerves, lax habit of body, and poor thin blood, who have suffered great evacuations, immoderate watchings, study, or fatigue.

In the cure of this fever violent evacuations are to be avoided.

The first step is to cleanse the primæ viæ, which is done by a gentle puke.

N<sup>o</sup> 26. ℞ Pulv. ipecacuan. gr. x.  
Conserv. rosar. q. s. f. bolus.

If the vomit does not direct its course by the intestines, the following is frequently useful.

N<sup>o</sup> 29. ℞ Sal cornu cervi ℞ss.  
Succ. lemonum ℞iij.  
Aq. alexit. simpl. ℞jss. M. f. haust.

When the confusion and dejection of spirits are considerable, galbanum with camphire may be used, and blisters applied to the neck and back of the head.

In the subsultus tendinum musk is to be used, N<sup>o</sup> 25. The patient for ordinary drink is to be indulged in wine whey, and now and then, as the patient's strength requires, two or three glasses of generous port ought to be taken.

When the breathing is extremely laborious, and there is an oppression at the præcordia, these are taken off by the repeated application of blisters to the arms and legs, which likewise increase the vis vitæ.

It frequently happens in this Fever that great anxiety and oppression in the præcordia precede miliary eruptions, which, altho' seldom critical, are not to be suddenly repelled.

However,

22 THE SLOW NERVOUS FEVER.

However, as they are sometimes attended with profuse sweatings that weaken the patient, by means of wine and bark they are to be moderated.

Spirit vini gallici ℥ss. f. infusio clausa per dies aliquot, tres saltem quatuorve deinde coletur.

Of this one drachm to half an ounce is a dose every 6th or 8th hour.

A diarrhæa is frequently troublesome in this disease, and is to be moderated by opiates and theriaca Andromachi.

If evident remissions appear, then the bark is to be taken in considerable quantity.

The critical discharge is generally by salivation.

OF THE  
PUTRID MALIGNANT HOSPITAL

OR

## JAIL FEVER.

**C**OLD and heat alternately succeed, but the intensity of the heat is great in proportion to the cold, pulse tense, small, frequent, and unequal, pulsations of the carotid and temporal arteries, great prostration of strength, weakness and dejection of spirits, nausea and vomiting of black bile, headach, tinnitus aurium, difficult breathing, frequent sighs, pain in the stomach and back, a difficulty in lying in any one posture, tremor, subsultus tendinum, the tongue black and dry, the lips and teeth covered with a black putrid fordes, the blood so dissolved as not to coagulate; thirst considerable, a bitter and disagreeable taste in the mouth, the urine at first pale, afterwards high-coloured, and depositing a sediment like the grounds of coffee; the sweats profuse and fœtid; stools fœtid, thickish, and bloody, small livid spots appear like flea-bites, sometimes petechiæ, and when broader and of a darker colour called Vibices, hæmorrhages from different parts of the body, apthæ, gangrenous ulcerations in the throat, hiccup, death.

The

## 24 OF THE HOSPITAL FEVER.

The causes are improper food, moist and warm air, exhalations from corrupted animal and vegetable substances, or infectious myasmata.

It approaches to the low nervous, but in general is easily distinguished from the evident marks of putrefaction, and appearance of the eruptions.

### OF THE CURE.

In this disease violent evacuations are to be avoided, but in the beginning an emetic of ipecacuan and emetic tartar is always proper; the cordial and antiseptic medicines succeed best in the cure, especially the Peruvian bark with the warm alexiterials, according to the practice of Dr. Huxham and Sir John Pringle.

## INTERMITTENT FEVERS. 25

The tincture of roses and alum whey may be drank plentifully from time to time.

The sweating sickness which raged in London in 1665, is to be referred to this head of Fever.

---

O F

## INTERMITTENT FEVERS.

**T**HE paroxysm of an intermittent Fever may be divided into three stages :

### Symptoms of the First Stage.

Stage I. Yawning, a disagreeable sensation in the spine, paleness of the extremities, lassitude, weakness, a quick and small pulse, pain of the joints, back, and head, a sensation of cold, with horror, rigor, and insensibility, difficult breathing, anxiety, nausea, vomiting, great thirst, urine thin and pale.

Stage II. When these symptoms have continued a little, they become milder and heat succeeds

ceeds the cold, the skin is red from the heat increasing, the shaking abates, the breathing is somewhat easier, the anxiety is less, the pulse is fuller and stronger, the headach is increased, and sometimes delirium comes on; the patient is restless, thirst considerable, the urine is red.

Stage III. The heat abates, the skin is softer and more moist, a sweat breaks out, the pulse becomes soft and full, breathing easy, pains abate, all the other symptoms disappear, the urine deposits a sediment, the patient falls asleep, and awakes perfectly well.

In the intervals between the fits there is commonly a pulse slower than natural, a weakness and disposition to sweat.

According to the return of paroxysm, the Fever is distinguished into quotidian, tertian, quartan, and sometimes longer intervals.

Intermittent Fevers are justly considered by Sydenham as either autumnal or vernal.

The occasional cause of these are cold and moisture, myasmata, contagion, and sudden affections of the mind, such as fear and the like.

These

Those persons who are the most subject to intermittent Fevers, are such as are endued with most sensibility, and who are subject to spasmodic diseases, those who have been weakened by previous evacuations, the epidemic constitution, or other causes.

A putrescent tendency of our fluids from retained perspiration, or too large quantities of bile in the system have been considered as the proximate cause. But it is more probable that these are only effects of the disease, and the proximate cause is to be referred to a spasmodic contraction on the surface of the body.

#### OF THE PROGNOSIS.

They are seldom dangerous unless when long protracted. The autumnal more dangerous and difficult of cure than the vernal.

The tertian Fever is the gentlest and shortest in its duration of any.

The quartan, especially the autumnal, is the most difficult of cure, frequently not going away until the spring.

The quotidian is frequently of long duration, and very changeable into the continued; other circumstances are likewise to be attended to.

## OF THE CURE.

The cure of intermittent Fevers may be considered as natural or artificial.

Nature cures by taking off the spasm and provoking to sweat; we assist her by the use of diluting, diaphoretic, and antispasmodic medicines; such as the saline draughts in their state of effervescence, as N<sup>o</sup> 12, the pediluvium and semicupium.

If there are symptoms of inflammation present, V. S. must be premised, which will prevent its degeneracy into a continued Fever.

Vomits in the beginning are generally necessary to evacuate fordes, and to dispose to sweat N<sup>o</sup> 1, 2.

Small doses of ipecacuan, without vomiting, cure some vernal intermittents.

A caution is necessary in the use of purgatives, the drastic are to be avoided. Glysters of milk and sugar, or N<sup>o</sup> 3, 4, 5, are only to be had recourse to; and opiates ought to be given after them to take off the tendency to spasm.

During the cure, care is to be taken to avoid all the remote causes already mentioned. After  
the

the sweating fit care should be taken to dry the body with warm flannel, for if the body is allowed to macerate in its own sweat, cold with moisture takes place, and such a laxity is induced that the bark itself becomes unfit for the cure.

The artificial cure consists in preventing the return of the cold fit, upon which the succeeding symptoms depend.

This is not always adviseable, an intermittent Fever sometimes proving critical with regard to other diseases; but if this is not the case we prevent the return of the cold fit,

1. By exciting a sweat some hours before it is expected.

2. By correcting the morbid irritability or tendency to spasm.

The first ought to be done by the gentlest sudorific regimen, by having recourse to the saline draught, decoction of sarsaparilla, and the warm bath. Others again employ heating aromatic substances, which, though sometimes successful, are always attended with danger.

The second means of preventing the return is to be more especially trusted to, and this is done either by opiates or astringents.

The

## 30 INTERMITTENT FEVERS.

The opiates, before the paroxysm, will frequently moderate it, but it is a practice not to be depended on. Astringents of all kinds have been used, such as alum, galls, preparations of copper, and the like.

But it is the Peruvian bark we are to have recourse to.

Before its use it is proper to premise an emetic, and sometimes a gentle stomachic purgative of rhubarb and aloes.

N<sup>o</sup> 33. ℞ Aq. cinamom. tenuis,  
Alexeter simpl. aa. ʒvj.  
Pulv. cort. Peruv. ʒj.  
Syr. e cort. aurant. ʒiſs. M. f. haust.

The above may be taken more or less frequently, according to the duration of the interval.

It is better to repeat the dose frequently about the time the fit is expected.

If the bark should purge, that will be prevented by having recourse to a few drops of tinct. Thebaic.

The bark is taken sometimes during the cold fit, but it is observed by experience, that the cures produced are more subject to relapse.

The

## INTERMITTENT FEVERS. 31

The premature use of the bark is dangerous in infarctions of the lungs, and inflammations of the viscera.

If the skin be yellow and there be any swelling of the abdomen, we should add laxative and diuretic medicines to the bark.

N<sup>o</sup> 34. ℞ Pulv. cort. Peruv. ℥ss.  
Flor. chamomil. ℥ij.  
Sal ammon. crud. ℥j.  
Syrup. e cortice aurant. q. f. f.  
elect. cap. molem nuc. moschat. 4ta quaq. hora.

Many symptoms, such as dropsy, and œdematous swellings attributed to the bark, take their rise from the weakness produced by the Fever, and are often in the beginning cured by the bark.

If the intermittent verges on the inflammatory, the antiphlogistic regimen is to be pursued; if on the slow nervous fever, cordials, aromatics, snake root, myrrh, camphor, &c. are to be given, N<sup>o</sup> 28, 31.

After the fits are gone, the use of the bark with chalybeats is to be continued, and proper exercise to prevent a relapse.

O F

## INFLAMMATION IN GENERAL.

**I**N every inflammation of a particular part, there is a swelling, redness, pain, and for the most part a shining appearance, the pulse is quickned, there is considerable thirst, pulsation in the part affected, and the blood when drawn, gives the inflammatory crust; it however frequently happens, that symptoms of Inflammation appear in general in the system, when no particular part can be assigned as the cause, and produces inflammatory and acute Fevers, which are always attended with an increased circulation, and shews the vis vitæ to be enforced beyond its due bounds.

The topical Inflammations, when they are the primary affection, take their rise from external injuries, and sometimes from acrimony falling on particular parts from obstructed excretions.

And when the disease seems to be more general, it is often produced by cold and excess in the non-naturals.

Every Inflammation must be terminated either by resolution, suppuration, or gangrene; the most desirable termination is by resolution; for this  
purpose

purpose we are to diminish the febrile impetus especially in the beginning by V. S. from a large orifice, and according to the symptoms ad deliquium animæ; as the inflammation is frequently kept up by the acrimony of the retained excretions, they are to be promoted, especially that of sweat, by small doses of tartar emetic, N° 7, &c. succeeded by the saline draughts N° 12. If the patient should be costive, the means employed N° 3, 4, 5, 6, in Fever are to be then had recourse to.

The Inflammation is frequently kept up by the irritation of the part, hence the application of astringents, and sedatives, which become proper repellents.

by cordials, *sal c. c.* Castor. *contrayerva* and the like, are to be pursued.

If the symptoms of Inflammation do not cease, and it becomes advisable to produce suppuration, this is brought about by the external application of fomentations, cataplasms, and liniments, which by relaxing and taking off tension frequently favour a suppuration, and if suppuration be proper when the Inflammation is not sufficient to carry it on, the animal powers must be increased by cordials and full diet.

CHAPTER I  
THE EARLY HISTORY OF THE UNITED STATES

The first European settlement in North America was established by the Spanish in 1492. The English followed in 1607 with the Jamestown colony. The Pilgrims arrived in 1620 on the Mayflower, and the Massachusetts Bay colony was founded in 1630.

The American Revolution began in 1775, leading to the Declaration of Independence in 1776. The war ended in 1781 with the British surrender at Yorktown. The new nation was governed by the Articles of Confederation until 1789.

The Constitution was adopted in 1787, establishing the federal government. The first Congress met in 1789, and George Washington became the first President. The Louisiana Purchase in 1803 doubled the size of the United States.

The Civil War (1861-1865) was fought over the issue of slavery. Abraham Lincoln led the Union to victory, and the Emancipation Proclamation was issued in 1862. The war resulted in the abolition of slavery and the strengthening of the federal government.

The Reconstruction era (1863-1877) followed the Civil War, aiming to rebuild the South and integrate African Americans into society. The Reconstruction Acts and the Civil Rights Act of 1866 were key legislative measures.

The Gilded Age (1870-1900) was a period of rapid industrialization and economic growth. The Progressive Era (1890-1920) followed, focusing on social reforms and government regulation of business.

World War I (1914-1918) and World War II (1939-1945) were major global conflicts. The United States emerged as a superpower after World War II, leading to the Cold War (1945-1991) with the Soviet Union.

The Vietnam War (1955-1975) and the Watergate scandal (1972-1974) were significant events in the 1970s. The 1980s saw the rise of the Reagan administration and the end of the Cold War.

The 1990s and 2000s were marked by the end of the Cold War, the Gulf War, and the September 11 attacks. The 2008 financial crisis and the Obama administration were key events in the 21st century.

OF THE HISTORY OF THE

... of the ...

... of the ...

... of the ...

... of the ...

... of the ...

there is a general affection, shiverings and cold fits.

When there is any danger of a mortification coming on, then the pain of the part very suddenly abates, and the tumor assumes a brownish colour.

The skin about it is loose, the impression of the finger is left, it loses all sense and becomes livid.

Pustules appear, which contain a yellowish ichor, and about their base they are black. The skin, and parts under it, are corrupted, black, cold, deprived of sense, and converted into a foetid gangrenous mass. The gangrene spreads and affects the neighbouring parts; cold sweats appear; the pulse is small and quick; hiccup, succeeded by death.

A gangrene of internal parts is seldom cured.

Of external parts, if arising from an internal cause, is attended with more danger.

If the patient be young and healthy there is less danger; if old and feeble, the contrary.

To prevent its spreading, scarification must be employed.

36 OF A PHRENITIS.

Aq. fontan. ℥vj.  
Coq. paululum & cola.

To every pound of the above decoction let half an ounce of oil of turpentine, and an ounce of tincture of myrrh be added, and the part be frequently fomented with it.

The patient is to take the bark in large quantities, in form of decoction, with the tincture added to it, and likewise in substance. His strength is to be supported by cordials and wine.

A description and method of cure of the Scirrhus will occur under a different head.

---

OF A  
PHRENITIS.

**A** Phrenitis, is an acute inflammatory fever, arising from an inflammation of the brain or its membranes, attended with head-ach,

ach, an early delirium with fierceness, and inflammation of the eyes.

It is either idiopathic or symptomatic.

The general causes of inflammation may give rise to it.

The cure consists in early evacuations by bleeding and antiphlogistic purgatives.

N<sup>o</sup> 42. R Pulv. camphor. ℥j.  
 Sal. sedat. Homberg.  
 Sal. nitri. aa. ℥ss.

 Syrup. e cort. aurant. ℥ss. f. emul-  
 sio. ℥j. vel ℥ij. omni quarta hor. sumend.

If the symptoms do not give way to the above practice, blisters are to be applied to the head, and sinapisms to the feet, both which are more especially indicated when the disease is symptomatic.

The general cure of inflammation must be here attended to.

In some cases it may be necessary to have recourse to opiates.

OF THE  
INFLAMMATORY  
SORE THROAT.

**I**N this disease, the pharynx, tonsils, uvula and velum pendulum palati are frequently inflamed, and the inflammation is attended with a pain and difficulty of swallowing; sometimes the breathing is even affected, and fever for the most part accompanies these symptoms.

A resolution of the inflammation is here to be attempted by bleeding, either topical or general.

The use of gargarisms are extremely proper.

N<sup>o</sup> 43. R Decoct. pectoral. ℥viii.

COURT

OF

COMMONS

## PUTRID SORE THROAT. 39

Blisters are frequently proper.

The sudorific and antimonial course, N<sup>o</sup> 7, 8, 9, 10, 11, 12, ought to be pursued.

The general cure of inflammation ought to be here attended to.

If the inflammation should advance to suppuration, it may be useful to promote it by applying the steams of warm water, and washing the parts with pectoral decoction, and tincture of myrrh.

---

## OF THE PUTRID MALIGNANT,

OR

## ULCERATED SORE THROAT.

**T**HE inflammation is here more of the erysipelatous kind, and attended with ulcerations.

Symptoms of a putrid fever accompany it, and it therefore demands a method of cure very different from the former.

Bleeding

## 40 PUTRID SORE THROAT.

Bleeding or other evacuations are here seldom proper.

The cure is performed by the internal use of cordial, stimulating, and antiseptic substances.

An emetic in the beginning of this disease is extremely proper.

N<sup>o</sup> 45. ℞ Caricarum ℥j.

The

## 42 THE PERIPNEUMONY.

The pectoral decoction Pharm. Lond. may be drank ad libitum.

If the expectoration is copious, well concocted and of a yellow colour, especially if streaked with blood, it is a salutary sign.

If a gentle sweat comes on, with a sediment in the urine, the symptoms generally abate.

The steams of warm water received into the lungs will frequently afford relief.

If the inflammation suppurates in the interior part of the lungs, a phthisis pulmonalis is frequently produced. If on the more external parts, and the matter communicating with the external cavity, an empyema is produced.

The true peripneumony, when injudiciously treated by too violent evacuations, is sometimes converted into the BASTARD PERIPNEUMONY, which is a disease attended with difficulty of breathing, and fever, the pulse small, and other symptoms of a debilitated vis vitæ.

The cure is to be performed by gentle emetics and stomachic purgatives.

 coch. j. pro dosi.

The habit of body to be afterwards strengthened by bark and chalybeats.

O F A  
P L E U R I S Y.

**A**N inflammation of the pleura, attended with an acute fever, and pain in the side, difficult and painful respiration: the pulse is commonly hard, and in the beginning of the disease, a dry cough without expectoration.

The inflammation soon spreads on the surface of the lungs.

The cure to be attempted by resolution, and it will be readily understood, from what has been said on the subject of peripneumony. Bleeding, blisters, antiphlogistic purgatives, antimonials, saline draughts, and the expectorating medicines, N<sup>o</sup> 47, are to be employed.

If the pericardium is affected with inflammation, the pain is less acute, and seated more deeply; the pulse intermits, and palpitation is frequent. If the diaphragm is inflamed the disease is called a PARAPHRENITIS; the pain is more acute, and chiefly on the bastard ribs and lower vertebræ; attended with hiccup, delirium, and convulsions. The same treatment as in the Pleurisy becomes necessary.

And if the patient, in either disease, sinks, N<sup>o</sup> 15, 48, are to be had recourse to.

*[The text on this page is extremely faint and illegible due to fading and bleed-through from the reverse side. It appears to be a multi-paragraph document.]*

O F A

## PULMONARY CONSUMPTION.

**T**HIS disease is attended with a wasting of the body, hectic fever, cough and purulent spitting from an ulcer of the lungs.

Those of a narrow chest, high shoulders, and long neck, are the most subject to it.

It is frequently hereditary, and arises from a scrophulous habit.

It likewise frequently follows hæmoptoe and catarrhs that are neglected in their beginning.

Peripneumony and pleurisy terminate sometimes in this disease.

It begins with a cough, increased heat, pain of the breast, oppression in breathing, especially on the least motion, spitting considerable, and frequently bloody, salt taste in the mouth, prostration of strength and appetite, nausea and vomiting after meals, pulse quick and small, the spittings are purulent, exacerbations of fever towards the evening, colliquative sweats in the morning, diarrhæa, heat in the palms of the hands, the face flushes after meals, the functions  
lan-

languish, the eyes become hollow, facies hippocratica ensues and death.

The prognosis depends on the state of the disease, the causes, whether hereditary or others, that have given rise to it, the season of the year, and climate in which our patient lives.

In the beginning, the cure is to be attempted by small and repeated bleedings.

If it arises from hæmoptoe, the general anti-phlogistic course, mentioned under that disease, must be pursued.

The tincture of roses may be drank ad libitum.

The external application of blisters are frequently necessary.

When the cough is violent in the night, it is to be palliated by opiates.

The patient may drink large quantities of a mucilaginous liquor, as of G. Arab. and althea.

Emetics are sometimes necessary, and the patient should live chiefly on a milk diet, and use gentle exercise, avoiding cold and fatigue.

Sometimes the symptoms will abate in the winter, and break out in the spring with more violence;

violence; during the winter therefore cold is to be avoided, and if the oppression of the breathing and cough is not troublesome, the use of the cold bath, and Chalybeat and Bristol waters are often proper.

If the disease is purely scrophulous, it is frequently cured by the bark, joined to expectorating medicines.

If there is ulceration in the lungs, gentle exercise, sea voyages, a light vegetable diet, and the free use of butter-milk, greatly promote its healing.

Colliquative sweats, which weaken the patient, are restrained by elixir of vitriol and the bark.

Violent diarrhæas are checked by opiates.

OF THE  
LIVER.

**I**F the inflammation is in the concave part of the liver, the pain is obtuse, together with a sense of weight in the right hypochondrium; there is heat and anxiety about the præcordia, the pulse is not much quickened.

If the inflammation be in the convex part, the pain is more acute, and the breathing is frequently affected.

This disease, if properly treated, and taken in the beginning, is seldom dangerous.

The most favourable termination is by resolution.

This is effected by bleeding, according to the violence of the symptoms, either general or topical, and the external application of blisters.

## 52 INFLAMMATION OF LIVER.

The belly is to be kept open by antiphlogistic purgatives, or emollient glysters, N<sup>o</sup> 3, 4, 5, 6, fomentations may be employed, as N<sup>o</sup> 52.

If suppuration should come on it is dangerous, but sometimes the matter points outwardly, the ulcer is healed, and the hectic fever, from the absorption, is either prevented or cured by the bark, N<sup>o</sup> 33, to which a few drops of elixir vitrioli may be added.

In a scirrhus of the liver we must have recourse to the internal and external use of hemlock; the expressed juice is the most certain preparation, which at first may be taken in a dose of a tea-spoonful, and gradually increased.

It may be kept during the winter in a cool place, with a little oil, or spirit of wine, on its surface.

OF AN  
 INFLAMMATION  
 OF THE  
 KIDNEY.

**I**T is attended with a sense of heat and an acute pain in the region of the kidney, strangury, vomiting, and numbness in the thigh of the affected side.

It should be distinguished from a cholic.

It may arise from the general causes of inflammation, from the acrimony of urine, or the presence of stones.

The resolution of the inflammation is to be attempted by bleeding, the external application of blisters, fomentations, emollient glysters, and the drinking large quantities of barley water, and the mucilage of gum Arabic.

If there is little fever opiates may on some occasions be employed to abate the pain; the warm bath is frequently proper, and both will promote the passage of stones through the ureters.

O F A  
S T R A N G U R Y.

**A** Strangury is attended with a considerable pain in making urine, which is discharged in small quantities at a time, with a violent tenesmus, and most frequently arises from an inflammation in the neck of the bladder, or an abrasion of the mucus, which defends the bladder from the acrimony of the urine.

The drinking N<sup>o</sup> 59, or emulsions of almonds with camphor and nitre are proper.

---

O F  
R H E U M A T I S M.

**I**T is divided into the acute and chronic.

In the former the pains are attended with a considerable degree of fever; in the latter there is none.

The

The joints, the wrists and knees more especially, are affected with pain, attended frequently with inflammation and tumour.

It should be distinguished from the gout and venereal pains.

When the fever is of the acute inflammatory kind, bleeding, and the gentle diaphoretic course are to be employed, N<sup>o</sup> 7, 8, 9, 10, 11.

Topical bleedings, either by leeches or cupping-glasses, after a general bleeding, are frequently useful.

When the fever is moderate, and pains severe, the following is proper :

N<sup>o</sup> 63. R Extract. thebaic. gr. iij.  
 Pulv. ipecacuan. gr. iv.  
 Nitri,  
 Tart. vitriol. aa. gr. viij.  
 Syrup. croci q. s. f. bolus.

When the pains are attended with no fever, and more especially if they are confined to a particular part, blisters are to be applied, which are to be healed up as soon as possible, N<sup>o</sup> 40.

If the disease intermits, and on its return is preceded by any febrile paroxysm, the bark, N<sup>o</sup> 33, is to be given.

Chronic rheumatisms sometimes degenerate into palsy, and when there is any loss of motion electricity frequently cures.

O F T H E  
G O U T.

**S**OME days before the gout appears in the foot, the patient generally feels symptoms of indigestion, crudities and flatulency in his stomach, sometimes an immoderate desire for venery and confused dreams. About two o'clock in the morning, the patient is attacked with violent pain in the great toe, giving a sensation as if the ligaments, or tendo Achillis, were lacerated.

The fit is carried off in the morning by a gentle sweat.

The fit is more or less severe, and more or less durable, according to the age and constitution of the patient.

It is curable when the disease confines itself to the extremities, but when the viscera are affected with it, then all that can for the most part be done is to palliate and relieve the patient, for the stomach and other viscera are rendered so infirm by it, as not to perform their offices properly.

It should be distinguished from rheumatism.

Those

1848  
The first of the year was a very  
dry one, and the crops were  
very poor.

In the month of May the  
rain fell in such a quantity  
that the crops were  
very much improved, and  
the season was very  
successful.

The crops were very  
good, and the season  
was very successful.  
The crops were very  
good, and the season  
was very successful.

The crops were very  
good, and the season  
was very successful.

Those of a full habit of body, the plethoric, the luxuriant, the rich, the ingenious, and those who live a sedentary life, are the common subjects of it.

Cold and moisture, violent study, affections of the mind, and excessive venery, frequently give rise to it.

The cure consists in strengthening the organs of digestion, and keeping up a due inflammation on the extremities.

Vomits are sometimes proper, when there is nausea, eructations, and the lungs oppressed.

N<sup>o</sup> 67, R Pulv. ipecacuan. gr. xv—℞j.  
 Aq. cinamom. spt.  
 —Alexit. simpl. ad ℥ss. f.  
 haust.

The patient should drink an infusion of chamomile flowers along with it.

If the patient has lived freely, after the operation of the vomit, he should drink a few glasses of generous wine; such as Madeira or Port.

In an arthritic colic an infusion of chamomile flowers, with Madeira, is proper, and sometimes opiates may be necessary, but they should be sparingly used.

The diaphoretic and cordial course are to be tried to throw the fit on the extremities.

N<sup>o</sup> 68. ℞ Sal C. C. gr. x.  
 Aq. cinamom. simpl. ℥ij.  
 Tinct. guaiac. volat. aa. ℥j.  
 Syrup. zinziber. ℥ss. f. haust.

Canary and Madeira wines are the best cordials.

The application of blisters to the feet are, upon some occasions, allowable; and to moderate inflammation there, when too violent, leeches are to be employed.

The feet should be kept warm by means of oil-cloth.

In some cases a course of bitters become proper.

N<sup>o</sup> 69. ℞ Centaur. min. summit. manip. j.  
 Cort. aurant. ℥ij.  
 Vin. alb. ℥ij. infunde per 24  
 horas et cola. dosis ℥j.

The constant use of astringent substances, more especially the Duke of Portland's powder, has frequently killed the patient, by throwing the gout upon the vital parts.

The

The care of the goat depends very much on  
a well regulated diet, and a proper attention to  
the cleanliness of the animal.

If the animal is young and delicate, a milk  
diet, with proper exercise, is the best; if ad-  
vanced in years, and much weakened by it, and  
if accustomed to high living, then the animal  
requires a more solid diet, and the addition of  
some mineral matter, such as sulphur, iron, &c.

The use of mineral waters in their cases is  
very beneficial.

Cold and moisture are to be avoided.

The parasites of the goat are treated in  
the same manner, and proceed with any degree of  
severity, the same remedies being used.

The signs of a disease of the internal organs  
are very obscure.

The disease of the lungs is very common, and  
is attended with a cough, and a discharge of  
pus from the nostrils.

The disease of the liver is attended with  
a yellowish color of the skin, and a  
distention of the belly.

MEMORANDUM

TO THE PRESIDENT

FROM THE SECRETARY

DATE

SUBJECT

RE

BY

FOR

BY

The cure of the gout depends very much on a well-regulated diet, and a proper attention to the non-naturals.

If the patient is young and plethoric, a milk diet, with proper exercise, is the best; if advanced in years, and much weakened by it, and if accustomed to high living, then the animal diet, with the moderate use of wine, becomes necessary, avoiding the more flatulent vegetable substances.

The use of chalybeat waters in these cases is very proper.

Cold and moisture are to be avoided.

If the paroxysms of the gout are regular in their return, and preceded with any degree of fever, the bark may sometimes be used.

We ought to avoid the external application of repellents as dangerous.

O F T H E  
S M A L L - P O X .

**A** Fever, sometimes of the inflammatory, and sometimes of the putrid kind, precedes and accompanies the eruption.

They are to be considered as distinct or confluent.

In the distinct small-pox the fever goes off after the eruption; in the confluent it is only abated.

The eruptions appear sooner or later after the first attack of the fever, according to the nature and violence of the symptoms.

They should be distinguished from the chicken pock and other eruptions of a spurious kind, by attending to the course of the disease, and the duration of the pustules.

The cure of the small-pox consists in moderating the fever, the proper application of fresh and cold air, and the keeping the belly regular.

In the natural small-pox, when the body has not been properly prepared, bleeding may sometimes

times be necessary during the fever, and an emetic ought generally to be prescribed.

The belly ought to be kept open by gentle eccoprotics, as N<sup>o</sup> 5, 6.

The patient ought to avoid every irritating and stimulating application.

If the throat is sore he may use the following:

N<sup>o</sup> 70. ℞ Tinct. rosar. ℥viij.  
Mel. rofac. ℥ij. m. f. gargarism.

The external application of blisters to the throat becomes sometimes necessary. Or the following:

N<sup>o</sup> 71. ℞ Ol. olivar. ℥j.  
—camphor. gr. xx. solve  
Sp. fal vol. ammon. ℥ij. m. lini-  
ment  
Extern. applicand.

For common drink the patient should take large quantities of diluting acids.

N<sup>o</sup> 72. ℞ Spt. vitr. dulc.  
—marin. dulc. aa. p. æ.  
Aquæ tepid. q. f. f. mixtura  
gratæ aciditatis pro potu communi.

64 OF THE SMALL-POX.

If the pustules do not suppurate kindly, and if there are petechiæ between their interstices, with other symptoms of putrefaction and weakness, the bark is to be employed.

N<sup>o</sup> 73. R Cort. Peruv. ℥j.  
Extract. liquorit. ℥ij. affunde  
Aq. bullient. ℥ij. et adde  
Elix. vitriol. q. s. ad gratam acidi-  
ditatem cap. ℥j vel ℥ij. omni hora.

If the bark should purge it may be restrained by opiates.

If the cough and restlessness is considerable, a paretic ought to be taken in the evening, and the suppuration will be thereby promoted.

N<sup>o</sup> 74. R Elix. paretic. gtt. xxx. ad ℥jss.  
Aq. cinamom. simpl. ℥j. f. haust.

If peripneumonic symptoms should come on, they are to be removed by blisters, and are frequently by oxymel. scilliticum, and ammoniacal mixtures.

Emetics of ipecacuan are proper for this purpose.

If there are symptoms of inflammation in any period of the disease, bleeding is to be used.

After the disease is over, three or four doses of gentle purgatives are to be employed.

N<sup>o</sup> 75. ℞ Sal cathart. glauber. ʒvj. ad ʒj.  
 Mannæ ʒfs. solve in  
 Aq. pur. ʒvj.  
 Tinct. cardamom. ʒj. m. cap.  
 haust. fing. donec alvus solvatur.

N<sup>o</sup> 76. ℞ Infus. fenæ limon. ʒijfs.  
 Tinct. cardamom. ʒfs.  
 Mannæ ʒfs.  
 Solve ut f. haust.

In small-pox from inoculation we are seldom subject to the confluent kind, or any dangerous symptoms.

Advantages from inoculation consist in the choice of our subject, the reducing the body by preparation, and the external application of cold.

Care should be taken that the chicken-pock be not propagated by inoculation, instead of the natural small-pox.

And that the eruptions be allowed to go through their regular course, otherwise the body is not secured against a fresh infection.

O F T H E  
M E A S L E S.

**T**HE measles are attended with more inflammatory symptoms than the small-pox, and the antiphlogistic practice must be more especially put in execution.

Besides the fever, there commonly precedes the eruption, sneezing and a flow of tears. The eruption and efflorescence is hardly above the skin.

The most dangerous symptom in this disease is a peripneumony, which frequently attends or supervenes it; bleeding is the most effectual method of removing it; sometimes the application of blisters becomes necessary.

And the antimonial diaphoretic course is extremely useful.

If the cough should be very urgent, it is sometimes cured by a vomit, or the following :

N<sup>o</sup> 77. R Aq. fontan. ℥iv.  
Sal C. C. vol. ℥j.  
—nitri ℥ss.  
Ol. amygd. dulc. ℥j.  
Syrup. balsam. ℥ss. m.  
Cap. coch. ij. subinde.

And

## OF THE DYSENTERY. 67

And towards the end of the disease, when the symptoms of the inflammation are abated, if the cough continue troublesome, the elix. paretic. may be added, or other mild opiates.

---

## OF THE DYSENTERY.

**I**N the dysentery there is frequent purging, with tenesmus, griping, and the stools are often bloody.

It is a contagious disease, and constantly attended with fever, which, for the most part, is of the putrid kind.

The causes of dysentery are obstructed perspiration, from cold and moisture, contagious miasmata, and improper diet.

The cure consists in evacuating the putrid and contagious fordes, in promoting perspiration, and in abating pain.

If there are symptoms of inflammation in the beginning it may sometimes be necessary to bleed.

68 OF THE DYSENTERY.

An emetic of ipecacuan and tart. emetic,  
N<sup>o</sup> 1, ought to be given.

Afterwards the ipecacuan may be given in  
doses of two or three grains, or five grains, in  
which quantity it generally promotes perspi-  
ration.

The bark, with opiates to prevent its running off by stool, is extremely proper, and the patient ought to avoid flatulent diet, or weak acid wine.

O F A  
C H O L E R A M O R B U S.

**T**HIS disease is accompanied with a discharge of bile by vomiting and purging, attended with acute pain in the umbilical region, considerable heat, and thirst, and the pulse greatly quickened.

It arises from an increased secretion and acrimony of the bile, occasioned by an improper diet, and the eating too great quantities of fruit, such as cherries, cucumbers, and the like.

The first indication of cure is to promote the vomiting, and to dilute the bile.

This is done by drinking decoctions of the crust of bread, water-gruel, and chicken broth.

Emollient and oily clysters ought to be employed, N<sup>o</sup> 3, 4.

Afterwards the urgent symptoms must be palliated by N<sup>o</sup> 58.

An opiate and a purgative in this disease are joined with advantage.

## O F A N

HÆMOPTOE AND OTHER HÆ-  
MORRHAGES.

**I**N the hæmoptoe there is an evacuation of florid blood, frequently mixed with air bubbles from the injured vessels of the lungs.

It should be distinguished from a discharge of blood from the mouth, throat, or stomach.

It is always dangerous in this country, from the instability of the climate.

It is frequently hereditary, arising from an improper conformation of parts. (Vid. Phthisis Pulmonalis.)

Youth from eighteen to twenty-five are more especially subject to it, and it frequently terminates in consumption.

The cure consists in lessening the quantity of blood, and taking off the determination from the lungs.

Repeated bleeding from the arm, in small quantities at a time, is necessary.

The patient should use little exercise.—His common drink should be acidulated liquors, such as the Tinct. Rosar. and the like.—Small doses of Nitre, if the stomach will bear them, will moderate the discharge.

All acrid and irritating substances are to be avoided.

The patient is to live on a milk diet, and vegetables of easy digestion.

If the hæmoptoe be owing to suppressed evacuations, as the menses, or the like, they are to be restored.

76 OF AN HÆMOPTOE, &c.

The gentle diaphoretic course ought to be employed in this as in other hæmorrhages, and upon this is founded the use of ipecacuan, and the preparations of antimony in this disease, N<sup>o</sup> 8, 9, 10, the vitrum ceratum antimonii has been most frequently employed.

The belly should be kept regularly open by mild purgatives or glysters, N<sup>o</sup> 5, 6.

If the discharge is periodical and attended with fever, then the bark with elix. vitriol. is proper.

When the discharge is considerable with little or no fever, astringents are to be employed.

O R

D E P R A V E D A P P E T I T E.

**A** Depraved appetite for the most part arises from a weakened tone of the stomach, by which the proper mixture, and expulsion of the aliment into the intestines is impeded.

In such cases phlegm generally abounds, acidity is generally with cardialgia, nausea, flatulency, and the like.

When a want of appetite is owing to a relaxation of the stomach, such tonic medicines as have astringency, with a moderate degree of warmth, must be employed to brace the fibres and excite the proper peristaltic motion.

However previous to any course of medicine, it becomes necessary to cleanse the stomach by means of a vomit of ipecacuan.

Mustard

Mustard vomits are in this disease frequently useful.

The gentle stomachic purgatives are likewise proper.

The passage of stones through the ducts is greatly promoted by opiates, fomentations, and the warm bath.

O F T H E  
D I A B E T E S.

**I**N this Disease there is an immoderate flow of pale urine, attended with thirst, a dryness of the mouth, a wasting of the body, and other symptoms of weakness.

The disease seems to be owing to a preternatural laxity of the vessels of the kidney.

The cure consists in the proper use of astringent and strengthening medicines.

Alum whey may be drank very plentifully, and lime water has been found of great use.

N<sup>o</sup> 120. ℞ Tinct. japonic.

—cantharid. ad ℥ij. dof. ℥iij.  
ad ℥fs. bis terve de die.

The Peruvian Bark, preparation of steel, and chalybeate waters are generally very useful.

An animal and nourishing diet is commonly proper.

If the belly should be costive in this disease, stomachic purgatives of aloes and rhubarb are proper.

O F

## CALCULOUS CONCRETIONS.

**T**HE biliary and urinary passages are most subject to have stones collected in them.

The cure consists in palliating the urgent symptoms, and in dissolving the stone.

The symptoms are palliated by opiates and astringents.

The opiates ought not to be too frequently employed.

N<sup>o</sup> 121. R Uvæ ursi, ʒss.

Pulv. nuc. moschat. gr. ʒx. m.  
cap. bis terve in die.

The patient should drink mucilaginous liquors to correct the acrimony of the urine, and abate symptoms of strangury.

The stone, if possible, is to be dissolved by the internal use of lime water and the alkaline lixivium.

M

The

90    CALCULOUS CONCRETIONS.

The alkaline lixivium should be prepared by dissolving the common caustic in water, diluted to a proper degree with the infusum amar.

Costiveness should be avoided by

N<sup>o</sup> 122. ℞ Sapon. hispan. ʒj.  
Aloes. succotr. ʒss.  
Syrup. cort. aurant. q. f. f. pi-  
lul. ʒss. pro dosi.

During the use of lime water, or the alkaline lixivium, the patient is to avoid fatty meats, butter, malt liquor, and acid substances.

When the stone in the bladder is large, and attended with violent symptoms, lithotomy becomes necessary.

A blister applied to the os pubis will generally remove an incontinency of urine, especially if arising from a paralysis of the neck of the bladder.

AND JOHN WALLIS

O F T H E  
S E A - S C U R V Y.

**T**HIS is a disease that seldom or ever appears on land.

Cold, moisture, and the too frequent use of animal food, without vegetables, generally give rise to it.

There is a torpor and lassitude, general weakness, a bloated countenance, a fallow complexion, fœtid breath, soft spongy gums, attended with a discharge of blood from them, livid spots upon the skin, swelled legs, a contraction of the tendons, faintings, and frequently sudden death.

In this disease the fluids are considerably advanced to a state of putrefaction, and the solids much relaxed.

The cure consists in changing the present air, for a dry and warmer one, not impregnated with putrid exhalations, in an attention to diet, and to medicine.

Medicines which are powerful in restraining putrefaction, and which at the same time strengthen the system, are proper.

Of these the most powerful are the fresh juices of fruits, such as oranges and lemons, along with the Peruvian Bark.

Vegetables of all kinds are proper, and those which are called the antiscorbutic, act chiefly by evacuating the present acrimony, and obviating every tendency to generate more.

When there is no opportunity of employing fresh vegetables, the daily use of malt in infusion will either prevent or cure the disease.

The fossil acids are found to be of less efficacy than the unfermented acid of vegetables, such as cyder, acid of lemons, and the like.

Exercise and the use of the bark will prevent a relapse.

OF THE  
D R O P S Y.

**A** Preternatural collection of water in any cavity of the body is called a dropfy.

It has acquired a variety of names from the particular cavities affected.

The causes of dropfy are a general or particular laxity of the exhalent vessels, scirrhoties, or obstructions in particular viscera, and whatever tends to retard the return of venous blood to the heart.

In a dropfy there is always a greater proportion of watery fluid exhaled from the extremities of the arteries, than the lymphatics can readily absorb.

The cure consists in enabling the lymphatic system to absorb the superfluous fluid, and in promoting its discharge by our several excretions.

It is for the most part proper to begin with a vomit, which is to be repeated according to circumstances.

As this disease depends so much on a general weakness of the solids, a particular attention ought to be bestowed in strengthening these.

The diet should be nourishing and of easy digestion.

Exercise and the flesh-brush should be often employed.

A course of bitters with the bark is frequently used with advantage; and cures are often performed by chalybeat waters, though upon every other occasion, the less the quantity of fluid, swallowed, so much the better.

O F A N  
A P O P L E X Y.

**A**N Apoplexy is attended with an abolition of all the senses, both internal and external, and of voluntary motion.

It is distinguished according to its degree, and the causes that give rise to it, into the sanguineous and ferous apoplexy.

Whatever obstructs the flow of nervous influence into different parts of the body, may be considered as the proximate cause of the disease.

The obstruction in the sanguineous apoplexy is owing to a compression on the brain from the great quantity of blood, either as contained in the vessels, or extravasated from a rupture of them.

In the ferous or pituitous apoplexy the compression is owing to a collection of watery fluid in the ventricles, or between the coverings of the brain.

N. 2.

There

100 OF AN APOPLEXY.

There is frequently reason to believe that an apoplexy arises from a spasmodical affection of those parts.

The cure of the sanguineous apoplexy is to be attempted by diminishing the quantity of blood, and for this purpose evacuations may be more advantageously produced from the jugular vein, or temporal artery; at any rate a great deal will depend on the quantity obtained.

Purgatives must likewise be employed to make a derivation from the superior parts.

N<sup>o</sup> 144. R Tinct. sacrae ℥ij.

—jalap. ℥iij.

Blisters and sinapisms are necessary to rouse the Vis Vitæ.

The apoplexy which is truly spasmodical, is frequently regular in its return, and the fits are frequently prevented by a course of valerian and bark.

When

When the patient has recovered from the fit, the use of mustard seed in the dose of a table spoonful morning and evening is proper.

And an attention ought to be paid to the state of the belly; costiveness should be avoided, moderate exercise should be employed, and habitual evacuations ought to be promoted.

O F A

P A L S Y.

**A** Palsy is an abolition of motion, frequently attended with the loss or diminution of sense, in any particular part of the body.

It is frequently preceded by apoplexy, and sometimes follows wounds of the head; it is often produced by the external application of cold and sedative poisons, and sometimes the chronic rheumatism degenerates into Palsy.

If the patient is plethoric, bleeding in the beginning of the disease is frequently proper, but it should be done with the greatest caution.

The

The cure is chiefly to be attempted by the internal use, and external application of warm stimulating medicines, such as will promote the flow of nervous power,

N<sup>o</sup> 149. R Ung. virid. ℥j.

Stomachic purgatives are to be employed from time to time, as the state of the belly may seem to require them.

Blifters

Blisters applied to the parts affected, frequently relieve, and they ought to be healed up immediately.

More patients have been cured by electricity than by other means, when properly conducted and continued for a due length of time.

Bathing and drinking chalybeate waters frequently cure.

The diet of patients should be nourishing, and care is to be taken to avoid cold.

O F A N  
E P I L E P S Y.

**A**N Epilepsy is a convulsive disease, attended with an abolition of all the senses, both internal and external, with violent spasmodical contractions and convulsive motions in different parts of the body.

It is distinguished into the idiopathic and symptomatic.

It may be considered likewise as either hereditary, or as having arisen from various accidental causes. These distinctions are necessarily made to direct us properly in the prognosis and method of cure.

In the cure of the Epilepsy, four indications are to be had chiefly in view :

1. The body is to be rendered less irritable.
2. All the occasional causes are to be avoided.
3. The habit to their periodical return is to be destroyed.

O

4. The

4. The fit while present is to be moderated.

To answer the first intention, the patient must use moderate exercise, and food which is nourishing and of easy digestion; wine and water for common drink.

The medicines adapted for this purpose are astringents with the moderate use of aromatics.

If the patient be plethoric, it is advisable to perform V. S. to be repeated as occasion may require.

Whatever tends to hurry on the circulation, or to promote a greater flow of blood to the head, such as drunkenness and violent affections of the mind, are to be avoided.

Whatever tends to weaken the body, as too much venery, and the free use of mercurials, must be guarded against.

When the fits are regular in their return, and seem to be kept up by habit, they frequently disappear when the patient arrives at the age of puberty.

Emetics, blisters, and setons are attended with advantage.

The fits are to be moderated by the use of antispasmodics.

## CHOREA SANCTI VITI,

O R

## ST. VITUS'S DANCE.

**T**HIS is a convulsive disease, attended with an involuntary and ludicrous motion of the arms and legs.

Women and children are more especially subject to it.

Sometimes in the latter it arises from worms.

The cure consists in abating the irritability and strengthening the habit.

If the patient should be plethoric, then bleeding may be necessary, N<sup>o</sup> 153, 155, ought to be had recourse to.

The cold bath and chalybeat waters have been found very efficacious.

O F

OF THE  
LOCKED JAW,  
AND  
OTHER SPECIES OF TETANUS.

**S**pasmodical contractions of the muscles of the body have acquired different names according to the parts affected.

They are more or less general, more or less violent, according to the causes which have given rise to them.

They are more especially diseases of warm countries, where the irritability of the nerves is more frequently in a vitiated degree.

Moisture, and the external application of acrid and stimulating substances, are the most common occasional causes.

The intention of cure is to overcome the present spasm, and to guard against a relapse.

*[The text on this page is extremely faint and illegible. It appears to be a multi-paragraph document, possibly a letter or a report, but the words and sentences cannot be discerned.]*

OF THE  
 H Y S T E R I C  
 AND  
 HYPOCHONDRIAC DISEASES.

**T**HEY are such as Physicians have generally called nervous, flatulent, and spasmodical.

Their symptoms are so many, so various, and so irregular, and so frequently complicated with other diseases, that it would be extremely difficult to enumerate them.

P

The

The Hysteric and Hypochondriac Diseases are generally considered by Physicians as the same, and having only different names as affecting different sexes.

The same occasional and predisposing causes seem to give rise to both.

It is a mistaken opinion that the Hysteric Disease proceeds commonly from an unsound state of the womb.

They both rather proceed from an affection of the alimentary canal, disturbing digestion, generating flatulency, globus hystericus, and other spasmodical symptoms, from the general sympathy which prevails between the stomach and the most remote parts of the system. The causes are, a too great sensibility of the nerves, which disposes them to be violently affected by slight impressions, unnatural or depraved feeling, which exposes certain persons to violent and very extraordinary affections, from causes which would not disturb others.

The occasional causes are, suppressed evacuations, improper food either in quantity or quality, violent affections of the mind.

The general plan of cure in these diseases,

HYPPOCHONDRIAC DISEASE. 115

1. Is by strengthening the nervous power, to favour a more steady and equable distribution of it.
2. To moderate the too great irritability, and to avoid every occasional cause.

However, such is the variety of symptoms, that we shall here adapt our cure to each.

The first indication is answered by bitters and the bark.

N<sup>o</sup> 166. ℞ Cort. Peruv. pulv. ℥iv.  
Rad. gentian.  
Cort. aurant. aa. ℥jss. misce.  
Infunde in spt. vin. gallic. ℥iv. in balneo arenæ per dies sex, & cola.  
adde Spt. lavend. compos. ℥iv. bis die cap. ℥j. sumend. cum aquæ commun. ℥iv.

The elixir of vitriol may be taken frequently with the above tincture.

N<sup>o</sup> 121. ℞ Limatur ferri. gr. vij—x.  
Pulv. nuc. moschat. ℥ss.  
Conserv. cynosbat. q. s. f. bol.

Chalybeat waters, such as those of Bath and Tunbridge, are frequently proper.

When there are no particular obstructions in the viscera, cold bathing should be employed.

Cold should be guarded against.

The food should be nourishing and of easy digestion. Fat meats and heavy sauces are to be avoided.

Meat suppers are improper. For common drink, wine and water is to be preferred to malt liquor.

Moderate exercise, especially on horseback, is proper. Friction with the flesh-brush or a coarse linen cloth promotes circulation and strengthens the systems. The patient should go soon to bed, and rise early in the morning.

The mind should be kept as cheerful as possible; grief, fear, and anxiety are to be avoided.

It is only by pursuing the first intention of cure that any radical cure can be produced; however, in the mean time it becomes necessary to palliate many urgent symptoms, by such medicines as lessen the too great sensibility of nerves, and take off the spasmodic affections. Of these the principal are opium, castor, assa-fœtida, musk, and camphor. The semicupium

or

or pediluvium will frequently abate pain and remove a spasmodical affection.

Costiveness is a very frequent symptom, and ought to be avoided by taking aloes and soap along with assafœtida, and frequently the following, especially in hypochondriac complaints, is attended with low spirits.

N<sup>o</sup> 168. ℞ Tart. solub. ℥ij. ad ℥fs.  
 Solve in aq. fontan. ℥viiij.  
 adde Aq. cinamom. simpl.  
 Syrup. violar. aa. ℥j. misce.

This solution is to be taken at two draughts every other day, and be continued for several weeks.

OF THE  
SPASMODIC CHOLIC.

**I**N this Cholic the pain comes on by fits, is moveable in the intestinal canal, and is much relieved by a discharge of wind.

It is to be distinguished from an inflammation of the intestines.

It sometimes arises from an ascendent fermentable diet, but more frequently from an increased irritability.

If the patient is much disposed to vomit, that may be encouraged by warm water, or an infusion of chamomile flowers.

The pain is to be abated by opiates, the warm cathartic and antispasmodic medicines.

N<sup>o</sup> 169. ℞ Tinct. rhei. spt. ʒjss.

---

OF THE  
 VENEREAL DISEASE.

**T**HE Venereal disease may be distinguished  
 into local or universal.

In the last the constitution is so tainted, that  
 the internal use of mercury is absolutely neces-  
 sary, and from the difficulty of distinguishing  
 them, mercurials should be given internally in  
 every stage of the Venereal Disease.

The

## THE VENEREAL DISEASE. 121

The symptoms which proceed from a Venereal infection are so various and anomalous in their appearance, that it is impossible to enumerate all of them.

A simple Gonorrhœa may for the most part be cured in eight days, by attending to the following circumstances.

If there are symptoms of inflammation, V. S. may be proper, and the patient should be moderate in exercise and in drinking.

The following injection should be used (milk-warm) twice a day :

N<sup>o</sup> 174. R Aq. rosar. ℥vj.  
Sacchar. saturn. ℥j.  
Vitriol. alb. gr. viij.  
Mercur. dulc. gr. iij.  
G. Arabic. ℥iij.  
Pulv. e ceruss. compos. ℥j. m. f.  
injectio.

Purgatives of all kinds tend to increase the heat of urine and chordee, and ought therefore to be avoided.

Emulsions of almonds and G. Arabic may be drank freely.

122 THE VENEREAL DISEASE.

More bad consequences arise from allowing the discharge to go on, than by checking it in its beginning, by the moderate use of the above injection, which operates by lessening the irritability, and taking off the inflammatory state of these parts.

Although it may not frequently be necessary to have recourse to internal mercurials, yet by their use we remove every suspicion of a latent pox.

Chancres and buboes are to be considered as symptoms of a pox and to be treated accordingly.

Chancres are to be healed by external application.

N<sup>o</sup> 175. R Vitriol. cærul. gr. x.  
Aq. rosar. ℥iij. m. f. lotio.

N<sup>o</sup> 176. R Subl. corros. gr. ij.  
Aq. rosar. ℥j. f. lotio.

N<sup>o</sup> 177. R Calomel. ppt. ʒfs.  
Ung. simpl. ℥j. m.

The chancres are to be first washed either with the solution of blue vitriol, or corros. sublimate, and afterwards dressed with the above ointment.

Every

THE VENTRAL DISEASE. 113

The first point to be considered is the nature of the disease, which is characterized by the presence of a large amount of mucus in the stools, and is accompanied by a general debility, and a loss of appetite, and a tendency to vomit.

The second point to be considered is the cause of the disease, which is generally attributed to the use of cold and moist food, and to the presence of worms in the bowels.

The third point to be considered is the treatment of the disease, which is generally directed to the removal of the cause, and to the support of the system.

The fourth point to be considered is the prognosis of the disease, which is generally favorable, and is attended with little danger.

The fifth point to be considered is the prevention of the disease, which is generally directed to the avoidance of cold and moist food, and to the use of purgatives.

The sixth point to be considered is the nature of the disease, which is characterized by the presence of a large amount of mucus in the stools, and is accompanied by a general debility, and a loss of appetite, and a tendency to vomit.

The seventh point to be considered is the cause of the disease, which is generally attributed to the use of cold and moist food, and to the presence of worms in the bowels.

The eighth point to be considered is the treatment of the disease, which is generally directed to the removal of the cause, and to the support of the system.

THE VENERABLE

... of the ...

Although it may be ...

... of the ...

... of the ...

N° 173. ...

N° 174. ...

N° 175. ...

The ... of the ...

Every possible attempt should be made to repel buboes, which may be done in their beginning, by the external application of mercurial ointment which contains no turpentine, or emollient poultices, or the following :

N<sup>o</sup> 178. ℞ Farin. lini. q. f.  
 Aceti acerrimi,  
 Ol. olivar.  
                   vel  
 Butyr. recent. q. f.  
 Sacchar. saturn. ʒj. m. f. cata-  
 plasma.

The patient should live low, and have recourse to internal mercurials.

If the inflammation should have proceeded so far as to render it impossible to be discussed, then the suppuration is to be promoted by emollient poultices, full diet, and the buboe ought to be opened by the caustic.

In the cure of ulcerations of the groin, a milk diet, and the internal use of the bark becomes frequently necessary.

A swelled testicle is to be cured by bleeding, warm fomentations, and gentle laxatives ; it proceeds from an inflammation of the prostrate gland, brought on by violent exercise, too acrid injections, and the like.

Q 2

When

## 124 THE VENEREAL DISEASE.

When the inflammation abates, the running commonly returns.

The external application of warm vinegar, spt. mindirer. is attended with great relief.

For the cure of other symptoms of the pox, the patient should undergo a mercurial course, and care should be taken to avoid salivation, or other violent evacuations.

Mercury is an antidote and cures only from the quantity taken in, and that only when it is allowed to circulate freely in the constitution.

The largest quantity may be thrown in by unction, and salivation is either greatly moderated or prevented from becoming violent, by drinking large quantities of solutions of G. Arabic in water, and by the use of the warm bath.

N<sup>o</sup> 179. R Mercur. viv. depuratif. ʒj.  
Gum. Arabic. ʒfs.

Terantur invicem in mortar. lapid. add. cochl. aq. menth. donec mercurius penitus dispareat in mucum.

Exacte

The following is a list of the  
names of the persons who  
were present at the meeting  
held on the 1st of January  
1850 at the residence of  
Mr. J. W. Smith in the  
city of New York. The  
names are given in the  
order in which they  
were called upon to  
speak. The names of  
the ladies are given  
in italics. The names  
of the gentlemen are  
given in plain type.

The following Recipe will cure  
a Gonorrhoea, if taken in season.

To wash first the penis well with water  
& soap.

Then take as much starch, & water  
as will make a thin Syrup, make it  
just boil, & to every three ounces of it  
add half an ounce of Tinct. Theb. inject some  
of this up the urethra, every morning  
and evening.

also take one grain of Opium, or two  
every night for six or seven nights.

THE VENEREAL DISEASE. 125

Exacte subactis admisce sensim conterendo,

Mell. opt. ℥ss.

Syrup. balsam. ℥j.

Aq. menth. piper. ℥x. dof. m.  
& v. cochl. ij.

N<sup>o</sup> 180. R Mercur. calcinat. gr. j. ad gr. iij.  
Extract. thebaic. gr. fs. ad gr. j.  
f. pilul. h. f. fumend.

Corrosive sublimate and other acrid saline preparations of mercury tend rather to palliate, than radically to cure Venereal symptoms, and from their being disagreeable to the stomach their use is now pretty much laid aside.

The decoctions which should be drank during the mercurial course, are the following:

N<sup>o</sup> 181. R Rad. sarsaparillæ ℥iij.

—mezer. ℥ij.

Coque ex aq. fontan. ℥iij. ad ℥ij. colaturi.

adde Extract. glychirriz. ℥iij.

G. Arabic. ℥j. cap. ℥ss. quater  
de die.

The mezereon has of late been much recommended in Venereal nodes and other diseases of the periosteum.

The alterative course in the cure of the Venereal Disease is to be preferred, and it is necessary to continue the medicines for a fortnight after the symptoms have disappeared, and during the cure, the patient should keep warm, use a light nourishing diet, drink plenty of broths and the like.

---

OF THE  
DISEASES  
OF  
WOMEN.

OF THE MENSES OR CATAMENIA.

**A**BOUT the 14th or 15th year, sooner or later, according to climate and constitution, girls begin to menstruate.

At first every two months, afterwards every month, in the quantity from four to six ounces.

Symptoms

THE HISTORY OF THE  
CITY OF BOSTON  
FROM THE FIRST SETTLEMENT  
TO THE PRESENT TIME  
BY NATHANIEL BENTLEY  
VOLUME I  
PUBLISHED BY W. BENTLEY

et mane quotidie.

Symptoms of an approaching menstruation, are the following :

The mammæ begin to swell, there is a weight and pain about the os pubis and loins, head-ach, the legs sometimes swell, appetite is bad, and the patient becomes pale.

The menses begin to be less regular when the patient arrives at the 45th year, and commonly cease about the 50th, which is the most critical period of a woman's life.

If the symptoms before mentioned do not bring on the menses, the disease is called a Chlorosis.

OF A  
CHLOROSIS.

**I**N a Chlorosis the patient becomes languid, easily fatigued from exercise, drowsy, acid is generated in large quantity in the stomach, eructations, flatulency, vomiting, paleness, difficulty of breathing, and a general weakness of the whole alimentary canal.

The

128 OF A CHLOROSIS.

The cure is to be performed by strengthening the system, and assisting nature to bring on the discharge.

The patient is to use exercise suited to her strength.

The prevailing acidity is to be corrected by taking from time to time small doses of magnesia and rhubarb.

The testaceæ as prepared from oyster shells seem to have an advantage.

The diet ought rather to be animal than vegetable.

Tea and coffee are to be avoided.

N<sup>o</sup> 182. R Pulv. cort. Peruv. ʒj.

Violent spasmodical affections and pains preceding or accompanying menstruation, may be relieved by opiates.

O F A

## S U P P R E S S I O N

O F T H E

## M E N S E S.

**A** Morbid suppression is to be distinguished from the suppression during pregnancy.

Violent passions of the mind, improper diet, a sudden application of cold, and spasmodical affections from laxity and weakness, are the most frequent causes of this disease.

A suppression of the menses is more frequently the consequence, than the cause of many diseases which have been attributed to it.

Women under menstruation are more irritable than at any other period.

The symptoms arising from a suppression are much the same with those accompanying a chlorosis, they sometimes bring on hysterical affections, and sometimes fever.

OF A SUPPRESSION, &c. 131

If the suppression should arise from a spasmodical affection of the uterus,

Bleeding in the foot will frequently relieve; the semicupium, or the application of the vapour of water to the uterus itself, ought to be had recourse to.

The belly may be fomented, and emollient and oily glysters ought from time to time to be employed.

Antispasmodics may likewise be used.

Bol. armen. aa. p. æ. dofis ʒj.

Ipecacuan and antimonials in small doses are frequently proper.

Tincture of roses may be drank ad libitum.

A cloth dipped in brandy and vinegar, of each equal parts, may be applied cold to the loins.

A relapse is to be prevented by the use of bark, chalybeats, and other tonics.

And the general conduct before laid down in Hæmorrhages, is here to be attended to.

O F T H E  
F L U O R A L B U S.

**T**HE Fluor Albus is to be distinguished from a gonorrhæa.

If the disease is only topical, proceeding from a laxity of those parts, and is not in so violent a degree as to have weakened the primæ viæ, it is more easily cured, and the injection N° 174, will frequently effect it.

But as the discharge is sometimes critical, a sudden check put to it will be attended with bad consequences.

If the stomach is affected, vomits, bitters, and stomachic purgatives are commonly necessary.

The discharge is to be moderated by astringents.

THE

REPORT OF THE  
COMMISSIONERS OF THE  
LAND OFFICE

FOR THE YEAR  
1850

IN  
RESPONSE TO A  
RESOLUTION OF THE  
HOUSE OF REPRESENTATIVES

PASSED MARCH 10, 1849

WASHINGTON:  
GEO. WASHINGTON AND COMPANY  
PRINTERS

RESOLUTION

A resolution of the Senate of the United States, passed on the 15th day of March, 1833, in relation to the petition of the citizens of the State of New York, for the establishment of a public library in that State.

Resolved, That the Secretary of the Senate be and he do cause to be printed, and the same to be distributed to the several Senators, a copy of the report of the Committee on Education, in relation to the petition of the citizens of the State of New York, for the establishment of a public library in that State.

Approved on the 15th day of March, 1833.

Attest: My hand and the seal of the Senate, this 15th day of March, 1833.

Secretary of the Senate.

O F

## D E N T I T I O N .

**A**LL the symptoms accompanying teething proceed from irritation, which are relieved frequently by cutting the gum with the lancet. Fever and inflammation are to be moderated by bleeding, either V. S. or with leeches.

A gentle diarrhæa is rather to be encouraged.

And if there are convulsions, they must be moderated by opiates, musk, spt. c. c. and such other antispasmodics, and blisters may be sometimes necessary.

O F

## W O R M S .

**T**HE symptoms arising from worms are nausea, vomiting, griping, fevers, convulsions, epilepsy, marasmus, and many others.

There are three kinds of worms commonly present, viz.

The round worm, the ascarides, and the tænia.

The cure consists in expelling them, either alive or dead.

In evacuating the glutinous matter, which affords them a nidus, and in strengthening the intestines.

The first is done by purgatives.

Epilepsy, St. Vitus's Dance, and many other convulsive diseases yield readily to the above anthelmentics.

The diet should be nourishing, of easy digestion; proper exercise should be taken, cold bathing, and the flesh-brush by strengthening the tone of the parts, will dispose less to a relapse.

OF THE

Faint, illegible text, likely bleed-through from the reverse side of the page.

Faint, illegible text, likely bleed-through from the reverse side of the page. The text is mirrored and difficult to decipher.

**I**N the Rickets the bones are præternaturally soft, thick, and incurvated.

It happens from the sixth month to the third year, and seldom or ever after the fifth.

The indications of cure consist in strengthening the habit, and restoring to their tone or figure the parts that may have been vitiated.

As the state of the whole system depends so much on the state of the primæ viæ, a particular attention should be paid to that.

Small doses of ipecacuan, as an emetic, may be exhibited, and stomachic purgatives of rhubarb and aloes, ought from time to time to be employed.

The use of bark and chalybeats are proper.

Small doses of the cuprum ammoniacum have often produced good effects.

The cold bath should be employed when the patient has strength to bear it.

The diet should be nourishing, and the exercise should be regular, and properly conducted within the strength of the patient.

O F T H E  
H O O P I N G - C O U G H .

**I**T is a violent cough, attended with convulsive motions of the glottis, and a noise like the crowing of a cock, with little or no discharge from the lungs; there is frequently great inclination to vomit, and accompanied for the most part with fever.

It is seldom a dangerous, though obstinate disease.

The cure is to be attempted by the use of vomits, antispasmodics, and such medicines as strengthen the system.

If the fever is of the acute inflammatory nature, V. S. should be had recourse to.

## SCROPHULOUS AFFECTIONS. 143

In the evening tart. emetic. ought to be given, with a little nitre and pulv. contrayerv. to excite a gentle sweat.

The bark with castor, and other antispasmodics, are employed to advantage.

Gentle purgatives of calomel and rhubarb may sometimes be necessary.

The cicuta has lately been much recommended.

Country air, asses milk, and proper exercise, will frequently cure when medicines have failed.

---

O F

## SCROPHULOUS AFFECTIONS.

**I**NDURATED tumours of the lymphatic glands, which frequently degenerate into troublesome ulcers, are termed scrophulous.

They are either hereditary, or may arise from a neglect in the non-naturals.

They generally accompany a too great laxity of the habit, which, together with a general cachexy, must be obviated.

The

144 SCROPHULOUS AFFECTIONS.

The bark, with chalybeats and bitters are the most proper, from time to time exhibiting a purgative of rhubarb and calomel or such other.

Sea bathing, and the drinking of sea water, with proper cautions, are useful.

Mercurial alteratives will frequently avail.

The expressed juice of the tussilago, burnt sponge, and alkaline salts, have been considered as specifics.

When the glands suppurate the ulcers are slow of healing; sometimes they give way to the application of mercurials, sometimes to copper, and sometimes to lead.
