#### THE

LADY LETTICE WENDY,

OF

WENDY IN CAMBRIDGESHIRE.

#### MADAM,

L

WO or three reafons induce me to prefent this difcourie to your Ladythip, and to make choice of you for its patronefs. First, Because I owe it to the liberality of your honoured brother, that I have this leifure to write any thing. Secondly, Because also your many and fingle favours, feeing I am not in a capacity to requite them, feem to exact from me at least a publick acknowledgment, which such a dedication gives me an opportunity to make. Thirdly, Because of such kind of writings I know not where to chuse a more able judge or more candid reader. I am fenfible that you do so much abhor any thing that

## The Epistle Dedicatory.

looks like flattery, that, out of an excefs of modefty, you cannot patiently bear the hearing of your own just commendations; and, therefore, should I enlarge upon that subject, I know I should have but little thanks for my pains.

Indeeed you have much better motives to do well than the praise of men; the favour of God, peace of confcience, the hope and expectation of a future reward of eternal happinefs; and, therefore, I had rather write of you to others, to provoke them to imitate fo excellent an example, than to yourfelf, to encourage you in your Chriftian courfe, and to fortify you in your athletick conflicts with the greateft of temporal evils, bodily pain and anguish; though I do not know why you should reject any confideration that may conduce to Jupport you under fo heavy preffures, and of folong continuance; of which, to ingenuous natures, true honour, that is, the current teftimony and approbation of good men, is not the meaneft. No less man than St Augustin was doubtful, whether the extremity of bodily pain was not the greatest evil that human nature was capable of fuffering ; " Nay, faith " he, I was fometimes compelled to confent to Cornelius Celfus, that it was fo; neither " did his reafons feem to me abfurd; we be-" ing compounded of two parts, foul and bo-" dy, of which the first is the better, the latter the worfer; the greatest good must be

## The Episile Dedicatory.

" the best thing belonging to the better part, " that is, wildom; and the greatest evil the " worft thing incident to the worft part, (the " body) that is, pain." Now, though I know not whether this reason be firm and conclufive, yet I am of accord with him, that of all the evils we are fenfible of in this world, it is the foreft; the most refolute patience being baffled and proftrated by a fierce and lafting paroxyim of the gout, or ftone, or cholick, and compelling to yield to its furious infults, and confess itself vanquished, the foul being unable to divert, or to do any thing elfe, but pore upon the pain; and, therefore, those Stoical vaunts of their wife man's being happy in Phalaris's bull, I utterly reject and explode, as vain rodomontades, and chimerical figments; for that there never was fuch a wife man among them, or indeed could be; yet do I not fay, that the patience of a good man can be fo far conquered by the sharpest and severeft torments, as to be compelled to deny or blaspheme God or his religion; yea, or fo much as to complain of his injuffice; though perchance he may be brought, with Job, to curfe his day, yet not curfe his God, as his wife tempted him to do.

Now that the great Aravoleurns and Bracelns, the most just Judge and Rewarder, would be pleased to qualify and mitigate your sufferings, as not to exceed the measure of your strength and patience, or elfe arm you with such an

## The Epistle Dedicatory.

high degree of Christian fortitude, as to be able to grapple with the most extreme; and when you have finished your course in this world, grant you a placid and easy passage out of it, and dignify you, as one of his victors, with a crown of eternal glory and felicity, is the prayer of,

MADAM,

## YOUR LADYSHIP'S

MOST DEVOTED IN ALL SERVICE,

## JOHN RAY.

### THE

# PREFACE.

IN all ages wherein learning hath flourished, com-plaint hath been made of the itch of writting, and the multitude of wortheless books, wherewith importunate fcriblers have peftered the world : Scribimus indocts doctique : and-Tenet infanabile multos scribendi cacoethes. I am fenfible that this tractate may likely incur the cenfure of a fuperfluous piece. and myfelf the blame of giving the reader unneceffary trouble, there having been fo much fo well written of this fubject by the most learned men of our time. Dr More, Dr Cudworth, Dr Stillingfleet, late Bishop. of Worcefter, Dr Parker, late of Oxen; and, to name no more, the honourable Robert Boyle, Efq; fo that it will need fome apology. First, Therefore, in excufe of it, I plead, that there are in it fome confiderations new and untouched by other; wherein. if I be miftaken, I alledge, Secondly, That the manner of delivery and expression may be more suitable to fome mens apprehension, and facil to their understandings If that will not hold, I pretend, Thirdly, that all the particulars contained in this book cannot be found in any one piece known to me, but lie fcattered and difperfed in many; and fo this may ferve to relieve those fastidious readers, that are not willing to take the pains to fearch them out; and poffibly, there may be fome whofe ability (whatever their industry might be) will not ferve them to purchafe, nor their opportunity to borrow those books, who yet may fpare money enough to buy fo inconfiderable a trifle. If none of these excuses fuffice to acquite me of blame, and remove all prejudice, I have two further reasons to offer, which I think will reach home, and justify this undertaking. First,

That all men who prefume to write, at leaft, whofe writtings the printers will venture to publish, are of fome note in the world; and where they do, or have lived and converfed, have fome fphere of friends and acquaintance, that know and efteem them, who, it is likely, will buy any book they shall write for the author's fake, who otherwife would have read none of that fubject, though ten times better; and fo the book, however inferior to what have been already published, may happen to do much good. Secondly, By virtue of any function, I fufpect myfelf to be obliged to write fomething in divinity, having written fo much on other fubjects; for, not being permitted to ferve the church with my tongue in preaching, I know not but it may be my duty to ferve it with my hand by writing : and I have made choice of this fubject, as thinking myfelf beft qualified to treat of it. If what I have now written thall find fo favourable acceptance, as to encourage me to proceed, God granting life and health. the reader may expect more; if otherwife, I must be content to be laid afide as ufelefs, and fatisfy myfelf in having made this experiment.

As for this discourse, I have been careful to admit nothing for matter of fact or experiment, but what is undoubtedly true, left I should build upon a fandy and ruinous foundation; and by the admixture of what is false, render that which is true fuspicious.

I might have added many more particulars; nay, my text warrants me to run over all the vifible works of God in particular, and to trace the footfteps of his wifdom in the composition, order, harmony, and uses of every one of them, as well as of those that I have felected. But, First, this would be a task far transfernding my skill and abilities; nay, the joint skill and endeavours of all men now living, or that shall live after a thousand ages, should the world last fo long. "For no man can find out the work that "God maketh from the beginning to the end," Ecclef. iii. 11. Secondly, I was willing to confult the infirmity of the reader, or indeed of mankind in general; which, after a flort confinement to one fort of difh, is apt to looth it, though never fo wholefome and which at firft was most pleafant and acceptable; and fo to moderate my difcourfe, as to make an end of writing, before I might prefume he flould be quite tired with reading.

I fhall now add a word or two concerning the ufefulnefs of the argument, or matter of this difcourfe, and the reafon I had to make choice of it befides what I have already offered.

First, The belief of a Deity being the foundation of all religion (religion being nothing but a devout worshipping of God, or an inclination of mind to ferve and worship him; " for he that cometh to God, " must believe that he is God," it is a matter of the hgheft concernment to be firmly fettled and eftablifhed in a full perfuation of this main point; now this must be demonstrated by argument's drawn from the light of nature, and works of the creation; for, as all other sciences, fo divinity proves not, but fuppofes its fubjects, taking it for granted, that by natural light men are fufficiently convinced of the being of a Deity. There are indeed fupernatural demonstrations of this fundamental truth, but not common to all perfons or times, and fo liable to cavil and exception by atheiftical perfons, as inward illuminations of mind, a fpirit of prophecy, and foretelling future contingents, illustrious miracles, and the like; but these proofs, taken from effects and operations, exposed to every man's view, not to be denied or queftioned by any, are most effectual to convince all that deny or doubt of it; neither are they only convictive of the greatest and fubtlest adverfaries, but intelligible alfo to the meaneft capacities;

b

for you may hear illiterate perfons, of the loweft rank of the commonality, affirming that they need no proof of the being of a God; for that every pile of grafs, or ear of corn, fufficiently proves that; for, fay they, all the men of the world cannot make fuch a thing as one of thefe; and if they cannot do it, who can or did make it but God? To tell them, that it made itfelf, or fprung up by chance, would be as ridiculous as to tell the greateft philofophers fo.

Secondly, The particulars of this difcourse ferve not only to demonstrate the being of a Deity, but alfo to illustrate fome of his principal attributes; as, namely, his infinite power and wildom; the vaft multitude of creatures, and those not only small, but immenfely great, the fun and the moon, and all the heavenly hoft, are effects and proofs of his almighty power " The heavens declare the glory of God, " and the firmament fheweth his handy work," Pfal. xix. 1. The admirable contrivance of all and each of them, the adapting all the parts of animals to their feveral uses, the provisions that is made for their sustenance, which is often taken notice of infcripture. Pfal. cxiv. 15, 16. " The eyes of all wait " upon thee: thou givest them their meat in due " feafon. Thou openeft thy hand, and fatisfieft the " defire of every living thing Math. vi. 26. Be-" hold the fowls of the air, for they fow not, nei-" ther do they reap, nor gather into barns; yet " your heavenly father, feedeth them. Pfal cxlvii. " 9. He giveth to the beaft his food, and to the " young ravens when they cry." And, laftly, their mutual fubferviency to each other, and unanimous confpiring to promote and carry on the publick good, are evident demonstrations of his fovereign wifdom.

Laftly, They ferve to ftir up and increase in us the affections and habits of admiration, humility and gratitude, Pfal. viii. 3. " When I confider the hea-

### THE PREFACE.

" vens, the work of thy fingers, the moon and the "ftars which thou haft ordained: what is man that "thou art mindful of him, or the fon of man that "thou vifiteft him?" And to these purposes the holy Pfalmist is very frequent in the enumeration and confideration of these works, which may warrant me doing the like, and justify the denominating such a difcourse as this, rather theological than philosophical.

[Note, That by the works of the creation, in the title, I mean the works created by God at first, and by him conferved to this day in the same state and condition in which they were at first made: for confervation (according to the judgment both of philosophers and divines) is a continued creation.]

### THE

# CONTENTS OFTHE

## FIRST PART.

- THE multitude of creatures, an argument of the wifdom and power of God, Page 25, 26.
- That the fixed stars are innumerable, agreed on all fides, as well as by fuch as embraces the new hypothesis, 26. 27.
- That there are fo many funs placed at unequal diffances, and each having its planets moving about it, furnished with their inhabitants, like the earth; as by those that adhere to the old, that they are all situated in the same spherical superficies, 27.
- A guels at the number of terrestrial bodies: 1. Inanimate as stones, earths, concrete and inconcrete juices, metals and minerals. 2. Animals, birds, beasts. fishes, and infects. 3. Plants, herbs, and trees, 28, 29, 30, 31.
- Working the fame effect by divers means and inftruments, an argument of wildom; and that God doth this in the works of the creation, proved by feveral examples, 31, 32, 33, 34.
- That the material works of God are wifely contrived and adapted to ends both general and particular, 35.
- The Aristotelean hypothesis, that the world was co eternal with God, condemned, 36.
- The Epicurean hypothefis, that the world was made by a cafual concurrence and cohefion of atoms, rejected. 36, 37. Their declination of atoms juftly derided, and their whole hypothefis ingenioufly confuted by Cicero, 38, 39, 40, 41.

- The Cartesian hypothesis, that supposing God had only created matter, divided it into a certain number of parts, and put it into motion, according to a few laws, it would of itself have produced the world without any more ado, confuted in Dr Cudworth's words, 42,----48.
- Des Cartes his affertion, that the ends of God in any of his works are equally undifcovered by us, centured and reproved, 42, 43, 44.
- His opinion concerning the caufe of the motion of the heart, 47, 48.
- The honourable Mr Boyle's hypothefis confidered and pleaded against, 50, 51
- The author's mistake concerning the hypothesis of Mr Boyle acknowledged, 52.
- The parts of the body formed and fituated contrary to the laws of specifick gravity, 53.
- A plastick nature under God, superintending and effecting natural productions, 53, 54.
- Their opinion that hold the fouls of brutes to be material, and the whole animal body and foul to be a mere machine, not agreeable to the general fense of mankind, 55, 56, 57.
- Of the vilible works of God, and their division, 58, 59

The Atomick hypothesis approved, 59.

The works of nature far more exquisitely formed than the works of art, 58, 59.

- The various fpecies of inanimate bodies to be attributed to the divers figures of their principles, or minute component particles, 60. That these principles are naturally indivisible, proved, *ibid*. They are not very numerous, 59, 60.
- Of the heavenly bodies, 61. That the whole univerfe is divided into two forts of bodies, viz. thin and fluid, denfe and confiftent, *ibid*. That this laft fort are endued with a twofold power, 1. Of gravity, 61. 2. Of circular motion, and why, 62. The heavenly bodies moved in the molt regular, facil, and convenient manner, 62, 63.

Of the fun, his ules, and the convenience of his fituation and motion 64

Of the moon, and its uses, 65.

- Of the reft of the planets and fixed ftars; the regularity and conftancy of their motions; whence Cicero rationally infers, that they are governed by reafon, 66.
- Eclipfes useful to fettle chronology, and determine longitudes 67.
- Of terrestrial inanimate simple bodies, as elements, commonly so called, 67. First, Fire, its various uses, 68 Of air; its use and necessary for bleathing to all forts of animals, aquatick as well as terrestrial: nay in a fort to plants themselves, 69 The effects and uses of its gravity and elastick quality, 70.
- That the foetus in the womb hath a kind of respiration, and whence it receives the air, 70 71, 72.
- That the air infinuates itself into the water for the refpiration of filles, 73. and even into fubre reaceous waters, whence it clears the mines of damps, 73 74 A plattick nature neceffary for putting the diaphragm and muscles of refpiration into motion at first, 74.
- Of water; its uses, 75. Of the sea, and its tides. *ibid*. An objection concerning the needlessness of so much sea, of no use to mankind, answered and the wildom of God in thus unequally dividing sea and land, manifested and afferted, 76. The use of floods, 76, 77, 78.
- That the winds bring up more vapours from the fea than they carry down thither, 79
- That the motion of the water levels the bottom of the fea, 80. The reason why the sea plants grow for the most part flat like a fan, and none in the great depths, 80, 81.
- Of fprings and rivers, baths and mineral water, 81, 82. Simple water nourisheth not. 82.
- Of the earth ; its uses and differences 82.
- Of meteors, or bodies imperfectly mixed. And, 1. Of rain, 83, 2. Of wind, and its various ules, 84.
- Of inanimate mixed bodies, 85. 1. Stones, their qua-

lities and ufes, 85, 86, 87. particularly of the loadstone, its admirable phaenomena, effects and uses, 88 2 Metals; their various uses of great importance to mankind, as iron, without which we could have had nothing of culture or civility; gold and filver for the coining of money, which how many ways useful, is shewn out of Dr Cockburn's effays. 89, 90.

- That the minute component particles of bodies are naturally indivisible, proved, 91, 92.
- Of vegetables or plants, their stature and magnitude, figure, shape, and site of leaves, flowers and fruits, and their parts, all determined, as also their age and duration, 93, 94. The admirable complication of the seminal plants, 94 95 The uses of the several parts of plants, roots, fibres, vessels, barks and leaves, 95, 96. The beauty and elegancy of the leaves, flowers, and fruits of plants, 97. That there is such a thing as beauty and comelines of proportion proved, 97, 98.
- The ules of flowers 98, 99. Of feeds and their teguments, and observations concerning them, 99, 100. Their lasting vitality or foecundity. 100 The pappous plummage of seeds, 101. The tendrils and prickles of plants, of what use, 102.
- That wheat, the best of all grains, is patient both of heat and cold, and scarce retuseth any climate, and that scarce any grain is more fruitful, 102, 103.
- Of the fignatures of plants, 103, 104.
  - Of animals, the provision that is made for the continuance of species, 104, 105 That semales have within them from the beginning the seeds of all the young they shall ever bring forth, 105. An observation of Cicero's about multiparous creatures, *ibid* Why birds lay eggs, 106 Of what use the yolk of the egg is to the chicken, *ibid*
  - Birds that cannot number, yet omit not any one of their young in feeding of them, 107. Though they cannot number, yet that they can diffinguish many from few, proved, *ibid*. The speedy growth of the young birds in the nest, 108. The process of build-

ing their nefts, and incubation, 108, 109. Feeding, breeding, and defending their young, and the admirable Tropyn, 109, 110. Proportion between males and females in all kinds of animals kept up constantly, 110 The conveniency of the time of the year when the feveral forts of animals are brought forth, 110, 111. Why birds fwallow pebble ftones, 117. The provision of nature for keeping of birds nelts clean, 118. Various strange instincts of animals, 113, 114, &c. as, that animals thould know where their natural weapons are fituated, and how to make use uf them; that the weak and timorous should be made fwift of foot or wing for flight; that they flould naturally know their enemies, and fuch as prey upon them, though they had never feen them before; that as foon as they are brought forth they fhould know their proper food; that ducklings, though led by a hen, fo foon as they fee water, should venture into it. the hen in vain endeavouring to hinder or reclaim them : that birds of the fame kind fhould make nefts exactly alike wherefoever bred, and though they had never feen a nest before.

- The migration of birds from one country to another, a ftrange and unaccountable action, 115, 116.
- The wonderful art observable in the construction, situation, and figure of the cells in honey combs, 118, 119, 120. That bees and other animals lay up in store, either for the food of their young, or their own winter provision, 120.
- The provision that is made for the prefervation and fecurity of weak and timorous creatures, and for the diminishing of the rapacious, 121, 122, 123.
- The fitnefs of the parts of the bodies of animals to every one's nature and manner of living, inftanced in, 1. The fwine, 124, &c. 2. The mole, 125. 3. The tamandua, or ant bear, 126. 4. The camelion, 127. 5. The whole genus of wood peckers, *ibid.* 6. Swallows, 128. Douckers, or loons, *ibid.*

In birds all the members are fitted for the use of flying, 139, &c. The use of the tail in birds, 130.

The bodies of fifthes most conveniently formed and provided for the use of fwiming, 133, 134. And particularly those of cetaceous fishes, for the respiration and preferving their natural heat, 134. And of amphibious creatures, *ibid*.

The fitting of the parts of animals one to another, vizthe genitals of the fexes, 135. The nipples of the paps to the mouth and organs of fuction, *ibid*. The admirable ftructure of the breafts or paps, for the preparing and feparating, the containing and retaining of the milk, that it doth not flow out without preffure or fuction, *ibid*.

Several observations of Aristotle's relating to the fitness of the parts to the creatures nature and manner of living, and to their respective uses, 137.

Another remarkable inftance, in proportioning the length of the necks to that of the legs in animals, 138, 138. Of the aponeurofis in the neck, why given to most quadrupeds, and not to man, 239. That fome birds have but short legs, and yet long necks; and why, 139, 140. That this instance connot be accounted for by atheists, 139.

The various kinds of voices the fame animal uses on divers occasions, and to divers purposes, argumentative of providence and counsel in conferring them upon it, being so extremely useful and serviceable to the creature, 140.

An objection against the use of several bodies I have instanced relating to man, answered, 141. A discourse in the person of Almighty God to man, 142. &c.

The incredible fmallness and fubtileness of some animalcules, an argument and proof of the admirable art of the Creator, 145, 146.

Practical inferences from the precedent difcourfe, wherein it is shewn, that the world was in some sense made for man, yet not so as to have no other end or use of its creation but to serve him, 148, &c. The contemplation and consideration of the works of God may probably be some part of our employment in heaven, 149.

The fun, moon, stars, &c. are called upon to praife God, which they can do no otherwife, than by affording man. and other intelligent beings, matter or fubject of praifing him; and therefore men and angels are called upon to confider those great effects of the divine power, wildom and goodness, and to give God the praife and glory due to him for them, 155 156 &c. That God doth, and may justly intend and design his own glory, 158, 159, 160.

# SECOND PART.

OF the whole body of the earth : and first of its figure, which is demonstrated to be spherical, 162,

- The conveniencies of this figure shewn for union of parts, strength, convenience of habitation, and circular motion upon its own poles, 163. 164.
- II. Of its motion, both diurnal upon its own poles, and and annual in the ecliptick ; and both these she vn to be rational, and not diffonant to fcripture, 165, 166 &c. The prefent direction and constant parallelism of its axis to itfelf, shewn to be most convenient for the inhabitants of the earth, by the inconvenience of any different polition, 166, 167, 168, &c. That the Torrid Zone is habitable, and flored with great multirudes of men and other animals, contrary to the opinion of fome of the antients, 169. Neither are the heats there prejudicial to the longevity of men, ibid. A digreffion to prove that the lives of men are longest in the hotest countries, 170, 171. That it would not be more convenient for the inhabitants of the earth if the tropicks flood at a greater diffance, proved. A very confiderable, and heretofore unobferved convenience of this inclination of the earth's axis, which Mr Keill affords us, 171, 172, 173
- Of the usefulness of the present figure, constitution and confistency of the several parts of this terraqueous globe, 174, 175.
- An enumeration of some plants which afford almost

whatever is neceffary for human life, 175.-178,

- Plants having a kind of cifterns or basons formed of their leaves compacted together, for the containing and preferving of water, &c. 176, 177.
- Of mountains and their uses, 181,-185.
- The wildom of God discovered in the structure of the bodies of men and other animals.
- Eleven general observations demonstrating this wisdom and goodnels of God in forming our bodies.
- 1. The erect pofture of the body of man, 185 commodious, (1) For the fulfaining of the head, 186. (2.) For profpect, *ibid* (3.) For walking and using our hands, 187. That this erection of the body was intended by nature, proved by feveral arguments, and particularly the fastening the cone of the heart to the midriff; of which an account is given out of Dr Tyson's anatomy of the Orang Outang, 188, 189.
- 2. In that there is nothing deficient or redundant in the body of man, 190. A notable ftory of a man's giving fuck to a young child well attested, *ibid*.
- 3. The parts of the body most conveniently situated for use, for ornament, and for mutual affiltance, 191, -193.
- 4. Ample provision made for the defence and fecurity of the principal parts, heart, brain, and lungs, 193, &c.
- 5. Abundant provision made against evil accidents and inconveniencies, 195, 196.
- Some observations concerning sleep, 197, 198. That the infensibleness of pain during sleep proceeds rather from the relaxation of the nerves than their obstruction, 198
- 6. The conftancy observed in the number, figure, and fite of the principal parts, and the variety in the less, 198, 199.
- 7. The annexing of pleasure to those actions that are necesfary for the support of the *individuum*, and the continuation and propagation of the kind, 199.
- 8. The multitude of intentions the Creator mult have in the formation and fitting the feveral parts for their refpective actions and uses, 200.

- 9. The fitting and accommodating fome parts to divers offices and uses, an argument of wildom and defign in the contrivance of the body of man and other animals, 201.
- 10. In the nourifhment of their bodies, making that food which is proper to preferve them in a healthful state, grateful to the taste, and agreeable to the stomach. Of the great use of pain, 202, 203.
- 11. The variety of lineaments and diffimilitude of the faces of men, as alfo of their voices and hand-writings, all of mighty importance to man, 204, 205, 206.
- Of the particular parts of the body. And, 1/2, Of the head and hair, 206. The reafon of baldnefs, ibid. 2dly, Of the eye, its beauty, 207. Its humours and tunicles transparent, 208. (1.) For the clearnes. (2) For the diffinctness of vision, 200. The parts of the eye of a figure most convenient for the collection of the vifual rays, viz. convex, 208, 209. The uveous tunicle hath a mulculous power for contracting and dilating of the pupil, 209. Its infide, and that of the chroids, why blackened, 210. The figure of the eye alterable, according to the exigency of the object, in respect of distance or propinguity, 210, 211. Why the optic nerve is not inferted right behind the eye, 211. Why, though the rays be decuffated in the pupil of the eye, the object is not feen inverted, 212. The use of the aqueous humour, and that it is fuddenly reparable, 212, 213. The Tunica Cornea protuberant above the white of the eye, and why, 213. The use of the muscles of the eye, 214 The provision for the defence and fecurity of this precious part. ibid. The ules of the eye-lids, and their frequent winking, 215. That as man wants, fo he needs not, the feventh or suspensory muscle, which is of great use and neceffity to brutes, 216. The need and use of the nictating membrane in brutes, and that man needs it not, 216, 217.

3dly, Of the ear, 217 The use of the Auricula, 218. Of the Tympanum of the ear, its bones, and their muscles; and of the use of the ear, wax, &c. *ibid*.

- 4thly, Of the teeth, nine remarkable observations concerning their fituation, structure and uses 219, 220, 221.
- 5thly, Of the tongue and its various uses; for talling and gathering of food; for managing of maltication; for forming of words, &c. 221, Speaking, proper to man, 222 Of the Ductus Salivales, and of the great use of the faliva, or fpittle, 223.
- 6thly, Of the wind pipe, its admirable structure and uses, 223.
- 7tbly, Of the heart, the use and neceffity of its pulse, for the circulation of the blood, and the admirable make and contrivance of it for that office, 224, &c. Of the muscular coat, and pulse of the arteries, effected by a kind of constrition, or priestaltick motion, and not merely by a wave of the blood in every pulse, 225, 226, 227.
- The wonderful artifice of nature in regulating the motion of the blood in the veins and arteries, by affilting and promoting it in the one, and moderating it in the other. The use of the Vena fine pari, 228, 229.
- 8thly, Of the hand, its structure and various uses not eafily to be enumerated, 290,-233.
- 9thly Of the back bone, its figure, and why divided into vertebres, 233.
- The provision that is made for the eafy and expedite motion of the bones in their articulation by a twofold juice. 1. An oily one fupplied by the marrow. 2. Mucilaginous, prepared and feparated by certain glandules made for that purpose. 234. This inunction of the head of the bones with these juices is useful, 1. To facilitate motion, 234. 2. To prevent attrition, 235.

Why the bones are made hollow, 236.

- Why the belly is flethy, and not inclosed with bones like the breaft, 237.
- The motion of the guts, 238. Of the liver, and use of the gall, *ibid*
- Of the bladder, its structure and use; of the kidneys, and glandules, and ureters, their composition and uses, *ibid*.

That nature employs all the methods and artifices of chymifts in analizing of bodies, and feparating their parts, and out-does them and the feveral particulars inflanced in, 284.

Observations about the gullet and diaphragm, 285.

- An admirable flory out of Galen, about the taking a kid out of the womb of its dam, and bringing it up by hand; and remarks upon it, 285,-288.
- The natural texture of membranes fo made, as to be immenfely dilatable, of great use and necessiry in gestation, 289.
- A notable inftance of providence in the make of the veins and arteries near the heart, 290, 291.
- The atheifts main fubterfuge and presence to elude and evade all our arguments and inflances, to demonstrate the neceffity of providence, defign and wisdom, in the formation of all the parts of the world, viz. That things made uses, and not uses things precluded and confuted, 292, 293
- An answer to an objection against the wildom of God in making inferior ranks of creatures, 299, &c.
- Many practical inferences and observations, from 306, to the end of the book.

### THE

# WISDOM OF GOD

#### MANIFESTED IN THE

# WORKS

### OFTHE

# CREATION.

### PART I.

### PSALM civ. 24.

### How manifold are thy works, O Lord! In wifdom haft thou made them all.

IN these words are two clauses; in the first whereof the Pfalmist admires the multitude of God's works; How manifold are thy works, O Lord! In the fecond he celebrates his wildom in the creation of them; In wildom h ft thou made them all.

Of the First of these I shall fay little, only briefly run over the works of this visible world, and give some guess at the number of them; whence it will appear. that upon this account they will deferve admiration, the number of them being uninvestigable by us, and so affording us a demon-

strative proof of the unlimited extent of the Creator's skill, and the fecundity of his wildom and power. That the number of corporcal creatures is unmeafurably great, and known only to the Creator himfelf, may thus probably be collected : First of all, The number of fixed stars is on all hands acknowledged to be next to infinite. Secondly, Every fixed ftar, in the now-received hypothefis, is a fun, or fun-like body, and in like manner incircled with a chorus of planets moving about it; for the fixed ftars are not all placed in one and the fame concave fpherical fuperficies, and equidiftant from us, as they feem to be, but are varioufly and diforderly fituated, fome nearer, fome further off, just like trees in a wood or forest, as Gaffendus exemplifies them. And, as in a wood, though the trees grow never fo irregularly, yet the eye of the spectator, wherever placed, or whitherfoever removed, defcribes still a circle of trees : fo would it in like manner, wherever it were in the forest of stars, describe a spherical superficies about it. Thirdly, Each of thefe planets is in all likelihood furnished with as great variety of corporeal creatures, animate and inanimate, as the earth is, and all as different in nature as they are in place from the terreftrial, and from each other. Whence it will follow, that thefe must be much more infinite than the ftars; I do not mean abfolutely, according to philosophic exactness, infinite, but only infinite or innumerable as to us, or their number prodigi-

That the fixed flars are innumerable, may thus be made out: those visible to the naked eye are by the leaft account acknowledged to be above a thousand, excluding those towards the South pole, which are not visible in our horizon : besides these, there have been incomparably more detected and brought to light by the telescopes; the milky way being

oufly great.

found to be (as was formerly conjectured) nothing but great companies, or swarms of minute stars fingly invisible, but by reason of their proximity mingling and confounding their lights, and ap-pearing like lucid clouds. And it is likely that, had we more perfect telescopes, many thousands more might be discovered; and yet, after all, an incredible multitude remain, by reafon of their immense distance beyond all ken, by the best telefcopes that could poffibly be invented or polifhed by the wit and hand of an angel: for if the world be (as Des Cartes would have it) indefinitely extended, that is, fo far as no human intellect can fancy any bounds of it; then what we fee, or can come to fee, must be the least part of what is undifcoverable by us, the whole universe extending a thousand times farther beyond the utmost stars we can possibly descry, than those be distant from the earth we live upon. This hypothesis of the fixed ftars being fo many funs, &c. feems more agreeable to the Divine greatness and magnificence. But that which induces me much to doubt of the magnitude of the universe, and immense diftance of the fixed stars, is the flupendous phenomena of comets their fudden accention, or appearance in full magnitude, the length of their tails, and swiftness of their motion, and gradual diminution of bulk and motion, till at laft they difappear. That the universe is indefinitely extended, Des Cartes, upon a false ground, (that the formal ratio of a body was nothing but extension into. length, breadth, and profoundity, or having partes extra partes, and that body and fpace were fynonymous terms) afferted; it may as well be limited this way, as in the old hypothefis, which places the ftars fixed in the fame fpherical fuperficies; according to which (old hypothefis) they may also be demonstrated by the fame mediums to be innume28

rable, only inftead of their diftance fubftituting their fmallnefs for the reafon of their invifibility.

But leaving the celeftial bodies, I now come to the terrestrial: which are either inanimate or animate. The inanimate are the elements, meteors, and foffils of all forts, at the number of which last I cannot give any probable guess; but if the rule which fome confiderate philosopers deliver, holds good, viz. how much more imperfect any genus, or order of beings is, fo much more numerous are the fpecies contained under it. As for example: birds being a more perfect kind of animals than fifhes, there are more of these than of those; and for the like reafon more birds than quadrupeds, and more infects than of any of the reft, and fo more plants than animals, nature being more fparing in her more excellent productions. If this rule, I fay, holds good, then should there be more species of foffils, or generally of inanimate bodies than of vegitables, of which there is fome reafon to doubt, unlefs we will admit all forts of formed ftones to be diffinct fpecies.

Animate bodies are divided into four great genera, or orders, beafts, birds fishes and infects.

The fpecies of beafts, including alfo ferpents, are not very numerous: of fuch as are certainly known and deferibed, I dare fay not above 150; and yet I believe, not many, that are of any confiderable bignefs, in the known regions of the world, have efcaped the cognizance of the curious I reckon all dogs to be of one fpecies, they mingling together in generation, and the breed of fuch mixtures being prolifick.

The number of birds known, and defcribed, may be near 500; and the number of fifnes, fecluding shell fifh, as many; but if the shell-fifh be taken in, more than fix times the number. How many of each genus remain yet undifcovered, one cannot certainly nor very nearly conjecture; but we may fuppofe the whole fum of beafts and birds to exceed by a third part, and fifthes by one half, those known.

The infects, if we take in the exanguious, both terreftrial and aquatick, may, in derogation to the precedent rule, for number, vie even with plants themfelves: for the exanguious alone, by what that learned and critical naturalift, my honoured friend, Dr Martin Lifter, hath already obferved and delineated, I conjecture, cannot be fewer than 3000 fpecies, perhaps many more.

The butterflies or beetles are fuch numerous tribes that I believe in our own native country alone the fpecies of each kind may amount to 150, or more. And if we fhould make the caterpillars and bexapods, from whence thefe come, to be diftinct fpecies, as most naturalists have done, the number will be doubled, and thefe two genera will afford us 600 fpecies; but if those be admitted for diftinct fpecies, I fee no reason but their aureliae also may pretend to a specific difference from the caterpillars and butterflies, and so we shall have 306 species more, therefore we exclude both these from the degree of species, making them to be the fame infect under a different larva or habit.

The fly-kind, if under the name we comprehend all other flying infects, as well fuch as have four as fuch as have but two wings, of both which kinds there are many fubordinate genera, will be found in a multitude of fpecies to equal, if not exceed, both the fore-mentioned kinds.

The creeping infects that never come to be winged, though for number they may fall fhort of the flying or winged, yet are they allo very numerous; as by running over thr feveral kinds I could eafily demonstrate. Supposing then there be a thousand feveral forts of infects in this 'illand, and

Part I.

the fea near it, if the fame proportion holds between the infects native of England, and those of the reft of the world, as doth between plants domeftick and exotick, (that is, as I guefs, near a decuple) the fpecies of infects in the whole earth, (land and water) will amount to 10000, and I do believe, they rather exceed than fall thort of that fum. Since the writing hereof, having this fummer, anno 1691, with fome diligence profecuted the history of our English infects, and making collections of the feveral species of each tribe, but particularly and efpecially of the butterflies, both nocturnal and diurnal, I find the number of each of these alone as breed in our neighbourhood (about Braintree and Notely in Effex) to exceed the fum I last year affigned to all England, having myfelf observed and described about 200 kinds, great and fmall, many yet remaining, as I have good reafon to believe, by me undifcovered. This I have, fince the writing hereof, found true in experience, having every year observed not a few new kinds: nor do I think, that if I should live twenty years longer, I fhould, by my utmost diligence and industry in fearching them out, come to an end of them. If. then, within the fmall compais of a mile or two, there are fo many fpecies to be found, furely the most modest conjecture cannot estimate the number of all the kinds of papilios native of this island to fall fhort of 300, which is twice fo many as I last fummer gueffed them to be; wherefore, using the fame argumentations, the number of all the British' infects will amount to 2000, and the total fum of those of the whole earth will be 20000. The number of plants contained in C. Bauhin's Penax is about 6000, which are all that had been defcribed by the authors that wrote before him, or observed by himself; in which work, befides miftakes and repetitions incident to the most wary

30

Part I.

and knowing men in fuch a work as that, there are a great many, I might fay fome hundreds, put down for different species, which, in my opinion, are but accidental varieties : which I do not fay to detract from the excellent pains and performance of that learned, judicious, and laborious herbarift, or to defraud him of his deferved honour, but only to fhew that he was too much fwayed by the opinions then generally current among herbarifts, that different colour, or multiplicity of leaves in the flower, and the like accidents, were fufficient to constitute a specific difference. But supposing there had been 6000 then known and defcribed. I cannot think but that there are in the world more than triple that number; there being in the vaft continent of America as great a variety of fpecies as with us. and yet but few common to Europe, or perhaps Afric and Afia. And if, on the other fide of the Equator, there be much land ftill remaining undifcovered, as probably there may, we must suppose the number of plants to be far greater.

What can we infer from all this? If the number of creatures be fo exceeding great, how great, nay immense, must needs be the power and wildom of him who formed them all! For (that I may borrow the words of a noble and excellent author) as it argues and manifests more skill by far in an artificer, to be able to frame both clocks and watches, and pumps, and mills, and grenadoes, and rockets, than he could difplay in making but one of those forts of engines; so the Almighty difcovers more of his wifdom in forming fuch a vaft multitude of different forts of creatures, and all with admirable and irreprovable art, than if he had created but a few; for this declares the greatnefs and unbounded capacity of his underftanding. Again, the fame fuperiority of knowledge would be difplayed, by contriving engines of the fame kind,

or for the fame purpofes, after different fashions, as the moving of clocks or other engines by fprings, instead of weights: so the infinitely wife Creator hath fhewn, in many inftances, that he is not confined to one only inftrument for the working one effect, but can perform the fame thing by divers means. So, though feathers feem necessary for flying, yet hath he enabled feveral creatures to fly without them, as two forts of fifhes, one fort of lizard, and the batt, not to mention the numerous tribes of flying infects. In like manner, though the airbladder in fifnes feems neceffary for fwimming, yet fome are fo formed as to fwim without it, viz. First, The Cartilagineous kind, which, by what artifice they poize themfelves, afcend and defcend at pleasure, and continue in what depth of water they lift, is as yet unknown to us Secondly, The Cetaceous kind, or fea-beafts, differing in nothing almost from quadrupeds, but the want of feet. The air, which in refpiration thefe receive into their lungs, may ferve to render their bodies equiponderant to the water; and the conftruction or dilatation of it, by the help of the diaphragm and mufcles of refpiration, may probably affift them to afcend or defcend in the water, by a light impulse thereof with their fins.

Again, Though the water being a cold element, the moft wife God hath fo attempered the blood and bodies of fifhes in general, that a fmall degree of heat is fufficient to preferve their due confiftency and motion, and to maintain life; yet to fhew that he can preferve a creature in the fea, and in the coldeft part of the fea too, that may have as great a degree of heat as quadrupeds themfelves, he hath created variety of thefe cetaceous fifhes. which converfe chiefly in the Northern feas, whofe whole body being incompafied round with a copious fat or blubber, (which, by reflecting and

32

Part I.

redoubling the internal heat, and keeping off the external cold, doth the fame thing to them that cloaths do to us) is enabled to abide the greatest cold of the fea water. The reafon why these fishes delight to frequent chiefly the Northern feas, is, I conceive, not only for the quiet which they enjoy there, but becaufe the Northern air, which they breathe in, being more fully charged with those particles supposed nitrous, which are the element of fire, is fitteft to maintain the vital heat in that activity which is fufficient to move fuch an unwieldy bulk as their bodies are with due celerity, and to bear up against and repel the ambient cold; and may likewife enable them to continue longer under water than a warmer and thinner air could.

Another inftance to prove that God can and doth by different means produce the fame effect, is, the various ways of extracting the nutricious juice out of the aliment, in feveral kinds of creatures.

1. In man and viviparous quadrupeds, the food moiftened with the fpittle (faliva) is first chewed and prepared in the mouth, then fwallowed into the stomach where being mingled with some diffolvent juices, it is by the heat hereof concocted, macerated, and reduced into a chyle or cremor, and so evacuated into the intestines, where being mixed with the choler and pantreatick juice, it is further subtilized and rendered so fluid and penetrant, that the thinner and finer part of it easily finds its way in at the streight orifices of the lacteous veins.

2. In birds there is no mattication or comminution of the meat in the mouth; but in fuch as are not carnivorous, it is immediately fwallowed into the crop or craw, or at leaft into a kind of antestomach (which I have observed in many, especially in piscivorous birds) where it is moistened and mollified by some proper juice from the glandules di34

ftilling in there, and thence transferred into the gizard or mulculous ftomach, where by the working of the mulcles compounding the fides of that ventricle, and by the affiftance of fmall peebles (which the creature fwallows for that purpofe) it is as it were by mill ftones, ground fmall, and fo transmitted to the guts, to be further attenuated and fubtilized by the fore-mentioned choler and pancreatic juice.

3. In oviparous quadrupeds, as chamelions, lizards, frogs, as alfo all forts of Serpents, there is no maffication, or comminution of the meat either in mouth or ftomach; but as they fwallow infects or other animals whole, fo they void their fkins unbroken, having a heat, or fpirits powerful enough to extract the juice they have need of, without breaking that which contains it; as the Parifian academifts tell us. I myfelf cannot warrant the truth of the observation in all. Here, by the bye, we take notice of the wonderful dilatability or extensiveness of the throats and gullete of ferpents: I myfelf have taken two entire adult mice out of the ftomach of an adder, whose neck was not bigger than my little anger. These creatures, I fay, draw out the juice of what they fwallow without any comminution, or fo much as breaking the fkin; even as it is feen that the juice of grapes, is drawn as well from the \* rape, where they remain whole, as from a vat, where they are bruis'd; to borrow the Parifian philosophers fimilitude.

4. Fishes, which neither chew their meat in their mouths, nor grind it in their stomachs, do by the help of a diffolvent liquor, there by nature provided, corrode, and reduce it, skin, bones and all, into a chylus, or cremor; and yet (which you seem won-

• Whole grapes plucked from the clufter, and wine poured upon them in a veffel. derful) this liquor manifests nothing of acidity to the taste: But notwithstanding, how mild and gentle foever it seems to be, it corrodes flesh very strangely and gradually, as aquafortis, or the like corrosive waters, do metals, as appears to the eye; for I have observed fish in the stomachs of others, thus partially corroded, first, the superficial part of the flesh, and then deeper and deeper by degrees to the bones

I come now to the fecond part of the words, in wi/dom haft thou made them all, in discourfing whereof, I shall endeavour to make out in particulars what the Psalmist here afferts in general concerning the works of God, that they are all very wisely contrived and adapted to ends both particular and general.

But before I enter upon this tafk, I fhall, by way of preface or introduction, fay fomething concerning those systems which undertake to give an account of the formation of the universe by mechanical hypotheses of matter, moved either uncertainly, or according to fome catholick laws without the intervention and affistance of any superior or immaterial agent.

There is no greater, at least no more palpable and convincing argument of the existence of a Deity, than the admirable art and wildom that discovers itfelf in the make and constitution, the order and disposition, the ends and uses of all the parts and members of this stately fabrick of heaven and earth : For if in the works of art (as for example) a curious edifice or machine, counsel, design, and direction, to an end appearing in the whole frame, and in all the several pieces of it, do necessarily infer the being and operation of some intelligent architect, or engineer: why shall not also, in the works of nature, that grandeur and magnificence, that excellent contrivance for beauty, order, use, &c. which

Part I.

is obfervable in them, wherein they do as much transcend the effects of human art as infinite power and wisdom exceeds finite, infer the existence and efficiency of an omnipotent and all wise Creator.

To evade the force of this argument, and to give fome account of the original of the world, atheiftical perfons have fet up two hypothefes.

The firft is that of Ariftotle, that the world was from eternity in the fame condition that now it is, having run through the fucceffions of infinite generations; for which they add, felf existent and unproduced: For Aristotle doth not deny God to be the efficient cause of the world; but only afferts that he created it from eternity, making him a necessary cause thereof; it proceeding from him by way of emanation, as light from the fun.

This hypothefis, which hath fome fhew of reafon, for fomething must neceffarily exist of itfelf and if fomething, why may not all things? this hypothefis, I fay, is fo clearly and fully confuted by the reverend and learned Dr Tillotson. late Lord Archbishop of Canterbury, and Primate of all England, in his first printed fermon; and the right reverend father in God, John, late Lord Bishop of Chester, in book I. chap. v. of his treatife of the Principles of Natural Religion, that nothing material can by me be added: To whom therefore I refer the reader.

#### The Epicurean Hypothesis rejected.

THE fecond hypothesis is that of she Epicureans, who held, that there were two principles felfexistent. First, Space or vacuity; Secondly, Matter, or body both of infinite duration and extenstantion. In this infinite space, or vacuity, which hath neither beginning, nor end, nor middle,

36

no limits, or extremes, innumerable minute bodies, into which the matter was divided, called atoms, because by reason of their perfect folidity they were really indivifible; for they hold no body capable of division, but what hath vacuities intersperfed with matter, of various but a determinate number of figures, and equally ponderous, do perpendicularly defeend, and by their fortuitous concourse, make compound bodies, and at last the world itfelf. But now, becaufe if all thefe atoms fhould defcend plum down with equal velocity, as, according to their doctrine, they ought to do, being (as we faid) all perfectly folid and imporous, and the vacuum not refifting their motion, they would never the one overtake the other, but, like the drops of a shower, would always keep the fame diftances, and fo there could be no concourfe, or cohefion of them, and confequently nothing created; partly to avoid this destructive confequence, and partly to give fome account of the freedom of will (which they did affert contrary to the Democritic fate) they did abfurdly feign a declination of fome of these principles, without any fhadow or pretence of reafon. The former of these motives you have set down by Lucretius, De Nat. Rerum, lib. 2. in these words :

Corpora cum deorfum rectum per inane feruntur Ponderibus propriis, incerto tempore, forte, Incertifque locis, spatio discedere paulum; Tantum quod nomen mutatum dicere poss.

## And again,

Quod nisi declinare solerent, omnia deorsum Imbris uti guttae caderent per inane profundum; Nec soret offensus natus, nec plaga creata Principiis, ita nil unquam natura creasset.

37

Part I.

Now feeds in downward motion must decline, Tho' vary little from th' exactest line; For did they still move strait, they needs must fall Like drops of rain, dissolv'd and scatter d all, For ever tumbling thro' the mighty space, And never join to make one single mass.

The fecond motive they had to introduce this gratuitous declination of atoms, the fame poet gives us in these verses, lib. 2.

-----Si semper motus connectitur omnis, Et vetere exoritur semper novus ordine certo; Nec declinando faciunt primordia motus Principium quoddam quod fati foedera rumpat, Ex infinito ne causam causa sequatur; Libera per terras unde baec animantibus, extat, Unde baec est, inquam, satis avolsa voluntas?

Befides, did all things move in direct line, And ftill one motion to another join In certain order, and no feeds decline, And make a motion fit to diffipate The well-wrought chains of caufes and ftrong fate; Whence comes that freedom living creatures find? Whence comes the will fo free, fo unconfin'd, Above the power of fate?

The folly and unreafonablenefs of this ridiculous and ungrounded figment, I cannot better difplay and reprove than in the words of Cicero, in the beginning of his firft book *De Finibus Bonorum et Malorum*. This declination (faith he) is altogether childifhly feigned, and yet neither doth it at all folve the difficulty, or effect what they defire: for, firft, They fay the atoms decline, and yet affign no reafon why. Now nothing is more fhameful

8

aud unworthy a natural philosopher [turpius phyfico] than to affert any thing to be done without a cause, or to give no reason of it. Besides, this is contrary to their own hypothefis taken from fenfe, that all weights do naturally move perpendicularly downward. Secondly, Again fuppoling this were true, and that there were fuch a declination of atoms, yet will it not effect what they intend; for either they do all decline, and fo there will be no more concourse than if they did perpendicularly descend, or fome decline, and fome fall plum down, which is ridiculoufly to affign diffinct offices and tafks to the atoms, which are all of the fame nature and folidity. Again, in his book De Fato, he fmartly derides this fond conceit thus : What caufe is there in nature which turns the atoms afide? Or do they caft lots among themfelves, which shall decline, which not? Or why do they decline the leaft interval that may be, and not a greater? Why not two or , three minima as well as one? Optare boc guidem eft nou disputare. For neither is the atom by any extrinfical impulse diverted from its natural courfe neither can there be any caufe imagined in the vacuity through which it is carried, why it fhould not move directly; neither is there any change made in the atom itself, that it should not retain the motion natural to it, by force of its weight or gravity.

As for the whole atomical hypothesis, either Epicurean or Democritic, I shall not, nor need I, spend time to confute it; this having been already folidly and sufficienty done by many learned men, but especially Dr Cudworth, in his Intellectual System of the Universe, and the late Bissop of Worcester, Dr Stillingsset, in his Origenes Sacrae. Only I cannot omit the Ciceronian confutation thereof, which I find in the place first quoted, and in his first and second books De Natura Deorum, 40

because it may ferve as a general introduction to the folowing particulars. Such a turbulent concourse of atoms could never (faith he) hunc mundi ornatum efficere, compose fo well-ordered and beautiful a ftructure as the world; which therefore both in Greek and Latin hath from thence [ab ornatu et munditie] obtained its name. And, again, most fully and appositely in his fecond De Nat. Deorum: if the works of nature were better, more exact and perfect, than the works of art, and art effects nothing without reason, neither can the works of nature be thought to be effected without reafon; for, is it not absurd and incongruous, that when thou beholdest a statue or curious picture, thou fhouldst acknowledge that art was used to the making of it; or when thou feeft the courfe of a ship upon the waters, thou fhouldft not doubt but the motion of it is regulated and directed by reafon and art; or when thon confidereft a fun-dial or clock. thou shouldst understand presently, that the hours are shewn by art and not by chance; and yet imagine or believe, that the world which comprehends all these arts and artificers, was made without counfel or reafon? If one fhould carry into Scythia or Britain fuch a fphere as our friend Poffidonius lately made, each of whole conversions did the fame thing in the fun and moon, and other five planets, which we fee effected every night and day in the heavens, who among those barbarians would doubt that that fphere, was compofed by reason and art? A wonder than it must needs be, that there should be any man found fo flupid and forfaken of reason, as to persuade himfelf, that this most beautiful and adorned world was, or could be produced by the fortuitous concourse of atoms. He that can prevail with himfelf to believe this, I do not fee why he may not as well admit, that if there were made innumerable

figures of the one and twenty letters, in gold, fuppofe, or any other metal, and thefe well shaken and mixed together, and thrown down from fome high place to the ground, they, when they lighted upon the earth, would be fo difpofed and ranked, that a man might fee and read in them Ennius's Annals; whereas it were a great chance if he should find one verfe thereof among them all : for, if this concourse of atoms could make a whole world, why may it not fometimes make, and why hath it not somewhere or other in the earth, made a temple, or a gallery, or a portico, or a houfe, or a city? which yet it is fo far from doing, and every' man fo far from believing, that fhould any one of us be cast, suppose, upon a desolate island, and find there a magnificent palace, artificially contrived according to the exacteft rules of architecture, and curioufly adorned, and furnished, it would never once enter into his head, that this was done by an earthquake, or the fortitous shuffling together of its component materials; or that it had ftood there ever fince the conftruction of the world, or first cohension of atoms; but would prefently conclude, that there had been fome intelligent architect there, the effect of whofe art and skill it was. Or should he find there but one fingle sheet of parchment or paper, an epiftle or oration written, full of profound fense, expressed in proper and fignificant words, illustrated and adorned with elegant phrase; it were beyond the poffibility of the wit of man to perfuade him, that this was done. by the temerarious dashes of an unguided pen. or by the rude fcatering of ink upon the paper. or by the lucky protection of fo many letters at all adventures; but he would be convinced by the evidence of the thing at first fight, that there had been not only fome man, but fome fcholar there.

e monne addite augusta particular abount for anticities

## The Cartesian Hypothesis considered and censured.

Having rejected this atheistick hypothesis of Epicurus and Democritus, I should now proceed to give particular instances of the art and wisdom clearly appearing in the feveral parts and members of the universe; from which we may justly infer this general conclusion of the Pfalmist) In wisdom hast thou made them all: but that there is a fort of professed theists, I mean Monf. Des Cartes, and his followers, who endeavour to difarm us of his decretory weapon to evacuate and exterminate, this argument, which hath been so fuccessful in all ages to demonstrate the existence, and enforce the belief of a Deity, and to convince and silence all atheistick gainsayers. And this they do,

First, By excluding and banishing all confideration of final caufes from natural philosophy, upon presence, that they are all and every one in particular undifcoverable by us; and that it is rafhnefs and arrogance in us to think we can find out God's ends, and be partakers of his counfels Atque ob hanc unicam rationem, totum illud causarum genus quod a fine peti solet, in rebus physicis nullum usum habere existimo; non enim ab/que temeritate me puto investigare posse fines Dei, Medit. Metaph. " And "for this only reason, I think, all that kind of " caufes which is wont to be taken from the end, " to have no use in physicks or natural matters; for "I cannot, without rashness, think myself able " to find out the ends of God." And, again, in his Principles of Philosophy; Nullas unquam raziones circa res naturales, a fine quem Deus aut natura in iis faciendis sibi propo/uit, admittimus, quia non tantum nobis debcmus arrogare ut ejus concilierum participes esse possimus. "We can by no es means admit any reasons about natural things,

#### in the CREATION.

Part I.

" taken from the end which God or nature propofed to themfelves in making of them: becaufe " we ought not to arrogate fo much to ourfelves, " as to think we may be partakers of his counfels." And more exprefly in his fourth anfwer, viz to Gaffendus' objections; Nec fingi potest, aliquor Dei fines magis quam alios in propatulo effe; omnes enim imperferutabili ejns Sapientiae aby fo funt eodom modo reconditi; that is, " Neither can nor ought we " to feign or imagine that fome of God's ends are " more manifest than others: for all lie in like " manner, or equally hidden in the unfearchable abyfs of his wifdom."

This confident affertion of Des Cartes is fully examined and reproved by that honourable and excellent perfon, Mr Boyle, in his Difquifition about the final caufes of natural things, Sect. I. From page 10 to the end; and therefore I fhall not need fay much to it, only in brief this, that it feems to me fatfe, and of evil confequences, as being derogatory from the glory of God, and defructive of the acknowledgment and belief of a Deity.

For, ftrit, Seeing, (for inftance) that the eye is employed by man, and all animals, for the ufe of vision, as they are framed, is fo neceffary for them, that they could not live without it; and God Almighty knew that it would be fo; and it is fo admirably fitted and adapted to this ufe, that all the wit and art of men and angels could not have contrived it better, if fo well, it must needs be highly abfurd and unreasonable to affirm, either that it was not defigned at all for this use, or that it is impossible for man to know whether it was or not.

Secondly, How can man give thanks and praife to God for the use of his limbs and senses, and those his good creatures, which ferve for his suftenance, when he cannot be fure they were made in any respect for him; nay, when it is as likely they were not, and that he doth but abuse them, to serve ends for which they were never intended;

Thirdly, this opinion, as I hinted before, fupperfedes and caffates the beft medium we have to demonftrate the Being of a Deity, leaving us no other demonftrative proof, but that taken from the innate idea; which, if it be a demonstration, is but an obfcure one, not fatisfying many of the learned themfelves, and being too fubtle and metaphyfical to be apprehended by vulgar capacities, and confequently of no force to perfuade and convince them.

Secondly, They endeavour to evacuate and difannul our great argument, by pretending to folve all the phaenomena of nature, and to give an account of the production and efformation of the universe, and all the corpereal beings therein, both celeftial and terrestrial, as well animate as inanimate, nor excluding animals themfelves, by a flight hypothefis of matter fo and fo divided and moved. The hypothefis you have in Des Cartes' Principles of philofophy, Part II, " All the matter of this visible world " is by him fuppofed to have been at first divided " by God into parts nearly equal to each other, of " a mean fize, viz. about the bignefs of those where-" of the heavenly bodies are now compounded; al-" together having as much motion as is now found " in the world; and thefe to have been equally " moved feverally, every one by itfelf about its own " centre, and among one another, fo as to compose " a fluid body; and alfo many of them jointly, or " in company, about feveral other points fo far di-" ftant from one another, and in the fame manner " difposed as the centres of the fixed ftars now " are, ' So that God had no more to do than to create the matter, divide it into parts, and put it into motion, according to fome few laws, and that would of itself produce the world, and all the creatures therein.

44

For a confutation of this hypothesis, I might refer the reader to Dr Cudworth's fystem, p. 603. 604. but for his eafe I will transcribe the words: ----God, in the mean time, standing by as an idle spectator of this lusus atomorum, this sportful dance of atoms, and of the various refults thereof. Nay, thefe mechanic theifts have here quite outftripped and outdone the atomic theifts themfelves, they being much more extravagant than ever those were ; for the professed atheists durst never venture to affirm that this regular fystem of things refulted from the fortuitous motions of atoms at the very first, before they had for a long time together produced many other inept combinations, or aggregate forms of particular things, and nonfenfical fyftems of the whole; and they supposed also, that the regularity of things here in this world would not always continue fuch neither, but that fome time or other, confusion and diforder will break in again. Moreover, that befides this world of ours, there are, at this very inftant, innumerable other worlds irregular, and that there is but one of a thoufand, or ten thousand among the infinite worlds that have fuch regularity in them; the reafon of all which is, becaufe it was generally taken for granted, and looked upon as a common notion, that Tav ато тихия à ты антоматы ибен ан ыты улистал, as Aristotle expreffeth it; none of those things which are from fortune, or chance, come to pafs always alike. But our mechanic theifts will have their atoms never fo much as once to have fumbled in these their motions, nor to have produced any inept fyftem, or incongruous forms at all, but from the very first all along to have taken up their places, and ranged themfelves fo orderly, methodically and directly, as that they could not poffibly have done it better, had they been directed by the most perfect wildom. Wherefore these atomic theists ut-

Part I.

terly evacuate that grand argument for a God, taken from the phaenomenon of the artificial frame of things, which hath been fo much infifted upon in all ages, and which commonly makes the firongeft imprefiion of any other upon the minds of men, &c. the Atheifts, in the mean time, laughing in their fleeves, and not a little triumphing to fee the caufe of Theifm thus betrayed by its profefied friends and afferters, and the grand argument for the fame totally flurred by them, and fo their work done, as it were, to their hands.

Now as, this argues the greatest infensibility of mind, or fottifhnefs and ftupidity, in pretended Theifts, not to take the least notice of the regular and artificial frame of things, or of the fignatures of the divine art and wildom in them, nor to look upon the world and things of nature with any other eyes than oxen and horfes do; fo are there many phaenomena in nature, which being partly above the force of these mechanic powers, and partly contrary to the fame, can therefore never be folved by them, nor without final caufes and fome vital principles : As for example, that of gravity, or the tendency of bodies downward, the motion of the diaphragm in refpiration, the fystole and diaftole of the heart, which is nothing but a muscular construction and relaxation, and therefore not mechanical but vital. We might alfo add, among many others, the interfection of the planes. of the Equator and Ecliptic, or the earth's diurnal motion upon an axis not parallel to that of the Ecliptic, or perpendicular to the plane thereof: For though Des Cartes would needs imagine this earth of ours once to have been a fun, and fo itfelf the centre of a leffer vortex, whofe axis was then directed after this manner, and which therefore still kept the fame fite or posture, by reason of the strait particles finding no fit pores or traces, for

their paffages through it, but only in this direction, yet does he himfelf confess, that because that thefe two motions of the earth, the annual and diurnal, would be much more conveniently made upon parallel axes, therefore according to the laws of mechanism, they should be perpetually brought nearer and nearer together, till at length the Equator and Ecliptic come to have their axes parallel, which, as it hath not yet come to pafs, fo neither hath there been for these last two thousand years (according to the beft observations and judgments of aftronomers) any nearer approach made of them one to another. Wherefore the continuation of thefe two motions of the earth, the annual and diurnal, upon axes not parallel, is refolvable into nothing but a final and mental caufe, or the TO Benrisov, becaufe it was best it should be fo, the variety of the feafons of the year depending thereupon. But the greatest of all the particular phaenomena, is the formation and organization of the bodies of animals, confifting of fuch variety and curiofity, that thefe mechanic philosophers being no way able to give an account thereof from the neceffary motion of matter, unguided by mind for ends, prudently therefore break off their fysten there, when they flould come to animals, and fo leave it altogether untouched. We acknowledge indeed there is a posthumous piece extant, imputed to Cartes, and entitled De la Formation du Foetus. wherein there is fome pretence made to folve all this fortuitous mechanism. But as the theory thereof is built wholly upon a falle supposition, fufficiently confuted by our Harvey, in his book of generation, . That the feed doth materially enter into the composition of the egg;' fo is it all along precarious and exceptionable : Nor doth it extend at all to differences that are in feveral animals, nor offer the leaft reason why an animal of

Part I.

one species might not be form'd out of the feed of another. Thus far the Doctor, with whom for the main I do confent. I shall only add, that natural philosophers, when they endeavour to give an account of any of the works of nature, by preconceived principles of their own, are for the most part grofsly miftaken, and confuted by experience; as Des Cartes in a matter that lay before him, obvious to fense, and infinitely more easy to find out the caufe of, than to give an account of the formation of the world; that is, the pulfe of the heart, which he attributes to an ebullition and fudden expansion of the blood, in its ventricles, after the manner of the milk, which being heated to fuch a degree, doth fuddenly, and as it were all at once, flush up, and run over the veffel. Whether this ebullition be caufed by a nitro-fulphureous ferment lodged efpecially in the left ventricle of the heart, which mingling with the blood, excites fuch an ebullition, as we fee made by the mixture of fome chymical liquors, viz oil of vitriol, and deliquated falt of tartar; or, by the vital flame warming and boiling the blood. But this conceit of his is contrary both to reafon and experience : For, first, It is altogether unreafonable to imagine and affirm that the cool venal blood should be heated to fo high a degree in fo thort a time, as the interval of two pulses, which is lefs than the fixth part of a minute. Secondly, In cold animals, as for example eels, the heart will beat for many hours after it is taken out of the body, yea, though the ventricle be opened, and all the blood fqueezed out. Thirdly, The process of the fibres which compound the fides of the ventricles running in fpiral lines from the tip to the bafe of the heart, fome one way, and fome the contrary, do clearly fhew that the fystole of the heart is nothing but a muscular constriction, as a purfe is that by drawing the ftrings contrary-

48

ways; which is alfo confirmed by experience: For if the vertex of the heart be cut off, and a finger thruft up into one of the ventricles, in every fyftole the finger will be fenfibly and manifeftly pinched by the fides of the ventricle. But for a full confutation of this fancy, I refer the reader to Dr Lower's treatife *De Corde*, *cap.* 2. And Des Cartes' rules concerning the transferring of motion from one body in motion to another in motion, or in reft, are the most of them by experience found to be falfe; as they affirm who have made trial of them.

The pulfe of the heart Dr Cudworth would have to be no mechanical, but a vital motion, which to me feems probable, becaufe it is not under the command of the will; nor are we confcious of any power to caufe, or to reftrain it, but it is carried on and continued without our knowledge, or notice; neither can it be caufed by the impulse of any external movement, unless it be heat. But how can the fpirit, agitated by heat, unguided by a vital principle, produce fuch a regular reciprocal motion? If that fite which the heart and its fibres. have in the diaftole be most natural to them, (as it feems to be) why doth it again contract itfelf, and not reft in that posture? If it be once contracted in a fystole by the influx of the spirits, why, the fpirits continually flowing in without let, doth it not always remain fo? [for the fystole feems to refemble the forcible bending of a fpring, and the diastole its flying out again to its natural fite.] What is the fpring and principal efficient of this reciprocation? What directs and moderates the motions of the fpirits? They being but ftupid and fenseless matter, cannot of themselves continue any regular and conftant motion, without the guidance and regulation of fome intelligent being. You will fay, What agent is it which you would have to

effect this? The fenfitive foul it cannot be, becaufe that is indivisible; but the heart, when feparated wholly from the body in fome animals, continues fill to pulfe for a confiderable time: Nay, when it hath quite ceased, it may be brought to beat anew by the application of warm spittle, or by pricking it gently with a pin, or needle. I answer, it may be in these instances, the feattering spirits remaining in the heart, may for a time, being agitated by the heat, cause these faint pulfations; though I should rather attribute them to a plassic nature, or vital principle, as the vegetation of plants must also be.

But, to proceed, neither can I wholly acquiefce in the hypothesis of that honourable and defervedly famous author, 1 formerly had occasion to mention, which I find in his free enquiry into the vulgar notion of nature, p. 77, 78. delivered in these words. " I think it probable, that the great and " wife Author of things did, when he first formed " the universe and undiffinguished matter into the " world, put its parts into various motions, where-" by they were neceffarily divided into number-" lefs portions of differing bulks, figures, and fi-" tuations, in refpect of each other: and that by " his infinite wildom and power, he did fo guide " and over-rule the motions of these parts, at the " beginning of things, as that (whether in a fhort-" er or a longer time, reafon cannot determine) • they were finally disposed into that beautiful " and orderly frame that we call the World; a-" mong whole parts fome were fo curioully con-" trived, as to be fit to become the feed, or femi-" nal principles, of plants and animals. And, I " further conceive, that he fettled fuch laws, or " rules, of local motion among the parts of the " univerfal matter, that by his ordinary and pre-" ferving concourse, the feveral parts of the uni-

30

Part I.

" verfe thus once compleated, should be able to maintain the great construction, or system, and oeconomy of the mundane bodies, and propagate the species of living creatures." The same hypothesis he repeats again, p. 124, 125. of the fame treatife.

This hypothefis, I fay, I cannot fully acquiefce in, because an intelligent being feems to me requifite to execute the laws of motion: for first, motion being a fluent thing, and one part of its duration being abfolutely independent upon another, it doth not follow, that becaufe any thing moves this moment, it must necessarily continue to do fo the next, unless it were actually posseffed of its future motion, which is a contradiction; but it stands in as much need of an efficient to preferve and continue its motion, as it did at first to produce it. Secondly, Let matter be divided into the fubtilest parts imaginable, and these be moved as fwiftly as you will, it is but a fenseles and stupid being still, and makes no nearer approach to fenfe. perception, or vital energy, than it had before; and do but only ftop the internal motion of its parts, and reduce them to reft, the finest and most fubtile body that is, may become as gross, and heavy, and ftiff, as steel, or stone. And, as for any external laws, or established rules of motion, the stupid matter is not capable of observing, or taking any notice of them, but would be as fullen as the mountain was that Mahomet commanded to come down to him; neither can those laws execute themfelves: therefore there must, besides matter and law be fome efficient, and that either a quality, or power, inherent in the matter itself, which is hard, to conceive, or fome external intelligent agent, either God himfelf immediately, or some plastick nature.

Happening lately to read the Christian Virtuof. written by the fame author of the Inquiry into the vulgar Notions of Nature, (the illustrious Mr Boyle) I find therein these words: " Nor will the force " of all that has been faid for God's fpecial provi-" dence be eluded, by faying, with fome deifts, " that after the first formation of the universe, all " things were brought to pafs by the fettled laws " of nature. For though this be confidently, and " not without colour, pretended, yet, I confess, it " doth not fatisfy me :---- For I look upon a " law, as a moral, not phyfical, caufe, as being in-" deed but a notional thing, according to which an " intelligent and free agent is bound to regulate " its actions. But inanimate bodies are utterly in-" capable of understanding what it is, or what it " enjoins, or when they act conformably, or un-" conformably to it: therefore the actions of ina-" nimate bodies, which cannot incite, or moderate " their own actions, are produced by real power. " not by laws."

All this being confonant to what I have here written, against what I took to be this honourable perfon's hypothefis, I must needs, to do him right, acknowledge myself mistaken; perceiving now, that his opinion was, that God almighty did not only eftablish laws and rules of local motion among the parts of the universal matter, but did, and does alfo himfelf, execute them, or move the parts of matter, according to them: So that we are in the main agreed, differing chiefly about the agent that executes those laws, which he holds to be God himfelf immediately, we a plastic nature: for the reafons alledged by Dr Cudworth, in his fystem, page. 149. which are, first. Becaufe the former, according to vulgar apprehension, would render the divine Providence operofe, follicitous, and distractious; and thereby make the belief of it en-

tertained with greater difficulty, and give advantage to Athiefts. Secondly, It is not fo decorous in respect of God, that he should autoupyer aravia, fet his own hand, as it were, to every work, and immediately do all the meanest and triflingest things himfelf drudgingly, without making use of any inferior or fubordinate minister. These two reasons are plausible, but not cogent; the two following are of greater force. Thirdly, The flow and gradual progrefs that is in the generation, of things which would feem to be a vain and idle pomp, or trifling formality, if the agent were omnipotent. Fourthly, Those amaptumala, as Aristotle calls them, whofe errors and bungles which are committed when the matter is inept, or contumacious, as in monsters, &c. which argue the agent not to be irrefiftible; and that nature is fuch a thing as is not altogether uncapable, as well as human art, of being fometimes frustrated and difappointed by the indifposition of the matter: whereas an omnipotent agent would always do its work infallibly and irrefiftibly, no ineptitude, or ftubbornness of the matter being ever able to hinder fuch an one, or make him bungle, or fumble in any thing. So far the doctor. For my part, I should make no fcruple to attribute the formation of plants, their growth and nutrition, to the vegetable foul in them; and likewife the formation of animals, to the vegitative power of their fouls; but that the fegments and cuttings of fome plants, nay, the very chips and smallest fragments of their body, branches, or roots, will grow and become perfect plants themfelves, and fo the vegetable foul, if that were the architect, would be divisible, and confequently no fpiritual, or intellegent, being; which the plattick principle must be, as we have shewn: for that must prefide over the whole oeconomy of the plant, and be one fingle agent, which

54

takes care of the bulk and figure of the whole, and the fituation, figure, texture of all the parts, root, ftalk, branches, leaves, flowers, fruit, and all their veffels and juices. I therefore incline to Dr. Cudworth's opinion, That God ufes for thefe effects the fubordinate ministry of some inferior plastic nature; as, in his works of providence, he doth of angels. For the description whereof I refer the reader to his fystem.

Secondly, In particular I am difficult to believe, that the bodies of animals can be formed by matter divided and moved by what laws you will, or can imagine, without the immediate prefidency, direction, and regulation of fome intelligent being. In the generation, or first formation of, fuppose the human body out of (though not an homogeneous liquor, yet) a fluid substance, the only material agent, or mover, is a moderate heat. Now how this, by producing an inteffine motion in the particles of the matter, which can be conceived to differ in nothing elfe but figure, magnitude, and gravity, should by virtue thereof, not only feparate the heterogeneous parts, but affemble the homogeneous into masses, or systems, and that not each kind into one mass, but into many and disjoined ones, as it were fo many troops; and that in each troop the particular particles should take their places, and call themselves into fuch a figure; as for example, the bones, being about 300, are formed of various fizes and shapes, so situate and connected, as to be subfervient to many hundred intentions and uses, and many of them confpire to one and the fame action, and all this contrarily to the laws of fpecific gravity, in whatever posture the body be formed; for the bones, whofe component parts are the heavier, will be above fome parts of the fleth which are the lighter; how much more then, fee-

ing it is formed with the head, (which, for its bignels is the heaviest of all the parts) uppermost. This, I fay, I cannot by any means conceive. I might instance in all the homogeneous parts of the body, either fites and figures, and afk by what imagi-nable laws of motion their bulk, figure, fituation, and connection can be made out? What account can be given of the valves, of the veins, and arteries, of the heart, and of the veins elfewhere, and of their fituation; of the figure and confiftency of all the humours and membranes of the eye, all confpiring and exactly fitted to the use of feeing? But I have touched upon that already, and shall discourse it largely afterward. You will afk me, Who, or what, is the operator in the formation of the bodies of man, and other animals? I anfwer, 'The fenfitive foul itfelf, if it be a fpiritual and immaterial fubstance, as I am inclinable to believe; but if it be material, and confequently, the whole animal but a mere machine, or automaton, as I can hardly admit; then must we have recourse to a plastic nature.

That the foul of brutes is material, and the whole animal, foul and body, but a mere machine, is the opinion, publickly owned and declared, of Des Cartes, Gaffendus, Dr Willis, and others. The fame is also neceffarily confequent upon the doctrine of the peripatetics, viz. That the fenfitive foul is educed out of the power of the matter; for nothing can be educed out of the matter but what was there before; which must be either matter, or some modification of it. And therefore they cannot grant it to be a fpiritual fubstance, unless they will affert it to be educed out of nothing. This opinion, I fay, I can hardly digeft : I should rather think animals to be endued with a lower degree of reafon, than that they are mere machines. I could instance in many actions of

50

brutes they are hardly to be accounted for, without reafon and argumentation; as that commonly noted of dogs, that running before their masters, they will ftop at a divarication of the way, till they fee which hand their mafters will take; and that when they have gotten a prey, which they fear their masters will take from them, they will run away and hide it, and afterwards return to it. What account can be given why a dog, being to leap upon a table which he fees to be too high for him to reach at once, if a ftool or chair happens to ftand near it, doth first mount up that, and from thence to the table? If he was a machine, or piece of clockwork, and his motion caufed by the ftriking of a fpring, there is no reafon imaginable why the fpring, being fet on work, fhould not carry the machine in a right line toward the object that put it in motion, as well when the table is high as when it is low; whereas I have often obferved the first leap the creature hath taken up the ftool, not to be directly toward the table, but in a line oblique, and much declining from the object that moved it, or that part of the table on which it ftood.

Many the like actions there are, which I fhall not fpend time to relate Should this be true, that beafts were automata, or machines, they could have no fenfe, or perception of pleafure, or pain; and, confequently, no cruelty could be exercifed towards them; which is contrary to the doleful fignifications they make when beaten; or tormented; and contrary to the common fenfe of mankind, all men naturally pitying them, as apprehending them to have fuch a fenfe and feeling of pain and mifery as themfelves have; whereas no man is troubled to fee a plant torn, or cut, or ftamped, or mangled how you pleafe; and at laft feemingly contrary to the fcripture too; for it is

faid, Prov. xii. 10. A righteous man regardeth the life of his beast, but the tender mercies of the wicked are cruel. The former clause is usually Englished, A good man is merciful to his beast; which is the true exposition of it, as appears by the opposite clause that the wicked are cruel. What lefs, then, can be inferred from this place, than that cruelty may be exercifed towards beafts, which, were they mere machines, it could not be? To which I do not fee what can be answered, but that the fcripture accommodates itself to the common, though false opinion of mankind, who take these animals to be endued with fense of pain, and think that cruelty may be exercifed towards them; though, in reality, there is no fuch thing; befides, having the fame members and organs of fense as we have, it is very probable they have the fame fenfations and perceptions with us. To this Des Cartes answers, or indeed faith, he hath nothing to answer; but that if they think as well as we, they have an immortal foul as well as we: which is not at all likely, because there is no reason to believe it of some animals, without believing it of all; whereas there are many too imperfect to believe it of them; fuch as are oysters, and sponges, and the like. To which I answer, that there is no necessity they should be immortal, because it is possible they may be destroyed, or annihilated. But I shall not wade further into this controversy, because it is beside my scope, and there hath been as much written of it already, as I have to fay, by Dr Moore, Dr Cudworth, Des Cartes, Dr Willis, and others, pro and con.

## Of the visible works of God, and their division.

I come now to take a view of the works of the creation, and to observe something of the wildom

57

58

of God, difcernable in the formation of them, in their order and harmony, and in their ends and uses. And, fr ft, I shall run them over flightly. remarking chiefly what is obvious and exposed to the eyes and notice of the more carelefs and incurious observer. Secondly, I shall felect one or two particular pieces, and take a more exact furvey of them; though, even in thefe, more will efcape our notice than can be difcovered by the most diligent ferutiny; for our eyes and fenfes, however armed or affifted, are too groß to difcern the curiofity of the workmanship of nature, or those minute parts 'by which it acts and of which bodies are composed; and our understanding too dark and infirm, to difcover and comprehend all the ends and uses to which the infinitely wife Creator did defign them.

But, before I proceed; being put in mind thereof by the mention of the affiftance of our eyes; I cannot omit one general observation concerning the curiofity of the works of nature in comparison of the works of art, which I shall propose in the late Bishop of Chester's words, (Treatife of natural religion, lib 1. chap 6.) " The observations " which have been made in thefe latter times by " the help of the microfcope; fince we had the ufe " and improvement of it; discover a vast differ-" ence between natural and artificial things. " Whatever is natural, beheld through that, ap-" pears exquifitely formed, and adorned with all " imaginable elegancy and beauty. There are fuch " inimitable glidings in the fmalleft feeds of " plants, but especially in the parts of animals, " in the head or eye of a fmall fly; fuch accu-" racy, order, and fymmetry in the frame of the " utmost minute creatures, a loufe, for example, " or a mite, as no man were able to conceive with-" out feeing of them. Whereas the most curious

works of art, the fharpeft and fineft needle, doth appear as a blunt rough bar of iron, coming from a furnace, or the forge: the moft accurate engravings, or embolsments, feem fuch rude, bungling, and deformed work, as if they had been done with a mattock or trowel; fo vaft a difference is there betwixt the fkill of nature, and the rudenefs and imperfection of art. I might and, that the works of nature, the better lights and glaffes you ufe, the more clear and exactly formed they appear; whereas the effects of human art, the more curioufly they are viewed and examined, the more of deformity they difcover."

This being premised; for our more clear and diftinct proceeding in our curfory view of the creation, I shall rank the parts of this material and visible world under feveral heads. Bodies are either inanimate or animate. Inanimate bodies are either celestial or terrestrial. Celestial, as the fun, moon, and itars; terreitrial, are either fimple, as the four elements, fire, water, earth, and air; or mixed, either imprfectly, as the meteors or more perfectly, as ftones, metals, minerals, and the like. Animate bodies are either fuch as are endued with a vegitative foul, as plants; or a fenfitive foul, as the bodies of animals, birds, beafts, fishes, and infects; or a rational foul, as the body of man, and the vehicles of angels; if any fuch there be.

I make use of this division to comply with the common and received opinion, and for easier comprehension and memory, though I do not think it agreeable to philosophic verity and accuracy, but do rather incline to the atomic hypothesis; for these bodies we call elements, are only the ingredients of mixed bodies; neither are they abso60

lutely fimple themfelves, as they do exift in the world, the fea water containing a copious falt manifest to fense; and both fea and fresh water fufficing to nourish many species of fish, and confequently containing the various parts of which their bodies are compounded. And I believe there are many species of bodies, which the Perepatetics call mixed, which are as fimple as the elements themfelves; as metals, falts. and fome forts of stones. I should therefore, with Dr Grew, and others, rather attribute the various fpecies of inanimate bodies to the divers figures of the minute particles of which they are made up: and the reafon why there is a fet, and conftant number, of them in the world, none deftroyed, nor any new ones produced, I take to be, becaufe the fum of the figures of those minute bodies into which matter was at first divided, is determinate and fixed. 2. Becaufe those minute parts are inndivisible, not abfolutely but by a natural force; fo that there neither is, nor can be, more or fewer of them: for, were they divifible into fmall and diverfely figured parts by fire, or any other natural agent, the species of nature must be confounded, fome might be loft and deftroyed, but new ones would certainly be produced; unlefs we could fuppofe thefe new diminutive particles should again affemble and marshall themselves into corpufcles of fuch figures as they compounded before; which I fee no poffibility for them to do, without fome Geos and Muxins to direct them: not that I think these inanimate bodies do confift wholly of one fort of atoms, but that their bulk canfifts mainly or chiefly of one fort. But whereas it may be objected, that metals (which of all others, feem to be most fimple) may be tranfmuted one into another, and fo the fpecies doth not depend upon the being compounded of atoms of one figure; I answer, I am not fully fatisfied of the matter of fact: but if any fuch tranfmutation be, poffibly all metals may be of one fpecies, and the diverfity may proceed from the admixture of different bodies with the principles of the metal. If it be afked, why may not atoms of different fpecies concur to the composition of bodies; and fo, though there be but a few forts of original principles, may there not be produced infinite fpecies of compound bodies, as by the various dispositions and combination of twenty-four letters, innumerable words may be made up? I answer, because the heterogeneous atoms or principles are not naturally apt to cohere and stick together when they are mingled in the fame liquor, as the homogeneous readily do.

I do not believe that the fpecies of principles, or indivisible particles, are exceeding numerous; but possibly the immediate component particles of the bodies of plants and animals, may be themselves compounded.

## Of the heavenly bodies.

Before I come to treat of the heavenly bodies in particular, I shall premise in general, that the whole universe is divided into two forts of bodies, the one very thin and fluid, the other more dense, folid, and confistent. The thin and fluid is the ether, comprehending the air or atmosphere encompaising the particular stars and planets. Now, for the stability and perpetuity of the whole universe, the divine wisdom and providence hath given to the folid and stable parts a two-fold power, one of gravity, and the other of circular motion. By the first, they are preserved from dissolution and dissipation, which the second would otherwise infer: for it being by the confent of philosophers, an innate property of every body moved circular-

Part I.

ly about any centre, to recede, or endeavour to recede, from that centre of its motion, and the more ftrongly the fwifter it is moved, the ftars and planets being whirl'd about with great velocity, would fuddenly, did nothing inhibit it, at leaft in a fhort time be fhattered in pieces, and fcattered every way thro' the ether. But now their gravity unites and binds them up faft, hindring the difperfion of their parts, I will not difpute what gravity is; only I will add, that for ought I have heard, or read, the mechanical philofophers have not as yet given a clear and fatisfactory account of it.

The fecond thing is a circular motion upon their own axis, and in fome of them also it is probably, about other points, if we admit the hypothesis of every fixed ftar's being a fun, or fun-like body, and having a choir of planets in like manner moving about him. These revolutions, we have reason to believe, are as exactly equal and uniform as the earth's are; which could not be, were there any place for chance, and did not a providence continually over-fee and fecure them from all alteration and imminution, which either internal changes in their own part, or external accidents and occurrences, would at one time or other neceffarily induce. Without this circular motion of the earth, here could be no living: one hemisphere could be condemned to perpetual cold and darknefs, the other continually roafted and parched by the funbeams. And it is reafonable to think, that this circular motion is as neceffary to most other planetary bodies, as it is to the earth. As for the fixed stars, if they be fun like bodies, it is probable alfo each of them moves circularly upon its own axis, as the fun doth : but what neceffity there is of fuch a motion, for want of understanding the nature of those bodies, I must confess myself not yet to comprehend; though that it is very great,

63

I doubt not, both for themfelves, and for the bodies about them

First, For the celestial, or heavenly bodies, the equability and conftancy of their motions, the certainty of their periods and revolutions, the conveniency of their order and fituation, argue them to be ordained and governed by wildom and understanding; yea, 10 much wifdom as man cannot eafily fathom or comprehend : for we fee, by how much the hypothefes of aftronomers are more fimple and conformable to reafon, by fo much do they give a better account of the heavenly motions. It is reported of Alphonfus king of Arragon, (I know not whether truly) that when he faw and confidered the many eccentricks, epicycles, epicycles upon epicycles, librations, and contrariety of motions, which were requifite in the old hypothesis to give an account of the celeftial phaenomena, he fhould prefume blafphemoufly to fay, that the univerfe was a bungling piece; and that if he had been of God's counfel, he could have directed him to have made it better. A fpeech as rafh and ignorant, as daring and prophane.

For it was nothing but ignorance of the true process of nature, that induced the contrivers of that hypothesis to invent fuch abfurd suppositions, and him to accept them for true, and attribute them to the great Author of the heavenly motions: for in the new hypothesis of the modern astronomers, we see most of those absurdities and irregularities rectified and removed; and I doubt not but they would all vanish, could we certainly discover the true method and process of nature in those revolutions: for feeing in those works of nature, which we converse with, we constantly find those axioms true, *Natura not facit circuitus*, Nature doth not fetch a compass when it may proceed in a straight line; and, Natura nec abandat in superstais nec deficit in

## Part I.

64

neceffariis, Nature abounds not in what is fuperfluous, neither is deficient in what is neceffary: we may alfo rationally conclude concerning the heavenly bodies, feeing there is fo much exactnefs obferved in the time of their motions, that they punctually come about in the fame periods to the hundredth part of a minute, as may, beyond exception, be demonstrated by comparing their revolutions; furely there is alfo ufed the most fimple, facile, and convenient way for the performance of them. Among thefe heavenly bodies,

First, The fun, a vast globe of fire esteemed by the antienter and most modest computation above 160 times bigger than the earth; the very life of this inferior world, without whofe falutary and vivific beans, all motion, both animal, vital, and natural, would speedily cease, and nothing be left here below, but darknefs and death. All plants and animals must needs in a very short time be not only mortified, but, together with the furface of land and water, frozen as hard as a flint of adamant: fo that of all the creatures of the world, the ancient heathens had most reason to worship him as a God, though no true reafon; becaufe he was but a creature, and not God : and we Chriftians do think, that the fervice of the animals that live upon the earth, and principally man, was one end of his creation; feeing without him there could no fuch things have been. This fun, I fay, according to the old hypothesis, whirled round about the earth daily with incredible celerity, making night and day by his rifing and fetting; winter and fummer, by his access to the feveral tropics, creating fuch a grateful variety of feafons, enlightening all parts of the earth by his beams, and cherishing them by his heat, fituate and moved fo in respect of this fublunary world, (and it is likely alfo in refpect of all the planets about him) that art and counfel could not have defigned either to have placed him better, or moved him more conveniently for the fervice thereof, as I could eafily make appear by the inconveniencies that would follow upon the fuppofition of any other fituation and motion, fhew forth the great wifdom of him who fo difpofed and moved him.

Secondly, The moon, a body, in all probability fomewhat like the earth we live upon, by its conftant and regular motion, helps us to divide our time, reflects the fun-beams to us, and fo by illuminating the air, takes away in fome meafure the disconsolate darkness of our winter-nights; procures, or at least regulates, the fluxes and refluxes of the fea, whereby the water is kept in constant motion, and preserved from putrefaction, and fo rendered more falutary for the maintenance of its breed, and uleful and ferviceable for man's convenience of fishing and navigation; not to mention the great influence it is fuppofed to have upon all moift bodies, and the growth and increafe of vegetables and animals; men generally observing the age of the moon in the planting of all kinds of trees, fowing of grain, grafting and inoculating, and pruning of fruit-trees, gathering of fruit, cutting of corn and grafs; and thence alfo making prognofficks of weather, becaufe fuch obfervations feem to me uncertain. Did this luminary ferve to no other ends and ufes, as 1 am perfuaded it doth many, especially to maintain the creatures which in all likelihood breed and inhabit there, for which I refer you to the ingenious treatifes written by Bilhop Wilkins, and Monfieur Fontenelle, on that fubject; yet thefe were enough to evince it to be the effect and product of divine wildom and power.

Thirdly, As for the rest of the planets, besides their particular uses, which are to us unknown,

Part I.

or merely conjectural, their courfes and revolutions, their flations and retrogradations, observed constantly fo many ages together in most certain and determinate periods of time, do fufficiently demonstrate, that their motions are instituted and governed by counsel, wildom, and understanding.

Fourthly, the like may be faid of the fixed ftars, whofe motions are regular, equal and conftant: fo that we fee nothing in the heavens which argnes chance, vanity, or error; but, on the contrary, rule, order, and conftancy; the effects and arguments of wifdom: wherefore as Cicero excellently concludes, Celestem ergo admirabilem ordinem, incredibilemque constantiam, ex qua conservatio et salus omnium omnis oritur, qui vacare mente putat, nae ipse mentis expers habendus est : " Where-" fore, whofoever thinketh that the admirable or-" der, and incredible conftancy, of the heavenly " bodies and their motions, whereupon the pre-" fervation and welfare of all things doth depend. " is not governed by mind and underftanding, " he himself is to be accounted void thereof." And again, "Shall we (faith he) when we fee an " artificial engine, as a fphere or dial or the like, " at first fight, acknowledge, that it is a work of reason and art ) Cum autem impetum coeli, admirabili cum celeritate moveri vertique videamus, constantissime conficientem vicissitudines anniversarias, cum summa salute et conservatione rerum omnium, du!isare pofumus quin ea non solum ratione fiant, sed excellenti guadam divinague ratione ? " And can we, " when we fee the force of the heavens moved and " whirled about with admirable celerity, most con-" ftantly finishing its anniversary vicifitudes, to " the eminent welfare and prefervation of all things, " doubt at all that thefe things are performed not " only by reafon, but by a certain excellent and di-. vine reafon ?"

To these things I shall add an observation, which I must confess myself to have borrowed of the honourable perfon more than once mentioned already; that even the eclipfes of the fun and moon, though they be frightful things to the fuperstitous, vulgar, and of ill influence on mankind, if we may believe the no lefs fuperstitious astrologers, yet to knowing men, that can skilfully apply them, are of great use, and fuch as common heads could never have imagined: fince not only they may on divers occasions, help to fettle chronology, and rectify the mistakes of historians that wrote many ages ago; but which is, though a lefs wonder, yet of greater utility, they are (as things yet fland) neceffary to define, with competent certainty, the longitude of places or points on the tarraqueous globe, which is a thing of very great moment not only to geography, but to the most useful and important art of navigaton. To which may be added, which I shall hereafter mention, that they ferve to demonftrate the fpherical roundness of the earth; so that I may well conclude with the pfalmift, Pfal. xix. 1. The heavens declare the glory of God, and the firmament Sbeweth his handy-work.

# Of terrestrial and inanimate simple bodies.

I come now to confider the terreftrial bodies. I fhall fay nothing of the whole body of the earth in general, becaufe I referve that as one of the particulars I fhall more carefully and curioufly examine.

Terrestrial bodies, according to our method before propounded, are either animate, or inanimate. And the inanimate either fimple or mixed; fimple as the four elements, fire, water, earth, and air: I call these elements, in compliance, (as I faid before) with the vulgarly received opinion; not that I think them to be the principles or component ingredients of all other fublunary bodies: I might call them the four great aggregates of bodies of the fame species, or four forts of bodies, of which there are aggregates. Thefe, notwithstanding they are endued with contrary qualities, and are continually encroaching one upon another, yet they are fo balanced, and kept in fuch an equilibrium, that neither prevaileth over other, but what one gets in one place, it lofeth in another.

First, Fire cherisheth and reviveth by its heat, without which all things would be torpid, and without motion; nay, without fire, no life, it being the vital flame refiding in the blood, that keeps the bodily machine in motion, and renders it a fit organ for the foul to work by. The ules of fire (I do not here speak of the Peripatetics elementary fire in the concave of the moon; which is but a mere figment; but our ordinary culinary) are in a manner infinite for dreffing and preparing of victuals, baked, boiled and roafted; for melting and refining of metals and minerals; for the fufion of glass, [a material whose uses are fo many. that it is not eafy to enumerate them ) it ferving us to make windows for our houses, drinking veffels, to diftil and preferve all forts of fermented liquors, distilled waters, spirits, oils, extracts, and other chymical preparations, as alfo veffels to diffil and prepare them in ;, for looking glaffes, fpectacles, microscopes and telescopes, whereby our fight is not only relieved, but wonderfully affitted to make rare discoveries] for making all forts. of instruments for husbandry, mechanical arts and trades, all forts of arms or weapons of war, defensive or offensive; for fulminating engines; for burning of lime, baking of bricks, tiles, and all forts of poters veffels, or earthen ware; for cafting and forming metalline veffels and utenfils; for distillations, and all chymical operations hinted before in the ufe of glass; for affording us lights for any work or exercise in winter-nights; for digging in mines and dark caverns; and, finally, by its comfortable warmth, fecuring us from the injuries of cold, or relieving us when we have been bitten and benummed with it. A subject or utensil of so various and inexplicable use, who could have invented and formed, but an infinitely wife and powerful efficient?

Secondly, The air ferves us, and all animals, to breathe in; containing the fewel of that vital flame we fpeak of, without which it would fpeedily languish and go out; fo neceffary it is for us, and other land-animals, that, without the use of it, we could live but very few minutes. Nay, fishes and other water-animals cannot abide without the use of it; for if you put fish into a veffel of a narrow mouth, full of water, they will live and fwim there, not only days and months, but even years; but if, with your hand, or any other cover, you ftop the veffel, fo as wholly to exclude the air, or interrupt its communication with the water, they will fuddenly be fuffocated; as Rondeletius affirms he often experimented. If you fill not the veffel up to the top, but leave fome space empty for the air to take up, and then clap your hand upon the mouth of the veffel, the fifhes will prefently contend which shall get uppermost in the water, that fo they may enjoy the open air; which I have also observed them to do in a pool of water that hath been almost dry in the fummer-time, becaufe the air that infinuated itfelf into the water did not suffice them for respiration. Neither is it lefs neceffary for infects than it is for other animals, but rather more, thefe having more airveffels for their bulk by far than they, there being many orifices on each fide their bodies for the admiffion of air, which, if you ftop with oil or ho-

Part I

ney, the infect prefently dies, and revives no more. This was an observation of the ancients, though the reason of it they did not understand, (Oleo ulito insecta omnia exanimantur Plin.) which was nothing but the intercluding of the air; for though you put oil upon them, if you put it not upon, or obstruct those orifices therewith, whereby they draw the air, they fuffer nothing: if you obftruct only fome, and not others, the parts which are near and supplied with air from thence, are by and by convulfed, and fhortly relaxed and deprived of motion, the reft that were untouched ftill retaining it. Nay, more than all this; plants themfelves have a kind of respiration, being furnished with plenty of veffels for the derivation of air to all their parts, as hath been observed, nay, first discovered, by that great and curious naturalist, Ma'pighius. Another use of the air, is, to fustain the flight of birds and infects. Moreover, by its gravity it raifes the water in pumps, fiphons, and other engines, and performs all those feats which former philosophers, through ignorance of the efficient caufe, attributed to a final, namely, nature's abhorrence of a vacuity or empty space. The elaflic or expansive faculty of the air, whereby it dilates itfelf, when compressed, (indeed this lower region of it, by reafon of the weight of the fuperincumbent, is always in a comprefied ftate) hath been made use of in the common weatherglaffes, in wind-guns, and in feveral ingenious water-works, and doubtlefs hath a great intereft in many natural effects and operations.

Against what we have faid of the neceffity of the air for the maintenance of the vital flame, it may be objected, that the foctus in the womb lives, its heart pulses, and its blood circulates; and yet it draws in no air, neither hath the air any accels to it. To which I answer, that it Part I.

doth receive air, fo much as is fufficient for it in its prefent eftate, from the maternal blood by the placenta uterina, or the cotyledons. This opinion generally propounded, viz. that the refpiration of the dam did ferve the foetus alfo, or fupply fufficient air to it, I have met with in books; but the explicit notion of it I owe to my learned and worthy friend Dr Edward Hulfe, which, comparing with mine own anatomical observations, I found fo confonant to reason, and highly probable, that I could not but yield a firm affent to it. I fay then, that the chief use of the circulation of the blood through the cotyledons of a calf in the womb, (which I have often diffected) and by analogy through the placenta uterina in an human foetus, feems to be the impregnation of the blood with air, for the feeding of the vital flame : for if it were only for nutrition, what need of two fuch great arteries to convey the blood thither? It would (one might rationally think) be more likely, that as in the abdomen of every animal, fo here, there should have been some lacteal veins formed, beginning from the placenta, or cotyledons, which concurring in one common ductus, fhould at laft empty themfelves into the vena cava. Secondly, I have observed in a calf, the umbilical veffels to terminate in certain bodies divided into a multitude of carneous papillae, (as I may fo call them) which are received into fo many fockets of the cotyledons. growing in the womb; which carneous papillae may, without force or laceration, be drawn out of those fockets. Now these papillae do well refemble the aristae, or radii, of a fish's gills, and very probably have the fame use to take in the air; fo that the maternal blood, which flows to the cotyledons, and encircles these papillae, communicates by them to the blood of the foetus, the air wherewith itself is impregnate, as the water flow-

ing about the carneous radii of the fifh's gills doth the air that is lodged therein to them. Thirdly, That the maternal blood flows most copiously to the placenta uterina in women, is manifest from the great hemorrhagy that fucceeds the feparation thereof at the birth. Fourthly, After the stomach and inteffines are formed, the foetus feems to take in its whole nourifhment by the mouth, there being always found in the ftomach of a calf, plenty of the liquor contained in the amnios wherein he fwims, and facces in his inteffines, and abundance of urine in the allantoides; fo that the foetus in the womb doth live, as it were, the life of a fifh. Laftly, Why elfe should there be such an instant neceffity of respiration to foon as ever the foetus is fallen off from the womb?

I know that if the foetus be taken but of the womb inclosed in the fecundines, it will continue to live, and the blood to circulate for a confiderable time, as Dr Harvey obferves. The reafon whereof I conceive to be, becaufe the blood ftill circulates through the cotyledons, or placenta, which are now exposed to the open air, and fo from thence receives fufficient supplies thereof, to continue its gentle motion, and feed the vital flame. But when, upon exclusion of the young, the umbilical veffels are broken, and no more air is received that way, the plastic nature, to preferve the life of the animal, fpeedily raifes the lungs, and draws into them air in great abundance, which caufes a fudden and mighty accention in the blood, to the maintenance whereof a far greater quantity of air is requifite, than would ferve to feed the mild and languid flame before.

This way we may give a facile and very probable account of it, to wit, becaufe receiving no more communications of air from its dam, or mother, it must needs have a speedy supply from without,

ション

or elfe extinguish and die for want of it, being not able to live longer without air at its first birth, than it can do afterward.

Upon this occasion, give me leave to discourse a little concerning the air's infinuating itfelf into the water. I fay therefore, that the air, at least that part of it which is the aliment of fire and fewel of the vital flame in animals, eafily penetrates the body of water exposed to it, and diffuseth itself through every part of it. Hence it is, that we find fifh in fubterraneous rivers, and foffil fifh in the earth itfelf; which can no more live without air there than in the open waters : hence the miners, when they come once at water, are out of all danger of damps. You'll fay, how gets the air into the water in fubterraneous rivers, and into the earth to the foffil fifhes? I anfwer, the fame way that the water doth : which I fuppofe to be by its upper fuperficies; the water de-Icending by pores and paffages that there it finds into chinks and veins, and by confluence of many of them by degrees fwelling into a ftream, the air accompanies and follows it by a conftant fucceffion. As for foffil fifhes, fome make their way into the earth up the veins of water, opening into the banks of rivers, where they lie till they grow fo great that they cannot return : in which veins they find air enough to ferve their turn, needing not much by reafon that they lie ftill, and move but little. Others. in times of floods, are left in the meadows, and with the water fink into the earth at fome holes and pores that the water finds or makes, by which alfo they are supplied with air. The reason why the miners are out of danger of damps when they come to water, I conceive, is, because then prefently the air that ftagnated in the fhafts finks into the water, and fresh air defcends and fucceeds, and fo K

74

there is a circulation; in the fame manner as by the finking of an air-fhaft, the air hath liberty to circulate, and carry out the fteams both of the miners breath and the damps, which would otherwife ftagnate there. Indeed, though there were no damps, yet the nitrous part of the air being fpent and confumed by the breathing of the miners, the remaining part fhould be rendered altogether unfit for refpiration, unlefs new and fresh air could fucceed.

And here, methinks, appears a neceffity of bringing in the agency of fome superintendent intelligent being, be it a plastic nature, or what you will: for what elfe fhould put the diaphragm, and all the muscles ferving to refriration, in motion all of a fudden fo foon as ever the foetus is brought forth? Why could they not have refted as well as they did in the womb? What aileth them that they must needs bestir themselves to get in air to maintain the creature's life? why could they not patiently fuffer it to die? That the air of itfelf could not rush in, is clear; for that, on the contrary, there is required fome force to remove the incumbent air, and make room for the external to enter. You will fay, the fpirits do at this time flow to the organs of refpiration, the diaphragm, and other muscles which concur to that action, and move them. But what roufes the fpirits which were quiefcent during the continuance of the foetus in the womb? Here is no appearing impellent, but the external air, the body fuffering no change but of place, out of its clofe and warm prifon in the open and cool air : but how, or why, that should have fuch an influence upon the fpirits, as to drive them into those muscles electively. I am not fubtile enough to difcern. As for the respiration of the chick in the egg, I suppose the air not only to be included in the white, but alfo to be fupplied through the shell and membranes.

Thirdly, Water is one part, and that not the least of our fustenance, and that affords the greatest share of matter in all productions; being not (as it exifts in the world) a fimple and unmixed body, but containing in it the principles, or minute component particles, of all bodies. To speak nothing of those inferior uses of walhing and bathing, dreffing and preparing victuals. But if, we shall confider the great concepticula and congregations of water; and the diffribution of it, all over the dry land in the fprings and rivers: there will occur abundant arguments, of wifdom and understanding The fea what infinite varity of fishes doth it nourish! Psalm civ 26. In the verse next to my text, The earth s full of thy riches: so is that great and wide sea, wherein are things creeping innumerable, both fmall and great heafts, &c. How doth it exactly compose itself to a level or equal superficies, and in the earth make up one fpherical roundness! How doth it constantly obferve its ebbs and flows, its fpring and nepetides; and still retains its faltness, fo convenient for the maintainance of its inhabitants, ferving alfo the uses of man for navigation, and the convenience of carriage! That it thould be confined by shores, and strands, and limits, I mean at first, when it was natural to it to overflow and ftand above the earth ! All these particulars declare abundance of wildom in their primitive constitution. This last the Pfalmist takes notice of in the 6th, 7th, 8th, and 9th verfes of this pfalm: speaking of the earth at the first creation, he faith, Thou covereds it with the deep as with a garment; the waters flood above the mountains; at thy rebuke they fled, at the voice of thy thunder they hasted away (the mountains afcend, the valleys defcend \$ unto the place thou hast prepared for them. Those hast fet a bound that they may not pass over; that 76

they turn not again to cover the earth. But what need was there (may fome fay) that the fea fhould be made fo large, that its fuperfiecies fhould equal, if not exceed, that of the dry land? Where is the wifdom of the Creator in making fo much ufelefs fea, and fo little dry land, which would have been far more beneficial and ferviceable to mankind? Might not at leaft half the fea have been fpared, and added to the land, for the entertainment and maintenance of men, who, by the continual firiving and fighting to enlarge their bounds, and encroaching upon one another, feem to be ftraitened for want of room?

To this objection against the wifdom of God, in thus dividing fea and land, Mr Keill, in his Examination of Dr Burnet's theory of the earth, p. 92, 93. thus answers: " This, as most other of " the athiefts arguments, proceeds from a deep " ignorance of natural philosophy: for if there " were but half the fea that now is, there would " be also but half the quantity of vapours; and " confequently, we could have but half fo many " rivers as now there are, to fupply all the dry " land we have at prefent, and half as much more; " for the quantity of vapours which are raifed, " bears a proportion to the furface whence they are " raifed, as well as to the heat which raifed them. " The wife Creator, therefore, did fo prudently " order it, that the fea fhould be large enough to " fupply vapours fufficient for all the land, which " it would not do if it were lefs than now it is."

But, against this it may be objected : why should not all the vapours which are raised out of the fea, fall down again into it by rain? Is there not as much reason that the vapours which are exhaled out of the earth, should be carried down to the fea, as that those raised up out of the fea be brought up upon the dry land? If some, by winds, be driven

from the fea up land; others, by the fame caufe, will be blown down from land to fea, and fo ballancing one another, they will in fum fall equally upon fea and land; and, confequently, the fea contribute nothing to the watering of the earth, or the maintenance of rivers.

To which I anfwer: that as to the watering of the earth, there needs no fupply from the fea, there being fufficient water exhaled out of itfelf to do that: there is no more returned upon it by rain; fo as to reft upon it; than an equivalent quantity to what was raifed out of it.

But the rivers must be fupplied other ways. Our opinion is, that they have their fupply from rain and vapours. The question is; whence these vapours are brought? We answer, from the fea. But what brings them up from the fea? I answer, the winds : and fo I am arrived at the main difficulty why fhould not the winds carry them that are exhal'd out of the earth down to the fea, as well as bring them up upon the earth, which are raifed from the fea? or, which is all one, why fhould not the wind blow indifferently from fea and land! To which I answer; that I must needs acknowledge myfelf not to comprehend the reason hereof. God is truly faid. Pfal. cxxxv. 7. To bring the wind out of his treasuries: but the matter of fact is -most certain, viz. That the winds do bring abundantly more vapours up from the fea than they carry down thither.

First, Because otherwise there can no account be given of floods. It is clear that floods with us proceed from rain; and it is often a vast quantity of water, they carry down to the sea. Whence come those vapours, which supply all this water? I hope those who bring up springs and rivers from the great abys, will not bring those vapours, which sunite into drops; and descend in rain from thence too. Should they rife from the dry land only, they would foon render it dry indeed; more parched than the defarts of Lybia. We fhould quickly come to an end of floods, and of rain too, if nothing were returned from the fea again; not to mention, that the fea must needs, in fuch a case, overflow its shores, and enlarge its bounds.

But this way there is an eafy account to be given. It is clear, that the fun doth exhale vapours both from fea and land; and, that the fuperficies of fea and land is fufficient to yield vapours for rain, rivers, and floods; when heated to fuch a degree as the fun heats it: fo that there wants only wind to bring up fo great a proportion of vapours from the fea as may afford water for the floods; that is, fo much as is returned back again to the fea.

Some may perchance demand, To what purpofe ferve the floods? What use is there of them? I anfwer, to return back to the fea the furplufage of water, after the earth is fated with rain It may be further asked, What need more rain be poured upon the earth than is fufficient to water it? I reply, That the rain brings down from the mountains and higher grounds, a great quantity of earth; and in times of floods, fpreads it upon the meadows, and levels, rendering them thereby fo fruitful, as to ftand in need of no culture, or mannuring. So we fee the land of Egypt owes its great fertility to the annual overflowing of the river Nilus: and it is likely the countries bordering upon the river Ganges may receive the like benefite by the overflowing thereof. Moreover, all rain water contains in it a copious fediment of terrestrial matter, which, by ftanding, it precipitates, and is not a fimple elementary water. This terreftrial- matter ferves for the nourifhment of plants, and not the water itself, which is but a vehicle to derive this nutriment to all the parts of the plants: and

therefore the more rain, the more of this nutritious matter may be precipitated upon the earth, and fo the earth rendered more fruitful. Befides all this, it is not unlikely, that the rain-water may be endued with fome vegetating or prolific virtue, derived from fome faline or oleofe particles it contains : for we fee, that aquatic plants, which grow in the very water, do not thrive and flourish in dry fummers, when they are not also watered with the dew of heaven

Secondly, Another argument to prove that the winds bring up more vapours from the fea than they carry down thither, is; becaufe the winds do more frequently blow from the fea than to the fea. This appears from the trees which grow on, and near, the fea-fhores all along the weftern coaft of England, whofe heads and boughs I have obferved to run out far to land-ward; but toward the fea to be fo fnubbed by the winds, as if their boughs and leaves had been pared or fhaven off on that fide.

It is also observed, that the western wind; which is the most violent and boisterous of all with us in England, which comes from off the great Atlantic ocean, is of longest continuance. Julius Caefar, in his 5th book of *Commentaries de bello Gallico*, faith of it, *Magnam partem omnis temporis in bis locis fluere conjuevit*; it is wont to blow in these quarters a great part of the whole year: which obfervation holds true at this day, the wind lying in that corner at least three quarters of the year.

Since this motion of the winds is conftant; there is, doubtlefs, a conftant and fettled caufe of it, which deferves to be enquired into, and fearched out, by the ftudy and endeavours of the most fagacious naturalist. But however the wind be raifed, it may more easily blow from fea to land, than from land to fea; becaufe, the fuperficies of the fea being even, or level, there is nothing to ftop its courfe; but on the land there are not only woods, but mountains, to hinder and divert it.

Having myself feen fo much of the bottom of the fea round about the coafts of England, and a great part of the low countries, of Italy and Sicily. I must needs adhere to what I delivered; that where the bottom of the fea is not rocky, but earth, owze, or fand, (and, that is incomparably the greatest part of it,) it is by the motion of the waters, fo far as the reciprocation of the fea extends to the bottom, brought to a level; and if it fhould be now unequal, would in time be levelled. again. By level, I do not mean fo as to have no declivity; (for the reciprocation preferves that, the flood hindering the conftant carrying down of the bottom) but only to have an equal and uniform defcent from the fhores to the deeps Now, all those relations of urinators belong only to those places where they have dived, which are always rocky; for there is no reafon why they fhould dive where the bottom is level and fandy. That the motion of the water defcends to a good depth, I prove from those plants that grow deepest in the fea, becaufe they generally grow flat, in manner of a fan, and not with branches on all fides like trees, which is fo contrived by the providence of nature; for that the edges of them do in that pofture with most ease cut the water flowing to and fro; and should the flat fide be objected to the stream it would foon be turned edge-ways by the force of it, because in that fite it doth least refist the motion of the water : whereas, did the branches of these plants grow round, they would be thrown backward and forward every tide. Nay, not only the herbaceous and woody fubmarine plants, but alfo the Lithophyta \* themfelves, affect \* Stone-plants.

this manner of growing, as I have observed in various kinds of corals and pori. Hence I fuspect all those relations concerning trees growing at the bottom of the fea, and bringing forth fruit there : and as for the Maldiva nut, till better information, I adhere to Garcias' opinion, which may be seen in Blusius. Farther, I do believe, that in the great depths of the fea, there grow no plants at all, the bottom being too remote from the external air, which though it may pierce the water fo low, yet I doubt whether in quantity fufficient for the vegetation of plants, nay, we are told, that in those deep and bottomless feas, there are no fish at all; yet, not because there are no plants, or infects to feed them, (for, that they can live upon alone, Rondeletius' experiment about water keeping them in a glass doth undeniably prove) but, because their spawn would be lost in those feas; the bottom being too cold for it to quicken there; or rather, because, being lighter than the water there, it would not fink to the bottom, but be buoyed up by it, and carried away to the shallows.

Again, The great use and convenience, the beauty and variety of fo many fprings and fountains, fo many brooks and rivers, fo many lakes and standing pools of water, and these fo feattered and dispersed all the earth over, that no great part of it is defitute of them, without which it must without a supply otherwise, be defolate and void of inhabitants, afford abundant arguments of wisdom and counsel: that springs should break forth on the fides of mountains most remote from the feat that there should way be made for rivers through straits and rocks, and subterraneous vaults, so that one would think that nature had cut a way on purpose to derive the water which elfe would overflow and drown whole countries : that the water

L

paffing through the veins of the earth, should be rendered fresh and potable, which it cannot be by any percolations we can make, but the faline particles will pafs through a tenfold filtre: that in fome places there should fpring forth metallick and mineral waters, and hot baths, and these fo constant and permanent for many ages; to convenient for divers medicinal intentions and uses, the causes of which things, or the means and methods by which they are performed, have not been as yet certainly difcovered; only, in general, Pliny's remark may be true, Tales funt aquae, qualis terra per quam fluunt. Hence they are cold, hot, fweet, ftinking, purgative, diarctick, or ferrugineous, faline, petrefying, bituminofe venenofe, and of other qualities.

Laftly, The earth, which is the bafis and fupport of all animals and plants, and affords them the hard and folid part of their bodies, yielding us food and fuftenance, and partly alfo cloathing; for I do not think that water supplies man, and other animals, or even plants themfelves, with sheir nourishment, but serves chiefly for a vehicle to the alimentary particles, to convey and diffribute them to the feveral parts of the body. Water, as it exifts in the world, is not a fimple unmixed body, but contains the terrestrial compoponent parts of the bodies of animals and plants; Simple elementary water nourifhes not at all. How variously is the furface of this earth diffinguished into hills and valleys, and plains, and high mountains, affording pleafant profpects ? How curioufly clothed and adorned with the grateful verdure of herbs and stately trees, either difperfed and fcattered fingly, or as it were affembled in woods and groves, and all these beautified and illustrated with elegant flowers and fruits, quorum omnium incredibilis multitudo, insatiabili varietats

distinguitur, as Tully faith. This also shews forth to them that confider it, both the power and wifdom of God: fo that we may conclude with Solomon, Prov. iii. 19 The Lord, by wisdom, hath founded the earth, by understanding, hath he established the heavens.

But now, if we pass from fimple to mixed bodies, we shall still find more matter of admiration, and argument of wisdom. Of these we shall first confider those they call imperfectly mixed, or meteors.,

## Of METEORS.

As first of all, Rain, which is nothing else but water by the heat of the fun divided into very small invisible parts, ascending into the air, till encountering the cold, it be by degrees condenfed into clouds, and descends in drops: this though it be exhaled from the falt fea, yet, by this natural diftillation, is rendered fresh and potable, which our artificial distillations have hitherto been hardly able, to effect, notwithstanding the eminent use it would be of to navigators, and the rewards promifed to them that should refolve that problem, of diffilling fresh water out of falt. That the clouds should be fo caried about by the winds, as to be almost equally dispersed and distributed, no part of the earth wanting convenient showers, unless when it pleaseth God, for the punishment of a nation, to with-hold rain by a fpecial interpofition of his providence; or, if any land wants rain, they have a fupply fome other way; as the land of Egypt, though there feldom falls any rain there, yet hath abundant recompence made it by the annual overflowing of the river. This distribution of the clouds and rain is to me (I fay) a great argument of providence and divine disposition: for elfe I do not fee but why there might be in fome lands continual fucceffive droughts for many years, till they were quite depopulated; in others, as lafting rains, till they were overflown and drowned; and thefe, if the clouds moved cafually, often happening; whereas, fince the antienteft records of hiftory, we do not read or hear of any fuch droughts or innundations, unlefs perhaps that of Cyprus, wherein there fell no rain for thirty-fix years, till the ifland was almost quite diferted, in the reign of Constantine: which, doubtlefs, fell not out without the wife dispofition of providence, for great and weighty reasons.

Again if we confider the manner of the rain's defcent, diffilling down gradually, and by drops, which is most convenient for the watering of the earth; whereas, if it should fall down in a continual ftream like a river, it would gall the ground wash away plants by the roots, overthrow houses, and greatly incommode, if not suffocate, annimals: if, I fay, we confider these things; and many more that might be added: we might in this respect alfo cry out with the apostle, O the depth of the riches both of the wisdom and knowledge of God!

Secondly, Another meteor is the wind; which, how many ufes it doth ferve to, is not eafy to enumerate; but many it doth, viz. to ventilate and break the air, and diffipate noifome and contagious vapours, which otherwife ftagnating might occafion many difeafes in animals; and therefore it is an obfervation concerning our native country, Anglia ventofa, fi non ventofa, veneno/a: to transfer the clouds from place to place, for the more commodious watering of the earth: to temper the exceffes of the heat, as they find who in Brafil, New Spain, the neighbouring iflands, and other the like countries near the equator, reap the benefit of the breezes; to fill the fails of fhips, and carry them on their voyages to remote

Part I.

#### in the CREATION.

countries; which of what eminent advantage it is to mankind, for the procuring and continuing of trade and mutual commerce between the most distant nations, the illustrating every corner of the earth, and the perfecting geography and na-tural history, is apparent to every man. That the monfoons and trade-winds should be fo constant and periodical, even to the 30th degree of latitude all round the globe, and that they should fo feldom transgress or fall short of those bounds, is a fubject worthy of the thoughts of the greatest philofophers. To this may be added the driving about of windmills for grinding of corn, making of oil, draining of pools, raifing of water, fawing of wood, fulling of cloth, &c. That it should feldom or never be fo violent and boifterous as to overturn houses, yea, whole cities; to tear up trees by the roots, and proftrate woods; to drive the fea over the lower countries; as, were it the effect of chance, or mere natural causes, not moderated by a fuperior power, it would in all likelihood often do. Hurricanes, spouts, and inundations, would be more frequent than they are. All thefe things declare the wifdom and goodnefs of him, who bringeth the winds out of his treasures,

# Of inanimate mixed bodies.

I proceed now to fuch inanimate bodies as are called *perfecte mixta*, perfectly mixed, improperly enough, there being many of them (for ought I know) as fimple as those they call elements. These are stores, metals, minerals, and falts.

In ftones, which one would think were a neglected genus, what variety? what beauty and elegancy? what conftancy in their temper, and confiftency in their figures and colours? I fhall first speak of some notable qualities wherewith some

## Part I.

of them are endued. Secondly, The remarkable uses they are of to us. The qualities I shall instance in, are, First, Colour; which in some of them is most lively, sparkling, and beautiful; the carbuncle, or rubine, thining with red, the fapphire with blue, the emerald with green, the topaz, or chryfolite of the ancients, with a yellow, or gold colour, the amethift, as it were, tinctured with wine, the opal varying its colours like changeable taffata. as it is diverfly exposed to the light. Secondly, Hardnefs; wherein fome ftones exceed all other bodies, and, among them, the adamant, all other ftones; being exalted to that degree thereof, that art in vain endeavours to counterfeit it, the fictitious stones of chymists in imitation being eafily detected by an ordinary lapidift. Thirdly, Figure; many of them shoot into regular figures, as crystal and baftard diamonds into hexagonal; others into those that are more elegant and compounded. as those formed in imitation of the shells of testaceous fifnes of all forts, fharks teeth and vertebres, &c. If these be originally stones, or primary productions of nature in imitation of shells, and fishes bones, and not the shells and bones themfelves petrified, as we have fometimes thought. Some have a kind of vegetation and refemblance of plants, as corals, pori, and fungites, which grow upon the rocks like fhrubs: to which I might add our ordinary ftar-ftones and trochites. which I look upon as a fort of rock plants.

Secondly, For the uses; fome ferve for building, and many forts of veffels and utenfils, for pillars and statues, and other carved works in relievo, for the temples, ornament of palaces, porticos, piazzas, conduits, &c. as freeflone and marble: fome to burn into lime, as chalk and lime-ftone; fome, with the mixture of beriglia or kelp, to make glafs, as that the Venetians call congulo, and

common flint, which ferve also to ftrike fire; fome to cover houses, as flates; fome for marking, as morochthus, and the fore-mentioned chalk, which is a poluchreston, ferving, moreover, for manuring land, and fome medicinal uses; fome to make veffels of, which will endure the fire, as that found in the country of Chiavenna near Plurs. To these useful stones I might add the warming-stone, digged in Cornwall, which being once well heated at the fire, retains its warmth a great while, and hath been found to give eafe and relief in feveral pains and difeafes. particularly in that of the internal haemorrhoids. I might also take notice, that fome ftones are endued with an electrical or attractical virtue. " My honoured friend, Dr " Tancred Robinfon, in his manufcript itinerary " of Italy, relates the many various figures he " observed naturally delineated and drawn on feve-" ral forts of ftones digged up in the quarries, " caverns and rocks about Florence, and other " parts of Italy, not only reprefenting citics, " mountains, ruins, clouds, oriental characters, " rivers, woods, animals, but also fome plants " (as ivy, moffes, maiden-hair, ferns, and fuch " vegetables as grow in those places) fo exactly " defigned and imprefied upon feveral kinds of " ftones, as though fome skilful painters or fculp-" tors had been working upon them. The doctor " observes also the wonderful diversity of shapes " and colours that ores and other foffils fhoot " into, refembling almost every thing in nature, " for which it feems very difficult to him to affign " any caufe or principle. In the pyrites alone he " believes he himfelf may have feen at home and " abroad above a hundred varieties, and yet he " confesses he has been but a rude observer of " them. In the diaphanous foffils (as ambers, s crystals, agates, &c.) preferved in the cabinets

" of the Great Duke of Tufcany, Cardinal Chigi, " Settali, Moscardi, and other repositories or " mufacums of that curious country, he takes " notice of the admirable diversity of bodies in-" cluded and naturally imprifoned within them, " as flies, spiders, frogs, locusts, bees, pif-" mires, gnats, grashoppers, drops of liquor, " hair, leaves, rushes, moss, feeds, and other " herbage; which feem to prove them to have " been once in a state of fluidity. The Bononia " ftone digged up in the Appenines is remarkable " for its fhining quality. The amianthus for its " incombuftibility. The oculus mundi for its mo-" tion and change of colour. The lapis nephriti-" cus, calaminaris, offiocolla, actites, &c. for their " medicinal ufes."

I might fpend much time in the discoursing of the most strange and unaccountable nature and power of the loadstone, a fubject which hath exercifed the wits and pens of the most acute and ingenious philosophers; and yet the hypotheses which they have invented to give an account of its admirably phaenomena feem to me lame and unfatisfactory. What can we fay of the fubtility, activity, and penetrancy of its effluvia, which no obstacle can stop or repell, but they will make their way through all forts of bodies, firm and fluid, denfe and rare, heavy and light, pellucid and opaque? Nay, they will pafs through a vacuity or empty space, at least devoid of air, and any other fenfible body. Its attractive power of iron was known to the ancients: its verticity and direction to the poles of the earth is of later invention : which, of how infinite advantage it hath been to thefe two or three last ages, the great improvement of navigation, and advancement of trade and commerce, by rendering the remotest countries eafily acceffible; the noble difcovery of a vaft continent or new

world, befides a multitude of unknown kingdoms and iflands; the refolving experimentally those antient problems of the fpherical roundness of the earth; of the being of Antipodes, or the habitableness of the torrid zone; and the rendering the whole terraqueous globe circumnavigable; do abundantly demonstrate: whereas formerly they were wont to coast it, and creep along the shore, fcarce daring to venture out of the ken of land: when they did, having no other guide but the Cynosura, or poleftar, and those near it, and in cloudy weather none at all.

As for metals, they are fo many ways useful to mankind, and those uses fo well known to all, that it would be loft labour to fay any thing of them. Without the use of these, we could have nothing of culture or civility; no tillages or agriculture; no reaping or mowing; no ploughing or digging no pruning or lopping, grafting, or incifion; no mechanical arts or trades; no veffels or utenfils of househould stuff; no convenient houses or edifices; no fhipping or navigation. What a kind of barbarous and fordid life we must necessarily have lived, the Indians in the northern part of America are a clear demonstration. Only it is remarkable, that those which are of most frequent and neceffary use, as iron, brafs, and lead, are the most common and plentiful: others that are more rare, may better be fpared, vet are they thereby qualified to be made the common measure and ftandard of the value of all other commodities, and fo ferve for coin or money, to which use they have been employed by all civil nations in all ages.

Now, of what mighty importance the use of money is to mankind, the learned and ingenious Dr Cockburn shews us, in the second part of his effay concerning the Nature of Christian Faith, p. 88.

Whenever faith he, the use of money began, it was an admirable contrivance for rewarding and encouraging industry, for carrying on trade and commerce, certainly, eafily, and fpeedily; for obliging all to employ their various parts and feveral capacities for the common good, and engaging every one to communicate the benefit of his particular labour, without any prejudice to himfelf. Covetoufnefs indeed, or an inordinate love of money, is vitious, and the root of much evil, and ought to be remedied; but the use of of money is neceffary, and attended with manifold advantages. Where money has not yet taken place, where the use of it hath not yet been introduced, arts and fciences are not cultivated, nor any of those exercifes plied, which polite men's fpirits, and which abate the uneafinefs of life. Men there are brutifh and favage, none mind any thing but eating and drinking, and the other acts of brutal nature; their thoughts afpire no higher than merely to maintain their life and breath: like the beafts they walk abroad all the day long, and range a. bout from place to place, only to feek their food. Whatever may be fuppofed to follow if all were acted with great generofity and true charity, yet, according to the prefent temper of mankind, it is abfolutely neceffary that there be fome method and means of commutation, as that of money, for rendering all and every one mutually useful and ferviceable.

Now gold and filver by their rarity are wonderfully fitted and accomodated for this use of permutation for all forts of commodities, or making money of: whereas, were they as common and eafy to come by, as straw or stubble; fand or stones; they would be of no more use for bartering and commerce than they.

And here he goes on to shew the wonderful pro-

Part L.

vidence of God, in keeping up the value of gold and filver, notwithstanding the vast quantities which have been digged out of the earth in all ages, and fo continuing them a fit material to make money of. For which I refer to the book.

Of thefe, gold is remarkable for its admirable ductility and ponderofity, wherein it excells all other bodies hitherto known. I fhall only add, concerning metals that they do pertinacioufly refift all transmutation; and though one would sometimes think they were turned into a different subftance, yet do they but as it were lurk under a larva or vizard, and may be reduced again into their natural form and complexions, in despite of all the tortures of Vulcan or corrosive waters. Note, That this was written above thirty years fince, when I thought I had reason to distrust whatever had then been reported or written to affirm the transmutation of metals one into another.

I shall omit the confideration of other minerals, and of falts and earths, becaufe I have nothing to fay of their uses, but only fuch as refer to man, which I cannot affirm to have been the fole or primary end of the formation of them. Indeed, to fpeak in general of these terrestrial inanimate bodies they having no fuch organization of parts as the bodies of animals, nor any fo intricate variety of texture, but that their production may plaufibly be accounted for by an hypothesis of matter divided into minute particles or atoms naturally indivifible, of various but a determinate number of figures, and perhaps also differing in magnitude, and these moved and continually kept in motion according to certain established laws or rules; we cannot fo clearly difcover the uses for which they were created, but may probably conclude, that, among other ends, they were made for those for which they ferve us and other animals; as I shall more

fully make out heareafter. It is here to be noted, That, according to our hypothesis, the number of the atoms of each feveral kind that is of the fame figure and magnitude, is not nearly equal; but there be infinitely more of fome fpecies than of others, as of those that compound those vast aggregates of air, water, and earth, more abundantly than of fuch as make up metals and minerals: The reafon whereof may probably be, becaufe those are necessary to the life and being of man and all other animals, and therefore must be always at hand; thefe only ufeful to man, and ferving rather his conveniencies than neceffities. The reafon why I affirm the minute component particles of bodies to be naturally indivifible by any agent we can employ, (even fire itfelf) which is the only catholick diffolvent, other menstruums being rather inftruments than efficients in all folutions, apt by reafon of the figure and fmallnefs of their parts to cut and divide other bodies (as wedges cleave wood) when actuated by fire or its heat, which elfe would have no efficacy at all (as wedges have not, unless driven by a beetle:) the reason, I fay, I have already given: I shall now instance in a body whofe minute parts appear to be indiffoluble by the force of fire; and that is common water: which diftil, boil, circulate, work upon how you will by fire, you can only diffolve it into vapour, which when the motion ceafes, eafily returns into water again; vapour being nothing elfe but the minute parts thereof, by heat agitated and feparated one from another. For another inflance some of the most learned and experienced chymists

do affirm quickfilver to be intranimutable, and therefore call it *liquor aeternus* And I am of opinion, that the fame holds of all fimple bodies, that their component particles are indiffoluble by any natural

agent,

We may here note the order and method that metals and minerals obferve in their growth, how regularly they fhoot, ferment, and, as it were, vegetate and regenerate falts, in their proper and conftant figures, as our ingenious countryman, Dr, Jordan obferves at large in his difcourfe of baths and mineral waters.

### Of vegetables or plants.

I have now done with inanimate bodies both fimple and mixed. The animate are,

First, Such as are endued only with a negative foul, and therefore commonly called vegetables or plants; of which, if we confider either their ftature and fhape, or their age and duration, we fhall find it wonderful: for why fhould fome plants nife up to a great height, others creep upon the ground, which perhaps may have equal feeds? nay, the leffer plant many times the greater feed. Why fhould each particular fo obferve its kind, as constantly to produce the fame leaf for confistency, figure, division, and edging, and bring forth the fame kind of flower, and fruit, and feed? and that though you translate it into a foil which naturally puts forth no fuch kind of plant, fo that it is fome \* logos spermaticos which doth effect this, or rather fome intelligent plastic nature, as we have before intimated. For what account can be given of the determination of the growth and magnitude of plants from mechanical principles, of matter moved without the prefidency and guidance of fome fuperior agent? Why may not trees grow up as high as the clouds or vapours afcend? Or if you fay the cold of the superior air checks them; why may they not fpread and extend their lateral branches fo far, till their distance from the centre of gravity

\* Seminal form or virtue.

deprefs them to the earth, be the tree never fo high? How comes it to pafs, that though by culture and manure they may be highly improved, and augmented to a double, treble, nay, fome a much greater proportion in magnitude of all their parts, yet is this advance reftrained within certain limits? There is a maximum quod fic which they cannot exceed. You can by no culture or art extend a fennel stalk to the stature and bigness of an oak: then, why fhould fome be very long-lived, others only annual or biennial? How can we imagine, that any laws of motion can determine the fituation of the leaves, to come forth by pairs, or alternately, or circling the ftalk; the flowers to grow fingly, or in company and tufts, to come forth in the bofoms of the leaves and branches, or on the tops of branches and ftalks; the figure of the leaves, that they should be divided into fo many jags or efcallops, and curioufly indented round the edges; as alfo of the flower-leaves, their number and fite, the figure and number of the stamina and their apices, the figure of the stile and feed-veffel, and the number of cells into which it is divided? That all this be done, and all thefe parts duly proportioned one to another, there feems to be neceffary fome intelligent plastic nature, which may understand and regulate the whole oeconomy of the plants : for this cannot be the vegetative foul, becaufe that is material and divifible together with the body; which appears, in that a branch cut off a plant will take root, and grow, and become a perfect plant itfelf, as we have already observed. I had almost forgotten the complication of the feed leaves of some plants in the feed, which is fo ftrange, that one cannot believe it to be done by matter, however moved by any laws or rules imaginable. Some of them being fo clofe-plaited, and ftraitly

Part I.

folded up and thrust together within the membranes of the seed, that it would puzzle a man to imitate it, and yet none of the folds sticking or growing together; so that they may easily be taken out of their cases, and spread and extended even with one's fingers.

Secondly, If we confider each particular part of a plant, we shall find it not without its end or use; the root, for its stability and drawing nourishment from the earth; the fibres, to contain and convey the fap; befides which, there is a large fort of veffels to contain the proper and fpecific juice of the plant, and others to carry air for fuch a kind of refpiration as it needeth; of which we have already fpoken. The outer and inner bark in trees ferve to defend the trunk and boughs from the exceffes of heat and cold, and drought, and to convey the fap for the annual augmentation of the tree; for, in truth, every tree may in some fense be faid to be an annual plant, both leaf, flower and fruit, proceeding from the coat that was fuperinduced over the wood the last year, which coat alfo never beareth any more, but together with the old wood ferves as a form or block to fuftain the fucceeding annual coat. The leaves before the gemma or bud be explicated to embrace and defend the flower and fruit, which is even then perfectly formed; afterwards to preferve the branches, flowers and fruit from the injuries of the fummer-fun, which would too much parch. and dry them, if they lay open and exposed to its beams without any shelter : the leaves, I fay, qualify and contemper the heat, and ferve alfo to hinder the too hafty evaporation of the moisture about the root : but the principal use of the leaves (as we learn of Signior Malphigii, Monfieur Perault, and Monfieur Marriotte) is to concoct and prepare the fap for the nourithment of the fruit,

96

and the whole plant, not only that which afcends from the root, but what they take in from without, from the dew, moift air, and rain. This they prove becaufe many trees, if defpoiled of their leaves, will die, as it happens fometimes in mul-berry-trees, when they are plucked off to feed filk-worms. And becaufe if in fummer time you denude a vine-branch of its leaves, the grapes will never come to maturity: but though you expose the grapes to the fun-beams, if you pluck not off the leaves' they will ripen notwithstanding. That there is a regrefs of the fap in plants from above downwards, and that this defcendent juice is that which principally nourisheth both fruit and plant, is clearly proved by the experiments of Signior Malphigii, and those late ones of an ingenious countryman of our own, \* Thomas Brotherton, Efg; of which I shall mention only one; that is, if you cut off a ring of bark from the trunk of any tree, that part of the tree above the barked ring shall grow and increase in bignefs. but not that beneath.

But whether there be fuch a conftant circulation of the fap in plants as there is of the blood in animals, as they would from hence infer; there is fome reafon to doubt. I might add hereto the pleafant and delectable cooling and refreshing shade they afford in the fummer time; which was very much efteemed by the inhabitants of hot countries, who always took great delight and pleafure to fit in the open air, under fhady trees. Hence that expression fo often repeated in scripture, of every man's sitting under his own vine, and under his own fig tree, where also they used to eat, as appears by Abraham's entertaining the angels under a tree, and standing by them when they did eat, Gen. xviii. 8. Moreover, the leaves of plants

\* Philosophical transactions, Numb. 187.

are very beautiful and ornamental. That there is great pulchritude and comeliness of proportion in the leaves flowers and fruits of plants, is attested

Part I.

the leaves, flowers and fruits of plants, is attefted by the general verdict of mankind, as Dr More and others well observe. The adorning and beautifying the temples and buildings in all ages, is an evident and undeniable testimony of this; for what is more ordinary with architects than the taking in leaves, and flowers, and fruitage, for the garnishing of their work; as the Roman the leaves of achanthus fat. and the Jewish of palm-trees and pomegranates ? and thefe more frequently than any of the five regular folids, as being more comely and pleafant to behold. If any man shall object, that comeliness of proportion and beauty is but a mere conceit, and that all things are alike handfome to men who have as good eyes as others; and that this appears by the variation of fashions, which doth fo alter men's fancies, that what erewhile feemed very handfome and comely, when it is once worn out of fashion, appears very abfurd, uncouth, and ridiculous. To this I answer; that cuftom and use doth much in those things where little of proportion and fymmetry fhew themfelves, or which are alike comely and beautiful, to difparage the one, and commend the other : but there are degrees of things; for (that I may use Dr More's words \* ) I dare appeal to any man that is not funk into fo forlorn a pitch of degeneracy, that he is as flupid to thefe things as the bafeft beasts, whether, for example, a rightly-cut tetraedrom, cube, or icofaedrom have no more pulchritude in them than any rude broken ftone lying in the field or high-ways; or, to name other folid figures, which though they be not regular, properly fo called, yet have a fettled idea and nature, as a cone, fphere, or cylinder, whether \* Antidote against Atheifin, 1. 2. c. 5.

N

the fight of those do not more gratify the minds of men, and pretend to more elegancy of shape, than those rude cuttings or chippings of free-ftone that fall from the mafon's hands, and ferve for nothing but to fill up the middle of the wall, as fit to be hid from the eyes of men for their uglinefs? and therefore it is observable, that if nature shape any thing but near to this geometrical accuracy, that we take notice of it with much content and pleafure, and greedily gather and treafure it up. As if it be but exactly round, as those spherical ftones found in Cuba, and fome alfo in our own land; or have but its fides parallel, as those rhomboideal felenites found near St. Ives in Huntingtonfhire, and many other places in England. Whereas ordinary ftones of rude and uncertain figures we pass by, and take no notice of at all. But though the figures of these bodies be pleasing and agreeable to our minds, yet (as we have already observed) those of the leaves, flowers, and fruits of trees, more. And it is remarkable, that in the circumfcription and complication of many leaves, flowers, fruits, and feeds, nature affects a regular figure. Of a pentagonal or quincunial difpofition, Sir Thomas Brown of Norwich produces feveral examples in his difcourfe about the guicunx. And doubtlefs, inftances might be given in other regular figures, were men but obfervant.

The flowers ferve to cherifh and defend the firft and tender rudiments of the fruit; I might alfo add the mafculine or prolific feed contained in the chives or apices of the ftamina. These, befides the elegancy of their figures, are many of them endued with splendid and lovely colours, and likewise most grateful and fragrant odours. Indeed such is the beauty and lustre of some flowers, that our Saviour faith of the lilies of the fields (which some, not without reason, suppose

to have been tulips) that Solomon in all his glory was not arrayed like one of thefe. And it is obferved by Spigelius\*, That the art of the most skilful painter cannot fo mingle and temper his colours, as exactly to imitate or counterfeit the native ones of the flowers of vegetables.

As for the feeds of plants, Dr More+ effects it an evident fign of divine providence, that every kind hath its feed: for it being no neceffary refult of the motion of the matter, (as the whole contrivance of the plant indeed is not) and it being of fo great confequence that they have feed for the continuance and propagation of their own fpecies, and alfo for the gratifying man's art, induftry and neceffities, (for much of hufbandry and gardening lies in this) it cannot be but an act of counfel to furnith the feveral kinds of plants with their feeds

Now, the feed being fo neceffary for the maintenance and increase of the feveral species, it is worth the observation, what care is taken to fecure and preferve it, being in fome doubly and trebly defended. As for inftance, in the walnut, almond and plumbs, of all forts; we have first a thick pulpy covering, then a hard fhell, within which is the feed inclosed in a double membrane. In the nutmeg, another tegument is added befides all thefe, viz. the mace between the green pericarpium and the hard fhell, immediately inclofing the kernel. Neither yet doth the exterior pulp of the fruit or pericarpium ferve only for the defence and fecurity of the feed, whilft it hangs upon the plant, but after it is mature and fallen upon the earth, for the ftercoration of the foil and promotion of the growth, though not the first germination of the seminal plant. Hence (as Petrus de Creicentiis.

\* Ifag. ad rem herbariam.

+ Antidote against Atheifm, 1. 2. c. 2.

tells us\*) hufbandmen, to make their vines bear, manure them with vine leaves, or the hufks of expressed grapes; and they observe those to be most fruitful which are so manured with their own: which observation holds true also in all other trees and herbs. But besides this use of the pulp, or pericarpium, for the guard and benefit of the seed, it serves also by a secondary intention of nature in many fruits for the food and suffernance of man and other animals.

Another thing worthy the noting in feeds, and argumentative of providence and defign, is that papofe plumage growing upon the tops of fome of them, whereby they are capable of being wafted with the wind, and by that means feattered and diffeminated far and wide.

Futhermore; most feeds having in them a feminal plant perfectly formed, as the young is in the womb of animals, the elegant complication thereof in fome species is a very pleasant and admirable spectacle; so that no man that hath a foul in him can imagine or believe it was so formed and folded up without wisdom and providence. But of this I have spoken already.

Laftly, The immense smallness of some feeds, not to be seen by the naked eye, so that the number of feeds produced at once in some one plant, as for example, reedmace (*Tipha Palustrus*) harts-tongue, and many forts of serns, may amount to a million; is a convincing argument of the infinite understanding and art of the former of them.

And it is remarkable that fuch moffes as grow upon walls, the roofs of houfes, and other high places, have feeds fo exceflively fmall, that when thaken out of their veffels they appear like vapour or fmoke, fo that they may either afcend of them-

\* Agric. 1. 2. c. 6.

felves, or by an eafy impulse of the wind be raifed up to the tops of houses, walls or rocks; and we need not wonder how the mosses got thither, or imagine they sprung up spontaneously there.

I might alfo take notice of many other particulars concerning vegetables; as, first, that because they are defigned for the food of animals, therefore nature hath taken more extraordinary care, and made more abundant provision for their propagation and increase; fo that they are multiplied and propagated not only by the feed, but many alfo by the root, producing off-fets, or creeping under ground; many by ftrings or wires running above ground, as ftrawberry, and the like; fome by flips or cuttings, and fome by feveral of these ways. And for the fecurity of fuch species as are produced only by feed, it hath endued all feed with a lafting vitality, that fo if by reafon of exceffive cold or drought, or any other accident, it happen not to germinate the first year, it will continue its foecundity, I do not fay two or three, nor fix or feven, but even twenty or thirty years; and when the impediment is removed, the earth in fit cafe, and the feafon proper, fpring up, bear fruit, and continue its species. Hence it is that plants are fometimes loft for a while in places where they formerly abounded; and again, after fome years, appear new: loft, either becaufe the fprings were not proper for their germination, or because the land was fallowed, or because plenty of weeds or other herbs prevented their coming up and the like; and, appearing again, when these impediments are removed. Secondly, That fome forts of plants, as vines, all forts of pulfe, hops, briony, all pomiferous herbs, pumpions, melons, gourds, cucumbers, and divers other fpecies, that are weak and unable to raife or fupport themfelves. are either endued with a faculty of twining about other that are near, or elfe furnished with claspers and tendrils, whereby, as it were with hands, they catch hold of them, and fo ramping upon trees, fhrubs, hedges or poles, they mount up to a great height, and fecure themfelves and their fruit. Thirdly, That others are armed with prickles, and thorns, to fecure them from the browzing of beafts, as also to shelter others that grow under them: moreover, they are hereby rendered very ufeful to man, as if defigned by nature to make both quick and dead hedges and fences. The great naturalist, Pliny, hath given an ingenious account of the providence and defign of nature in thus arming and fencing them, in these words: Inde (speaking of nature) excogitavit aliquas afpectu bispidas, tuctu truces, ut tantum non vocem ipsius naturae fingentis illas, rationemque reddentis exaudire videamur, ne se depascat avida quadrupes, ne procaces manus rapiant, ne neglecta vestigia obterant, ne insidens ales infringat; bis muniendo aculeis telifque armando, remediis ut salva ac tuta sint. Ita hoc quoque quod in iis odimus hominum caufa excegitatum eft.

It is worthy the noting, that wheat, which is the beft fort of grain, of which the pureft, most favoury and wholefome bread is made, is patient of both extremes, heat and cold, growing and bringing its feed to maturity not only in temperate countries, but alfo on one hand in the cold and northern, viz. Scotland, Denmark, &c. on the other, in the hottest and most foutherly, as Egypt, Barbary, Mauritania, the East-Indies, Guinea, Madagascar, &c. scarce refusing any climate.

Nor is it less observable, and not to be commemorated without acknowledgment of the divine benignity to us, that (as Pliny rightly notes) nothing is more fruitful than wheat, Quid ei natura (faith he) [rectius, naturae parens] tribuit, quod eo

### Part I. in the CREATION.

maxime hominem alit, utpote cum e modio, fi et aptum folum, quale in Byzacio Africae campo, centeni quinquaginta modii reddentur. Misit ex eo loco Divo Augusto procurator ejus ex uno grano (vix credibile dictu) 400 paucis minus germina : Misit et Neroni similiter 360 stipulas ex uno grano. "Which fer-" tility, nature (he should have faid, the Author " of nature) hath conferred upon it, becaufe it " feeds man chiefly with it. One bufhel, if fown " in a fit and proper foil, fuch as is Byzachium, a " field of Africa, yielding 150 of annual increase. " Augustus's procurator fent him from that place " 400 within a few blades fpringing from the " fame grain : and to Nero were fent thence 360." If Pliny, a heathen, could make this fertility of wheat argumentative of the bounty of God to man, making fuch plentiful provision for him of that which is of most pleafant taste and wholesome nourifhment, furely it ought not to be paffed over by us Chriftians without notice taking and thankfgiving.

As for the fignatures of plants, or the notes impreffed upon them, as indices of their virtues, though \* fome lay great ftrefs upon them, accounting them firong arguments to prove, that fome understanding principle is the highest original of the works of nature, as indeed they were, could it certainly be made appear, that there were fuch. marks defignedly fet upon them; becaufe all that I find mentioned and collected by authors, feem to me to be rather fancied by men, than defigned by nature to fignify or point out any fuch virtues or qualities as they would make us believe. I have elfewhere, I think upon good grounds, rejected them : and finding no reafon, as yet, to alter my opinion, I shall not further infis on them : howbeit, I will not deny, but that the noxious and malignant plants do many of them difcover fomething

\* Dr More Antid. 1 2. c 6.

of their nature by the fad and melancholic vifage of their leaves, flowers and fruit. And that I may not leave that head wholly untouched, one obfervation 1 shall add relating to the virtues of plants, in which I think there is fomething of truth; that is, that there are, by the wife difpolition of providence, fuch species of plants produced in every country, as are most proper and convenient for the meat and medicine of the men and animals that are bred and inhabit there: in fo much, that Solemander writes, that from the frequency of the plants that fprung up naturally in any region, he could eafily gather what endemial difeafes the inhabitants thereof were fubject to : fo, in Denmark, Friezland, and Holland, where the fourvy ufually reigns, the proper remedy thereof, fcurvy grafs, doth plentifully grow.

# Of bodies endued with a sensitive soul, or animals.

I proceed now to the confideration of animate bodies endued with a fenfitive foul, called animals. Of thefe I shall only make fome general observations, not curiously confider the parts of each particular species, fave only as they ferve for instances or examples.

First of all, Because it is the great design of Providence to maintain and continue every species, I shall take notice of the great care and abundant provision that is made for the securing this end. Quanta ad eam rem vis, ut in fuo quaeque genere permaneat? Cic. Why can we imagine all creatures should be made male and semale but to this purpose? Why should there be implanted in each fex such a vehement and life-lasting appetite of copulation? Why in viviparous animals, in the time of gestation, should the nourisfiment be carried to the embryo in the womb, which at other

Part I.

times goeth not that way? when the young is brought forth, how comes all the nourifhment then to be transferred from the womb to the breaft or paps, leaving its former channel, the dam at fuch time being for the most part lean and ill-favoured ?-To all this I might add, as a great proof and instance of the care that is taken, and provision made for the prefervation and continuance of the species, the lasting foecundity of the animal feed or egg in the females of man, beafts, and birds. I fay, the animal feed, becaufe it is to me highly probable, that the females, as well of beafts as birds, have in them from their first formation the feeds of all the young they will afterwards bring forth, which when they are all fpent and exhaufted by what means foever, the animal becomes barren and effete. These feeds in some species of animals continue fruitful, and apt to take life by the admixture of the male feed fifty years or more, and in fome birds fourfcore or an hundred. Here I cannot omit one very remarkable observation I find in Cicero; Atque ut intelligamus (faith he) nihil horum esse fortuitum, sed haec omnia providae solertisque naturae; quae multiplices foetus procreant, ut sues, ut canes, his mammarum data est multitudo, quas easdem paucas habent eae bestiae quae pauca gignunt. " That we may understand that none of these " things (he had been speaking of) is fortuitous, " but that all are the effects of provident and faga-" cious nature; multiparous quadrupeds, as swine, " as dogs, are furnished with a multitude of paps. " Whereas those beafts which bring forth few, have to no wife and check and a co " but a few."

That flying creatures of the greater fort, that is, birds, fhould all lay eggs, and none bring forth live young, is a manifest argument of divine providence, defigning thereby their prefervation and fecurity, that there might be the more plenty of 106

them; and that neither the birds of prey the ferpent, nor the fowler, fhould firaiten their generation too much: for if they had been viviparous, the burden of their womb, if they had brought forth any competent number at a time, had been fo great and heavy, that their wings would have failed them, and they become an eafy prey to their enemies: or, if they had brought but one or two at a time, they would have been troubled all the year long with feeding their young, or bearing them in their womb \*.

This mention of feeding their young puts me in mind of two or three confiderable observations referring thereto.

First, Seeing it would be for many reasons inconvenient for birds to give fuck, and yet no lefs inconvenient, if not destructive, to the chicken upon exclusion, all of a fudden, to make fo great a change in its deit, as to pafs from liquid to hard food, before the flomach be gradually confolidated, and by use firengehened and habituated to grind and concoct it, and its tender and pappy flefh fitted to be nourished by fuch ftrong and folid diet, and before the bird be by little and little accuftomed to use its bill, and gather it up, which as first it doth but very flowly and imperfectly; therefore nature hath provided a large yolk in every egg, a great part whereof remaineth after the chicken is hatched, and is taken up and inclosed in its belly, and by a channel made on purpose, received by degrees into the guts, and ferves inftead of milk to nourifh the chick for a confiderable time; which neverthelefs mean while feeds itfelf by the mouth a little at a time, and gradually more and more, as it gets a perfecter ability and habit of gathering up its meat, and its ftomach is ftrengthened

Dr More's antidote against Atheism, 1. 2. c. 9.

Part L.

to macerate and concoct it, and its flesh hardened and fitted to be nourished by it

Secondly, That birds which feed their young in the neft, though in all likelihood they have no ability of counting the number of them, fhould yet (though they bring but one morfel of meat at a time, and have not fewer, it may be, than feven or eight young in the neft together, which at the return of their dams, do all at once with equal greedinefs, hold up their heads and gape) not omit or forget one of them, but feed them all which, unlefs they did carefully obferve and retain in memory which they had fed, which not, were impoffible to be done: this, I fay, feems to me moft ftrange and admirable, and beyond the poffibility of a mere machine to perform.

Another experiment I shall add, to prove that though birds have not an exact power of numbring, yet have they of diftinguishing many from few, and knowing when they come near to a certain number : and that is, that when they have laid fuch a number of eggs as they can conveniently cover and hatch, they give over, and begin to fit, not becaufe they are neceffarily determined to fuch a number; for that they are not, as is clear, becaufe they are in ability to go on and lay more at their pleafure. Hens, for example, if you let their eggs alone, when they have laid fourteen or fifteen, will give over, and begin to fit; whereas, if you daily withdraw their eggs, they will go on to lay five times that number ; (yet fome of them are fo cunning, that if you leave them but one egg, they will not lay to it, but forfake their neft.) This holds not only in domeftic and mansuete birds; for then it might be thought the effect of cicuration or institution, but also in the wild : for my honoured friend, Dr Martin Lifter, informed me, that of his own knowledge, one and the faine

100

108

fwallow, by the fubtracting daily of her eggs, proceeded to lay nineteen fucceffively, and then gave over; as 1 have \* elfewhere noted. Now, that I am upon this fubject of the number of eggs, give me leave to add a remarkable obfervation referring thereto, viz. that birds, and fuch oviparous creatures, as are long-lived, have eggs enough at firft conceived in them to ferve them for many years laying, probably for as many as they are to live, allowing fuch a proportion for every year, as will ferve for one or two incubations; whereas infects, which are to breed but once, lay all their eggs at once, have they never fo many. Now, had thefe things been governed by chance, I fee no reafon why it fhould conftantly fall out fo.

Thirdly, The marvellous fpeedy growth of birds that are hatched in nefts, and fed by the old ones there, till they be fledged, and come almost to their full bignefs; at which perfection they arrive within the short term of about one fortnight; feems to me an argument of providence, designing thereby their prefervation, that they might not lie long in a condition exposed to the ravine of any vermine that may find them, being utterly unable to escape or shift for themselves.

Another and no lefs effectual argument may be taken from the care and providence ufed for the hatching and rearing their young. And, firft, They fearch out a fecret and quiet place where they may be fecure and undifturbed in their incubation; then they make themfelves nefts every one after his kind, that fo their eggs and young may lie foft and warm, and their exclusion and growth be promoted Thefe nefts are fome of them fo elegant and artificial, that it is hard for man to imitate them or make the like. I have feen nefts of an Indian bird fo artificially composed of the fibres,

\* Preface to Mr Willoughby's Ornithol.

I think, of fome roots, fo curioufly interwoven and platted together, as is admirable to behold: which nefts they hang on the ends of twigs of trees over the water, to fecure their eggs and young from the ravage of apes and monkies, and other beafts, that might else prey upon them. After they have laid their eggs how dilligently and patiently do they fit upon them till they be hatched, fcarce affording themfelves time to go off to get them meat? Nay, with fuch an ardent and impetuous defire of fitting are they infpired, that if you take away all their eggs, they will fit upon an empty neft: and yet one would think that fitting were none of the most pleasant works. After their young are hatched for fome time they do almost constantly brood them under their wings, left the cold, and fometimes perhaps the heat, fhould harm them. All this while they alfo labour hard to get them food, sparing it out of their own bellies, and pining themselves almost to death, rather than they should want. Moreover, it is admirable to observe with what courage they are at that time infpired, that they will even venture their own lives in defence of them. The most timorous, as hens and geefe, become then fo couragious, as to dare to fly in the face of a man that shall moleft or difqueit their young, which would never do fo much in their own defence. These things being contrary to any motions of fense, or inftinct of felf prefervation, and fo eminent pieces of felf denial, must needs be the works of Providence, for the continuation of the fpecies, and upholding of the world: efpecially if we confider, that all these pains are bestowed upon a thing which takes no notice of it, will render them no thanks for it, nor make them any requital or amends; as alfo, that after the young is come to fome growth, and able to thift for itfelf,

the old one retains no fuch storge to it, takes no further care of it, but will fall upon it, and beat it indifferently with others. To thefe I shall add three observations more, relating to this head. The first borrowed of Dr Cudworth, System, p. 69. One thing neceffary to the confervation of the species of animals; that is, the keeping up conftantly in the world a due numerical proportion between the fexes of male and female, doth neceffarily infer a superintending providence. For, did this depend only upon mechanism, it cannot well be conceived, but that in fome ages or other there thould happen to be all males or all females, and fo the fpecies fail. Nay, it cannot well be thought otherwife, but that there is in this a providence, fuperior to that of the plastic or fpermatic nature, which hath not fo much of knowledge and difcretion allowed to it, as whereby to be able to govern this affair.

The fecond of Mr Boyle in his treatife of the bigh veneration man's intellect owes to God, p. 32. that is, the conveniency of the feafon (or time of year) of the production of animals, when there is proper food and entertainment ready for them. 'So " we fee, that, according to the usual course of na-" ture, lambs, kids, and many other living crea-" tures, are brought into the world at the fpring of " the year; when tender grafs, and other nutri-" tive plants, are provided for their food. And " the like may be observed in the production of " filk-worms," (yea, all other erucas, and many infects more) " whole eggs, according to nature's in-" flitution, are hatched when mulberry-trees be-" gin to bud, and put forth-those leaves, whereon " those precious infects are to feed; the aliments " being tender, whilft the worms themfelves are " fo, and growing more ftrong and fubstantial, as " the infects increate in vigour and bulk." To

Part I.

thefe I shall add another instance, that is, of the wasp; whose breeding is deferred till after the fummer-folitice, few of them appearing before July: whereas one would be apt to think the vigorous and quickening heat of the fun, in the youth of the year, thould provoke them to generate much fooner: [provoke them, I fay, because every wasp's neft is begun by one great mother-wasp, which overlives the winter, lying hid in some hollow tree or other latibulum;] because then, and not till then, pears, plumbs, and other fruit, defigned principally for their food, begin to ripen.

The third is mine own, That all infects which do not themselves feed their young, nor treasure up provision in store for their fustenance, lay their eggs in fuch places as are most convenient for their exclusion, and where, when hatched, their proper food is ready for them: fo, for example, we fee two forts of white butterflies fastening their eggs to cabbage-leaves, becaufe they are fit aliment for the caterpillars that come of them; whereas, should they affix them to the leaves of a plant improper for their food, such caterpillars must needs be lost, they chusing rather to die than to tafte of fuch plants; for that kind of infect (I mean caterpillars, hath a nice and delicate palate, fome of them feeding only upon one particular fpecies of plant, others on divers indeed, but those of the fame nature and quality; utterly refufing them of a contrary. Like instances might be produced in the other tribes of infects, it being perpetual in all, (if not hindered or imprifoned) electively to lay their eggs in places where they are feldom loft or mifcarry, and where they have a fupply of nourishment for their young, fo foon as they are hatched, and need it : whereas, should they fcatter them carelefsly and indifferently in any place, the greatest part of the young would in all

likelihood perifh foon after their exclusion, for want of food; and fo their numbers continually decreafing, the whole species in a few years would be in danger to be lost. Whereas no such thing, I dare fay, hath happened fince the first creation.

It is here very remarkable, that those infects, for whose young nature hath not made provision of fufficient fustenance, do themselves gather and lay up in store for them. So, for example: The bee, the proper food of whose \* eluae is honey, or perchance erithace, (which we English bee-bread) neither of which viands being any where to be found amassed by nature in quantity sufficient for their maintenance, doth herself with unwearied diligence and industry, flying from flower to flower, collect and treassure them up.

To these I shall now add an observation of Mr. Lewenhoeck's, concerning the fudden growth of fome forts of infects, and the reason of it.

It is (faith he) a wonderful thing, and worthy the observation, in flesh-flies, that a fly-maggot, in five days space after it is hatched, arrives at its full growth and perfect magnitude For if to the perfecting of it there were required, suppose a month's time or more, (as in fome other maggots is needful) it is impoffible that about the fummerfolftice any fuch flies should be produced, because the fly-maggots have no ability to fearch out any other food than that wherein they are placed by their dams. Now this food, fuppose it be flesh, fish, or the entrails of beasts, lying in the fields, exposed to the hot fun-beams, can last but a few days in cafe and condition to be fit aliment for these creatures, but will soon be quite parched and dried up, and therefore the most wife Creator hath given fuch a nature and temperament to them, that within a very few days they attain to their \* Bee Maggot.

113

-just growth and magnitude; whereas on the contrary, other maggots, who are in no fuch danger of being straitened for food, continue a whole month or more before they give over to eat and ceafe to grow. He proceeds further to tell us, that fome of thefe fly-maggots which he fed daily with fresh meat, he brought to perfection in four days time; fo that he conceives that in the heat of fummer the eggs of a fly, or the maggots contained in them, may in lefs than a month's space run through all their changes, and come to perfect flies, which may themfelves lay eggs again.

Secondly, I shall take notice of the various strange instincts of animals, which will necessarily demonstrate that they are directed to ends, unknown to them, by a wife superintendent: As, 1. That all creatures should know how to defend themfelves and offend their enemies, where their natural weapons are fituate, and how to make ufe of them. A calf will fo manage his head as though he would push with horns even before they shoot. A boar knows the use of his tushes; a dog of his teeth; a horfe of his hoofs; a cock of his fpurs; a bee of her fting; a ram will butt with his head, yea though he be brought up tame, and never faw that manner of fighting. Now, why another animal which hath no horns fhould not make a shew of pushing, or no spurs, of striking with his legs, and the like, I know not, but that every kind is providentially directed to the ufe of its proper and natural weapons. 2. That those animals that are weak, and have neither weapons nor courage to fight, are for the most part created fwift of foot or wing, and fo being naturally timorous, are both willing and able to fave themfelves by flight. 3. That poultry, partridge, and other birds, should at the first fight know birds of prey, and make fign of it by a peculiar note of their P

voice to their young, who prefently thereupon hide themfelves; that the lamb should acknowsedge the wolf its enemy, though it had never feen one before (as is taken for granted by most naturalifts, and may for ought I know be true) argues the providence of nature, or more truly the God of nature, who for their prefervation hath put fuch an inftinct into them. 4. That young animals as foon as they are brought forth should know their food; as for example, fuch as are nourished with milk prefently find their way to the paps, and fuck at them; whereas none of those that are not defigned for that nourishment ever offer to fuck, or feek out any fuch food. Again, 5. That fuch creatures as are whole footed or fin-toed, viz. fome birds, and quadrupeds, are naturally directed to go into the water, and fwim there, as we fee ducklings, though hatched and led by a hen, if fhe brings them to the brink of a river or pond of water, they prefently leave her, and in they go, though they never faw any fuch thing done before, and though the hen clucks and calls, and doth what fhe can to keep them out. This Pliny takes notice of, Hift. Nat lib. 10 cap. 55, in these words, speaking of hens: Super omnia est anatum ovis subditis atque exclusis admiratio, primo non plane agnoscentis foetum: mox incertos incubitus solicite convocantis : postremo lamenta circa piscinae stagna, mergentibus se pullis natura duce. So that we see. every part in animals is fitted to its use, and the knowledge of this use put into them; for neither do any fort of web-footed fowls live conftantly upon the land, or fear to enter the water, nor any land-fowl fo much as attempt to fwim there. 6. Birds of the fame kind make their nefts of the fame materials, laid in the fame order, and exactly of the fame figure: fo that by the fight of the neft one may certainly know what bird it

belongs to; and this they do though living in diftant countries, and though they never faw nor could fee any neft made, that is, though taken out of the neft and brought up by hand; neither were any of the fame kind ever observed to make a different neft either for matter or fashion : This, together with the curious and artificial contexture of fuch nefts, and their fitnefs and convenience for the reception, hatching and cherifhing the eggs and young of their refpective builders (which we have before taken notice of) is a great argument of a fuperior Author of their and other natures, who hath endued them with these inftincts, whereby they are as it were acted and driven to bring about ends which themfelves aim not at (fo far as we can discern) but are directed to; for (as Arittotle observes) υτε τεχνε, υτε ζητησανία, υτε βυλευσαμενα ποιει. " They act not by art, neither do they enquire, " neither do they deliberate about what they do."

And therefore, as Dr Cudworth faith well, they are not mafters of that wifdom according to which they act, but only paffive to the inftincts and imprefies thereof upon them. And indeed to affirm, that brute animals do all thefe things by a knowledge of their own, and which themfelves are mafters of, and that without deliberation and confultation, were to make them to be endued with a moft perfect intellect, far transcending that of human reafon; whereas it is plain enough that brutes are not above confultation, but below it, and that thefe inftincts of nature in them are nothing but a kind of fate upon them.

The migration of birds from an hotter to a colder country, or a colder to an hotter, according to the feafons of the year, as their nature is, I know not how to give an account of, it is fo ftrange and admirable. What moves them to fhift their quarters? You will fay, the difagreeableness of the temper of

Part I.

the air the conftitution of their bodies, or want of food. But how come they to be directed to the fame place yearly, though fometimes but a little island, the foland-goofe to the Baffe of Edinburgh-Firth, which they could not possibly fee, and fo it could have no influence upon them that way? The cold or the heat might poffibly drive them in a right line fron either; but that they should impell land birds to venture over a wide ocean, of which they can fee no end, is ftrangee and unaccountable; one would think that the fight of fo much water, and prefent fear of drowning, fhould overcome the fense of hunger, or difagreeableness of the temper of the air. Befides, how come they to fteer their courfe aright to their feveral quarters, which before the compafs was invented was hard for a man himfelf to do, they being not able, as I noted before, to fee them at that diftance? Think we that the quails, for instance, could fee quite crofs the Mediterranean-Sea? and yet it is clear they fly out of Italy into Africa, lighting many times on thips in the midst of the fea, to reft themselves when tired and spent with flying. That they should thus shift places, is very convenient for them, and accordingly we fee they do it; which feems to be impossible they should, unless themfelves were endued with reafon, or directed and acted by a fuperior intelligent caufe.

The like may be faid of the migration of diverfe forts of filhes; as for example; the falmon, which from the fea yearly afcends up a river fometimes 400 or 500 miles, only to caft their fpawn, and fecure it in banks of fand, for the prefervation of it till the young be hatched or excluded, and then return to fea again. How thefe creatures, when they have been wandring a long time in the wide ocean, fhould again find out and repair to the mouths of the fame rivers, feems to me very

116

strange and hardly accountable, without recourse to inftinct, and the direction of a fuperior caufe. That birds, feeing they have no teeth for the mattication and preparation of their food, should, for the more convenient comminution of it in their ftomachs or gizzards, fwallow down little pebbleftones or other hard bodies; and, becaufe all are not fit or proper for that use, should first try them in their bills, to feel whether they be rough or angular, for their turns, which, if they find them not to be, they reject them; when thefe, by the working of their itomach, are worn fmooth, or too fmall for their use, they void them by fiege, and pick up others. That these are of great use to them for the grinding of their meat, there is no doubt. And I have observed in birds that have been kept up in houses, where they could get no pebbles, the very yolks of their eggs have changed colour, and become a great deal paler than theirs who have their liberty to go abroad.

Befides, I have observed in many birds, the gullet, before its entrance into the gizzard, to be much dilated, and thick fet, or as it were granulated, with a multitude of glandules, each whereof was provided with its excretory veffel, out of which, by an easy pressure, you might squeeze a juice or pap, which ferved for the fame use which the faliva doth in quadrupeds, that is, for the macerating and diffolution of the meat into a chyle: for that the faliva, notwithstanding its infipidness, hath a notable virtue of macerating and diffolving bodies, appears by the effects it hath in killing of quickfilver, termenting of dough like leaven or yeast, taking away warts, and curing other cutaneous diftempers; fometimes exulcerating the jaws, and rotting the teeth.

Give me leave to add one particular more concerning birds, which fome may perchance think too

Part I.

homely and indecent to be mentioned in fuch a difcourfe as this; yet begaufe it is not below the providence of nature, and defigned for cleanlinefs. and fome great men have thought it worth the obferving, I need not be ashamed to take notice of it; that is, that in young birds that are fed in the neft, the excrement that is voided at one time is fo vifcid, that it hangs together in a great lump, as if it were inclosed in a film, fo that it may eafily be taken up and carried away by the old bird in her bill: befides, by a strange instinct, the young bird elevates her hinder parts fo high, for the most part, that the feldom fails to caft what comes from her clear over the fide of the neft. So we fee here is a double provision made to keep the neft clean, which, if it were defiled with ordure, the young ones must necessarily be utterly marred and ruined.

- 7. The bee, a creature of the lowest forms of animals, fo that no man can fufpect it to have any confiderable measure of understanding, or to have knowledge of, much lefs to aim at, any end; yet makes her combs and cells with that geometrical accuracy, that fhe must needs be acted by an inflinct implanted in her by the wife Author of nature; for, first, She plants them in a perpendicular posture, and fo close together, as with conveniency they may, beginning at the top, and working downwards, that fo no room may be loft in the hive, and that fhe may have eafy access to all the combs and cells. Befides, the combs being wrought double, that is, with cells on each fide, a common bottom, or partition-wall, could not in any other fite have fo conveniently, if at all, received or contained the honey; then fhe makes the particular cells most geometrically and artificially, as the famous mathematician Pappus demonstrates in the preface to his third book of Mathematical Collections. First of all, (faith he, fpeakPart I.

ing of the cells) it is convenient that they be of fuch figures as may cohere one to another, and have common fides, elfe there would be empty fpaces left between them, to no use, but to the weakening and fpoiling of the work, if any thing should get in there; and, therefore, though a round figure be most capacious for the honey, and most convenient for the bee to creep into, yet did she not make choice of that, becaufe then there must have been triangulor fpaces left void. Now, there are only three rectilineous and ordinate figures, which can ferve to this purpofe; and inordinate, or unlike ones, must have been not only lefs elegant and beautiful, but unequal. [Ordinate figures, are fuch as have all their fides and all their angles equal.] The three ordinate figures are, triangles, fquares, and hexagons; for the fpace about any point may be filled up either by fix equilateral triangles, or four fquares, or three hexagons ; whereas three pentagons are too little, and three heptagons too much. Of thefe three, the bee makes ufe of the hexagon, both becaufe it is more capacious than either of the other, provided they be of equal compass, and fo equal matter spent in the construction of each. And, Secondly, Because it is most commodious for the bee to creep into. And Laftly, Becaufe in the other figures more angles and fides must have met together at the fame point, and fo the work could not have been fo firm and ftrong. Moreover, the combs being double; the cells on each fide the partition are fo ordered, that the angles on one fide infift upon the centres of the bottoms of the cells on the other fide, and not angle upon or against angle; which alfo must needs contribute to the strength and firmnefs of the work : thefe cells the fills with honey for her winter provision, and curiously. clofes them up with covers of wax, that keep the

included liquor from spilling, and from external

injuries, as Mr Boyle truly observes, Treatife of final causes, p. 169. Another fort of bee, I have observed. may be called the tree-bee, whole industry is admirable in making provision for her young : Firft, She digs round vaults or burrows [Cuniculos] in a rotten or decayed tree, of a great length; in them the builds or forms her cylindrical nefts or cafes. refembling cartriges, or a very narrow thimble, only in proportion longer, of pieces of rofe, or other leaves, which fhe fhears off with her mouth. and plaits and joins clofe together by fome glutinous fubstance; these cases she fills with a red pap, of a thinner confiftency than an electuary, of no pleafant tafte, which where fhe gathers I know not : and, which is most remarkable, she forms these cafes, and ftores them with this provision before fhe hath any young one hatched, or fo much as an egg laid: for on the top of the pap the lays one egg, and then clofes up the veffel with a cover of leaves. The inclosed egg foon becomes an eula, or maggot, which feeding upon the pap till it comes to its full growth, changes to a nympha, and after comes out a bee. Another infect noted for her feeming prudence, in making provision for the winter, proposed by Solomon for our imitation, is the ant, which (as all naturalists agree) hoards up grains of corn against the winter for her fustenance, and is reported by fome to \* bite off the germen of them, left they should sprout by the moisture of the earth; which I look upon as a mere fiction : neither fhould 1 be forward to credit the former relation, were it not for the authority of the fcripture, becaufe I could never obferve any fuch ftoring of grain by our

Yet there is a quadruped taken notice of even by the vulgar, for laying up in store provision for the \* Plin. 1. 11. c. 30.

country ants.

## Part I. in the CREATION.

winter) that is, the fquirrel, whofe hoards of nuts are frequently found, and pillaged by them.

The beaver is by credible perfons, eye-witneffes, affirmed to build him houfes for flielter and fecurity in winter-time. See Mr Boyle of *final caufes*. p. 173.

Befides these I have mentioned, an hundred others may be found in books relating especially to physick : as, that dogs when they are fick, should vomit themfelves by eating grass; that swine should refuse meat as soon as they seel themselves ill, and so recover by abstinence; that the bird Ibis should teach men the way of administring clysters, Plin lib. 8. cap 27. the wild goats of Dictamnus, for drawing out of darts and healing wounds; the swallow, the use of celandine for repairing the fight, &c *ibid.* Of the truth of which, because I am not fully fatissied, I shall make no inference from them.

Thirdly, I shall remark the care that is taken for the prefervation of the weak. and fuch as are exposed to the injuries, and preventing the increase of fuch as are noifome and hurtful : for as it is a demonstration of the divine power and magnificence to create fuch variety of animals, not only great, but fmall, not only firing and couragious, but alfo weak and timorous; fo is it no lefs argument of his wifdom to give to thefe means, and the power and skill of using them, to preferve themselves from the violence and injuries of those. That of the weak, fome fhould dig vaults and holes in the earth, as rabbets, to fecure themfelves and their young; others fhould be armed with hard fhells; others with prickles; the reft that have no fuch armature, should be endued with great swiftness or pernicity; and not only fo, but fome alfo have their eves flanding fo prominent, as the hare, that they can fee as well behind as before them, that fo they may have their enemy always in their eye; and

121

long, hollow, moveable ears, to receive and convey the least found, or that which comes from far, that they be not fuddenly furprifed or taken (as they fay) napping. Moreover, it is remarkable, that in this animal, and in the rabbet, the muscles of the loins and hind legs are extraordinarily large in proportion to the reft of the body, or those of other animals, as if made on purpose for swiftnefs, that they may be able to escape the teeth of fo many enemies as continually purfue and chafe them. Add hereto the length of their hind legs, which is no fmall advantage to them, as is noted by dame Julan Barns, in an antient dialogue in verse between the huntsman, and his man: the man there asks his master, what is the reason, why the hare when the is near fpent makes up a hill? The mafter answers, that nature hath made the hinder-legs of the hare longer than the fore-legs; by which means the climbs the hill with much more eafe than the dogs, whole legs are of equal length, and fo leaves the dogs behind her, and many times efcapes away clear, and faves her life. This last observation, I must confess my felf to have borrowed out of the papers of my honoured friend Mr John Aubrey, which he was pleafed to give me a fight of.

I might here add much concerning the wiles and rules, which thefe timid creatures make ufe of to fave themfelves, and efcape their perfecutors, but that I am fomewhat diffident of the truth of those stories and relations. I shall only aver what myself have fometimes observed of a duck, when closely purfued by a water-dog; she not only dives to fave herself, which yet she never does but when driven to an exigent, and just ready to be caught, because it is painful and difficult to her) but when the comes up again, brings not her whole body above water, but only her bill, and part of her

122.

head, holding the reft underneath, that fo the dog, who the mean time turns round and looks about him, may not efpy her, till the have recovered breath.

As for fheep, which have no natural weapons or means to defend or fecure themfelves, neither heels to run, nor claws to dig; they are delivered into the hand, and committed to the care and tuition of man; and ferving him for divers ufes, are nourifhed and protected by him; and fo enjoying their beings for a time, by this means propagate and continue their fpecies: fo that there are none defitute of fome means to preferve themfelves, and their kind; and thefe means fo effectual, that notwithftanding all the endeavours and contrivances of man and beaft to deftroy them, there is not to this day one fpecies loft of fuch as are mentioned in hiftories, and confequently and undoubtedly neither of fuch as were at firft created.

Then for birds of prey, and rapacious animals, it is remarkable what Aristotle observes, that they are all folitary, and go not in flocks, Fautavoxar uder ayeraion, no birds of prey are gregarious. Again, that fuch creatures do not greatly multiply, rou yaufwvvxwv enigoroza mavra. They for the most part breeding and bringing forth but one, or two, or at leaft, a few young ones, at once: whereas they that are feeble and timorous are generally multiparous; or, if they bring forth but a few at once, as pigeons, they compendate that by their often breeding, viz. every month but two throughout the year; by this means providing for the continuation of their kind. But for the fecurity of theie rapacious birds, it is worthy the noting, that becaufe a prey is not always ready, but perhaps they may fail of one fome days, nature hath made them patient of a long inedia, and befides, when they

124

light upon one, they gorge themfelves fo therewith, as to fuffice for their nourifhment for a confiderable time.

Fourthly, I shall note the exact fitness of the parts of the bodies of animals to every one's nature and manner of living. A notable inftance of which we have in the fwine, a creature well known, and therefore what I shall observe of it is obvious to every man. His proper and natural food being chiefly the roots of plants, he is provided with a long and firong fnout; long, that he might thruft it to a fufficient depth into the ground, without offence to his eyes; ftrong and conveniently formed for the rooting and turning up the ground. And befides, he is endued with a notable fagacity of fcent, for the finding out fuch roots as are fit for his food. Hence in Italy, the ufual method for finding and gathering of trufles, or fubterraneous mufhromes, (called by the Italians tartufali, and in Latin tubera terrae) is, by tying a cord to the hind-leg of a pig, and driving him before them into fuch pastures, as usually produce that kind of mushrome. and observing where he ftops and begins to root, and there digging, they are fure to find a trufle; which when they have taken up, they drive away the pig to fearch for more. So I have myfelf obferved, that in passures where there are earth-nuts to be found up and down in feveral patches, though the roots lie deep in the ground, and the stalks be dead long before and quite gone, the fwine will by their fcent eafily find them out, and root only in those places where they grow.

This rooting of the hog in the earth, calls to mind another inftance of like nature, that is the Porpeffe, which, as his English name Porpeffe, *i. e.* \* Porc pefce, imports, resembles the hog, both in the firength of his snout, and also in the manner of \* Swine-fish

Part I.

Part I.

getting his food by rooting; for we found the ftomach of one we diffected, full of fand-eels, or launces, which for the most part lie deep in the fand, and cannot be gotten but by rooting or digging there. We have feen the country people in Cornwall, when the tide was out, to fetch them out of the fand, with iron-hooks thrust down under them, made for that purpose.

Furthermore, that very action for which the fwine is abominated, and looked upon as an unclean and impure creature, namely, wallowing in the mire, is defigned by nature for a very good end and ufe, viz. not only to cool his body, (for the fair water would have done that as well, nay, better, for commonly the mud and mire in fummertime is warm;) but alfo to fuffocate and deftroy lice, fleas, and other noifome and importunate infects, that are troublefome and noxious to him. For the fame reafon do all the poultry-kind and divers other birds, bafk themfelves in the duft in fummer time and hot weather, as is obvious to every one to obferve.

2. A fecond and no lefs remarkable inftance, I fhall produce, out of Dr More's *intidotc against atheism*, lib. 2. cap. 10 in a poor and contemptible quadruped, the mole.

First of all, (faith he) Her dwelling being under ground, where nothing is to be feen, nature hath to obfcurely fitted her with eyes, that naturalists can fcarcely agree, whether she hath any sight at all or no. [In our observation, moles have perfect eyes, and holes for them through the skin, fo that they are outwardly to be seen by any that shall dilligently fearch for them; though indeed they are exceeding small, not much bigger than a great pin's head.] But for amends, what she is capable. of for her defence and warning of danger, she has yery eminently conferred upon her; for the is

very quick of hearing : [doubtlefs her fubterrancous vaults are like trunks to convey any found a great way.] And then her fhort tail and fhort legs, but broad fore-feet armed with fharp claws, we fee by the event to what purpole they are, the fo fwiftly working herfelf under ground, and making her way fo fast in the earth, as they that behold it cannot but admire it. Her legs therefore are fhort, that fhe need dig no more than will ferve the mere thickness of her body: and her fore-feet are broad, that the may fcoup away much earth at a time; and she has little or no tail, because she courfes it not on the ground like a rat or moufe, but lives under the earth, and is fain to dig herfelf a dwelling there; and fhe making her way through fo thick an element, which will not eafily yield as the water and air do, it had been dangerous to draw fo long a train behind her; for her enemy might fall upon her rear, and fetch her out before the had perfected and got full possession of her works: which being fo, what more palpable argument of providence than fhe?

Another instance in quadrupeds might be the tamandua, or ant-bear, defcribed by Marcgrave and Pifo, who faith of them, that they are nightwalkers, and feek their food by night. Being kept tame, they are fed with flefh, but it must be minced finall, because they have not only a flender and tharp head and fnout, but allo a narrow and toothlefs mouth; their tongue is like a great luteftring, (as big as a goofe quill) round, and in the greater kind (for there are two fpecies) more than two foot long, and therefore lies doubled in a channel between the lower garts of the checks. This when hungry they thrust forth, being well moistened, and lay upon the trunk of trees, and when it is covered with ants, fuddenly draw it back into their mouths; if the ants lie fo deep, that they cannot come at them, they dig up the earth with their long and ftrong claws, wherewith for that purpofe their fore-feet are armed So we fee how their parts are fitted for this kind of diet, and no other; for the catching of it, and for the eating of it, it requiring no comminution by the teeth, as appears alfo in the chamaelion, which is another quadruped that imitates the tamandua in this property of darting out the tongue to a great length, with wonderful celerity; and for the fame purpofe too of catching of infects

Befides these quadrupeds, there are a whole genus of birds, called pici marcii, or wood-peckers, that in like manner have a tongue which they can shoot forth to a very great length, ending in a sharp ftiff bony rib, dented on each fide; and at pleafure thrust it deep into the holes, clefts, and crannies of trees, to stab and draw out coffi, or any other infects lurking there, as also into ant-hills, to ftrike and fetch out the ants and their eggs Moreover, they have fhort, but very ftrong legs, and their toes stand two forewards, two backwards, which disposition (as Aldrovandus well notes) nature, or rather the wildom of the Creator, hath granted to wood-peckers, becaufe it is very convenient for the climbing of trees, to which also conduces the fliffnefs of the feathers of their tails, and their bending downward, whereby they are fitted to ferve as a prop for them to lean upon, and bear up their bodies. As for the chamaelion, he imitates the woodfpite, not only in the make, motion, and use of his. tongue for striking ants, flies, and other infects; but also in the fite of his toes, whereby he is wonderfully qualified to run upon trees, which he does with that fwiftnefs, that one would think he flew, whereas upon the ground he walks very clumfily and ridiculoufly. A full description of the outward and inward parts of this animal, may

Part I.

be feen at the end of Penarolus' Obfervat. It is to be noted, that the chamaelion, though he hath teeth, uses them not for chewing his prey, but fwal-

lows it immediately.

I shall add two instances more in birds, and those are:

1. The fwallow, whofe proper food is fmall beetles, and other infects flying about in the air; as we have found by diffecting the stomachs both of old ones and neftlings : which is wonderfully fitted for the catching of these animalcules; for fhe hath long wings, and a forked tail, and fmall feet, whereby she is, as it were, made for swift flight, and enabled to continue long upon the wing, and to turn nimbly in the air: and fhe hath alfo an extraordinary wide mouth, fo that it is very hard for any infect, that comes in her way, to escape her. It is thought to be a fign of rain, when this bird flies low near to the ground; in which there may be fome truth; because the infects which the hunts may at fuch times, when the fuperior air is charged with vapours, have a fense of it, and defcend near the earth. Hence, when there are no more infects in the air, as in wintertime, those birds do either abscond, or betake themfelves into hot countries.

2. The colymbi, or duckers, or loons, whofe bodies are admirably fitted and conformed for diving under water, being covered with a very thick plumage, and the fuperficies of their feathers fo fmooth and flippery, that the water cannot penetrate or moiften them; whereby their bodies are defended from the cold, the water being kept at a diffance, and fo poifed, that by a light impulfe they may eafily afcend in it. Then their feet are fituate in the hindermoft part of their body, whereby they are enabled, fhooting their feet backwards, and ftriking the water upwards, to plunge themfelves down into it with great facility, and likewife, to move forewards therein. Then their legs are made flate and broad, and their feet cloven into toes with appendant membranes on each fide, by which configuration they eafily cut the water, and are drawn forward, and fo take their ftroke backwards; and befides, I conceive, that by means of this figure, their feet being moved to the right and left hand, ferve them as a rudder to enable them to turn under water: for fome conceive that they fiim easier under water than they do above it. How they raife themfelves up again, whether their bodies emerge of themfelves by their lightnefs, or whether by striking against the bottom, in manner of a leap, or by fome peculiar motion of their legs, I cannot determine. That they dive to the bottom is clear; for that in the ftomachs both of the greater and leffer kinds we found grafs and other weeds, and in the leffer kind nothing elfe; though both prey upon fifh. Their bills are made ftraight and tharp for the eafier cutting of the water, and ftriking their prey. Could we fee the motions of their legs and feet in the water, then we' thould better comprehend how they afcend, descend, and move to and fro; and discern how wifely and artificially their members are formed and adapted to those uses.

II. In birds, all the members are most exactly fitted for the use of flying. First, The muscles which ferve to move the wings, are the greatest and strongest, because much force is required to the agitation of them; the underside of them is also made concave, and the upper convex, that they may be easily listed up, and more strongly beat the air, which by this means doth more result the defcent of their body downward. Then the trunk of their body doth fomewhat resemble the hull of a 120

ship; the head, the prow, which is for the most part small, that it may the more easily cut the air, and make way for their bodies; the train ferves to steer, govern, and direct their flight; and however it may be held erect in their ftanding, or walking, yet is directed to lie almost in the fame plain with their backs or rather a little inclining, when they fly. That the train ferves to fleer and direct their flight, and turn their bodies like the rudder of a ship, is evident in the kite, who, by a light turning of his train, moves his body which way he pleases, Idem videntur artam gubernandi docuisse caudae flexibus, in coelo monstrante natura quad opus effet in profundo, Plin. lib 10. c. 10. " They " feem to have taught men the art of fteering a " fhip, by the flexures of their tails, nature shewing " in the air what was needful to be done in the deep." And it is notable that Aristotle truly observes, that whole-footed birds, and those that have long legs, have for the most part, short tails; and therefore whilft they fly, do not, as others, draw them up to their bellies, but ftretch them at length backwards that they may ferve to fteer and guide them inftead of tails. Neither doth the tail ferve only to direct and govern the flight, but also parly to support the body, and keep it even; wherefore, when fpread, it lies parallel to the horizon, and ftands not perpendicularly to it, as fifhes do. Hence birds that have no tails, as fome forts of colymbi, or duck- . ers, fly very inconveniently with their bodies almost erect.

To this I shall add farther, that the bodies of birds are small in comparison of quadrupeds, that they may more eafily be fupported in the air during their flight; which is a great argument of wifdom and defign: elfe why should we not see species of pegafi, or flying horses, of griffins, of harpies, and an hundred more, which might make a

shift to live well enough, notwithstanding they could make no use of their wings : befides, their bodies are not only fmall, but of a broad figure, that the air may more refift their defcents : they are alfo hollow and light; nay, their very bones are light: for though those of the legs and wings are folid and firm, yet have they ample cavities, by which means they become more rigid and ftiff; it being demonstrable, that a hollow body is more stiff and inflexible than a folid one of equal fubitance and matter. Then the feathers also are very light, yet their shafts hard and stiff, as being either empty, or filled with a light and fpungy fubstance, and their webs are not made of continued membranes; for then, had a rupture by any accident been made in them, it could not have been confolidated; but two series of numerous pumulae, or contiguous filaments, furnished all along with hooks on each fide, whereby catching hold on one another, they flick fast together; so that when they are rufiled, or discomposed, the bird with her bill can eafily preen them, and reduce them to their due polition again. And for their former cohaefion, the wife and bountiful Author of nature hath provided and placed on the rump two glandules, having their excretory veffels, round which grow feathers in form of a pencil, to which the bird turning her head, catches hold upon them with her bill, and a little compreffing the glandules, fqueezes out and brings away therewith an oily pap, or liniment, most fit and proper for the inunction of the feathers, and caufing their little filaments more ftrongly to cohere. And is not this strange and admirable, and argumentative of providence, that there should be such an unguent, or pap, prepared; fuch an open veffel to excern it into, to receive and retain it; that the bird should know where it is fituate, and how and to what purposes to use it? And because the bird is

Part I.

to live many years, and the feathers in time-would. and must necessarily be worn and shattered, nature hath made provision for the caffing and renewing of them yearly. Moreover, those large bladders or membranes, extending to the bottoms of the bellies of birds, into which the breath is received, conduce much to the alleviating of the body, and facilitating the flight: for the air received into these bladders, is by the heat of the body extended into twice, or thrice, the dimenfions of the external, and fo must needs add a lightness to the body. And the bird when she would defcend, may either compress this air by the muscles of the abdomen, or expire as much of it as may enable her to defcend fwifter, or flower, as the pleafes. I might add the ufe of the feathers in cherishing and keeping the body warm; which, the creature being of finall bulk, must needs stand in great flead against the rigour of the cold. And for this reason we see, that water-fowls, which were to fwim, and fit long upon the cold water, have their feathers very thick fet upon their breafts and bellies, and besides a plentiful down there growing, to fence against the cold of the water,

and to keep off its immediate contact That the tails of all birds in general do not conduce to their turning to the right and left, according to the common opinion, but rather for their afcent and defcent, fome modern philotophers have obferved and proved by experiment; for that if you pluck off. for inftance, a pigeon's tail, the will neverthelefs, with equal facility, turn to and fro: which upon fecond thought, and further confideration, I grant to be true, in birds whofe tails are pointed, and end in a right line : but in those that have forked tails, Autopfy convinceth us that it hath this use, and therefore they pronounce too boldly of all in general. For it is manifeft

to fight, that the forked-tail kite, by turning her train fideways, elevating one horn, and depreffing the other, turns her whole body. And doubtlefs, the tail hath the fame ufe in fwallows, who make the most fudden turns in the air of any birds, and have all of them forked tails.

III. As for filhes; their bodies are long and flender, or elfe thin, tor the most part, for their more easy fwimming, and dividing the water. The wind-bladder, wherewith most of them are furnished, ferves to poile their bodies, and keep them equiponderant to the water, which elfe would fink to the bottom, and lie groveling there, as hath, by breaking the bladder, been experimentally found, By the contraction and dilation of this bladder, they are able to raife or fink themfelves at pleafure, and continue in what depth of water they lift. The fins, made of griftly spokes, or rays, connected by membranes fo that they may be contracted, or extended like womens fans, and furnished with muscles for motion, serve partly for progression, but chiefly to hold the body upright; which appears in that when they are cut off it wavers to and fro, and fo foon as the fifh dies, the belly turns upwards. The great strength by which fishes dart themfelves forward with incredible celerity, like an arrow out of a bow, lies in their tails; their fins, mean time, left they fhould retord their motion, being held clofe to their bodies. And therefore almost the whole musculous fleth of the body. is beftowed upon the tail and back, and ferves for the vibration of the tail, the heavinefs and corpulency of the water requiring a great force to divide it.

In cetaceous fishes, or, as the Latins call them, fea beatts\*, the tail hath a different polition from what \* Beiluae Marmae.

it hath in all other fifhes; for whereas in thefe'it is erected perpendicular to the horizon, in them it lies parallel thereto, partly to fupp'y the use of the hinder pair of fins which these creatures lack, and partly to raile and deprefs the body at pleafure. For it being neceffary that these fishes should frequently afcend to the top of the water to breathe, or take in and let out the air, it was fitting and convenient that they fhould be provided with an organ to facilitate their afcent and defcent, as they had occafion. And as for the turning of their bodies in the water, they must perform that as birds do, by the motion of one of their fins, while the other is quiefcent. It is no lefs remarkable in them, that their whole body is encompafied round with a copious fat, which our fishermen call the blubber, of a great thicknefs; which ferves partly to poife their bodies, and render them equiponderant to the water; partly to keep off the water at fome diftance from the blood, the immediate contact whereof would be apt to chill it; and partly alfo for the fame use that cloathes ferve us, to keep the fifh warm, by reflecting the hot fteams of the body, and fo redoubling the heat; as we have before noted. For we see, by experience, that fat bodies are nothing near fo fenfible of the impreffions of cold as lean. And have observed fat hogs to have lain abroad in the open air upon the cold ground in winter nights; whereas the lean ones have been glad to creep into their cotes, and lie upon heaps to keep themfelves warm.

I might here take notice of those amphibious creatures, which we may call acquatick quadrupeds (though one of them there is that hath but two feet, viz the manati, or fea-cow) the beaver, the otter, the phoca, or fea calf, the water rat and the frog, the toes of whose feet are joined by membranes, as in water fowls, for fwimming, and who have very fmall ears, and ear-holes, as the cetaceous fifnes have, for hearing in the water.

To this head belongs the adapting of the parts that minifter to generation in the fexes one to another; and in creatures that nourifh their young with milk, the nipples of the breaft to the mouth and organs of fuction; which he muft needs be wilfully blind and void of fenfe, that either difcerns not, or denies to be intended and made one for the other. That the nipples fhould be made fpungy, and with fuch perforations, as to admit paffage to the milk when drawn, otherwife to retain it; and the teeth of the young either not fprung, or fo foft and tender, as not to hurt the nipples of the dam, are effects and arguments of providence and defign.

A more full description of the breasts and nipples I meet with, in a book of that ingenious anatomist and physician, Antonius Nuck, entitled, Adenographia Curiofa, cap 2 He makes the breasts to be nothing but glandules of that fort they call conglomeratae, made up of an infinite number of little knots, or kernels, each whereof has its excretory vessel, or lactiferous duct ; three, or four, or five of these prefently meet, and join into one fmall trunk, in like manner do the adjacent glandules meet and unite : feveral of these leffer trunks, or branches, concurring, make up an excretory veffel of a notable bignefs, like to that of the pancreas, but not fo long, yet fufficiently large, to receive and retain a good quantity of milk; which before it enters the nipple; is again contracted, and ftraitened to that degree, that it will scarce admit a small briftle. Who now can be fo impudent as to deny, that all this was contrived and defigned purpofely to retain the milk, that it should not flow out of itself, but easily be drawn out by pressure and

Part I.

fuction; or to affirm that this fell out accidentally, than which there could not have been a more ingenious contrivance for the use to which it is employed, invented by the wit of man?

To this head of the fitness of the parts of the body to the creature's nature, and manner of living, belongs that observation of Aristotle, Tay opvilay boa nev xantwoxa oapropaya mavra. " Such birds as " have crooked beaks and talons, are all carni-" vorous ;" and fo of quadrupeds, xap xaposovra, carnivora omnia. All that have ferrate teeth, are carnivorous. This observation holds true concerning all European birds; but I know not but that parrots may be an exception of it. Yet it is remarkable, that fuch birds as are carnivorous have no gizzard, or musculous, but a membranous stomach; that kind of food needing no fuch grinding or comminution as feeds do, but being torn to ftrings, or fmall flakes, by the beak, may be eafily concocted by a membranous ftomach.

To the fitnefs of all the parts and members of animals to their respective uses, may also be referred another observation of the fame Aristotle, Havra ra Zwa apriss EXH Assas " All animals have even " feet, not more on one fide than another ;" which, if they had, would either hinder their walking, or hang by, not only useles, but also burthensome. For though a creature might make a limping fhift to hop, fuppofe with three feet, yet nothing fo conveniently or fteddily to walk, or run, or indeed to fland: fo that we fee nature hath made choice of what is most fit, proper, and useful. They have also not only an even number of feet, anfwering by pairs one to another, which is as well decent as convenient, but those too of an equal length, I mean, the feveral pairs; whereas, were these on one fide longer than they on the other, it

## in the CREATION.

## Part I.

would have caufed an inconvenient halting or limping in their going.

I shall mention but one more observation of Arifotle, that is, IIT nvov Movor ouder, " There is no creature " only volatile," or no flying animal, but hath feet as well as wings, a power of walking or creeping upon the earth, becaufe there is no food, or at leaft not fufficient food, for them to be had always in the air; or if in hot countries we may suppose there is, the air being never without ftore of infects flying about in it, yet could fuch birds take no reft; for, having no feet, they could not pearch upon trees; and if they fhould alight upon the ground, they could by no means raife themfelves any more, as we fee those birds which have but short feet. as the fwift and martinet, with difficulty do: belides, they would want means of breeding, having no where to lay their eggs, to fit, hatch, or brood their young. As for the ftory of the Manucodiata, or bird of Paradife, which in the former ages was generally received and accepted for true. even by the learned, it is now difcovered to be a fable, and rejected and exploded by all men; those birds being well known to have legs and feet as well as others, and those not short, small, or feeble ones, but fufficiently great and ftrong, and armed with crooked talons, as being the members of birds of prev.

It is alfo very remarkable, that all flying infects fhould be covered with fhelly fcales, like armour, partly to fecure them from external violence, from, injuries by blows and preffures; partly to defend, their tender mufcles from the heat of the fun beams, which would be apt to parch and dry them up, being of fmall bulk; partly alfo to reftrain the fpirits and to prevent their evaporation.

I shall now add another instance of the wisdom of nature, or rather the God of nature, in adapt-

ing the parts of the fame animal one to another, and that is, the proportioning the length of the neck to that of the legs. For feeing terrestrial animals, as well birds as quadrupeds, are endued with legs, upon which they fland, and wherewith they tranffer themselves from place to place, to gather their food, and for other conveniencies of life, and fo the trunk of their body must needs be elevated above the superficies of the earth, fo that they could not conveniently either gather their food, or drink, if they wanted a neck; therefore nature hath not only furnished them therewith, but with fuch an one as is commenfurable to their legs, except here the elephant, which hath indeed a fhort neck, for the exceffive weight of his head and teeth, which to a long neck would have been insupportable, but is provided with a trunk, wherewith, as with a hand, he takes up his food and drink, and brings it to his mouth. I fay, the necks of birds and quadrupeds are commenfurate to their legs, fo that they which have long legs, have long necks, and they that have fhort legs, fhort ones, as is feen in the crocodile, and all lizards; and those that have no legs, as they do not want necks, fo neither have they any, as fifhes. This equality between the length of the legs and neck, is especially seen in beasts that feed conftantly upon grafs, whofe necks and legs are always very near equal; very near, I fay, becaufe the neck must necessarily have fome advantage, in that it cannot hang perpendicularly down, but must incline a little : moreover, because this fort of creatures must needs hold their heads down in an inclining posture for a confiderable time together, which would be very laborious and painful for the muscles, therefore on each fide the ridge of the vertebres of the neck, nature hath placed an enveveupaois, or nervous ligament, of a great thick-

Part I.

138

nefs and ftrength, apt to ftretch, and fhrink again, as need requires, and void of fenfe, extending fro m the head (to which, and the next vertebres of the neck, it is fastened at that end) to the middle vertebres of the back, (to which it is knit at the other) to affift them to support the head in that pofture; which anovenpoors is taken notice of by the vulgar by the name of fixfax, or pack-wax, or white-leather. It is also very observable in fowls that wade in the water, which having long legs, have alfo necks answerably long; only in these too there is an exception, exceeding worthy to be noted : for fome water-fowl, which are palmipeds, or whole-footed, have very long necks, and yet but fhort legs, as fwans and geele, and fome Indian birds; wherein we may observe the admirable providence of nature. For fuch birds as were to fearch and gather their food, whether herbs or infects, in the bottom of pools and deep waters, have long necks for that purpofe, though their legs, as is most convenient for fwimming, be but fhort: whereas there are no land-fowl to be feen with fhort legs, and long necks, but all have their necks in length commenfurate to their legs. This inftance is the more confiderable, becaufe the atheifts ufual fiam will not here help them out. For (fay they) there were many animals of difproportionate parts, and of abfurd and uncouth shapes produced at first, in the infancy of the world; but, becaufe they could not gather their food, to perform other functions necessary to maintain life, they foon perished, and were lost again. For these birds we see can gather their food upon land conveniently enough, notwithstanding the length of their necks. For example ; geele graze upon commons, and can feed themselves fat upon land; yet is there not one land-bird which hath its neck thus difproportionate to its legs, nor one water

Part I.

one neither, but fuch as are defined by nature in fuch a manner as we have mentioned to fearch and gather their food. For nature makes not a long neck to no purpofe.

Laftly, Another argument of providence and counfel relating to animals, is, the various kinds of voices the fame animal uses on diverse occasions, and to different purpofes. Hen-birds, for example, have a peculiar fort of voice when they would call the male; which is fo eminent in quails, that it is taken notice of by men, who by counterfeiting this voice with a quail-pipe, eafily draw the cocks into their fnares. The common hen, all the while fhe is broody, fits, and leads her chickens, uses a voice which we call clocking; another fle employs when the calls her chickens to partake of any food the hath found for them; upon hearing whereof, they fpeedily run to her: another when upon fight of a bird of prey, or apprehension of any danger, she would scare them, bidding them, as it were, to shift for themfelves, whereupon they fpeedily run away, and feek shelter among bushes, or in the thick grafs, or elfewhere difperfing themfelves far and wide. These actions do indeed necessarily infer knowledge and intention of, and direction to the ends and uses to which they ferve, not in birds themfelves, but in a fuperior agent, who hath put an inftinct in them of using fuch a voice upon fuch an occafion; and in the young, of doing that upon hearing of it, which by providence was intended. Other voices the hath when angry, when the hath laid an egg, when in pain, or great fear, all fignificant; which may more eafily be accounted for, as being effects of the feveral paffions of anger, grief, fear, joy : which yet are all argumentative of providence, intending their feveral fignifications and ules.

I might also instance in quadrupeds; some of

149

which have as great a diverfity of voices as hens themfelves; and all of them fignificant; for example, that common domeftick animal the cat, as is obvious to every one to obferve, and therefore I shall not spend time to mention particulars.

Object. But against the uses of several bodies I have instanced in, that refer to man, it may be objected, That these uses were not designed by nature in the formation of the things, but that the things were by the wit of man accommodated to those uses.

To which I answer, with Dr More, in the Appendix to his Antidote against Atheism, That the feveral useful dependencies of this kind, (viz. of ftones, timber, and metals, for building of houfes or fhips, the magnet for navigation, &c. Fire for melting of metals, and forging of inftruments for the purpofes mentioned) we only find, not make them. For whether we think of it or no, it is, for example, manifest, that fuel is good to continue fire, and fire to melt metals, and metals to make inftruments to build fhips and houfes, and fo on. Wherefore it being true, that there is fuch a fubordinate usefulness in the things themfelves that are made to our hand, it is but reafon in us to impute it to fuch a caufe as was aware of the usefulness and ferviceableness of its own works. To which I shall add, that fince we find materials fo fit to ferve all the necefficies and conveniencies, and to excercife and employ the wit and induftry of an intelligent and active being; and fince there is fuch an one created that is endued with skill and ability to use them, and which by their help is enabled to rule over and fubdue all inferior creatures, but without them had been left neceffitous, helplefs, and obnoxious to injuries above any other; and fince the omniscient Creator could not but know all the uses to which they might and

would be employed by man; to them that acknowledge the being of a deity, it is little lefs than a demonstration, that they were created intentionally, I do not fay only, for those uses.

Methinks, by all this provision for the use and fervice of man, the Almighty interpretatively speaks to him in this manner: " I have now placed thee in a fpacious and well furnished world; I have endued thee with an ability of understanding what is beautiful and proportionable, and have made that which is to agreeable and delightful to thee; I have provided thee with materials whereon to exercife and employ thy art and ftrength; I have given thee an excellent inftrument, the hand, accommodated to make use of them all; I have diftinguished the earth into hills and vallies, and plains, and meadows, and woods; all thefe parts, capable of culture and improvement by thy induftry; I have committed to thee for thy affiftance in thy labours of plowing, and carrying, and drawing, and travel, the laborious ox, the patient afs, and the ftrong and ferviceable horfe ; I have created a multitude of feeds for thee to make choice out of them, of what is most pleafant to thy tafte, and of most wholesome and plentiful nourifhment; I have also made great variety of trees, bearing fruit both for food and phyfic, those too capable of being meliorated and improved by transplantation, stercoration, incifion, pruning, watering, and other arts and devices Till and manure thy fields, fow them with thy feeds; extirpate noxious and unprofitable herbs; guard them from the invation and spoil of beafts; clear and fence in thy meadows and pastures; drefs and prune thy vines, and fo rank and difpose them as is most fuitable to the climate; plant thee orchards, with all forts of fruittrees, in fuch order as may be most beautiful to

Part I.

the eye, and most comprehensive of plants; Gardens for culinary herbs, and all kinds of falleting; for delectable flowers, to gratify the eye with their agreeable colours and figures, and the fcent with their fragrant odours; for odoriferous and evergreen fhrubs and fuffrutices; for exotic and medicinal plants of all forts; and difpofe them in that comely order, as may be both pleafant to behold, and commodious of accels. I have furnished thee with all materials for building, as ftone, and timber, and flate, and lime, and clay, and earth, whereof to make bricks and tiles; deck and befpangle the country with houses and villages convenient for thy habitation, provided with outhouses and stables for the harbouring and shelter of thy cattle, with barns and granaries for the reception, and cuftody, and ftoring up thy corn and fruits. I have made thee a fociable creature, Zwov πολιτιχον for the improvement of thy underftanding by conference, and communication of observations and experiments; for mutual help, and affistance, and defence; build thee large towns and cities, with ftraight and well paved ftreets, and elegant rows of houses, adorned with magnificent temples for my honour and worthip, with beautiful palaces for thy princes and grandees with flately halls for publick meetings of the citizens and their feveral companies, and the feffions of the court of judicature; befides publick porticos and aqueducts. I have implanted in thy nature a defire of feeing strange and foreign, and finding out, unknown countries, for the improvement and advance of thy knowledge in geography, by observing the bays, and creeks, and havens, and promontories, the out-lets of rivers the fituation of the maritime towns and cities, the longitude and latitude, &c. of those places: In politicks, by noting their government, their

Part I.

manners, laws and cuftoms, their diet and medicines, their trade and manufactures, their houfes and buildings, their exercises and sports, &c. In phyfiology, or natural hiftory, by fearching out their natural rarities, the productions both of land and water; what species of animals, plants, and minerals, of fruits and drugs are to be found here, what commodities for bartering and permutation, whereby thou mayest be enabled to make large additions to natural history, to advance those other sciences, and to benefit and enrich thy country by increase of its trade, and merchandize. I have given thee timber and iron to build the hulls of thips, tall trees for mafts, flax and hemp for fails, cables, and cordage, for rigging. I have armed thee with courage and hardineis to attempt the feas, and traverfe the fpacious plains of that liquid element. I have affifted thee with a compass, to direct thy course when thou shalt be out of all ken of land, and have nothing in view but fky and water. Go thither for the purpofes before-mentioned, and bring home what may be ufeful and beneficial to thy country in general, or thyfelf in particular."

I perfuade myfelf, that the bountiful and gracious Author of man's being and faculties, and all things elfe, delights in the beauty of his creation, and is well pleafed with the induftry of man, in adorning the earth with beautiful cities and caftles; with pleafant villages and country-houfes; with regular gardens and orchards, and plantations of all forts of fhrubs, and herbs, and fruits, for meat, medicine, or moderate delight; with fhady woods and groves, and walks fet with rows of elegant trees; with paftures cloathed with flocks, and vallies covered with corn, and meadows burthened with grafs and whatever elfe differenceth a civil and well cultivated region, from a barren and defolate wildernefs.

Part I.

If a country thus planted and adorned, thus polished and civilized, thus improved to the height by all manner of culture for the fupport and fuftenance, and convenient entertainment of innumerable multitudes of people, be not to be preferred before a barbarous and inhospitable Scythia, without houfes, without plantations, without corn-fields and vineyards, where the roving herds of the favage and truculent inhabitants transfer themfelves from place to place in waggons, as they can find pasture and forage for their cattle, 1 and live upon milk, and flesh roafted in the fun, at the pomels of their faddles; or a rude and unpolifhed America, peopled with flothful and naked Indians, instead of well-built houfes, living in pitiful huts and cabins, made of poles fet end-ways; then furely the brute beafts condition, and manner of living, to which, what we have mentioned doth nearly approach, is to be effeemed better than man's, and wit and reafon was in vain bestowed on him.

Laftly, I might draw an argument of the admirable art and skill of the Creator and composer of them; from the incredible smallness of some of those natural and enlivened machines, the body of animals.

Any work of art of extraordinary finenefs and fubtlety, be it but a fmall engine or movement, or a curious carved or turned work of ivory or metals, fuch as those cups turned of ivory by Ofwaldus Nerlinger of Suevia, mentioned by Joan. Faber, in his expositions of Recchus his Mexican animals, which all had the perfect form of cups, and were gilt with a golden border about the brim, of that wonderful smallness, that Faber himself put a thousand of them into an excavated pepper corn; and when he was weary of the work, and yet had

not filled the veffel, his friend, John Charlus Schad, that shewed them him, put in four hundred more. Any fuch work, I fay, is beheld with admiration, and purchased at a great rate, and treasured up as a fingular rarity in the mufacums and cabinets of the curious, and as fuch is one of the first things thewed to travellers and strangers. But what are these for their fineness and parvity (for which alone, and their figure, they are confiderable) to those minute machines endowed with life and motion, I mean, the bodies of those animalcula, not long fince difcovered in pepper-water, by Mr Levenhoek, of Delft, in Holland, (whofe obtervations were confirmed and improved by our learned and worthy countryman, Dr Robert Hook) who tells us, that fome of his friends (whofe teftimonials he defired) did affirm, that they had feen 10000, others 30000, others 450001 little living creatures, in a quantity of water no bigger than a grain of millet; and yet he made it his request to them, that they would only justify (that they might be within compass) half the number that they believed each of them faw in the water. From the greatest of these numbers he infers, that there will be 8280000 of these living creatures feen in one drop of water; which number (faith he) I can with truth affirm, I have difcerned. This proceeds he) doth exceed belief: But I do affirm, if a large grain of fand were broken into. 8000000 of equal parts, one of these would not exceed the bigness of one of those creatures. Dr Hook tells us, that after he had difcovered vaft multitudes of these exceeding small creatures which Mr Leuenhoek had described, upon making use of other lights and glaffes, he not only magnified those he had discovered to a very great bigness, but difcovered many other forts very much fmaller than them he first faw, and some of them so exceed-

Part I.

ing fmall, that millions of millions might be contained in one drop of water. If Pliny confidering fuch infects as were known to him, and those were none but what were visible to the naked eye, was moved to cry out, That the artifice of nature was no where more confpicuous than in these: And again, In his tum parvis atque tum nullis quae ratio, quanta vis, quam inextricabilis perfectio? And again, Rerum natura nusquam magis quam in minmis tota est, Hist. Nat. 1. 11. c. 1. What would he have faid, if he had seen animals of so stupendous simalines, as I have mentioned! How would he have been rapt into an extracy of astonishment and admiration!

Again: If confidering the body of a guat, (which by his own confession is none of the least of infects) he could make fo many admiring queries, . Where hath nature disposed so many fenses in a " gnat ?' Ubi visum praetendit ? Ubi gustatum applicavit! Ubi odoratum inseruit? Ubi vero truculentam illam et portione maximam vocem ingeneravit? Qua subtilitate pennas adnexuit? Praelongavit pedum crura? Disposuit jejunam caveam uti alvum? avidam sanguinis et potissimum humani sitim accendit? Telum vero perfodiendo tergori quo soiculavit ingenio? Atque ut in capaci, cum cerni non possie exilitas, ita reciproca geminavit arte, ut fodiendo acaminatum pariter forbendeque filtulohum effet. Which words should I translate, would lose of their emphasis and elegancy; if, I fay, he could make fuch queries about the members of a gnu, what may we make; and what would he in all likelihood have made, had he feen thefe incredibly finak living creatures? How would be have admired the immense subtility (as he phrases it) of their parts? For to use Dr Hook's words in his Microfcopium, p. 103. If these creatures be fo exceeding finall, what must we think of their muscles and other parts?

Certain it is, that the mechanism by which nature performs the mufcular motion, is exceeding fmall and curious, and to the performance of every mulcular motion, in greater animals at leaft, there are not fewer diffinct parts concerned than many millions of

millions, and these visible through a microscope. U/e. Let us then confider the works of God. and observe the operations of his hands: Let us take notice of, and admire his infinite wildom and goodnefs in the formation of them: No creature in this fublunary world is capable of fo doing, befides man, and yet we are deficient herein; We content ourfelves with the knowledge of the tongues, or a little skill in philology, or history perhaps, and antiquity, and neglect that which to me feems more material. I mean, natural hiftory, and the works of the creation : I do not difcommend or derogate from those other studies: I should betray mine own ignorance and weaknefs fhould I do fo; I only with they might not altogether justle out, and exclude this. I with that this might be brought in fashion among us; I wish men would be fo equal and civil, as not to difparage, deride, and vilify those studies which themselves skill not of, or are not conversant in; no knowledge can be more pleafant than this, none that doth fo fatisfy and feed the foul; in comparison whereto that of words end phrases seem to me infipid and jejune. That learning (faith a wife and observant prelate) which confifts only in the form and pedagogy of arts, or the critical notions upon words and phrafes, hath in it this intrinfical imperfection, that it is only fo far to be effeemed, as it conduceth to the knowledge of things, being in itfelf but a kind of pedantry, apt to infect a man with fuch odd humours of pride, and affectation, and curiofity, as will render him unfit for any great employment, words being but the images of matter, to be

148

Part I.

wholly given up to the ftudy of thefe, what is it but Pygmalion's frenzy, to fall in love with a picture or image? As for oratory, which is the beft fkill about words, that hath by fome wife men been effeemed but a voluntary art, like to cookery, which fpoils wholefome meats, and helps unwholefome, by the variety of fauces, ferving more to the pleafure of tafte, than the health of the body.

It may be (for ought I know, and as fome divines have thought) part of our bufinefs and employment in eternity, to contemplate the works of God, and to give him the glory of his wifdom, power, and goodnefs, manifefted in the creation of them. I am fure it is part of the bufinefs of a Sabbath day, and the Sabbath is a type of that eternal reft; for the Sabbath feems to have been first instituted for a commemoration of the works of the creation, from which God is faid to have rested upon the feventh day.

It is not likely that eternal life shall be a torpid and unactive state, or that it shall confist only in an uninterrupted and endless act of love; the other faculties shall be employed as well as the will, in actions fuitable to and perfective of their natures, efpecially the understanding, the fupreme faculty of the foul, which chiefly differenceth us from brute beafts, and makes us capable of virtue and vice, of rewards and punifhments, shall be bufied and employed in contemplating the works of God, and observing the divine art and wisdom, manifested in the stricture and composition of them; and reflecting upon their great Architect the praife and glory due to him. Then shall we clearly fee, to our great fatisfaction and admiration, the ends and uses of these things, which here were either too fubtile for us to penetrate and difcover, or too remote and unacceffible for us to come to any dif-

149

tinct view of, viz. the planets and fixed ftars; those illustrious bodies, whose contents and inhabitans, whole stores and furniture, we have here fo longing a defire to know, as also their mutual fubferviency to each other. Now the mind of man being not capable at once to advert to more than one thing, a particular view and examination of fuch an innumerable number of valt bodies, and the great multitude of fpecies, both of animate and inanimate beings, which each of them contains, will afford matter enough to exercise and employ our minds, I do not fay, to all eternity, but to many ages, should we do nothing elfe.

Let it not fuffice us to be book-learned, to read what others have written, and to take upon truft more falschood than truth; but let us ourselves examine things as we have opportunity and converse with nature as well as books. Let us endeayour to promote and increase this knowledge, and make new difcoveries, not fo much distrusting our own parts or defpairing of our own abilities, as to think that our industry can add nothing to the invention of our anceftors, or correct any of their mistakes. Let us not think that the bounds of science are fixed like Hercules's pillars, and infcribed with a No plus ultra. Let us not think we have done, when we have learned what they have delivered to us: the treasures of nature are inexhaustible; here is employment enough for the vaftest parts, the most indefatigable industries, the happieft opportunities, the most prolix and undifturbed vacancies. Multa venientis aevi populus ignota nobis fiet : Multa seculis tunc futuris, cum memoria nostri exoleverit, reservantur. Pusilla res mundus oft, nifi in eo quod quaerat omnis mundus babeat, Seneca, Nat. Quaeft. lib 7. cap. 31. " The " people of the next age shall know many things un-" know to us : many are referv'd for ages then to

" come, when we shall be quite forgotten, no me-" mory of us remaining. The world would be a pi-" tiful fmall thing indeed, if it did not contain e-" nough for the inquiries of the whole world." Yet and again, Epist. 04. Multum adhuc restat operis, multumque restabit, nec ulli nato post mille saecula praecludetur occasio aliquid adhuc adjicienai. " Much " work still remains, and much will remain; nei-" ther to him that shall be born after a thousand a-" ges, will matter be wanting for new additions to " what hath already been invented." Much might be done, would we but endeavour, and nothing is infuperable to pains and patience. I know that a new fludy at first feems very vast, intricate, and difficult; but after a little refolution and progrefs, after a man becomes a little acquainted, as I may fo fay, with it, his underftanding is wonderfully cleared up and enlarged, the difficulties vanish, and the thing grows eafy and familiar. And for our encouragement in this ftudy, observe what the Pfalmist faith, Pfal. cxi. 2. The works of the Lord are great, fought out of all them that have pleasure therein. Which, though it be principally fpoken of the works of providence, yet may as well be verified of the works of the creation. I am forry to fee fo little account made of real experimental philosophy in this \* univerfity; and that those ingenious fciences of the mathematics are fo much neglected by us; and therefore do earneftly exhort those that are young, especially gentlemen, to set upon these studies, and take fome pains in them. They may poffibly invent fomething of eminent ufe and advantage to the world; and on fuch difcovery would abundantly compensate the expense and travel of one man's whole life. However, it is enough to maintain and continue what is already invented : neither do I fee what more ingenious and manly employment \* Cambridge, where the author lived at the first writing of this.

Part I.

they can purfue, tending more to the fatisfaction of their own minds, and the illustration of the glory of God; for he is wonderful in all his works.

But I would not have any man crofs his natural genius or inclinations, or undertake fuch methods of ftudy, as his parts are not fitted to, or not ferve thofe ends to which his friends, upon mature deliberation, have defigned him; but thofe who do abound with leifure, or who have a natural propenfion and genius inclining them thereto; or thofe, who by reafon of the ftrength and greatnefs of their parts, are able to compafs and comprehend the whole latitude of learning.

Neither yet need those who are defigned to divinity itfelf, fear to look into these studies, or think they will ingrofs their whole time, and that no confiderable progrefs can be made therein, unlefs men lay afide and neglect their ordinary callings, and neceffary employments. No fuch matter. Our life is long enough, and we might find time enough did we husband it well : Vitam non accepimus brevem, sed fecimus, nec inopes ejus, sed prodigi sumus, as Seneca faith, " We have not received a fhort " life, but have made it fo; neither do we want " time, but are prodigal of it." And did but young men fill up that time with these ftudies, which lies upon their hands, which they are incumbered with, and troubled how to pass away, much might be done even so. I do not see but the study of true phyfiology may be justly accounted a proper, or mpomaissia, preparative to divinity. But to leave that, it is a generally received opinion, that all this visible world was created for man; that man is the end of the creation; as if there were no other end of any creature, but fome way or other to be ferviceable to man. This opinion is as old as Tully; for, faith he, in his fecond book, De Nat. Deorum. Principio ipfe Mundus Deorum bo-

### in the CREATION.

minumque causa factus est: quaeque in eo sunt omnia ea parata ad fructum hominum et inventa sunt. But though this be vulgarly received, yet wife men now a days think otherwife. Mr More affirms,\* " That creatures are made to enjoy themfelves, as " well as to ferve us; and that it is a grofs piece of " ignorance and rufficity to think otherwife." And in another place : " This comes only out of pride " and ignorance, or a haughty prefumption; be-" caufe we are encouraged to believe, and in fome " fenfe all things are made for man, therefore to think \*\* that they are not at all made for themfelves. But " he that pronounceth this, is ignorant of the nature " of man, and the knowledge of things; For if a good " man be merciful to his beaft, then furely a good " God is bountiful and benign, and takes pleafure " that all his creatures enjoy themfelves, that have " life and fenfe, and are capable of enjoyment."

Those philosophers indeed, who hold man to be the only creature in this fublunary world endued with fenfe and perception, and that all other animals are mere machines or puppets, have fome reafon to think that all things here below were made for man. But this opinion feems to me too mean, and unworthy the majefty, wildom, and power of God : nor can it well confift with his veracity, inftead of a multitude of noble creatures, endued with life and fenfe, and fpontaneous motion, as all mankind till of late years believed, and none ever doubted of) fo that it feems we are naturally made to think fo) to have flocked the earth with divers fets of automata, without all fense and perception, being wholly acted from without, by the impulse of external objects.

But be this fo, there are infinite other creatures without this earth, which no confiderate man can think were made only for man, and have no other

\* Antid. Atheifm, l. 2. c 11.

153

ufe. For my part I cannot believe, that all things in the world were fo made for man, that they have no other ufe.

For it feems to me highly abfurd and unreafonable, to think, that bodies of fuch valt magnitude as the fixed ftars, were only made to twinkle to us, nay, a multitude of them there are, that do not fo much as twinkle, being either by reafon of their distance or of their smallness altogether invisible to the naked eye, and only difcoverable by a telefcope; and it is likely, perfecter telefcopes than we yet have, may bring to light many more; and who knows, how many lie out of the ken of the best telescope that can possibly be made? And, I believe, there are many species in nature, even in this fublunary world, which were never yet taken notice of by man, and confequently of no use to him, which yet we are not to think were created in vain; but may be found out by, and of ufe to, those who shall live after us in future ages. But though in this fense it be not true, that all things were made for man; yet, thus far it is that all the creatures in the world may be fome way or other useful to us, at least to exercise our wits and understandings, in confidering and contemplating of them, and to afford us fubject of admiring and glorifying their and our Maker. Seeing then, we do believe, and affert, that all things were in fome fense made for us, we are thereby obliged to make use of them for those purposes for which they ferve us, else we fruftrate this end of their creation. Now fome of them ferve only to exercise our minds: many others there be, which might probably ferve us to good purpose, whose uses are not discovered, nor are they ever like to be, without pains and industry. True it is, many of the greatest inventions have been accidentally flumbled up-

154

upon; but not by men fupine and carelefs, but bufy and inquifitive. Some reproach methinks it is to learned men, that there fhould be fo many animals in the world, whofe outward fhape is not yet taken notice of, or defcribed, much lefs their way of generation, food, manners, ufes, obferved.

The scripture, Pfalm cxlviii calls upon the fun, moon, and stars, fire and hail, snow and vapour, formy winds and tempests, mountains and all bills, fruitful trees, and all cedars, beasts and all cattle, creeping things and flying fowl, &c. to praise the Lord. How can that be? can fenfelefs and inanimate things praise God? fuch as are the fun, and moon, and stars. And although beafts be advanced higher to some degree of fense and perception; yet being void of reason and understanding, they know nothing of the caufes of things, or of the author and maker of themfelves, and other creatures. All that they are capable of doing, in reference to the praifing of God, is (as I faid before) by affording matter, or fubject, of praifing him, to rational and intelligent beings. So the Pfalmift, Pfalm xix. 1. The heavens declare the glory of God, and the firmament fleweth his handy-work. And therefore the Pfalmift, when he calls upon fun, and moon, and ftars, to praife God, doth in effect call upon men and angels, and other rational beings, to confider those great effects of the divine power and wildom, their vast dimensions, their regular motions and periods, their admirable difpofition and order, their eminent ends and uses in illuminating and enlivening the planets, and other bodies about them, and their inhabitants, by their comfortable and cherishing light, heat and influences, and to give God the glory of his power, in making fuch great and illustrious bodies, and of his wildom and goodnels in fo placing and delpoking of them, fo moving them regularly and conftantly, without clashing or interfering one with another, and enduing them with fuch excellent virtues and properties, as to render them fo ferviceable and beneficial to man, and all other creatures about them.

The like may be faid of fire, hail, fnow, and other elements and meteors, of trees, and other vegetables, of beafts, birds, infects, and all animals, when they are commanded to praise God, which they cannot do by themselves; man is commanded to confider them particularly, to observe and take notice of their curious structure, ends, and uses, and give God the praife of his wifdom, and other attributes therein manifested.

And therefore those who have leifure, opportunity, and abilities, to contemplate and confider any of these creatures, if they do it not, do as it were rob God of some part of his glory, in neglecting or flighting fo eminent a fubject of it, and wherein they might have discovered fo much art, wildom, and contrivance.

And it is particularly remarkable, that the divine author of this pfalm, amongst other creatures, calls upon infects alfo to praife God; which is as much as to fay, ye fons of men, neglect none of his works, those which feem most vile and contemptible: there is praife belongs to him for them. Think not that any thing he hath vouchfafed to create, is unworthy of thy cognizance, to be flighted by thee. It is pride and arrogance, or ignorance and folly, in thee fo to think. There is a greater depth of art and skill in the structure of the meaneft infect, than thou art able for to fathom, or comprehend.

The wifdom, art, and power of Almighty God, shines forth as visibly in the structure of the body of the minutest infect, as in that of a horse,

156

Part I.

or elephant : therefore God is faid to be, Maximus in minimis. We men esteem it a more difficult matter, and of greater art and curiofity, to frame a fmall watch, than a large clock; and no man blames him who spent his whole time in the confideration of the nature and works of a bee, or thinks his fubject was too narrow. Let us not then efteem any thing contemptible, or inconfiderable, or below our notice taking: for this is to derogate from the wifdom and art of the Creator, and to confess ourfelves unworthy of those endowments of knowledge and understanding which he hath bestowed on us. Do we praise Daedalus, and Architas, and Hero, and Callicrates, and Albertus Magnus and many others, which I might mention, for their cunning in inventing, and dexterity in framing and composing a few dead engines, or movements, and shall we not admire and magnify the great Anuispyos Kooms, Former of the world, who hath made fo many, yea, I may fay innumerable, rare pieces, and those too not dead ones, fuch as cease prefently to move fo foon as the fpring is down; but all living and themfelves performing their own motions, and those fo intricate and various, and requiring fuch a multitude of parts and fubordinate machines, that it is incomprehenfible what art, and skill and industry, must be employed in the framing of one of them ?

I have already noted out of Dr Hook that to the performance of every mufcular motion, at least in greater animals, there are not fewer diffinct parts concerned, than many millions of millions.

Further, from the confideration of our own fmallnefs and inconfiderablenefs, in refpect of the greatnefs and fplendor of those glorious heavenly bodies, the fun, moon, and stars, to which our bodies bear no proportion at all either in magnitude, or lustre; let us with the holy pfalmist raife up our hearts to magnify the goodnefs of God towards us in taking fuch notice of us, and making fuch provision for us. and advancing us fo highly above all his works, Pfalm viii. 3. "When I confider the heavens, the work of "thy fingers, the moon and the ftars which thou "haft ordained; what is man that thou art mind-"ful of him, and the fon of man that thou visiteft "him? for thou haft made him a little lower "than the angels, and haft crowned him with glo-"ry and honour, &c.

But it may be objected, that God Almighty was not fo felfifh and defirous of glory, as to make the world, and all the creatures therein, only for his own honour, and to be praifed by man. To affert this, were, in Des Cartes's opinion, an abfurd and childifh thing, and a refembling of God to a proud man. It is more worthy the Deity, to attribute the creation of the world, to the exundation and overflowing of his transfeendent and infinite goodness, which is of its own nature, and in the very notion of it, most free, diffusive, and communicative.

To this I thall anfwer in two words; Firft, The testimony of scripture makes God in all his actions to intend and defign his own glory, mainly, Prov. xvi, 4. God made all things for him/elf. How! for himself? He hath no need of them: he hath no use of them. No, he made them for the manifestation of his power, wisdom, and goodness, and that he might receive from the creatures that were able to take notice thereof, his tribute of praise, Pfal. 1. 14. Offer unto God thanksgiving. And in the next verse, I will deliver the, and thou shalt glorify me And again in the last verse, "Whose effereth praise, glorifieth me;" so praise is called a facrifice, and the calves of the lips, Hos. xiv. 2. Ifa. xlii. 8. I am the Lord, that is Part I.

my name, and my glory will I not give to another, Ifa. xlviii. 11. And I will not give my glory to another. The fcripture calls upon the heavens, and earth, and fun and moon, and ftars, and all other creatures, to praife the Lord; that is, by the mouth of man, (as I shewed before) who is hereby required to take notice of all these creatures, and to admire and praife the power, wisdom, and goodness of God, manifested in the creation and designations of them.

Secondly, It is most reasonable that God Almighty should intend his own glory : for he being infinite in all excellencies and perfections, and independent upon any other being; nothing can be faid or thought of him too great, and which he may not justly challenge as his due; nay, he cannot think too highly of himfelf, his other attributes being adequate to his understanding : fo that, though his understanding be infinite, yet he understands no more than his power can effect, becaufe that is infinite alfo. And therefore it is fit and reasonable, that he should own and accept the creatures acknowledgments and celebrations of those virtues and perfections, which he hath not received of any other, but possesset eternally and originally of himfelf. And indeed, (with reverence, be it spoken) what else can we imagine the ever-bleffed Deity to delight and take complacency in for ever, but his own infinite excellencies and perfections, and the manifestations and effects of them, the works of the creation, and the facrifices of praife and thanks offered up by fuch of his creatures as are capable of confidering those works and difcerning the traces and footsteps of his power and wifdom appearing in the formation of them; and moreover, whofe bounden duty it is fo to do? The reafon why man ought not to admire himfelf, to feek his own glory, is, because he is a dependent creature, and hath nothing but what he hath received; and not only de-

pendent, but imperfect, yea, weak and impotent : and yet I do not take humility in man to confift in difowning, or denying any gift or ability that is in him, but in a just valuation of just gifts and endowments yet rather thinking too meanly than too highly of them; because human nature is fo apt to err in running into the other extreme, to flatter itfelf, and to accept those praises that are not due to it; pride being an elation of spirit upon false grounds, or a desire and acceptance of undue honour. Otherwife, I do not fee why a man man not admit, and accept the testimonies of others, concerning any perfection, accomplishment, or skill, that he is really possessed of, yet can he not think of himfelf to deferve any praife or honour for it, because both the power and the habit are the gift of God; and confidering that one virtue is counterbalanced by many vices, and one skill and perfection with much ignorance and infirmity.

### THE END OF THE FIRST PART.

Part İ.

### THE

# WISDOM OF GOD

MANIFESTED IN THE

# WORKS

### OFTHE

# CREATION.

### Particularly in the

1. Whole Body of the EARTH. II. Bodies of MAN. And other ANIMALS.

## PART II.

I Proceed now to felect fome particular pieces of the creation and to confider them more diftinctly. They shall be only two.

I. The whole body of the earth. II. The body of man.

First, The body of the earth; and therein I shall take notice of, 1. Its figure. 2. Its motion. 3. The constitution of its parts.

D Part IF.

By earth I here understand not the dry land, or the earth contradistinguished to water, or the earth confidered as an element, but the whole terraqueous globe, composed of earth and water.

1. For the figure, I could eafily demonstrate it to be fpherical. That the water, which by reafon of its fluidity, should, one would think, compose itfelf to a level, yet doth not fo, but hath a gibbofe fuperficies, may to the eye be demonstrated upon the fea. For when two fhips failing contrary ways lofe the fight one of another, first the keel and hull difappear, afterwards the fails, and if when upon the deck you have perfectly loft fight of all, you get up to the top of the main-maft, you may defory it again. Now what should take away the fight of these ships from each other but the gibbosity of the interjacent water? The roundness of the earth from north to fouth is demonstrated from the appearance of northern ftars above the horizon, and lofs of the fouthern to them that travel north-ward; and on the contrary the lofs of the northern, and appearance of the fouthern to them that travel fouthward. For were the earth a plain, we should fee exactly the fame stars wherever we were placed on that plain. The roundness from east to west is demonstrated from eclipses of either of the great luminaries, For why the fame eclipfes, fuppose of the fun, which is feen to them that live more easterly, when the fun is elevated fix degrees above the horizon, should be feen to them that live one degree more westerly when the fun is but five degrees above the horizon, and fo lower and lower proportionably to them that live more and more wefterly, till at last it appear not at all, no account can be given but the globolity of the earth. For were the earth a perfect plain, the fun would appear eclipfed to all that live upon that plain, if not exactly in the fame elevation, yet

Part II.

pretty near it; but to be fure it would never appear to fome, the fun being elevated hgh above the horizon; and not at all to others. It being clearthen that the figure of the earth is fpherical, let us confider the conveniencies of this figure.

1. No figure is fo capacious as this, and confequently, whofe parts are fo well compacted and united, and lie fo near one to another for matual ftrength. Now the earth, which is the bafis of all am nimals, and, as fome think, of the whole creation, ought to be firm, and stable, and folid, and as much as is poffible, fecured from all ruins and concuffions. 2. This figure is most confonant and agreeable to the natural nutus, or tendency of all heavy bodies. Now the earth being fuch an one, and all its parts having an equal propension or conveniency to the centre, they must needs be in greatest rest, and most immoveable, when they are all equidistant from it; whereas, were it an angular body, all the angles would be vast and steep mountains, bearing a confiderable proportion to the whole bulk, and therefore shole parts being extremely more remote from the centre, than those about the middle of the plains, would confequently prefs very ftrongly thitherward ; and unlefs the earth were made of adamant or marble, in time the other parts would give way, till all were levelled,

3. Were the earth an angular body and not round, all the whole earth would be nothing elfe but vaft mountains, and fo incommodious for animals to live upon; for the middle point of every fide would be nearer the centre than any other, and coniequently from that point, which way foever one travelled, would be up-hill, the tendency of all heavy bodies being perpedicularly to the centre: Befides, how much this would obftruct commerce, is eafily feen; for not only the declivity of all places would render them very difficult to be travelled over, but likewife the midft of every fide being loweft and neareft the centre, if there were any rain, or any rivers, muft needs be filled with a lake of water, there being no way to difcharge it, and poffibly the water would rife fo high, as to overflow the whole *latus*. But, furely, there, would be much more danger of the innundation of whole countries than now there is, all the waters falling upon the earth, by reafon of its declivity every way, eafily defcending down to the common receptacle the fea. And thefe lakes of water being far diftant one from another, there could be no commerce between far remote countries, but by land.

4 A fpherical figure is most commodious for dinetial motion, or revolution, upon its own axis: for in that, neither can the medium at all result the motion of the body, because it stands not in its way, no part coming into any space but what the precedent left, neither doth one part of the superficies move faster than another: Whereas were it angular, the parts about the angles would find strong resultance from the air and those parts also about the angles would move much faster than those about the middle of the planes, being remoter from the centre than they. It remains therefore that this figure is the most commodious for motion.

Here I cannot but take notice of the folly and flupidity of the Epicureans, who fancied the earth to be flat and contiguous to the heavens on all fides, that it defcended a great way with long roots; and that the fun was new made every morning, and not much bigger than it feems to the eye, and of a flat figure, and many other fuch grofs abfurdites, as children among us would be afhamed of.

Secondly, I come now to fpeak of the motion of the earth. That the earth (fpeaking according to philosophical accurateness) doth move both upon

Part II.

Part II.

its own poles, and in the ecliptic, is now the received opinion of the most learned and skilful mathematicians. To prove the diurnal motion of it upon its poles, I need produce no other argument than, First, The vast disproportion in respect of magnitude, that is between the earth and the heavens, and the great unlikelihood that fuch an infinite number of vast bodies should move about fo inconfiderable a fpot as the earth, which in comparison with them, by the concurrent fuffrages of mathematicians of both perfuasions, is a mere point, that is, next to nothing. Secondly, The immenfe and incredible celerity of the motion of the heavenly bodies in the ancient hypothefis Thirdly, Of its annual motion in the ecliptic, the stations and retrogradations of the superior planets, are a convincing argument, there being a clear and facile account thereof to be given from the mere motion of the earth in the ecliptic; whereas in the old hypothefis no account can be given, but by the unreasonable fiction of epicycles, and contrary motions; add hereto, the great unlikelihood of fuch an enormous epicycle as Venus must describe about the fun, not under the fun, as the old aftronomers fancied. About the fun, 1 fay, as appears by its being hid or eclipfed by it, and by its feveral phafes, like the moon So that whofoever doth clearly understand both hypothefes, cannot, I perfuade myfelf, adhere to the old, and reject the new, without doing fome violence to his faculties.

Against this opinion lie two objections, First, That it is contrary to fense, and the common opinion and belief of mankind. Secondly, That it feemeth contrary to some expressions in scripture. To the first I answer, that our fenses are sometimes mistaken, and what appears to them is not always in reality so as it appears. For example: The sum or moon, appear no bigger, at most,

than a cart-wheel, and of a flat figure. The earth feems to be plain : the heavens to cover it like a canopy, and to be contiguous to it round about : a fire-brand nimbly moved round, appears like a circle of fire; and to give a parallel instance, a boat lying still at anchor in a river, to him that fails and rows by it, feems to move apace; and when the clouds pafs nimbly under the moon, the moon itlef feems to move the contrary way. And there have been whole books written in confutation of vulgar errors. Secondly, As to the fcripture, when fpeaking of these things, it accommodates itfelf to the common and received opinions, and employs the ufual phrafes and forms of speech (as all wife men also do, though, in strictness, they be of a different or contrary opinion) without intention of delivering any thing doctrinally concerning thefe points, or confuting the contrary : and yet by those that maintain the opinion of the earth's motion, there might a convenient interpretation be given of fuch places as feem to contradict it. Howbeit, becaufe fome pious perfons might be offended at fuch an opinion, as favouring of novelty, thinking it inconfiftent with divine revelation, I shall not positively affert it, only propofe it as an hypothefis not altogether improbable. Supposing then, that the earth doth move about upon its own poles, and in the ecliptic about the fun, I shall shew how admirably its fituation and motion are contrived for the conveniency of man, and other animals : which I cannot do more fully and clearly than Dr More hath already done in his Antidote against Atheism, whole words therefore I shall borrow.

First, Speaking of the parallelism of the axis of the earth, he faith, I demand whether it be better to have the axis of the carth fleady and perpetually parallel to itfelf, or to have it carelefsly tum-

166

Part II.

ble this way and that way as it happens, or at leaft, very variously and intricately; And you cannot but answer me, it is better to have it steady and parallel; for in this lies the neceffary foundation of the art of navigation and dialling. For that fleady ftream of particles, which is fuppofed to keep the axis of the earth parallel to itfelf, affords the mariner both his cynofura, and his compass. The load-ftone and the load-ftar depend both upon this. The load-ftone, as I could demonstrate, were it not too great a digreffion; and the loadftar, because that which keeps the axis parallel to itfelf, makes each of the poles constantly respect fuch a point in the heavens; as for example, the north-pole to point almost directly to that which we call the pole-ftar. And befides, dialling could not be at all without this fleadinefs of the axis. But both these arts are pleasant, and one especially of mighty importance to mankind. For thus there is an orderly measuring of our time for affairs at home, and an opportunity of traffick abroad, with the most remote nations of the world, and fo there is a mutual fupply of the feveral commodities of all countries, befides the enlarging our underftandings by fo ample experience we get both of men and things. Wherefore if we were rationally to confalt, whether the axis of the earth were better be held fleady and parallel to itfelf, or left at random, we would conclude it ought to be fready, and fo we find it de facto, though the earth move floating in the liquid heavens. So that appealing to our own faculties we are to affirm, that the constant direction of the axis of the earth was established by a principle of wifdom and council.

Again, There being feveral postures of this steady direction of the axis of the carth, viz, either perpendicular to a plane, going through the centre of the fun, or co-incident, or inclining, I demand

-1

which of all these reason and knowledge would make choice of? Not of a perpendicular posture; for fo both the pleafant variety, and great convenience of fummer and winter, fpring and autumn, would be loft, and for want of acceilion of the fun. thefe parts of the earth, which now bring forth fruits and are habitable, would be in an incapacity of ever bringing forth any; fith then, the heat could never be greater than now it is at our 10th of March, or the 11th of September, and therefore not sufficient to bring their fruits and grain to maturity, and confequently could entertain no inhabitants; and those parts that the full heat of the fun could reach, he plying them always alike without any annual receffion, or intermiffion, would at last grow tired, or exhausted, or be wholly dried up, and want moisture, the fun diffipating and caffing off the clouds northwards and fouthwards. Befides we observe that an orderly vicifitude of things, doth much more gratify the contemplative property in man.

And now in the fecond place, neither would reafon make choice of a co-incident position. For if the axis thus lay in a plain that goeth through the centre of the fun, the ecliptick would like a colure, or one of the meridians, pais through the poles of the earth, which would put the inhabitants of the world into a pitiful condition. For they that escape best in the temperate zone, would be accloyed with long nights very tedious, no lefs than forty days, and those that now never have their night above twenty-four hours, as Friefland, Iceland, the furthest parts of Russia and Norway would be deprived of the fun, above an hundred and thirty days together. Ourfelves in England, and the reft of the fame clime would be clofed up in darknefs no lefs than a hundred, or eighty days; and fo proportionable of the reft, both in

and out of the temperate Zoncs. And as for fummer and winter, though those viciffitudes would be, yet it could not but cause raging diseases, to have the fun stay so long, describing his little circles so near the poles, and lying so hot on the inhabitants, that had been in so long extremity of darkness and cold before.

It remains therefore, that the posture of the axis of the earth- be inclining, not perpendicular, not co-incident, to the fore-mentioned plane. And verily, it is not only inclining, but in fo fit a proportion, and there can be no fitter imagined to make it, to the utmost capacity, as well pleafant as habitable. For though the course of the fun be curbed between the tropicks, yet are not those parts directly subject to his perpendicular beams, either uninhabitable, or extremely hot, as the antients fancied : by the testimony of travellers, and particularly Sir Walter Rawleigh, the parts under and near the line, being as fruitful and pleafant, and fit to make a paradife of, as any in the world. And that they are as fuitable to the nature of man, and as convenient to live in, appears from the longevity of the natives; as for inftance, the Ethiopes, called by the antients Maxpolion, but especially in the Brasilians in America, the ordinary term of whole life is a hundred years, as is fet down by Pifo, a learned phyfician of Holland, who travelled thither on purpose to augment natural knowledge, but especially what related to phyfick: And reafonable it is that this should be fo; for neither doth the fun lie long upon them, their day being but twelve hours, and their night as long, to cool and refresh them: and befides, they have frequent showers, and conftant breezes, or fresh gales of wind from the East. It was the opinion of Asclepiades, as Plutarch reports, that generally the inhabitants of

X

170

cold countries are longer-lived than those of hor, becaufe the cold keeps in the natural heat, as it were locking up the pores to prevent its evaporation; whereas in hot regions the heat is eafily diffipated, the pores being large and open to give it way. Which opinion, becaufe I find fome learned men still to adhere to, I shall produce fome further instances of Monsieur Rochefort's history of the Antilles islands, to confirm the contrary, and to fhew how often and eafily we may be deceived, if we truft to our own ratiocinations, how plaufible foever, and confult not experience.

The ordinary life (faith he) of our Caribbeans is an hundred and fifty years long, and fometimes more. There were fome among them not long fince living, who remembered to have feen the first Spaniards that boarded America, who we may thence conclude, lived to be at least 160 years old

The Hollanders who traffick in the Molucca iflands, affure us, that the ordinary term of life of the natives there is one hundred and thirty years.

Vincent le Blanc tells us, that in Sumatra, Java, and the neighbouring islands, the life of the inhabitants is extended to 140 years, and that in the realm of Caffuby it reaches 150. Francis Pirara promotes the life of the Brafilians beyond the term we have fet it, v. g. to 160 years, or more, and fays that in Florida and Jucatan there are men found who pass that age. And it is faid, that the French in Laudonier's voyage into Florida, anno 1,64, faw a certain old man, who affirmed himfelf to be three hundred years old, and the father of five generations; and well he might be of double that number. "

Laftly, Mapheous reports, that a certain Bengalife vaunted himfelf to be 335 years old. So far-Monfieur Rochefort. Indeed thefe two laft inftances, being perchance fingular and extraordinary, Part II.

do not prove the point; for even among us, where the ordinary term of life is about threefcore and ten, or fourscore, there occur some rare instances of perfons, who have lived 130, 140, 150 years and more. But the other testemonies being general, prove it, beyond contradiction; neither yet is the thing itself improbable; for there being not fo great inequality of weather in those hot countries, as there is in cold, the body is kept in a more equal temper, and not having fuch frequent shocks, as are occafioned by fuch air, and often changes, and that from one extreme to another, holds out much longer. So we fee infirm and crazy perfons, when they come to be fo weak as to be fixed to their beds, hold out many years, fome I have heaad of, that have lain bed rid 20 years; because in the bed they are always kept in an almost equal temper of heat, who, had they been exposed to the excelles of heat and cold, would not probably have furvived one.

Seeing then, this best posture which our reason could make choice of, we see really established in nature, we cannot but acknowledge it to be the iffue of wisdom, counsel, and providence. Moreover, a further argument to evince this, is, that though it cannot but be acknowledged, that if the axis of the earth were perpendicular to the plane of the ecliptick, her motion would be more easy and natural, yet notwithstanding for the conveniencies fore-mentioned, we see it is made in an inclining posture.

Another very confiderable, and heretofore unobserved convenience of this inclination of the earth's axis, Mr Keill affords us in his Examination of Dr Burnets Theory of the earth, p. 69.

There is, faith he, one more [befides what he had mentioned before] confiderable advantage, which we reap by the prefent polition of the earth which I will here infert, becaufe I do not know that it is taken notice of by any; and it is, that by the prefent inclination of the earth's axis to the plane of the ecliptick, we who live beyond 45 degrees of latitude, and ftand most in need of it, have more of the fun's heat throughout the year than if he had fhined always in the equator; that is, if we take the fum of the fun's actions upon us both in fummer and winter, they are greater than its heat would be if he moved always in the equator; or, which is the fame thing, the aggregate of the fun's heat upon us while he defcribes any two oppofite parallels, is greater than it would be if in those two days he defcribed the equator; whereas in the torrid zone, and even in the temperate, almost as far as 45 degrees of latitude, the fum of the fun's heat in fummer and winter is lefs than it would be, were the axis of the earth perpendicular to the plane of the ecliptick; for the demonftration of which I refer the reader to the book itfelf.

I think (proceeds he) this confideration cannot but lead us into a transcendent admiration of the divine wifdom, which hath placed the earth in fuch a pofture, as brings with it feveral conveniencies beyond what we can eafily difcover without fludy and application; and I make no queflion, but if the reft of the works of nature were well observed, we should find feveral advantages which accrue to us by their prefent conftitution, which are far beyond the uses of them that are yet difcovered; by which it will plainly appear, that God hath chofen better for us than we could have done for ourfelves.

If any man should object and fay, it would be more convenient for the inhabitants of the earth if the tropicks flood at a greater diffance, and the fun moved farther northward and fouthward, for

Part II.

fo the north and fouth parts would be relieved, and not exposed to fo extreme cold, and thereby rendered uninhabitable, as now they are.

To this I answer, that this would be more inconvenient to the inhabitants of the earth in general, and yet would afford the north and fouth parts but little more comfort; for then as much as the distances between the Tropicks were enlarged, fo much would also the Artick and Antartick circles be enlarged too; and fo we here in England, and fo on northerly, should not have that grateful and useful succession of day and night, but proportionably to the fun's coming towards us, fo would our days be of more than twenty-four hours length; and according to his recess in winter, our nights proportionable; which how great an inconvenience it would be, is eafily feen: Whereas now the whole latitude of the earth, which hath at any time above twenty-four hours day, and twentyfour hours night, is little and inconfiderable in comparison of the whole bulk, as lying near the Poles; and yet neither is that part altogether unuseful, for in the waters there live fishes, which ellewhere are not obvious; fo we know the chief whale-fifting is in Greenland) yea, and not only fish, but great variety of water fowl, both whole and cloven footed, frequent the waters, and feed there, breeding also on the cliffs by the fea-fide, as they do with us; the figures and descriptions of a great many whereof are given us by Martin in his voyage to Spitzberg, or Greenland; and on the land bears and foxes, and deer, in the most northerly country that was ever yet touched; and doubtlefs, if we fhall difcover further to the very North Pole, we shall find all that tract not to be vain, useless or unoccupied.

Thirdly, The third and last thing I proposed was, the constitution and consistency of the parts

OD Part II.

of the earth And first, admirable it is that the waters should be gathered together into fuch great conceptacula, and the dry land appear; and th ugh we had not been affured thereof by divine revelation, we could not in reason but have thought such a division and separation to have been the work of Omnipotency, and infinite Wildom and Goodnefs; for in this condition the water nourithes and maintains innumerable multitudes of various kinds of filhes, and the dry land fupports and feeds as great variety of plants and animals, which have their firm footing and habitation; whereas had all been earth, all the species of fishes had been loft, and all those commodities which the water affords us; or all water there had been no living for plants; or terrestrial animals, or man himfelf, and all the beauty, glory and variety of this inferior world had been gone, nothing being to be 'feen, but one uniform dark body of water; or had all been mixed and made up of water and earth into one body of mud and mire, as one would think should be most natural; for why fuch a separation as at present we find should be made, no account can be given but providence; I fay, had all this globe been mire or mud, then could there have been no poffibility for any animals at all to have lived, excepting fome few, and those very dull and inferior ones too That therefore the earth should be made thus, and not only fo, but with to great variety of parts, as mountains, plains, vallies, fand, gravel, lime, stone, clay, marble, argilla, &c. which are fo delectable and pleafant and likewife fo ufeful and convenient for the breeding and living of various plants and animals, fome affecting mountains, some plains, some vallies, fome watery places, fome shade, some sun, some clay, some fand, some gravel, &c. That the earth should be fo figured as to have mountains in

Part II.

the mid-land parts, abounding with fprings of water, pouring down streams and rivers for the neceffities and conveniencies of the inhabitants of the lower countries, and that the levels and plains should be formed with fo eafy a declivity as to caft off the water, and yet not render travelling or tillage very difficult or laborious; these things, I fay, must needs be the refult of counfel, wildom, and defign; especially when (as I faid before) not that way which feems more facile and obvious to chance is chosen, but that which is more difficult and hard to be traced, when it is most convenient and proper for those nobler ends and defigns which were intended by its wife Creator and governor. Add to all this, that the whole dry land is, for the most part, covered over with a lovely carpet of green grafs, and other herbs, of a colour not only most grateful and agreeable, but most useful and falutary to the eye; and this alfo decked and adorned with great variety of flowers of beautiful colours and figures, and of most pleafant and fragrant odours, for the refreshment of our spirits and our innocent delight; as also with beautiful fhrubs and stately trees, affording us not only pleafant and nourifhing fruits, many liquors, drugs, and good medicines, but timber, and utenfils for all forts of trades and the conveniencies of man; out of many thousands, of which we will only just name a few, lest we should be tedious and too bulky.

First, The cocoa, or cocker-nut tree, that fupplies the Indians with almost whatever they stand in need of, as bread, water, wine, vinegar, brandy, milk, oil, honey, sugar, needles, thread, linen, clothes, cups, spoons, befoms, baskets, paper, masts for ships, sails, cordage, nails, coverings for their houses, &c. which may be seen at large in the many printed relations of voyages and travels to the East-Indies, but most faithfully in the Hor-

Part II.

tus Malabaricus, published by that immortal patron of natural learning, Henry Van Reede Van Draekastein, who has had great commands and employs in the Dutch colonies.

Secondly, The Aloe Muricata, vel Aculeata, which yields the Americans every thing their neceffities require, as fences and houfes, darts, weapons, and other arms, fhoes linen, and clothes, needles and thread, wine and honey, befides many utenfils; for all which Hernandes, Garcililaffo de la Vega, and Margrave, may be confulted.

Thirdly, The Bandura Cingalenfium, called by fome the Priapus Vegetabilis, at the end of whofe leaves hang long facks or bags, containing a pure limpid water of great use to the natives when they want rain for eight or ten months together.

A parallel inftance to this of the Bandura, my learned and worthy friend Doctor Sloane affords us in a plant by him observed in the island of Jamaica, and defcribed by the title of Viscum Caryophilloides Maximum flore tripetalo pallide luteo, semine filamentofo, which is commonly called, in that island, Wild Pine, Philosoph. Transact. No. 251. Page 14. I shall not transcribe the whole description, but only that part of it which relates to this particular : " From the root (which he had described before) a-" rife leaves on every fide, after the manner of " leeks, or ananas, whence the name of wild-pine, " or aloes, being folded or inclosed one with ano-" ther, each of which is two foot and an half long, " and from a three inch breadth at beginning, or " bafe, ends in a point, having a very hollow or " concave inward fide, and a round or convex out-" ward one: fo that by all their hollow fides is " made within a very large prefervatory ciftern or " bafin, fit to contain a pretty quantity of wa-" ter, which in the rainy seafon falls upon the ut-

176

### in the CREATION.

Part II.

" most parts of the spreading leaves, which have channels in them, conveying it down to the ciftern where it is kept, as in a bottle, the leaves, after they are swelled out like a bulbous root to make the bottle, bending inward, or coming again close to the stalk, by that means hindering the evaporation of the water, by the heat of the fun beams.

" In the mountanious, as well as the dry low woods, in fcarcity of water, this refervatory is not only nececeffary and fufficient for the nourifhment of the plant itfelf, but likewife is very ufeful to men, birds, and all forts of infects, whither in fcarcity of water they come in troops, and feldom go away without refreshment.

"Captain Dampier, in his voyages, Vol. II. of "Campeche, tells us, that thefe bafins made of the leaves of the wild-pine, will hold a pint and half, or a quart of water, and that when they find thefe pines, they flick their knives into the leaves just above the roots, and that lets out the water, which they catch in their hats, as (faith he) I hve done many times to my great relief."

Fourthly, The cinnamon tree of Ceylon, in whofe parts there is a wonderful diverfity; out of the root they get a fort of camphire, and its oil; out of the bark of the trunk, the true oil of cinnamon; from the leaves, an oil like that of cloves; out of the fruit, a juniepr oil, mith a mixture of those of cinnamon and cloves; besides, they boil the berries into a fort of wax, out of which they make candles, plaisters, unguents. Here we may take notice of the candle trees of the West Indies, out of whose fruit boiled to a thick fat confistence, are made very good bendles, many of which have been lately distributed Z

# The WISDOM of GOD Part II.

178

by that most ingenious merchant, Mr Charles Dubois

Fifthly, The fountains, or dropping trees,' in the isles of Ferro, St Thomas, and in Guinea, which ferve the inhabitants instead of rain, and fresh springs: my honoured friend, Dr Tancred Robinson, in a late letter to me, is not of Voffius's opinion, that these trees are of the farulaccous kind, becaufe he observes, that by the descriptions of eye witneffes, and by the dried fample fent by Palidanus to the Duke of Wirtenberg, the leaves are quite different from those of Ferula's, coming nearer to the Seleli Ethiopicum Salicis vel Periclymeni folio: therfore the Doctor rather thinks them to be of the laurel kind, though he concludes here may be many different forts of these running aqueous-trees : because that phaenomenon does not depend upon or proceed from any peculiarity of the plant, but rather from the place of fituation; of which he writes more at large, in a letter printed in another discourse of mine.

Sixthly, and Laftly, We will only mention the names of fome other vegetables, which, with eighteen or twenty thousand more of that kind, do manifeft to mankind the illustrious bounty and providence of the almighty and omnifcent Creator, towards his undeferving creatures; as the cottontrees, the manyoc, or cafave; the potatoe; the Jefuit's bark-tree; the poppy; the rhubarb; the fcammony; the jalap; the coloquintida; the China; farfa; the ferpentaria virginiana, or fnakeweed; the nifi, or genfeg; the numerofe balfom, and gum-trees; many of which are of late much illustrated by the great industry and skill of that most difcerning botanist, Dr Leanerd Plukenet. Of what great use all these, and innumerable other plants, are to mankind in the feveral

parts of life, few or none can be ignorant; befides the known ufes in curing difeafes, in feeding and clothing the poor, in building, in dyeing in all mechanicks there may be as many more not yet difcover ed, and which may be referved on purpote to exercife the faculties beftowed on man, to find out what is neceffary, convenient, pleafant, or profitable to him.

To fum up all in brief : this terraqueous globe, we know, is made up of two parts :

I. A thin and fluid.

2. A firm and confiftent.

The former, called by the name of water; the latter of earth, or dry land. The land, being the more denfe and heavy body, doth naturally, descend beneath the water, and occupy the lower place; the water afcends and floats above it. But we fee that it is not thus: for the land, though the more heavy, is forcibly and contrary to its nature fo elevated, as to cast off the water, and stand above it, being (as the Pfalmist phrases it) founded upon or above the feas, and established above the floods, Pfalm xxiv. 2. and this in fuch manner, that not only one fide of the globe, but on all fides, there were probably continents and iflands. raifed fo equally as to counterbalance one another, the water flowing between them, and filling the hollow and depreffed places: neither was the dry land only raifed up, and made to appear, but fome parts (which we call mountains) were highly elevated above others, and those fo disposed and fituated (as we have fhewn) in the mid-land parts, and in continued chains running East and. West, as to render all the earth habitable, a great part whereof otherwife would not have been fo; but the Forrid Zone must indeed have been such a place as the antients fancied it, uninhabitable for heat. Let us now confider how much better it is that the dry

The WISDOM of GOD Part II. land should be thus raifed up, and the globe divided almost equally between earth and water,

than that all its furface should be one uniform and dark body of water; I fay water becaufe that naturally occupies the fuperior place, and not earth; for were it all water, the whole beauty of this inferior world were gone; there could be no fuch pleafant and delicious prospects as the earth now affords us; no diffinction, and grateful variety of mountains and hills, plains and vallies rivers and pools, and fountains; no fhady woods, ftored with lofty and towering trees for timber, lowly and more fpread ones for fhade and fruit; no amiable verdure of herbs, befpangled with an -infinite variety of fpecious and fragrant flowers; for those plants that grow at the bottom of the fea. are, for the most part, of a dull, fullen, and dirty olive colour, and bear no flowers at all; inftead of the elegant fhapes and colours, the fagacity and docility of ingenious beafts and birds, the mufical voices and accent of the aerial chorifters, there had been nothing but mute, and ftupid, and indocile fishes, which seem to want the very fense of difcipline, as may be gathered from that they are not vocal, and that there appear in them no organs of hearing, it being alfo doubtful whether the element they live in be capable of transmitting founds; the best fense they have, even their fight, can be but dull and imperfect, the element of water being femi-opaque, and reflecting a good part of the beams of light; the most noble and ingenious creatures that live there, the cetaceous kind, being near a-kin to terreftrial animals, and breathing in the fame element, the open air. Had, I fay, all been water, there had been no place for fuch a creature as man, as we fee there is no fuch there; there is no bufinel's for him, no fubject to employ his. art and faculties, and confequently there could be

effects of them; no fuch things as houses and cities, and stately edifices; as gardens and orchards, and walks, and labyrinths, as corn-fields and vineyards, and the rest of these ornaments, wherewith the wit and industry of man hath embellished the world.

These are great things and worthy the care and providence of the Creator; which whose confidereth, and doth not difcern and acknowledge, must needs be as stupid as the earth he goes upon.

But becaufe mountains have been looked upon by fome as warts, and fuperfluous excrefcences, of no ufe or benefit; nay, rather as figns and proofs that the prefent earth is nothing elfe but a heap of rubbifh and ruins, I fhall reduce and demonftrate in particulars the great ufe, benefit, and neceffity of them

I. They are of eminent use for the production and original of fprings and rivers : Without hills and mountains there could be no fuch things, or at least but very few; no more than we now find in plain and level countries, that is, fo few, that it was never my hap to fee one; in winter time indeed we might have torrents and land-floods. and perhaps fometimes great inundations; but in fummer nothing but stagnating water, referved in pools and cifterns, or drawn up out of deep wells ; but as for a great part of the earth (all lying within, or near the tropicks) it would neither have rivers. nor any rain at all; we should confequently lofe all those conveniencies and advantages that rivers afford us, of fifhing, navigation, carriage, driving of mills, engines, and many others. This end of mountains I find affigned by Mr Edmund Hally, a man of great fagacity and deep infight into the natures and caules of things, in a difcourse of his published in the Philosoph. Transact. Numb. 192. in these words : " This, if we may " allow final caufes [Hardiment, the thing is clear pronounce boldly, without any *i/s* or *ands*] this feems to be one defign of the hills, that their ridges being placed thro' the midft of their continents, might ferve as it were for alembicks, to diftil frefh water for the use of man and beast; and their heights to give a descent of those streams; to run gently, like so many veins of the microcos to be the more beneficial to the creation."

II. They are of great use for the generation, and convenient digging up of metals and minerals; which how necessary inftruments they are of culture and civility, I have before shewn; these we see are all digged out of mountains, and I doubt whether there is or can be any generation of them in perfectly plain and level countries; but if there be, yet could not such mines, without great pains and charges, if at all, be wrought; the delfs would be so flown with waters (it being impoffible to make any addits or foughs to drain them) that no gins or machines could suffice to lay and keep them dry.

III. They are useful to mankind in affording them convenient places for habitation, and fituations of houses and villages, ferving as skreens to keep off the cold and nipping blafts of the northern and easterly winds, and reflecting the benign and cherishing fun-beams, and fo rendring their habitation both more comfortable and more cheary in winter; and promoting the growth of herbs and fruit trees, and the maturation of their fruits in fummer; befides cafting off the waters, they lay the gardens, yards, and avenues to the houfes dry and clean, and fo as well more folitary as more elegant; whereas houfes built in plains, unlefs shaded with trees, lie bleak, and exposed to wind and weather, and all winter are apt to be grievoully annoyed with mire and dirt.

IV. They are very ornamental to the earth, affording pleafant and delightful profpects, both, 1. To them that look downwards from them upon the fubjacent countries; as they must needs acknowledge who have been but on the downs of Suffex, and enjoyed that ravishing prospect of the fea on one hand, and the country far and wide on the other. And, 2. To those that look upwards, and behold them from the plains and low grounds, which, what a refreshing and pleasure it is to the eye, they are best able to judge who have lived in the ifle of Ely, or other level countries, extending on all fides farther than one can ken; or have been out far at fea, where they can fee nothing but fky and water. That the mountains are pleafant objects to behold, appears, in that the very images of them, their draughts and landskips, are fo much efteemed.

V. They ferve for the production of great variety of herbs and trees; for it is a true obfervation, that mountains do efpecially abound with different species of vegetables, because of the great diverfity of foils that are found there, every vertex or eminency almost affording a new kind. Now these plants ferve partly for the food and fuftenance of fuch animals as are proper to the mountains, partly for medicinal uses, the chief phyfick herbs and roots, and the beft in their kinds, growing there; it being remarkable that the greateft and most luxuriant species in most genera of plants are natives of the mountains; partly alfo for the exercife and diversion of such ingenious and industrious perfons, as are delighted in fearching out these natural rarities, and observing the outward form, growth, natures and uses of each fpecies, and reflecting upon the Creator of them his due praises and benedictions.

VI. They ferve for the harbour, entertainment,

184

and maintenance of various animals, birds, beafts, and infects, that breed, feed, and frequent there; for the highest tops and pikes of the Alps themfelves are not destitute of their inhabitants; the ibex, or ftein-buck, the rupicapra, or chamois, among quadrupeds; the lagopus among birds; and I myfelf have observed beautiful papilios, and store of other infects, upon the tops of fome of the Alpine mountains. Nay, the higheft ridges of many of those mountains serve for the maintenance of cattle for the fervice of the inhabitants of the vallies; the men there, leaving their wives and vounger children below, do not, without fome difficulty, clamber up the acclivities, dragging their kine with them, where they feed them, and milk them, and make butter and cheefe, and do all the dairy-work, in fuch forry hovels and fheds as they build there to inhabit in during the fummer months; this I myfelf have feen and obferved in Mount Jura, not far from Geneva, which is high enough to retain fnow all the winter.

The fame they do alfo in the Grifons country, which is one of the higheft parts of the Alps; travelling through which, I did not fet foot off fnow for four days journey, at the latter end of March.

VII. Those long ridges and chains of losty and topping mountains, which run through the whole continents East and West, (as I have elsewhere obferved) ferve to stop the evagation of the vapours to the North and South in hot countries, condensing them, like alembick heads, into water, and so by a kind of external distillation giving original to springs and rivers; and likewise by amailing, cooling, and constipating of them, turn them into rain; by those means rendering the fervid regions of the Torrid Zone habitable. This difcourse concerning the use of mountains, I have made use of in another \* treatife; but because it is proper to this place, I have (with some alterations and enlargements) here repeated it.

I had almost forgotten that use they are of to mankind, in ferving for boundaries and defences to the territories of kingdoms and commonwealths.

A fecond particular I have made choice of more exactly to furvey and confider, is the body of man; wherein I fhall endeavour to difcover fomething of the wifdom and goodnefs of God: Firft, by making fome general obfervations concerning the body. Secondly, by running over and difcourfing upon its principal parts and members.

1. Then, in general, I fay, the wifdom and goodnefs of God appears in the erect pofture of the body of man, which is a privilege and advantage given to man above other animals; but though this be fo, yet I would not have you think that all the particulars I fhall mention are proper only to the body of man, diverfe of them agreeing to many other creatures. It is not my bufinefs to confider only the prerogatives of man above other animals, but the endowments and perfections which nature hath conferred on his body, though common to them with him. Of this crection of the body of man the antients have taken notice, as a particular gift and favour of God.

Pronaque cum spectent animalia caetera terram, Os homini sublime dedit, coelumque tueri Jussit, et erectos ad sydera tollere vultus.

Ovid. Metam. I.

And before him, Tully in his fecond book, De Nat. Deorum.

\* The diffolution of the world.

Ad banc providentiam naturae tam diligentem tamque solertem adjungi multa possunt, e quibus intelligatur quantae res hominibus a Deo, quamque eximiae tributae sunt, qui primum eos humo excitatos, celsos et erectos constituit, ut Deorum cognitionem coelum intuentes capere possent. Sunt enim e terra homines, non ut incolae atque babitatores, sed quasi spectatores superarum rerum atque coelestium, quarum spectaculum ad nullum aliud genus animantium pertinet.

Man being the only creature in this fublunary world made to contemplate heaven, it was convenient that he fhould have fuch a figure, or fitus of the parts of his body, that he might conveniently look upwards. But to fay the truth in this refpect of contemplating the heavens, or looking upwards, I do not fee what advantage a man hath by this erection, above other animals, the faces of most of them being more fupine than ours, which are only perpendicular to the horizon, whereas fome of theirs ftand reclining; but yet two or three other advantages we have of this erection, which I fhall here mention.

First, It is more commodious for the fustaining of the head, which being full of brains, and very heavy (the brain in man being far larger, in proportion to the bulk of his body, than in any other animal) would have been very painful and wearifome to carry, if the neck had lain parallel or inclining to the horizon.

Secondly, This figure is most convenient for prospect, and looking about one; a man may see further before him, which is no small advantage for avoiding danger, and discovering whatever he fearches after.

Thirdly, The conveniency of this fite of our bodies will more clearly appear, if we confider what a pitiful condition we had been in, if we had been conftantly neceffitated to ftand and walk upon

186

all four; man being, by the make of his body, of all quadrupeds (for now I must compare him with them) the most unsit for that kind of *inceffus*, as I shall shew anon; and besides that we should have wanted, at least in a great measure, the use of our hand, that invaluable instrument, without which he had wanted most of those advantages we enjoy as reasonable creatures; as I shall more particulary demonstrate afterwards.

But it may be perchance objected by fome, that nature did not intend this erection of the body, but that it is fuperinduced and artificial; for that children at first creep on all four, according to that of the poet;

## Mox quadrupes, ritugue tulit sua membra ferarum. Ovid.

To which I anfwer, that there is fo great an inequality in the length of our legs and arms, as would make it extremely inconvenient, if not impossible for us to walk upon all four, and fet us almost upon our heads; and therefore we fee that children do not creep upon their hands and feet, but upon their hands and knees; fo that it is plain that nature intended us to walk as we do, and not upon all four.

2. I argue from the fitus, or position of our faces; for had we been to walk upon all four, we had been the most prone of all animals, our faces being parallel to the horizon, and looking directly downwards.

3. The greatness and strength of the muscles of the thighs and legs above those of the arms, is a clear indication that they were by nature intended for a more difficult and laborious action, even the moving and transferring the whole body, and that motion to be fometimes continued for a great while together.

As for that argument taken from the contrary flexure of the joints of our arms and legs to that of quadrupeds, as that our knees bend forward, whereas the fame joint of their hind legs bends backward; and that our arms bend backward, whereas the knees of their fore legs bend foreward; although the obfervation be as old as Ariftotle, becaufe I think there is a miftake in it, in not comparing the fame joints (for the firft and uppermoft joint in a quadruped's hind legs bends forward as well as a man's knees, which anfwer to it, being the uppermoft joint of our legs, and the like mutatis mutandis may be faid of the arms) I fhall not infift upon it.

Another particular which may ferve to demonftrate that this erect pofture of the body of man was intended and defigned by the wife and good author of nature, is the fastening of the cone of the pericardium to the midriff; an account whereof I shall give the reader out of the ingenious Dr Tysons Anatomy of the Orang-Outang, or Pigmie, p. 49.

Vefalius, faith he, and others make it a peculiarity to man, that the pericardium, or bag that inclofes the heart, fhould be faftened to the Diaphragam. Vefalius tells us (De Corporis Humani Fabrica, lib. 9. cap. 8.) Caeterum involuchri mucro, et dextri ipfius lateris egregia portion fepti transversi nervea circulo validissime amploque admodum spatio connascitur, quod hominibus est peculiare. "The "point of the pericardium, and a very confiderable "portion of its right fide is most firmly fastened to "the nervous circle of the midriff for a large space, "which is peculiar to mankind." So Blancardius, Anat. Reformat. cap. 2. p. 8. Homo prae caeteris animalibus hec peculiare habet, quod ejus pericardium septi tranversi medio semper accrescat, cum idem in quadrupedum genere liberum et aliquanto spatio ab ipso remotum sit : "Man hath this peculiar "to him, and different from other animals, that his pericardium doth always grow to the middle of the midriff; whereas in the quadruped kind it is free, and removed some distance from it.

The pericardium in man is therefore thus fastened, that in expiration it might affift the diastole of the diaphragm: for otherwife the liver and ftomach being fo weighty, they would draw it down too much towards the abdomen, fo that, upon the relaxation of its fibres in its diaftole, it would not afcend fufficiently into the thorax, fo as to caufe a fubfidency of the lungs by leffening the cavity there. In quadrupeds there is no need of this adhesion of the pericardium to the diaphragm; for in them, in expiration, when the fibres of the diaphragm are relaxed, the weight of the vifcera of the abdomen will eafily prefs the diaphragm up into the cavity of the thorax, and fo perform that fervice; befides, were the pericardium fastened to the diaphragm in quadrupeds, it would hinder its fystole in infpiration, or its descent downwards upon the contraction of its muscular fibres; and the more, because the diaphragm being thus tied up, it could not then fo freely force down the weight of the vifcera, which are always preffing upon it, and confequently not fufficiently dilate the cavity of the thorax, and therefore must hinder their infpiration. Thus we fee how necessary it is, that in man, the pericardium should be fastened to the diaphragm, and in quadrupeds how inconvenient it would be. " And fince we find this diffe-" rence between the hearts of brutes and men in " this particular, how can we imagine but that it " must needs be the effect of wildom and defign, " and that man was intended by nature, to walk

" crect, and not upon all four, as quadrupeds " do?"

II. The body of man may thence be proved to be the effect of wifdom, becaufe there is nothing in it deficient, nothing fuperfluous, nothing but hath its end and ufe. So true are those maxims we have already made use of: Natura nikil facit frustra, and Natura non abundat in superfluis, nec deficit in necesfariis. "No part that we can well spare. The eye " cannot say to the hand, I have no need of thee; " nor the head to the feet, I have no need of you," 1 Cor. xii. 21. that I may usurp the Apostle's fimilitude.

The belly cannot quarrel with the members, nor they with the belly for her feeming floth; as they provide meat for her, fo fhe concocts and diftributes it to them; only it may be doubted to what ufe the paps in men fhould ferve. I answer, partly for ornament, partly for a kind of conformity between the fexes, and partly to defend and cherisch the heart; in fome they contain milk, as in a Danisch family we read of in Bartholine's Anatomical Observations; however, it follows not that they, or any other parts of the body, are useles, because we are ignorant.

I have lately met with a ftory in Signior Paulo Boccone's Natural Ob/ervations, printed at Bologna in Italy, 1684, well attefted, concerning a countryman, called Billardino di Billo, living in a village belonging to the city of Nocera in Umbria, called Somareggio, whofe wife dying, and leaving a young infant he nourifhed it with his own milk. This man, either becaufe in the fmall village where he lived there was not a wet nurfe to be had, or becaufe he was not able to hire one, took the child, and applying it to his own bofom, and putting the nipples of his breafts into its mouth, invited it to fuck, which the infant did, and after

190

divers times drawing, fetched fome milk; whereat the father encouraged, continued to apply it, and fo after a while it brought down the milk fo plentifully as to nourifh it for many months, till it was fit to be weaned. Hereupon my author having proved by fufficient authority of able anatomifts, fuch as Francifcus Maria Florentinus, and Marcellus Malphigius, that the paps of men have the fame ftructure, and the fame veffels with those of women, concludes, that nature hath not given paps to men, either to no purpose, or for mere ornament; but, if need requires, to fupply the defect of the female, and give fuck to the young.

Had we been born with a large wen upon our faces, or a Bavarian poke under our chins, or a great bunch upon our backs like camels, or any the like fuperfluous excrefcency, which thould be not only ufelefs but troublefome, not only ftand us in no ftead, but alfo be ill favoured to behold, and burdenfome to carry about; then we might have had fome pretence to doubt whether an intelligent and bountiful Creator had been our architect: For had the body been made by chance, it must in all likelihood have had many of these fuperfluous and unneceffary parts.

But now feeing there is none of our members but hath its place and ufe, none that we could fpare, or onveniently live without, were it but those we account excrements, the hair of our heads, or the nails on our fingers ends; we must needs be mad or fottish, if we can conceive any other than that an infinitely good and wife God was our author and former.

III. We may fetch an argument of the wifdom and providence of God from the convenient fituation and difpofition of the parts and members of our bodies; they are feated most conveniently for use, for ornament, and for mutual affistance!

First, For use. So we see the fenses of such eminent use for our well-being, fituate in the head, as centinels in a watch-tower, to receive and convey to the foul the impreffions of external objects. Sensus autem iuterpretes ac nuntii rerum in capite tanguam in arce mirifice ad usus necessarios et facti et collocati sunt. Cic. de Nat. Deorum. The eye can more eafily fee things at a distance, the ear receive founds from afar : How could the eye have been better placed, either for beauty and ornament, or for the guidance and direction of the whole body? As Cicero proceeds well, Nam oculi tanguam speculatores altissimum locum obtinent, ex quo plurima conspicientes funguntur suo munere: Et aures quae sonum recipere debent, qui natura in sublims fertur, recte in altis corporum partibus collocatae sunt; itemque nares, eo quod omnis odor ad superiora fertur, recte sursum sunt. " For " the eyes like centinels, occupy the highest place, " from whence feeing many things, they perform " their functions; and the ears, which are made for " the reception of founds, which naturally are car-" ried upwards, are rightly placed in the upper-" most parts of the body; also the nostrils, because " all odours afcend, are fitly fituate in the fuperior " parts. I might inftance in the other members: How could the hands have been more conveniently placed for all forts of exercises and works, and for the guard and fecurity of the head and principal parts? the heart, to difpense life and heat to the whole body, viz. near the centre; and yet becaufe it is harder for the blood to afcend than defcend, fomewhat nearer the head. It is also observable, that the finks of the body are removed as far from the nofe and eyes, as may be, which Cicero takes notice of in the fore-mentioned place: Ut in aedificiis architeEti avertunt ab oculis et naribus dominorum ea quae profluentia necessario essent tetri

# aliquid habitura; Sic natura res similes procul amandavit a sensibus.

Secondly, For ornament: What could have been better contrived, than that those members which are pairs, should stand by one another in equal altitude, and answer on each side one to another? And,

Thirdly, For mutual affiftance. We have before shewed how the eye stands most conveniently for guiding the hand, and the hand for defending the eye; and the like might be faid of the other parts, they are fo fituate, as to afford directions and help one to another. This will appear more clearly, if we imagine any of the members fituate in contrary places or positions. Had a man's arms been fitted only to bend backwards behind him, or his legs only to move backwards, what directions could his eyes then have afforded him in working or walking? Or how could he then have fed himfelf? Nay, had one arm been made to bend forward and the other directly backward, we had then loft half the use of them, fince they could not have affifted one the other in any action. Take the eyes, or any other of the organs of fenfe, and fee if you can find any fo convenient a feat for them in the whole body, as that they now possefs.

IV. From the ample provision that is made for the defence and fecurity of the principal parts; those are, I. The heart, which is the fountain of life and vegetation, Officina fpirituum vitalium, principium et fons caloris nativi, lucerna humidi radicalis; and that I may speak with the chymists, Ipse fol microcosmi, " the very sun of the " microcosm," or little world, in which is contained that vital flame, or heavenly fire, which Prometheus is fabled to have stole from Jupiter; or, as Aristotle phrases it, that Auaroyov to two attraver solver. Divinam quis respondens elemento stellarum. This for more security is situate in

Part IF.

the centre of the trunk of the body, covered first with his own membrane; called pericardium, lodged within the foft bed of the lungs, encompafied round with a double fence, (1.) Of firm bones or ribs, to bear off blows: (2.) Of thick muscles and fkins, befides the arms conveniently placed, to fence off any violence at a diftance, before it can approach to hurt it. 2. The brain, which is the principle of all fense and motion, the fountain of the animal fpirits, the chief feat and palace-royal of the foul; upon whofe fecurity depends whatever privilege belongs to us as fenfitive or rational creatures. This, I fay, being the prime and immediate organ of the foul, from the right constitution whereof proceeds the quickness of apprehension, acuteness of wit, folidity of judgment, method and order of invention, strength and power of memory (which if once weakened and difordered, there follows nothing but confusion and disturbance in our apprehentions, thoughts and judgment) is invironed round about with fuch a potent defence, that it must be a mighty force indeed that is able to injure it.

I A fcull, fo hard, thick, and tough, that it is almoft as eafy to fplit a helmet of iron as to make a fracture in it. This is covered with fkin, and hair, which ferve to keep it warm, being naturally a very cold part, and alfo to quench and diffipate the force of any ftroke that fhall be dealt it, and retund the edge of any weapon. 3. And yet more than all this, there is ftill a thick and tough membrane, which hangs loofer about it, and doth's not fo clofely embrace it, (that they call dura mater,) and in cafe the fkull happens to be broken, doth often preferve it from injury and diminution. And, laftly, a thin and fine membrane, ftrait, and clofely adhering, to keep it from quafhing and Part H.

fhaking. The many pairs of nerves proceeding from it, and afterwards diffributing and branching themfelves to all the parts of the body, either for nutrition or motion, are wonderful to behold in prepared bodies and even in the fchemes and figures of Dr Willis and Vieuffens.

I might instance 3. in the lungs, which are fo useful to us, as to life and fenfe, that the vulgar think our breath is our very life, and that we breathe out our fouls from thence; fuitable to which notion both anima and spiritus in Latin, and mutuma in Greek, are derived from words that fignify breath and wind; and efflare or exhalare animam fignify to die. And the old Romans used to apply mouth to mouth, and receive the last gasps of their dying friends, as if our fouls had come out that way. From hence, perhaps, might first fpring that opinion of the vehicles of spirits; the vulgar, as I hinted before, conceiving that the breath was, if not the foul itfelf, yet that wherein it was wafted and carried away. These lungs, I fay, are, for their better fecurity and defence, thut up in the fame cavity with the heart.

V In the abundant provision that is made againft evil accidents and inconveniencies. And the liberality of nature, as to this particular, appears, I. In that fhe hath given many members (which are of eminent ufe) by pairs, as two eyes, two ears, two noftrils, two hands, two feet, two breafts, [mammae] two reins; that fo, if by any crofs or unhappy accident one fhould be difabled or rendered ufelefs, the other might ferve us tolerably well; whereas had a man but one hand or one eye, &c. if that were gone, all were gone, and we left in an evil cafe. See then, and acknowledge the benignity of the Deity, who hath beftowed upon us two hands, and two eyes, and other the

like parts, not only for our neceffity but conveniency, fo long as we enjoy them; and for our fecurity, in cafe any mifchance deprive us of one of them. 2. In that all the veffels of the body have many ramifications; which particular branches, though they ferve mainly for one member or muscle, yet. fend forth fome twigs to the neighbouring mufcles, and fo interchangeably the branches that ferve thefe fend to them; fo that if one branch chance to be cut off or obstructed, its defect may, in some measure, be supplied by the twigs that come from the neighbouring veffels. 3. In that fhe hath provided fo many ways to evacuate what might be hurtful to us, or breed difeases in our bodies. If any thing oppress the head, it hath a power to free itfelf by fneezing : if any thing fall into the lungs, or if any humour be discharged upon them, they have a faculty of clearing themfelves, and cafting it. up by coughing; if any thing clog or burden the ftomach it hath an ability of contracting itfelf, and throwing it up by vomit. Befides thefe ways of evacuation, there are, fiege, urine, fweating, haemorrhaiges from the nofe, and haemorrhodial veins, fluxes of rheum. Now the reafon why nature hath provided fo many ways of evacuation, is, because of the different humours that are to be voided or caft out. When therefore there is a fecretion made of any noxious humour, it is carried off by that emunctory whole pores are fitted to receive and transmit the minute parts of it; if at least this feparation be made by percolation, as we will now suppose, but not affert, yet I doubt not but the same humour may be cast off by diverse emunctories, as is clear in urine and fweat, which are for the main the fame humour carried off feveral ways.

To this head of provision against inconveniencies, I shall add an observation or two concerning fleep, 1. Sleep being neceffary to man and other animals for their refreshment, and for the reparation of that great expence of fpirits which is made in the day-time by the conftant exercise of the fenfes and motions of the muscles, that it might ease and refresh us indeed, nature hath provided, that though we lie long upon one fide, we fhould have no fenfe of pain and uneafinefs during our reft, no, nor when we awake; whereas in reafon one would think, that the whole weight of the body preffing the mufcles and bones on which we lie, should be very burdenfome and uneafy, and create a grievous fenfe of pain; and we find by experience that it doth fo when we lie long awake in the night, we being not able (efpecially if never fo little indif-pofed) to reft one quarter of an hour in the fame posture, without shifting of fides, or at least etching this way and that way, more or lefs How this may be affected, is a great queftion. To me it feems most probable, that it is done by an inflation of the muscles, whereby they become both foft, and yet renitent, like fo many pillows, diffipating the force of the preffure, and fo preventing or taking away the fense of pain. That the muscles are in this manner inflated in time of reft, appears to the very eye in the faces of children, and may be proved from that, when we reft in our clothes, we are fain to loofen our garters, shoeftrings, and other ligatures, to give the fpirits free paffage, elfe we shall experience pain and uneafiness in those parts, which when we are waking we find not.

The reason of this phaenomenon, viz. that avalynoia, or want of pain, we experience in fleep, during and after a long decubitus on one fide, Dr Lister, in his *fourney to Paris*, p. 113. and Dr Jones, in his treatife of *The mysteries of Opium revealed*, attribute to the relaxation of the nerves and muf108

cles in time of fleep; and the fense of pain and uneafinels when we lie awake, to the tenfion of them during that time: this I do not deny, but yet I think the reafon I have affigned hath a great intereft in that reft and eafinefs we enjoy when afleep.

2. Because fleep is inconfistent with the fense of pain, therefore during reft, those nerves which convey that motion to the brain, which excites in the foul a fense of pain, are obstructed. This 1 myfelf have had frequent experience of, fince I have been troubled with fores on my legs; upon fudden awaking finding myfelf at perfect eafe, and void of all fense of pain for a minute's time or more, the pain then by degrees returning; which I could -attribute to nothing but the diffipating of that vapour, or whatever elfe it were, which obstructed the nerves, and giving the dolorifick motion free paffage again.

Upon fecond thoughts, and reading what Dr Lifter and Dr Jones have written concerning this fubject, I rather incline to believe, that the motion caufing a sense of pain, is conveyed to the brain by the nerves themfelves in tenfion, as we fee in cords, and the leaft touch at one end paffes speedily to the other, when they are firetched, which it doth not when they are relaxed, and not by the fpirits paffing through them; and, on the other fide, the infenfiblenefs of pain proceeds rather from the relaxation of the nerves than their obstruction ; but wet this tenfion of the nerves and muscles is owing to the fpirits flowing down into them, and diftending them.

VI. From the conftancy that is observed in the number, figure,' place, and make of all the principal parts; and from the variety in the lefs. Man is always mending and altering his works; but nature observes the fame tenor, because her works are fo perfect, that there is no place for amend-

ments; nothing that can be reprehended. The most fagacious men in fo many ages have not been able to find any flaw in these divinely contrived and formed machines, " no blot or error in this great vo-" lume of the world, as if any thing had been an im-" perfect effay at the first," (to use the Bishop of Chefter's words:) nothing that can be altered for the better, nothing but if it were altered would be marred. This could not have been, had man's body been the work of chance, and not counfel and providence: why should there be constantly the fame parts? why fhould they retain conftantly the fame places? why fhould they be endued with the fame fhape and figure? Nothing fo contrary as conftancy and chance. Should I fee a man throw the fame number a thousand times together upon but three dice, could you perfuade me that this were accidental, and that there was no neceffary caufe of it ? How much more then incredible is it, that conftancy in fuch a variety, fuch a multiplicity of parts, should be the refult of chance? Neither vet can these works be the effects of necessity or fate, for then there would be the fame conflancy obferved in the fmaller as well as the larger parts and veffels; whereas there we fee nature doth ludere, as it were, fport itself; the minute ramifications of all the veffels, veins, arteries, and nerves, infinitely varying in individuals of the fame fpecies, fo that they are not in any two alike.

VII. The great wildom of the divine Creator appears, in that there is pleafure annexed to thole actions that are neceffary for the fupport and prefervation of the individuum, and the continuation and propagation of the fpecies; and not only fo but pain to the neglect or forbearance of them. For the fupport of the perfon, it hath annexed pleafure to eating and drinking; which elfe, out of lazinefs, or multiplicity of bufinefs, a man 200

would be apt to neglect, or fometimes forget. Indeed to be obliged to chew and fwallow meat daily for two hours fpace, and to find no relifh or pleafure in it, would be one of the most burdenfome and ungrateful tasks of a man's whole life; but because this action is absolutely necessary, for abundant fecurity nature hath inferted in us a painful sense of hunger, to put us in mind of it; and to reward our performance hath adjoined pleasure to it. And as for the continuation of kind, I need not tell you, that the enjoyments which attend those actions are the highest gratifications of fense.

VIII. The wonderful art and providence of the contriver and former of our bodies, appears in the multitude of intentions he must have in the formation of the feveral parts of the qualifications they require, to fit them for their feveral ufes\*. Galen, in his book de Formatione Foetus, takes notice, " That there are in a human body above fix " hundred feveral muscles, and there are at leaft ten " feveral intentions or due qualifications to be observ-" ed in each of these; proper figure, just magnitude " right disposition of its feveral ends, upper and low-" er, position of the whole, the infertion of its pro-" per nerves, veins, and arteries, which are each of " them to be duly placed; fo that about the muf-" cles alone, no lefs than fix thousand feveral ends " or aims are to be attended to. The bones are " reckoned to be 284. The diffinct fcopes or in-" tentions in each of these are above 40; in all " about 100000. And thus it is in fome propor-" tion with all the other parts, the fkin, liga-" ments, veffels glandules, humours: but more " especially with the feveral members of the body " which do, in regard of the great variety and " multitude of those feveral intentions required to

\* Bishop of Chester's Nat. Rel. 1. 1. c. 6.

" them very much exceed the homogeneous parts; and the failing in any one of thefe, would caufe irregularity in the body, and in many of them fuch as would be very notorious." Now to imagine that fuch a machine, composed of fo many parts, to the right form, order, and motion whereof, fuch an infinite number of intentions are required, could be made without the contrivance of fome wife agent, must needs be irrational in the higheft degree.

This wonderful mechanism of human bodies, next to viewing the life, may be seen at large in the excellent figures of Spigelius and Bidloo, their fituation, order, connexion, and manner of separating them, in Lyserus his *Cult. Anatom.* The almost infinite ramifications, and inosculations of all the several forts of vessels, the structures of the glands, and other organs, may easily be detected by glasses, and traced by blowing in of air, and drying them, or by injecting through peculiar syringes melted wax or quick-filver; the operations whereof may be learned out of Swammerdam, Cafpar Bartholine, and Antonio Nuck.

IX Another argument of wildom and defign in contrivance of the body of man and other animals, is the fitting of fome parts to divers offices and ufes, whereby nature doth (as the proverb is) Una fidelia duos parietes dealhare, "Stop two gaps with "one bufh;" fo, for inftance, the tongue ferves not only for tafting, but alfo to affift the maftication of the meat and deglutition, by turning it about, and managing it in the mouth, to gather up the food, in man by licking; in the dog and cat-kind by lapping; in kine, by plucking up the grafs: particularly in man, it is of admirable ufe for the formation of words and fpeaking.

The diaphragm, and muscles of the abdomen, or lower belly, are of use not only for respiration,

Cc

but allo for compreffing the inteffines, and forcing the chyle into the lacteal veins, and likewife out of the faid veins into the thoracick channel; and here (to note that by the way) appears the ufe of a common receptacle of chyle, that by the motion of the muscles of respiration, it being preffed upon, the chyle might with more facility be impelled into the fore-mentioned duct; besides, this action of respiration and motion of the faid diaphragm and muscles, may ferve also for the comminution and concoction of the meat in the stant (as fome, not without reason, think) by their constant agitation and motion upwards and downwards, refembling the pounding or braying of materials in a mortar.

And to inftance in no more, the mulcular contraction and pulfe of the heart ferves not only for the circulation of the blood, but alfo for the more perfect mixture of its parts, preferving its due crafis and fluidity, and incorporating the chyle and other juices it receives with it.

X. The wifdom and goodnefs too of the divine former of our bodies, appears in the nourifhment of them; for that food which is of a wholefome juice, and proper to nourifh and preferve them in a healthful ftate, is both pleafant to the tafte, and grateful and agreeable to the ftomach, and continues to be fo till our hunger and thirft be well appeafed, and then begins to be lefs pleafant, and at laft even naufeous and loathfome. The full ftomach loaths the honey-comb.

On the other fide, that which is unwholefome and unfit for nourifhment, or deftructive of health, is alfo unpleafant to the tafte, and ungrateful and difagreeable to the ftomach, and that more or lefs, according as it is more or lefs improper or noxious. And though there be fome forts of food lefs pleafant to the tafte, which by use may be rendered

grateful, yet to perfons that are in health, and in no neceffity of using such viands, I think it were better to abstain from them, and follow nature, in eating such things as are agreeable to their palate and stomach; for such unpleasant diet must needs alter the temper of the body, before it can become acceptable; and doubtless for the worfe.

I might add hereto, that even pain, which is the most grievous and afflictive thing that we are fenfible of, is of great use to us. God hath annexed a fense of pain to all difeases and harms of the body inward and outward, (and there is no pain but proceeds from some harm or disease; to be an effectual fpur to excite and quicken us to feek for speedy help or remedy; and hath fo ordered it, that as the difease heals, fo the pain abates. Neither doth pain provoke us only to feek eafe and relief when we labour under it, but also makes us careful to avoid for the future all fuch things as are productive of it; that is, fuch things as are hurtful to our bodies, and destructive of the health. and well-being of them, which alfo are for the most part prohibited by God, and fo finful and injurious to our fouls. So we fee what care the divine providence hath taken, and what effectual means it hath ufed, for the healing of our difeafes, and the maintenance and prefervation of our health. This is the true reason of our pain; howbeit, I will not deny but that God doth fometimes himfelf immediately inflict diseases, even upon his own children, for many good confiderations, which I shall not here enumerate; neither shall I mention the uses that parents and masters make of it, for the correcting their children and fervants; or magistrates, for the punishing of malefactors, they being beyond my scope; only I cannot but take notice, that it is a monuxpusor, a thing of manifold uses, and neceffary for the government both of commonwealths and families.

XI. Some fetch an argument of providence from the variety of lineaments in the faces of men, which is fuch, that there are not two faces in the world, abfolutely alike; which is fomewhat ftrange, fince all the parts are in specie the fame. Were nature a blind architect, I fee not but the faces of fome men might be as like, as eggs laid by the fame hen, or bullets caft in the fame mould, or drops of water out of the fame bucket. This particular I find taken notice of by Pliny in his feventh book, cap. I. in these words: Jam in facie vultuque nostro, cum sint decem aut paulo plura membra, nullas duas in tot millibus hominum indiscretas effigies existere, quod ars nulla in paucis numero praestet affectando. To which, among other things, he thus prefaces; Naturae vero rerum vis atque majestas in omnibus momentis fide caret.

Though this at first may feem to be a matter of fmall moment, yet, if duly confidered, it will appear to be of mighty importance in all human affairs; for, should there be an undiscernable fimilitude between divers men, what confusion and disturbance would necessarily follow? What uncertainty in all fales and conveyances, in all bargains and contracts? What frauds and cheats, and fuborning of witneffes? What a fubverfion of all trade and commerce? What hazard in all judicial proceedings, in all affaults and batteries, in all murders and affaffinations? In thefts and robberies, what fecurity would there be to malefactors? who could fwear that fuch and fuch were the perfons that committed the fact, though they faw them never fo clearly? Many other inconveniencies might be inftanced in; fo that we fee this is no contemptible argument of the Wifdom and Goodnefs of God.

Neither is the difference of voices lefs confiderable, for the diffinguishing of fexes and particular perfons, and individuals of all animals, than that of faces; as Dr Cockburn makes out, Effay &c. part II. page 68, &c. Nay, in fome cafes more; for hereby perfons in the dark and those that are blind may know and diffinguish one other, which is of great importance to them; for otherwise they might be most grossly cheated and abused.

Farther, we may add out of the fame author, page 71. " And to no other caufe [than the wife " providence of God] can be referred the no lefs " ftrange diversity of hand-writings. Common " experience fhews, that though hundreds and " thousands were taught by one master, and one " and the fame form of writing, yet they fhould " all write differently; whether men write Court " or Roman hand, or any other, their is fome-" thing peculiar in every one's writing, which " diftinguisheth it. Some indeed can counterfeit " anothers character and fubscription, but the in-" ftances are rare, nor is it done without pain, and " trouble; nay, the most expert and skilful can-" not write much fo exactly like as that it cannot " be known whether it be genuine or counterfeit; " and if the providence of God did not fo order " it, what cheats and forgeries too would daily be " committed, which would not only justle private " men out of their rights, but also unhinge states " and governments, and turn all into confusion ? " The diverfity of hand-writings is of mighty " great use to the peace of the world; it prevents " frauds, and fecures men's property; it obligeth " the living and prefent to honefty and faithful-" nefs; it importeth the mind of the abfent, and " fheweth the will of the dead, which ought to be " facredly observed; and what is fo very useful, is

" not the effect of any human concert; men did " not of themfelves agree to it, they are only car-" ried to it by the fecret providence of God, who " understandeth and mindeth what is for the good " and interest of mankind in general, and of every " particular perfon "

Add farther to all this, That whereas there are feveral parts peculiar to brutes which are wanting in man; as for example, the feventh, or fufpenfory, muscle of the eye, the nictating membrane, the Atrong anoversons on the fides of the neck, called by fome packwax; it is very remarkable that these parts are of eminent and constant use to them; as I shall particularly shew hereafter; but to man would have been altogether ufelefs and fuperfluous.

I have done with my general observations; I proceed now more accurately and minutely to confider fome particular parts or members of the body; and first, the head; because it was to contain a large brain, made of the most capacious figure, as near as could be to a fpherical; upon this grows the hair, which, though it be efteemed an excrement, is of great ufe (as I shewed before) to cherish and keep warm the brain, and to quench the force of any ftroke, that might otherwise endanger the skull : it ferves also to disburthen the brain of a great deal of fuperfluous moisture, wherewith it abounds.

I find it remarked by Machetti, a famous anatomist in Padua, that the cause of baldness in men is the drynefs of the brain, and its fhrinking from the cranium or skull; he having observed, that in bald perfons, under the bald part, there was always a vacuity, or empty fpace, between the skull and the brain : and, laftly, to name no more, it ferves also for a graceful ornament to the face,

which our prefent age is fenfible enough of, beftowing fo much money upon falfe hair and perriwigs.

Secondly, Another member, which I shall more particularly treat of, is the eye; a part fo artificially composed, and commodiously fituated, as nothing can be contrived better for use, ornament, or fecurity; nothing to advantage added thereto, or altered therein. Of the beauty of the eye I shall fay little, leaving that to poets and orators; that it is a very pleafant and lovely object to behold, if we confider the figure, colour and fplendor of it, is the leaft that I can fay. The foul, as it is more immediately and ftrongly moved and affected by this part than any other, fo doth it manifelt all its paffions and perturbations by this. As the eyes are the windows to let in the fpecies of all exterior objects into the dark cells of the brain, for the information of the foul, fo are they flaming torches to reveal to those abroad, how the foul within is moved or affected. These representations made by the impressions of external objects upon the eye, are the most clear, lively, and distinct of any others. Now, to this use and purpose of informing us what is abroad round about us in this afpectable world, we shall find this structure and mechanifm of the eye, and every part thereof, fo well fitted and adapted, as not the least curiofity can be added: for, first of all the humours and tunicles are purely transparent, to let in the light and colours unfoiled and unfophifticated by any inward tincture. It is ufually faid by the Peripateticks, that the crystalline humour of the eye (which they ineptly fancied to be the immediate organ of vision, wherein all the species of external objects were terminated) is without all colour, because its office was to difcern all colours. or at least to receive the species of feveral colours and convey them to the common fenfe.

Now, if itfelf had been coloured, it would have tranfmitted all vifible objects functured with the fame colour; as we fee whatever is beheld through a coloured glafs, appears of the fome colour with the glafs: and to thofe that have the jaundice, or the like confusion of eyes, objects appear of that fame colour wherewith their eyes are infected. This, they fay, is in a great measure true, although they are much mistaken about the organ and manner of vision, and the uses of the humours and membranes of the eye. Two reasons, therefore, may be affigned, why all the membranes and humours of the eye are perfectly pellucid, and void of colour: First For the clearnes Secondly, For the distinctness of vision.

First, For the clearnefs; for had the tunicles and humours of the eye, all, or any of them, been colorate, many of the rays proceeding from the vifible object would have been stopped and suffocated before they could come to the bottom of the eye, where the formal organ of vision is situated: for it is a most certain rule, how much any body hath of colour, so much hath it of opacity; and by so much the more unsit it is to transmit the species.

Secondly, For the diffinctness of vision: for, as I faid before, and the Peripateticks observe well, were the humours of the eye tinctured with any colour, they would refund that colour upon the object, and fo it would not be represented to the foul, as in itself it is. So we see, that through a coloured glass things appear as well more dim and obscure, as tinctured with the colour thereof

Third/y, The parts of the eye are made convex and efpecially the cryftalline humour, which is of a lenticular figure, convex on both fides, that by the refractions there made, there might be a direction of many rays coming from one point in the object, viz. as many as the pupil can

#### in the CREATION.

Part II. receive, to one point answerable in the bottom of the eye, without which the fense would be very obscure, and also confused. There would be as much difference in the clearness and distinction of vision, were the outward furface of the tunica cornea plain, and the crystalline humour removed, as between the picture received on white paper in a dark room through an open or empty hole, and the fame received through a hole furnished with an exactly polified lenticular cryftal; which, how great it is, any one that hath feen but this experiment made, knows well enough. Indeed this experiment doth very much explain the manner of vision, the hole answering to the pupil of the eye, the crystalline humour to the lenticular glafs, the dark room to the cavity containing the vitreous humour, and the white paper to the tunica retina.

Fourthly, The uveous coat, or iris of the eye, hath a musculous power, and can dilate and contract that round hole in it, called the pupil, or fight of the eye. It contracts it for the excluding fuperfluous light, and preferving the eye from being injured by too vehement and lucid an object, and again dilates it for the apprehending objects more remote, or placed in a fainter light; tam miro artificio (faith Scheiner) quam munifica naturae largitate. If any one defires to make experiment of these particulars, he may (following Scheiner and Des Cartes their direction,) take a child, and fetting a candle before him, bid him look upon it, and he shall observe his pupil contract itself very much, to exclude the light, with the brightnefs whereof it would otherwife be dazzled and offended; (as we are, when after we have been fome time in the dark, a bright light is fuddenly brought in, and fet before us, till the pupils of our eyes have gradually contracted themfelves;) let the

Dd

candle be withdrawn or removed afide, he shall observe the child's pupil by degrees to dilate itself; or let him take a bead, or the like object, and holding it near the eye, command the child to look at it, the pupil will contract much when the object is near; but let it be withdrawn to a greater distance in the fame light, and he shall observe the pupil to be much enlarged.

Fifthly, The uveous coat, and also the infide of the chorides, are blackened like the walls of a tennis-court, that the rays may be there fuffocated and fuppreffed, and not reflected backwards, to confound the fight : and if any be, by the retiform coat, reflected, they are foon choaked in the black infide of the uvea. Whereas, were they re-Bected to and fro, there could be no diffinct vifion: as we fee the light admitted into the dark room, we even now fpeak of, obliterates the fpecies. which before were feen upon the white cloth or paper.

Sixthly, Because the rays from a nearer, and from a more remote object, do not meet just in the fame distance behind the crystalline humour, (as may eafily be observed in lenticular glass, where the point or concourse of the rays from a nearer object is at a greater diftance behind the glafs, and from a farther at a leffer) therefore the ciliary proceffes, or rather the ligaments, obferved in the infide of the sclerotick tunicles of the eye by a late ingenious anatomist, do ferve instead of a muscle, by their contraction to alter the figure of the eye, and make it broader, and confequently draw the retina nearer to the crystalline humour; and by their relaxation fuffer it to return to its natural diftance, according to the exigency of the object, in respect of distance or porpinquity ; and befides, poffibly the ciliary proceffes may, by their confiriction or relaxation, render the cryf-

210

talline itself more gibbose, or plain, and with the help of the muscles, a little alter the figure of the whole eye for the fame reason. To what I have faid, might be added, that the retiform tunicle is whitish, for the better and more true reception of the species of things: that there being a distance neceffarily required for the collection of the rays received by the pupil, viz those that proceed from one point of the object to one point again in the bottom of the eye, the retina must needs be set at a distance from the crystalline humour; and therefore nature hath provided a large room, and filled it with the pellucid vitreous humour most fit for that purpose.

I must not omit a notable observation concerning the place of the infertion of the optick nerve into the bulb of the eye, and the reafon of it; which I owe to that learned mathematician, Peter Herigon: Nervus opticus (faith he in his Optica) ad latus ponitur, ne pars imaginis in ejus foramen incidens pictura careat : " The optick nerve is not fi-" tuated directly behind the eye, but on one fide, left " that part of the image that falls upon the hole of " the optick nerve should want its picture." This I do not conceive to be the true reason of this fituation; for even now as it is fituate, that part of the object, whole rays fall upon the centre, or hole of the optick nerve, wants its picture, as we find by experience, that part not being feen by us, though we heed it not; but the reafon is, because if the optick axis should fall upon this centre (as it would do, were the nerve feated just behind the eye) this great inconvenience would follow, that the middle point of every object we viewed would be invifible, or there would be a dark fpot appearing in the midft of it. Thus we fee the admirable, wildom of nature in thus placing the optick nerve in refpect of the eye, which he that did not confider or underfituate for vision, than if it had been right behind.

ftand, would be apt to think more inconveniently

Another thing alfo concerning vision is most remarkable, that though there be a decuffation of the rays in the pupil of the eye, and fo the image of the object in the retina, or bottom of the eye, be inverted, yet doth not the object appear inverted, but in its right or natural posture; the reason whereof is, because the vifual rays coming in straight lines by those points of the fenfory, or retina, which they touch, affect the common fenfe or foul, according to their direction; that is, fignify to it, that those feveral parts of the object from whence they proceed, lie in straight lines (point for point) drawn through the pupil to the feveral points of the fenfory where they terminate, and which they prefs upon. Whereupon the foul must needs conceive the object, not in an inverted, but a right posture; and that the nerves are naturally made, not only to inform the foul of external objects which prefs upon them, but also of the fituation of fuch objects, is clear, because if the eyes be difforted, the object, will we, nill we, will appear double: fo if the fore and middle fingers be croffed, and a round body put between them, and moved, it will feem to be two; the reafon is, becaufe in that posture of the fingers the body touches the outfides of them, which in their natural fite are diftant one from another, and their nerves made to fignify to the foul, bodies feparate and diftant in like manner, two fingers lying between them. And though our reafon, by the help of our fight, corrects this error, yet cannot we but fancy it to be fo.

Neither is the aqueous humour, as fome may fupinely imagine, altogether utclefs or unprofitable as to vition, becaute, by its help, the uvea tunica is fuitained, which elfe would fail flat upon the cryf-

talline humour; and fluid it must be, to give way to the contraction and dilatation of the uveous: and because the outermost coat of the eye might chance to be wounded or pricked, and this humour being fluid, let out, therefore nature hath made provision fpeedily to repair it again in fuch a cafe, by the help of certain water pipes, or lymphaeducts, inferted into the bulb of the eye proceeding, from glandules defigned by nature to feparate this water from the blood for that use. Antonius Nuck affirms, that if the eye of an animal be pricked. and the aqueous humour fqueezed out, in ten hours fpace the faid humour and fight shall be restored to the eye, if at least the creature be kept in a dark place And that he did publicky demonstrate the fame in the anatomical theatre at Leyden, in a dog, out of whofe eye, being wounded, the aqueous humour did fo copioufly flow, that the membranes appeared flaccid, and yet in fix hours space the bulb of the eye was again replete with its humour, and that without the application of any medicines. Antonius Nuck de ductu novo faliva-11, &c.

Moreover, it is remarkable, that the cornea tunica, [horny or pellucid coat of the eye,] doth not lie in the fame fuperficies with the white of the eye, but rifeth up, as it were, a hillock, above its convexity, and is of an hyperbolical or parabolical figure; fo that, though the eye feems to be perfectly round, in reality it is not fo, but the iris thereof is protuberant above the white; and the reation is, becaufe that if the cornea tunica, or cryftalline humour, had been concentrical to the flerodes, the eye could not have admitted a whole hemitphere at one view, et fic animalis incolumitati in multis rebus minus cautum effet, as Scheiner well obferves; "In many things there had not been fuf-" incient caution or care taken for the animal's fafety. And now (that I may use the words of a late author \* of our own) the eye is already to pertect, that I believe the reafon of a man would eafily have rested here, and admired at his own contrivance. For he being able to move his whole body upward and downward, and on every fide, might have unawares thought himfelf fufficiently well provided for; but nature had provided muscles alfo to the eyes, that no perfection might be wanting; for we have often occasion to move our eves, our head being unmoved, as in reading and viewing more particularly an object fet before us, by transferring the axis of our eyes all over it; and that this may be done with the more eafe and accuracy, the hath furnished this organ with no lefs than fix mufcles, to move it upward downward, to the right and left, obliquely and round about.

I fhall now confider what provision is made for the defence and fecurity of this most excellent and useful part.

First, The eyes are funk in a convenient valley, latent utiliter, and are encompassed round with eminent parts, as with a rampart, et excelfis undique partibus Jepiuntur +; fo are defended from the ftrokes of any flat or broad bodies. Above ftand the eye brows, to keep off any thing from running down upon them, as drops of fweat from the forehead, or dust, or the like Superiora superciliis obducta sudorem a capite et fronte defluentem repellunt. Cic. Then follow the eye-lids, which fence them from any fudden aud leffer ftripes: these also round the edges are fortified with stiff briftles, as it were pallifadoes, against the incursion of importunate animals, ferving partly as a fan to firike away flies, or gnats, or any other troublefome infects; and partly to keep off fuperfluous light.

\* Dr More's Antidote against Atheifm.

† Cic. De Natura Deorum, l. 2.

Part II

#### in the CREATION.

Part IL.

Munitaeque sunt palpebrae tanguam valle pilorum, quibus et apertis oculis si quid incideret repelleretur, idem, ibid. And becaufe it was neceffary that man and other animals should sleep; which could not be fo well done if the light came in by the windows of the eyes; therefore hath nature provided these curtains to be then drawn to keep it out. And because the outward coat of the eye ought to be pellucid, to transmit the light, which, if the eyes should always stand open, would be apt to grow dry and fhrink, and lofe their diaphaneity, therefore are the eye-lids fo contrived as often to wink, that fo they may as it were glaze and varnish them over with the moissure they contain, there being glandules on purpose to separate an humour for that use, and withal wipe off whatever dust or filth may flick to them; and this, left they fhould hinder the fight, they do with the greatest celerity. Cicero hath taken notice, that they are made very foft, left they should hurt the fight. Mollifime tactu ne laederent aciem, aptissime facta et ad claudendas pupillas ne quid incideret, et ad aperiendas. idque providit ut identidem fieri posset maxima cum celeritate.

Secondly, If we confider the bulb or ball of the eye, the exterior membrane or coat thereof is made thick, tough, and ftrong, that it is a very hard matter to make a rupture in it, and befides fo flippery, that it eludes the force of any ftroke, to which alfo its globular figure gives it a very great advantage.

Lastly, Because for the guidance and direction of the body in walking, and any exercise, it is neceffary the eye should be uncovered and exposed to the air at all times and in all weathers, therefore the most wife Author of nature hath provided for it a hot bed of fat, which fills up the interstices of the muscles; and besides made it more pa-

tient and lefs fenfible of cold than our other parts; and though I cannot fay with Cicero, abfolutely free from danger or harm by that enemy, yet leaft obnoxious to the injuries thereof of any part, and not at all, unlefs it be immoderate and extreme.

To all this I might add the convenience of the fituation of the eye in respect of its proximity to the brain, the feat of apprehension and common fense; whereas had it been farther removed, the optick nerves had been liable to many more dangers and inconveniencies than now they are.

Seeing then the eye is composed of fo great variety of parts, all confpiring to the use of vision, whereof some are absolutely necessary, others very useful and convenient, none idle or superfluous; and which is remarkable, many of them of a different figure and confistency from any others in the body besides, as being transparent, which it was absolutely necessary they should be, to transmit the rays of light; who can but believe that this organ was designed and made purposely for the use for which it ferves?

Neither is it to be esteemed any defect or imperfection in the eyes of man, that they want the feventh muscle, or the nictating membrane, which the eyes of many other animals are furnished withal; for though they be very useful, and in a manner neceffary to them, confidering their manner of living, yet they are not fo to man. To fuch beafts as feed upon grafs, and other herbs, and therefore are forced to hold their eyes long in a hanging posture, and to look downwards for the chuling and gathering of their food, the feventh or fufpenfory muscle is very useful, to enable them to do so without much pain or weariness; yet to man, who doth not, nor hath any occasion, indeed cannot hold his head or look long downwards it would be useless and superfluous. As for the

216

nictating membrane, or Periopthalmium, which all birds, and I think most Quadrupeds, are furnished with, I have been long in doubt what the use of it might be; and have sometimes thought it was for the more abundant defence and security of the eye; but then I was puzzled to give any tolerable account, why nature should be more solicitous for the prefervation of the eyes of brutes than men, and in this respect also to be a stepmother to the most noble creature.

But the honourable \* Author formerly mentioned gives a probable account why frogs and birds are furnished with such a membrane. Frogs, because being amphibious animals, defigned to pass their lives in watery places, which for the most part abound with fedges, and other plants endowed with sharp edges, or points; and the progressive motion of this animal being to be made not by walking, but by leaping, if his eyes were not provided of fuch a fheath, he must either shut them, and so leap blindly, and by confequence dangeroufly, or by leaving them open, run a venture to have the cornea cut, pricked, or otherwife offended by the edges or points of the plants, or what may fall from them upon the animal's eye: Whereas this membrane (being fomething transparent as well as ftrong) is like a kind of spectacle that covers the eye without taking away the fight. Birds are likewife furnished with it, because being deffinated to fly among the branches of trees and bushes, their prickles, twigs, leaves, or other parts, would be apt otherwife to wound or offend their eyes. But yet still we are to feek why it is given to other quadrupeds, whole eyes are in no fuch danger.

Thirdly, The ear, another organ of fenfe, how admirably it is contrived for the receiving and conveying of founds! First, There is the outward

<sup>\*</sup> Boyle, of final Caufes, p. 53, 54.

ear, or auricula, made hollow and contracted by degrees, to draw the found inward, to take in as much as may be of it, as we use a funnel to pour liquor into any veffel And therefore if the auricula be cut clear off, the hearing is much impaired, and almost quite marred, as hath been by experience found From the aricula is extended a small, long, round hole, inward into the head. to intend the motion, and fo augment the force of the found, as we fee in a fhooting-trunk, the longer it is to a certain limit, the fwifter and more forcibly the air paffes in it, and drives the pellet-At the end of this hole is a membrane, fastened to a round bony limb, and ftretched like the head of a drum, and therefore by anatomists called allo tympanum, to received the impulse of the found, and vibrate or quaver according to its reciprocal motions or vibrations: The finall ear-bones being at the end fastened to the tympanum, and furnished with a muscle, ferve for the tension of that membrane, or the relaxation of it, according to the exigency of the animal; it being ftretched to the utmost when it would hearken diligently to a lower or more distant sound. Behind the drum are feveral vaults and anfractuous cavities in the ear-bone, filled only with what naturalists call the implanted air; fo to intend the least found imaginable, that the fenfe might be affected with it; as we fee in fubterraneous caves and vaults, how the found is redoubled, and what a great report it makes, however moderate it be: And becaufe it was for the behoof of the animal, that upon any fudden accident it might be awakened out of its fleep, therefore were there no fhuts or stopples made for the ears, that fo any loud or tharp noife might awaken it. as also a soft and gentle voice of murmur provoke it to fleep Now the ears, for the benefit and conveniencies of the animal, being always to ftand

open, becaufe there was tome danger that infects might creep in thereat, and eating their way thro' the *tvmpanum*, harbour in the cavities behind it; therefore hath nature loricated or plaiftered over the fides of the forementioned hole with ear-wax, to ftop and entangle any infects that fhould attempt to creep in there. But I must confefs my felf not fufficiently to understand the nature of founds, to give a full and fatisfactory account of the structure and uses of all the parts of the ear. They who have a mind to fearch into the curious anatomy and use of this part, may confult Monfieur du Verney.

Fourthly, The next part I shall take notice of shall be the teeth; concerning which I find feven observations in the honourable Mr. Boyle's treatife of final causes, which I shall briefly recapitulate, and add one or two more.

I That the teeth alone, among the bones, continue to grow in length during a man's whole life, as appears by the untightly length of one tooth, when its oppofite happens to fall or be pulled out; which was most providently defigned to repair the waste that is daily made of them by the frequent attrition in massive and the frequent attrition in massive to cure this blemish, by filing or cutting off the head of such an over-grown tooth, left that befal them which happened to a certain nun in Padua, who, upon cutting off a tooth in that manner, was prefently convulsed, and fell into an epileps, as Bartholine in his Anatomy reports.

II. That that part of the teeth which is extant above the gums, is naked, and not invested with that fensible membrane called *periosteum*, wherewith the other bones are covered.

III. That the teeth are of a clofer and harder fubftance than the reft of the bones, for the more eafy breaking and comminution of the more folid aliments, and that they might be more durable, and not fo foon worn down by grinding the food.

IV. That for the nonrifhing and cherifhing thefe fo neceffary bones, the all-wife author of things has admirably contrived an unfeen cavity in each fide of the jaw-bone, in which greater chanel are lodged an artery, a vein, and a nerve, which, through leffer cavities, as it were through gutters, fend their twigs to each particular tooth.

V. Becaufe infants were for a confiderable time to feed upon milk, which needs no chewing, and left teeth fhould hurt the tender nipples of the nurfe, nature hath deferred the production of them for many months in a human fœtus; whereas those of divers other animals, which are reduced to feek betimes food that needs maffication, are born with them.

VI. The different figure and fhape of the teeth is remarkable. That the fore-teeth should be formed broad, and with a thin and fharp edge, like chizzels, to cut off and take away a morfel from any folid food, called therefore incifores. The next, one on each fide, ftronger, and deeper rooted, and more pointed, called therefore canini, in English, eye-teeth, to tear the more tough and refifting fort of aliments. The reft called jaw-teeth, or grinders, in Latin, molares, are made flat and broad a top, and withal fomewhat uneven and rugged, that by their knobs and little cavities they may the better retain, grind, and commix the aliments.

VI. Becaufe the operations to be performed by the teeth, oftentimes require a confiderable firmnefs and firength, partly in the teeth themfelves, partly in the inftruments which move the lower jaw, which alone is moveable, nature hath provided this with ftrong muscles, to make it bear forcibly against the upper jaw. And thus not only placed

each tooth in a diffinct cavity of the jaw-bone, as it were in a clofe, ftrong, and deep focket, but has furnished the feveral forts of teeth with holdfasts fuitable to the firefs, that by reason of their different offices they are to be put to. And therefore, whereas the cutters and eye-teeth have ufually but one root, (which in these last named is wont to be very long) the grinders, that are employed to crack nuts, stores of fruit, bones, or other hard bodies, are furnished with three roots, and in the upper jaw often with four, because these are pendulous, and the fubstance of the jaw somewhat foster

VIII. The fituation of the teeth is most convenient, viz. the molares, or grinders, behind, nearest the center of motion, because, there is a greater strength or force, required to chew the meat, than to bite a piece, and the cutters before, that they may be ready to cut off a morfel from any folid food, to be transmitted to the grinders.

IX It is remarkable, that the jaw in men, and fuch animals as are furnished with grinders, hath an oblique and transverse motion, which is necessary for chewing and comminution of the meat; which it is observed not to have in those animals that want the molares

Now if (as Galen faith) he that fhall marfhal a company but of thirty-two men in due order, is commended for a skilful and industrious perfon, shall we not admire nature which hath fo skilfully ranked and disposed this quire of our teeth?

Fifthly, The tongue is no lefs admirable for the contexture, and manifold uses of it. First, It is the organ of tasting; for being of a spungy substance, the small particles of our meat and drink being mingled with the saliva, easily insinuate themselves into the pores of it, and so do either gratefully affect it, or harshly grate upon it ac-

cordingly as they are figur'd and mov'd; and hereby we difcern what is convenient or inconvenient for our nourishment. It helps us likewife in the chewing and fwallowing of our meat: And, laftly, It is the main inftrument of Speaking, a Quality fo peculiar to man, that no beaft could ever attain to it. And although birds have been taught to form fome words, yet they have been but a few, and those learnt with great difficulty; but what is the chief, the birds understand not the meaning of them, nor use them as figns of things, or their own conception of them; tho' they may use them as expressions of their passions; as parrots having been used to be fed at the prolation of certain words, may afterwards, when they are hungry, pronounce the fame. For this Des Cartes makes his main argument to prove that Brutes have no cogitation, becaufe the higheft of them could never be brought to fignify their thoughts, or conceptions, by any Artificial figns, ether words or Gestures, (which, if they had any, they would, in all likelihood, be forward enough to do;) whereas all men, both fools, and mutes, make ufe of words, or other figns, to express their thoughts about any fubjects that prefent themfelves, which figns also have no reference to any of their paffions. Whereas the figns that brute Animals may be taught to use, are no other than fuch as are the motions of fome of their paffions, Fear, Hope, Joy, &c. Hence some of the Jewish Rabbins did not fo absurdly define a man Animal loquens, a speaking creature Having had occasion just now to mention the Saliva, or Spittle, I am put in mind of the eminent use of this humour, which is commonly taken for an Excrement. Because a great part of our food is dry, therefore nature hath provided feveral Glandules to feparate this Juice from the

blood, and no lefs than four Pair of Channels to convey it into the mouth, which are of late Invention, and call d by Anatomifts ductus falivales, through which the faliva diffilling continually, ferves well to macerate and temper our meat, and make it fit to be chew'd and fwallow'd. If a copious Moifture did not, by thefe conduitpipes, inceffantly flow down into the mouths of horfes and kine, how were it poffible they fhould for a long time together grind and fwallow fuch dry meat as hay and ftraw? Moreover, it is ufeful not only in the mouth, but in the ftomach too, to promote concoction; as we have already noted.

Sixthly, To the mouth fucceeds the windpipe, no less wonderful in its conformation; for because continual refpiration is neceffary for the fupport of our lives, it is made with annulary cartilages, to keep it conftantly open, and that the fides of it may not flag and fall together; and left, when we fwallow, our meat or drink fhould fall in there and obstruct it, it hath a strong shut, or Valve, call'd epiglottis, to cover it close and ftop it when we fwallow; For the more convenient bending of our necks, it is not made of one entire continu'd cartilage, but of many annulary ones, join'd together by ftrong membranes, which membranes are muscular, compounded of straight and circular Fibres, for the more effectual contraction of the windpipe in any ftrong or violent expiration or coughing; and left the afperity or hardnefs of their cartilages; fhould hurt the Oefophagus, or gullet, which is tender, and of a fkinny fubstance, or hinder the fwallowing of our meat therefore these annulary griftles are not made round, or entire Circles; but where the gullet touches the windpipe, there to fill up the circle, is only a foft membrane, which may eafily give way to the dilatation of the gullet. And to demon-

ftrate that this was defignedly done for this end and use, so foon as the windpipe enters the lungs, its cartilages are no longer deficient, but perfect circles, or rings, becaufe there was no neceffity they should be fo, but it was more convenient they should be entire. Laftly, For the various Modulation of the Voice, the upper end of the windpipe is endu'd with feveral cartlages and Muscules, to contract or dilate it, as we would have our Voice flat or fharp: And moreover, the whole is continually moisten'd with a glutinous humour, isfuing out of the fmall Glandules that are upon its inner Coat, to fence it against the sharp Air receiv'd in, or Breath forc'd out; yet is it of quick and tender fense, that it may be easily provok'd to cast out by coughing, whatever may fall into it from without, or be difcharg'd into it from within.

It is also very remarkable which Caspar Bartholine hath observed in the Gullet, that where it perforateth the Midriff, the carneous Fibres of that muscular part are infected and arcuate, as it were a Spincter embracing and closing it fast, by a great Providence of nature, lest, in the perpetual Motion of the faid Midriff, the upper Orifice of the Stomach should gape, and cast out the Victuals as fast as it received it.

Seventhly, The heart, which hath been always efteem'd, and really is, one of the principal parts of the body, the primum vivens, & ultimum moriens, the first part that quickens, and the last that dies, by its inceffant motion distributing the blood, the vehicle of life, and with it the vital heat and Spirits, throughout the whole Body, whereby it doth continually irrigate, nourish, and keep hot, and supple all the members. Is it not admirable, that from this Fountain of Life and heat there should be channels and conduit-pipes to every, even the least and most remote, part of the body?

just as if from one water-house there should be Pipes conveying the water to every house in a town, and to every room in each house; or from one fountain in a garden there should be little Channels or Dykes cut to every bed, and every plant growing therein, as we have feen more than once done beyond the feas. I confess, the heart feems not to be defign'd to fo noble an use as is generally believ'd, that is, to be the fountain or confervatory of the vital flame, and to infpire the blood therewith, (for the lungs ferve rather for the Accenfion, or maintaining that flame, the blood receiving there from the air those particles which are one part of the pabulum, or fuel thereof, and fo impregnated, running back to the heart) but to ferve as a machine to receive the blood from the veins, and to force it out by the arteries through the whole body, as a fyringe doth any liquor, though not by the fame artifice: And yet this is no ignoble ufe, the continuance of the circulation of the blood being indifpenfably neceffary for the quickning and enlivening of all the members of the body, and fupplying of matter to the brain, for the preparation of the animal fpirits, the inftruments of all fenfe and motion. Now for this use of receiving and pumping out of the blood, the heart is admirably contrived. For, First, being a muscular part, the fides of it are composed of two orders of fibres, running circularly, or fpirally, from bafe to tip, contrarily one to the other, and fo being drawn or contracted contrary ways, do violently conftringe and straiten the ventricles, and strongly force out the blood, as we have formerly intimated : Then the veffels we call arteries, which carry from. the heart to the feveral parts, have valves which open outwards, like trap-doors, and give the blood a free passage out of the heart, but will not fuffer it to return back again thither; and the veins Ff

which bring it back from the feveral members to the heart, have valves or trap-doors, which open inwards, fo as to give way unto the blood to run into the heart, but prevent it from running back again that way. Befides, the arteries confift of a quadruple coat, the third of which is made up of annular or orbicular carneous fibres to a good thicknefs, and is of a mulcular nature, after every pulle of the heart, ferving to contract the veffet fucceffively with incredible celerity; fo by a kind of periftaltick motion, impelling the blood onwards to the capillary extremities, and thro' the muscles with great force and fwiftnefs. So the pulfe of the arteries is not only caufed by the pulfation of the heart driving the blood thro' them in manner of a wave or flush, (as Des Cartes and others would have it,) but by the coats of the arteries themfelves, which the experiments of a certain Lovain \* phyfician (the first whereof is Galen's) do, in my opinion, make good against him. " First," faith he, " if you " flit the artery, and thrust into it a pipe, so big as " to fill the cavity of it, and caft a ftrait ligature " upon that part of the artery containing the pite, " and fo bind it fast to the pipe; notwithstanding " the blood hath free paffage thro' the pipe, yet will a not the artery beat below the ligature; but do but " take off the ligature, it will commence again to " beat immediately." But becaufe one might be ready to reply to this experiment, that the reafon why when bound it did not beat, was, becaufe the current of the blood being ftraitned by the pipe, when beneath the pipe it came to have more liberty, was not fufficient to ftretch the coat of the artery, and fo caufe a pulfe; but when the ligature was taken off, it might flow between the inclofed tube, and the coat of the artery: There-

" Cartes, Ep. V. I. Ep. 77. & Sep.

226

fore he adds another, which clearly evinces, that

Part II.

this could not be the reason, but that it is something flowing down the coats of the artery that causes the pulse; that is, if you Araiten the artery never fo much, provided the fides of it do not quite meet, and ftop all Paffage of the blood, the will, notwithstanding, continue still to beat below or beyond the coarctation So we fee fome Phyticians, both ancient (as Galen) and modern, were of opinion, that the pulfe of the arteries was owing to their coats; though the first that I know of who observ'd the third coat of an artery to be a mulcular body, compos'd of annular fibres, was Dr. Willis This mention of the priestaltick Motion puts me in mind of an ocular Demonstration, of it, in the gullet of kine when they chew the cud, which I have often heheld with pleafure: for, after they have fwallow'd one morfel, if you look iteadfaitly upon their throat, you will foon fee another alcend, and run pretty fwiftly all along the throat up to the mouth, which it could not do, unless it were impell'd by the fuccestive contraction or peristaltick motion of the gullet, continually following; and it is remarkable that thefe ruminant creatures have a power by the imperium of their wills, of directing this priestallick motion upwards or downwards. I fhall add no more concerning the heart, but that it, and the brain, do mutuas operas tradere, enable one another to work : for, first the brain cannot itself live unless it receive continual supplies of blood from the heart, but less can it perform its functions of preparing and distributing the animal spirits, nor the heart pulse, unless it receives spirits, or something else that descends from the brain by the nerves. For do but, cut afunder the nerves that go from the brain to the heart, the motion thereof in most perfect

and hot creatures, ceafeth immediately. Which part began this round is the queftion.

I find in the *Philosophical Transactions*, N° 280. fome notable obfervations of the famous Anatomist Mr. William Cowper, concerning the artifice of nature, in regulating the motion of the blood in the veins and arteries, to affist and promote it in the one, and moderate it in the other, which I solve you in his own words:

"As the arteries (faith he) are known to export the blood, fo the veins to carry it back again to the heart, but having already defcribed their extremities, we come now to the large trunks of the veins; and here, as in the arteries, we find the common practice of nature, in difpoing the branches of veins to difcharge the refluent blood into the next adjacent trunk, and fo on to the heart. As the arteries afford abundance of inftances of checks given to the velocity of the current of blood through feveral parts, fo the veins fupply us with as many artifices, to affift its regular return to the heart, as well as favour those contrivances of the arteries.

"The carotid, vertebral, and fplenick arteries, are not only varioufly contorted, but alfo here and there dilated to moderate the motion of the blood; fo the veins that correspond to those arteries are alfo varioufly dilated. The beginnings of the internal jugulars have a bulbous cavity, which are diverticula to the refluent blood, in the finus's of the dura mater, left it should descend too fast into the jugulars. The like has been taken notice of by Dr. Lower in the vertebral finus's. The splenick vein has divers cells opening into it, near its extremities in human bodies; but in quadrupeds, the cells open into the trunks of the splentick veins.

228

Part II.

"The fpermatick veins do more than equal the length of the arteries of the teftes in men; their various divifions, and feveral inofculations and their valves are admirably contrived to fufpend the weight of the blood, in order to difcharge it into the larger trunks of the veins; and were it not that the refluent blood from the *teftes* is a *pondus* to the influent blood from the arteries, and ftill leffens its current in the *teftes*, thefe fpermatick veins, like thofe of other parts, might have difcharged the blood into the next adigcent trunk.

"Who can avoid furprife at the art of nature, " in contriving the veins that bring part of the " refluent blood from the lower parts of the bo-" dy, when they confider the neceffity of placing " the human heart, as well as that of most " quadrupeds, fo far from the centre of the body " towards its upper part; it is for that end ne-" ceffary that the large trunks of the veins and " arteries should not affociate each other; for if " all the blood fent to the lower parts by the de-" fcending trunk of the aorta, should return to " the heart again by one fingle trunk (as it is " fent out from thence) the weight of fo much " blood in the afcending trunk of the vena cava " would oppose all the force the heart could give " it for the arteries, and hinder its afcent; for " this reason the vena azygos or fine pari is " contrived to convey the blood fent to the muscles " of the back and thorax into the defcending " trunk of the vena cava above the heart; hence " it is evident that more blood comes into the " heart by the descending or upper trunk of the " vena cava, than paffes out by the afcending " trunk of the aorta; nor does the quantity " of blood conveyed to the heart by the fuperior st trunk of the vena cava, feem, without fome

"other defign in nature befides transporting it thither, to free the inferior trunk from its weight; but perhaps it was neceffary fo much blood should be ready there to join with the chyle, for its better mixture, before it reaches the right auricle of the heart" So far Mr Cowper.

Eighthly, The next part I shall treat of shall be the hand, this opyavov, opyavov, or fuperlative instrument, which serves us for fuch a multitude of uses, as it is not easy to enumerate; whereto. if we confider the make and ftructure of it, we thall find it wonderfully adapted. First, It is divided into four fingers bending forward, and one oppofite to them bending backwards, and of greater ftrength than any of them fingly, which we call the thumb, to join with them feverally. or united; whereby it is fitted to lay hold of objects of any fize or quantity; the least things, as any fmall fingle feed, are taken up by the thumb and forefinger; those a little greater by the thumb and two fingers, which also we chiefly employ to manage the needle in fewing, and the pen in writing; when we would take up a greater quantity of any thing. we make use of the thumb and all the fingers; sometimes we use one finger only, as in pointing at any thing, picking things out of holes or long and narrow veffels; fometimes all feverally at one time, as in stopping the strings when we play upon any mufical inftruments. Secondly, The fingers are ftrengthened with feveral bones, jointed together for motion, and furnished with several mufcles and tendons, like fo many pullies, to bend them circularly forwards; which is most cone venient for the firm holding and griping of any object; which of how great, constant and neceffary use it is in pulling or drawing, but especially in taking up and retaining any fort of tool or in-

ftrument to work withal in hufbandry and all mechanick arts, is fo obvious to every man's obfervation, that I need not fpend time to inftance in particulars: Moreover, the feveral fingers are furnished with feveral muscles to extend and open the hand, and to move to the right and left; and fo this division and motion of the fingers doth not hinder but that the whole hand may be employed as if it were all of a piece, as we fee it is, either expanded, as in striking out, fmoothing and folding up of cloaths, and some mechanick uses; or contracted as in fighting, kneading of dough, and the like; it is also notable and indeed wonderful, that the tendons bending the middle joint of the fingers should be perforated, to give passage to the tendons of the muscles which draw the uppermost joints, and all bound down clofe to the bone with ftrong fillets, left they should start up and hinder the hand in its work, flanding like fo many bowftrings. Thirdly, The fingers ends are ftrengthened with nails, as we fortify the ends of our flaves and forks with iron hooks or ferules; which nails ferve not only for defence, but for ornament, and many ufes. The fkin upon our fingers ends is thin, and of most exquisite fense, to help us to judge of any thing we handle. If now I should go about to reckon up the feveral ules of this instrument, time would fooner fail me than matter By the help of this we do all our works, we build ourfelves houses to dwell in, we make ourfelves garments to wear, we plow and fow our grounds with corn, drefs and cultivate our vineyards, gardens and orchards, gather and lay up our grain and fruits we prepare and make ready our victuals; fpinning, weaving, painting, carving, engraving, and that divinely invented art of writing, whereby we transmit our own thoughts to posterity, and converse with and participate the

332

observitions and inventions of them that are long ago dead. all performed by this; this is the only inftrument for all forts whatfoever, no improvement to be made of any experimental knowledge without it. Hence (as Aristotle faith well) they do amis that complain that man is worfe dealt with by nature than any other creatures: whereas they have fome hair, fome shells, some wool, some feathers, fome scales, to defend themselves from the injuries of the weather, man alone in born naked and without all covering; whereas they have natural weapons to defend themfelves and offend their enemies, some horns, some hoofs, some teeth, fome talons, fome claws, fome fpurs and beaks; man hath none of all thefe, but is weak and feeble, and unarmed fent into the world : Why, a hand, with reafon to use it, supplies the uses of all thefe, that is both a horn and a hoof, a talon and a tufk, &c. because it enables us to use weapons of these and other fashions, as fwords and spears, and guns; befides, this advantage a man hath of them that whereas they cannot at pleafure change their coverings, or lay afide their weapons, or make use of others as occasion ferves, but must abide winter and fummer, night and day with the fame cloathing on their backs, and fleep with their weapons upon them; a man can alter his cloathing according to the exigency of the weather, go warm in winter and cool in fummer, cover up himfelf hot in the night, and lay afide his cloaths in the day, and put on or off more or fewer, according as his work and exercise is; and can, as occasion requires, make use of divers forts of weapons, and choice of fuch at all turns as are most proper and convenient; whereby we are enabled to fubdue and rule over all other creatures, and use for our own behoof those qualities wherein they excel, as the strength of the ox, the valour

## Part II. in the CREATION.

and fwiftness of the horse, the fagacity and vigilancy of the dog, and fo make them as it were our own. Had we wanted this member in our bodies, we must have lived the life of brutes, without houfe or fhelter, but what the woods and rocks would have afforded, without cloaths or covering, without corn, or wine, or oil, or any other drink but water; without the warmth and comfort, or other uses of fire, and fo without any artificial baked, boiled, or roafted meats; but must have scrambled with the wild beafts for crabs, and nuts, and acorns, and fuch other things as the earth puts forth of her own accord; we had lain open and exposed to injuries, and had been unable to refift or defend ourselves against almost the weakest creature.

The remaining parts I shall but briefly run over.

That the back-bone should be divided into fo many vertebres for commodious bending, and not be one intire rigid bone, which being of that length would have been often in danger of fnapping in funder; that it should be made tapering, in form of a pillar; the lower vertebres being the broadest and largest, and the superior in order, lesser and leffer, for the greater firmness and stability of the trunk of the body: that the feveral verte-. bres should be fo elegantly and artificially compacted and joined together; that they are as ftrong and firm as if they were but one bone; that they fhould be all perforated in the middle with a large hole for the fpinal marrow or pith to pass along, and each particular have a hole on each fide to tranfmit the nerves to the muscles of the body, to convey both fenfe and motion; that by reafon of the forementioned clofe connexion of the vertebres it should be fo formed as not to admit any great flexure or recess from a right line, any angular, but only a moderate circular bending, left the

fpinal pith should be compressed, and fo the free intercourfe or paffage of the spirits to and fro be

ftopt. One observation relating to the motion of the bones in their articulations I shall here add, that is, the care that is taken with the provision that is made for the eafy and expedite motion of them, there being to that purpose a twofold liquor prepared for the inunction and lubrification of their heads or ends. I An oily one, furnished by the marrow. 2 A mucilaginous, fupplied by certain glandules feated in the articulations, both which together make up the most apt and proper mixture for this use and end that can be invented or thought upon; for not only both the ingredients are of a lubricating nature, but there is this advantage gained from their composition, that they do mutually improve one another; for the mucilage adds to the lubricity of the oil, and the oil preferves the mucilage from inspiffation, and contracting the confiftency of a gelly. Now this inunction is useful, indeed necessary, for three ends ohiefly:

I For the facilitating of motion. For though the ends of the bones are very fmooth, yet were they dry; they could not with that readinefs and eafe, nay, not without great difficulty, yield to and obey the flucks and attractions of the motory muscles; as we fee clocks and jacks, though the fcrews and teeth of the wheels and nuts be never fo fmooth and polished, yet if they be not oiled will hardly move, though you clog them with never fo much weight; but if you apply but a little oil, they presently whirl about very fwiftly with the tenth part of the force.

2 For preferving the ends of the bones from an incalescency, which they, being hard and folid bodies, would neceffarily contract from a fwift and

long continuing motion; fuch as that of running, or mowing, or threshing, or fawing, and the like, if they are immediately touched and rubbed against one another with that force they must needs do, efpecially in running, the whole weight of the body bearing upon the joints of the thighs and knees : fo we fee in the wheels of waggons or coaches, the hollows of the naves, by their fwift rotations on the ends of the axle-trees, produce a heat, fometimes fo intenfe as to fet them on fire; to prevent which they ftand in need to be frequently anointed or befmeared with a mixture of greafe and tar, imitating the fore-mentioned natural composition of oil and mucilage Nay, bodies fofter a great deal than metals contract a great heat by attrition, as is evident from those black circular lines we fee on boxes, difhes, and other turned veffels of wood, which are the effects of ignition, caufed by the preffure of an edged flick upon the vefiel turned nimbly in the lathe. And if there had not been a provision in the joints against fuch a preternatural incalescence upon their violent motion, this would have made a flothful world, and confined us to leifurely and deliberate movements, when there were the most urgent and hasty occasions to quicken us.

3. For the preventing of attrition, and wearing down the ends of the bones by their motion and rubbing one against another, which is so violent and lasting sometimes, that it is a wonder any inunction should suffice to secure their head from watting and confumption. I have often seen the tops of the teeth (which are of a harder substance than the rest of the bones) worn off by massication, in perfons who have loss most of their grinders, and been compelled constantly to make use of three or four only in chewing, so low, that at last the inward marrow and nerve lay bare, and they could no. longer for pain make use of them; fo that had there not been this provision made for the anointing the bones, the curious workmanship of nature in adapting them fo exactly one to another, as was most fit for the eafy performance of all those motions to which they were destined, would not suffice for use; but the ftirring part of mankind would foon find themfelves fitter for an hofpital than for action and the purfuit of bufinefs.

These observations I acknowledge myself to have borrowed of a late ingenious writer \* of Ofteology, who this concludes his difcourse upon this fubject : " And here we cannot avoid the notice of the vi-" fible footsteps of an infinite reason, which as they " are deeply imprefied upon the universe, fo more " especially on the fensible parts of it in those ra-" tional contrivances which are found in animals : " and we can never fufficiently admire the wildom " and providence of our great Creator, who has " given all parts in these animated beings, not only " fuch a structure as renders them fit for their ne-" ceffary motions and defigned functions, but with " all the benefit and advantage of whatever may pre-" ferve them or facilitate their action.

Moreover the artifice of nature is wonderful in the construction of the bones that are to support the body and to bear great burdens, or to be employed in ftrong exercifes, they being made hollow, for lightness and stiffness. For we have before noted, a body that is hollow may be demonstrated to be more rigid and inflexible than a folid one of the fame fubstance and weight; fo that here is provision made for the fliffnels and lightnels of the bones. But the ribs, which are not to bear any great weight, or to be ftrongly exercifed, but only to fence the breaft, have no cavity in them, and towards the fore part or breast are broad and thin, \* Mr Clopton Havers.

that fo they might bend and give way without danger of fracture; when bent returning by their elastick property to their figure again. Yet is not the hollow of the bones altogether ufelefs, but ferves to contain the marrow, which fupplies an oil for the maintaining and inunction of the bones and ligaments, and fo facilitating their motion in the articulations; and particularly (which we mentioned not hefore) of the ligaments, preferving them from drynefs and rigidity, and keeping them fupple and flexible, and ready to comply with all the motions and postures of that moveable part to which they appertain; and laftly, to fecure them from difruption, which, as ftrong as they are, they would be in fome danger of, upon a great and fudden stretch and contortion, if they were dry, &c. See more to this purpose in the treatife fore-quoted, page 183.

That whereas the breaft is encompafied with ribs, the belly is left free, that it might give way to the motion of the midriff in refpiration, and to the neceffary reception of meat and drink, as alfo for the convenient bending of the body; and in females for that extraordinary extension that is requifite in the time of their pregnancy.

That the lungs fhould be made up of fuch innumerable air-pipes and veficles, interwoven with blood veffels, in order to purify, ferment, or fupply the fanguineous mafs, with nitro-aerial particles, which rufh in by their elaftick power upon the mufcular extension of the thorax, and so feed the vital flame and spirits; for upon obstructing this communication all is prefently extinct, no circulation, no motion, no heat nor any fign of life remains,

That the flomach flould be membranous, and capable of dilatation and contraction, according to the quantity of meat contained in it; that it fhould be fituate under the liver, which by its heat might cherifh it, and contribute to concoction; that it fhould be endued with an acid or glandulous ferment, or fome corruptive quality, for fo fpeedy a diffolution of the meat, and preparation of chyle; that after concoction it fhould have an ability of contracting itfelf, and turning out the meat.

That the guts fhould immediately receive it from the phylorus, farther elaborate, prepare and feparate it, driving by their periftaltick motion the chyle into the lacteals, and the excrementitious parts to the podex, from whence there is no regrefs, unlefs when the valve of the colon is torn and relaxed. But for the curious ftructure of thefe parts fee more in Kerkringius, Gliffon, Willis, and Preyer.

That the bladder fhould be made of a membranous fubftance, and fo extremely dilatable, for receiving and containing the urine, till opportunity of emptying it; that it fhould have fluts for the ends of the ureters, fo artificially contrived as to give the urine free entrance, but to ftop all paffage backward, fo that they will not transmit the wind, though it be ftrongly blown and forced in

That the liver flould continually feparate the choler from the blood, and empty it into the inteftines, where there is good use for it, not only to provoke dejection, but also to attenuate the chyle, and render it fo fubtile and fluid as to enter in at the orifices of the lacteous veins

That in the kidneys there fhould be fuch innumerable little fiphons or tubes, conveying the urinous particles to the pelves and ureters, first difcovered by Bellini, and illustrated by Malpighi; that indeed all the glands of the body should be congeries of various forts of vessels cured, circumgyrated and complicated together, whereby they give the blood time to stop and separate thro' the

238

pores of the capillary veffels into the fecretory ones which afterwards all exonerate themfelves into one common ductus; as may be feen in the works of Dr Wharton, Graaf, Bartholine, Rudback, Bilfius. Malpighi, Nuck, and others. That the glands fhould feparate fuch variety of humours, all different in colour, tafte, fmell, and other qualities.

Finally, That all the bones, and all the mufcles, and all the veffels of the body, fhould be fo admirably contrived, and adapted, and compacted together for their feveral motions and ufes, and that moft geometrically, according to the ftricteft rules of mechanicks; that if in the whole body you change the figure, fituation, and conjunction but of one part, if you diminifh or increase the bulk and magnitude; in fine, if you endeavour any innovation or alteration, you marr and fpoil inftead of mending; how can all these things put together but beget wonder and aftonishment?

In the muscles alone there feems to be more geometry, than in all the artificial engines in the world; and therefore the different motions of animals are a fubject fit only for the great mathematicians to handle, among whom Steno, Dr Croon, and above all, Alphonso Borelli, have made their effays towards it.

That under one fkin there fhould be fuch infinite variety of parts, varioufly mingled, hard with foft, fluid with fixed, folid with hollow, those in reft with those in motion; fome with cavites, as morteffes to receive, others with tenons to fit those cavities, all these fo packed and thrust fo close together, that there is no unneceffary vacuity in the whole body, and yet fo far from classing or interfering one with another, or hindering each others motions, that they do all friendly confpire, all help and affist mutually one the other, all concur in one general end and defign, the good and prefervation of

- Part II.

the whole, are certainly arguments and effects of infinite wifdom and counfel; fo that he must needs be worfe than mad that can find in his heart to imagine all these to be casual and fortuitous, or not provided and defigned by a most wife and intelligent cause.

Every part is cloathed, joined together and corroborated by membranes, which upon feveral occafions (as extravafations of humours, compreffions or obstructions of veffels) are capable of a prodigious extension, as we see in the hydatides of the female tefficles or ovaries, in hydropical tumours of the lymphaeducts, of the foretum or peritonaeum. out of the laft of which alone twenty and even forty gallons of water have been drawn by a paracentefis or tapping; for which we have the undoubted authority of Tulpius, Meekren, Pechlin, Blasius, and other medical writers. What vaft facks and bags are neceffary to contain fuch a collection of water, which feems to iffue from the lymphaeducts, either delacerated or obstructed, and exonerating themselves into the foldings, or between the duplicatures of the membranes?

Those parts which one would think were of little use in the body, ferving chiefly to fill up empty spaces, as the fat, if examined strictly, will be found very beneficial and serviceable to it. 1. To cheristh and keep it warm, by hindering the evaporation of the hot steams of blood; as cloaths keep us warm in winter, by reflecting and doubling the heat. 2. To nouristh and maintain the body for fome time when food is wanting, ferving as fuel to preferve and continue the natural heat of the blood which requires an oily or fulphurous pabulum as well as fire. Hence upon long abstinence and fasting the body grows lean. Hence also fome beasts, as the marmotto, or mus alpinus, a creature as big or bigger than a rabbet, which absconds

240

all winter, doth (as Hildanus tells us) live upon its own fat; for in the autumn, when it fluts itfelf up in its hole (which it digs with its feet like a rabbit, making a neft with hay or ftraw to lodge itfelf warm) it is very fat; (Hildanus took out above a pound and an half of fat between the fkin and mufcles, and a pound out of the abdomen] but on the contrary, in the fpring-time, when it comes forth again, very lean, as the hunters experience in those they then take. 3. The internal fat ferves for the defence and fecurity of the veffels, that they might lie foft, and be fafely conveyed in their paffage, wherefore it is efpecially gathered about them.

By what pores, or paffages, or veffels, the fat is feparated from the blood when it is redundant. and again abforbed into it when it is deficient, is a matter of curious enquiry, and worthy to be industrioufly fought out by the most fagacious and dextrous anatomifts. The veffels whereinto it is received, and wherein contained, are by the microfcope detected to be bladders, and those doubtles perforated and pervious one into another; and though for their exceffive fubtilty and thinnefs they appear not in a lean body, yet feem to have been primitively formed and provided by nature to receive the fat upon occasion. Why the fat is collected chiefly about fome particular parts and veffels, and not others; as for example, the reins and the caul, I eafily confent with Galen and others the reafon to be, the cherifbing and keeping warm of those parts upon which fuch veffels are fpread; fo the caul ferves for warming the lower belly, like an apron or piece of woollen cloth. Hence a certain gladiator, whole caul Galen cut out, was fo liable to fuffer from the cold, that he was confirained to keep his belly conftantly covered with wool; for the inteffines containing a great

Part IL.

deal of food, there to undergo its last concoction, and no veffels of blood penetrating it, and flowing through it to keep it warm, they had need be defended from the injuries of the external air by outward coverings. Why there should be fuch copious fat gathered about the reins to inclose them, is not fo eafy to difcern, but furely there is a great and constant heat required there, for the separation of the urine from the blood, the conftant leparation and excretion whereof is neceffary for the prefervation of life; and we fee if the blood be in any degree chilled, the fecretion of upine is in a great measure ftopt, and the ferum cast upon the glandules of the mouth and throat; and if the blood be extraordinarily heated by exercise or otherwife, it cafts off its ferum plentifully by fweat, which may be effected by the fwift motion of the blood through the glandules of the fkin, where its plentiful ftreams being ftrengthened and conftipated into a liquor, force their way through those emunccories, which at other times transmit only infensible vapours. Some fuch effects may be wrought upon the blood by the heat of the kidneys. 'Certain it is that the humours excerned by fweat, and urine, are near a-kin, if not the fame; and therefore it is worthy the confideration, whether there might not be fome use made of fweating in a suppression of mrine. But I digrefs too far.

I shall only add to this particular, that because the design of nature in collecting fat in these places is for the fore-mentioned use, it hash for the effecting thereof fitted the vessels there with pores or passages proper for the separation and transmistion of it.

I should now proceed to treat of the generation and formation of the foetus in the womb, but that is a subject too difficult for me to handle, the body of man and other animals being formed in

42

## in the CREATION.

Part II.

the dark receffes of the matrix, or, as the Pfalmist phrases it, Plalm. cxxxix. 14. Made in secret, and curioufly wrought in the lowest parts of the earth. This work is fo admirable and unaccountable, that neither the atheifts, nor mechanical philosophers have attempted to declare the manner and procefs of it, but have (as I noted before) very cautioufly and prudently broke off their fystems of natural philosophy here, and left this point untouched; and those accounts which fome of them have attempted to give of the formation of a few of the parts, are fo exceffively abfurd and ridiculous, that they need no other confutation than ha, ha, he. And I have already further flown, that to me it feems impossible that matter divided into as minute and fubtile parts as you will or can imagine, and those moved according to what catholic laws foever can be devised, should without the prefidency and direction of fome intelligent agent, by the mere agitation of a gentle heat, run itself into fuch a curious machine as the body of man is.

Yet must it be confessed that the feed of animals is admirably qualified to be fashioned and formed by the plaftick nature into an organical body, containing the principles or component particles of all the feveral homogeneous parts thereof; for indeed every part of the body feems to club and contribute to the feed, elfe why fhould parents that are born blind or deaf, or that want a finger or any other part, or have one fuperfluous, fometimes generate children that have the fame defects, or imperfections; and yet (which is wonderful) nothing of the body or groffer matter of the feed comes near the first principle of the foetus, or in some fo much as enters the womb, but only fome contagious vapour or fubtile effluvia thereof, which feems to animate the gemma or cicatricula of the egg contained in the female ovary before it paffes

243

through the tubes or cornua into the uterus. How far the animalcules obferved in the feed of the males may contribute to generation, I leave to the more fagacious philofophers to enquire, and fhall here content myfelf with refering the reader to the feveral letters publifhed by Mr Lewenhoek.

But to what shall we attribute the foetus, its likeness to the parents, or omitting them, to the precedent progenitors; as I have observed, some parents that have been both black haired, to have generated most red haired children; because their ancestors hair hath been of that colour? Or why are twins so often extremely alike? Whether is this owing to the efficient, or to the mater?

Those effluvia we speak of in the male feed, as fubtile as they are, yet have they a great if not the greatest stroke in generation, as is clearly demonstrable in a mule, which doth more refemble the male parent, that is, the afs, than the female or horse. But now, why such different species should not only mingle together, but also generate an animal, and yet that that hybridous production should not again generate, and so a new race be carried on, but nature should stop here, and proceed no further, is to me a mystery, and unaccountable.

One thing relating to generation I cannot omit; that is, the conftruction of a fet of temporary parts (like fcaffolds in a building) to ferve a prefent end, which are afterwards laid afide, afford a ftrong argument of counfel and defign. Now for the ufe of the young during its inclofure in the womb there are feveral parts formed, as the membranes inveloping it, called the fecundines, the umbilical veffels, one vein, and two arteries; the urachus, to convey the urine out of the bladder, and the *placenta uterina*; part whereof fall away at the birth, as the fecundines and placenta; others degenerate into ligaments, as the ura-

chus and part of the umbilical vein; befides which, because the foetus during its abode in the womb hath no use of refpiration by the lungs, the blood doth not all, I may fay, not the greatest part of it, flow through them, but there are two paffages or channels contrived, one called the foramen ovale, by which part of the blood brought by the vena cava paffeth immediately into the left ventricle of the heart, without entering the right at all; the other is a large arterial channel paffing from the pulmonary artery immediately into the aorta, or great artery, which likewife derivers part of the blood thither, without running at all into the lungs; Thefe two are closed up foon after the child is born, when it breathes no more (as I may fo fay) by the placenta uterina, but refpiration by the lungs is needful for it. It is here to be noted, that though the lungs be formed fo foon as the other parts, yet during the abode of the foctus in the womb they ly by as ufelefs. In like manner I have observed, that in ruminating creatures the three foremost stomachs, not only during the continuance of the young in the womb, but fo long as it is fed with milk, are unemployed, and useless, the milk paffing immediately into the fourth.

Another obfervation I shall add concerning generation, which is of fome moment, because it takes away fome concessions of naturalists that give countenance to the atheists fictitious and ridiculous account of the first production of mankind and other animals, viz. That all forts of infects, yea, and some quadrupeds too, as frogs and mice, are produced spontaneously. My observation and affirmation is, that there is no such thing in nature as equivocal or spontaneous generation, but that all animals, as well small as great, not excluding the vilest and most contemptible infect,

are generated by animal parents of the fame species with themtelves; that noble Italian virtuofo Francifco Redi having experimented, that no putrified flesh (which one would think were the most likely of any thing) will of itfelf, if all infects be carefully kept from it, produce any. The fame ex periment, I remember Dr Wilkins, late Bithop of Chefter, told me had been made by fome of the Royal Society. No inftance against this opinion doth fo much puzzle me as worms bred in the inteftines of man and other animals. But feeing the round worms do manifettly generate, and probably the other kinds too, it is likely they come originally from feed, which, how it was brought into the guts, may aftewards poffibly be difcovered. Moreover, I am inclinable to believe that all plants too, that themfelves produce feed (which are all but fome very imperfect ones, which fcarce deferve the name of plants) come of feed themfelves. For the great naturalist Malpighius to make experiment whether earth would of itfelf put forth plants, took fome purpofely digged out of a deep place and put it into a glafs veffel, the top whereof he covered with filk many times doubled, and ftraitened over it; which would admit the water and air to pafs through, but exclude the least feed that might be wafted by the wind; the event was, that no plant at all fprung up in it. Nor need we wonder how in a ditch, bank or grafs-plat newly digged, or in the fen-banks in the ifle of Ely, muftard fhould abundantly fpring up, where in the memory of man none hath been known to grow, for it might come of feed which had lain there for more than a man's age, fome of the antients mentioning fome feeds that retain their fecundity forty years; and I have found in a paper received from a friend, but whom I have forgotten, that melon-feeds after thirty years are

beft for raifing of melons. As for the muftard that forung up in the ifle of Ely, though there had never been any in that country, yet might it have been brought down in the channels by the floods, und fo being thrown upon the banks together with the earth, might germinate and grow there.

And indeed a spontaneous generation of animals and plants, upon due examination, will be found to be nothing lefs than a creation of them; for after the matter was made, and the fea and dry land feparated, how is the creation of plants and animals defcribed, but by a commanding, that is, effectually caufing the waters and earth to produce their feveral kinds without any feed? Now creation being the work of Omnipotency, and incommunicable to any creature, it must be beyond the power of nature or natural agents to produce things after that manner. And as for God Almighty, he is faid to have refted from his work of creation after the feventh day. But if there be any spontaneous generation, there was nothing done at the creation, but what is daily done; for the earth and water produced animals then without feed, and fo they do ftill.

Because some, I understand, have been offended at my confident denial of all spontaneous generation, accounting it too bold and groundless, I shall a little enlarge upon it, and give my reasons, in order to their fatisfaction.

First, Then, I fay, fuch a fpontaneous generation feems to me to be nothing lets than a creation; for creation being not only a production of a nothing out of nothing, but also out of indisposed matter, as may be clearly inferred from the foripture, and is agreed by all divines, this spontaneous generation being such a production, wherein doth it differ from creation? Or what did God Almighty do at the first creation of animals and plants more than what (if this be true) we fee every day done? To me, I must confess, it seems almost demonstrable, that whatever agent can introduce a form into indisposed matter, or dispose the matter in an instant, must be superior to any natural one, not to say omnipotent.

Secondly, Thofe who have with the greateft diligence and application confidered and fearched into this matter, as thofe eminent virtuofi, Marcellus Malpighius, Francifcus Redi, John Swammerdam, Lewenhoek, and many others, are unanimoufly of this opinion, fave that Francifcus Redi would except fuch infects as are bred in galls, and fome other excrefcencies of plants. Now their authority weighs more with me, than the general vogue, or the concurrent fuffrages of a thoufand others, who never examined the thing fo carefully and circumfpectly as they have done, but run away with the cry of the common herd of philofophers.

First of all, Dr Swammerdam, who hath been, to the beft purpofe of any man I know of, bufied in fearching out and obferving the nature of all infects in general; all in general I fay, for as to one particular infect, to wit, the filk-worm, I must except Signior Malpighi; and to one genus of them, to wit, fpiders, Dr Lifter in his general history of infects, written in Low Dutch, and translated into French, p. 47. hath these words, Nous disons qu'il ne se fait dans toute la nature aucune generation par accident, &c. " We affirm that there " is not in all nature any accidental [or fpontaneous] " generation, but all come by propagation; wherein " chance hath not the least part or interest " And in p. 159. fpeaking of the generation of infects out of plants, in contradiction I suppose to Signior Redi, he faith, Nous croyons absolument, &c. " We " do abfolutely believe that it is not poffible to prove

248

" by experience that any infects are engendered out " of plants; but on the contrary, we are very well " informed and affured that these little animals are " not fhut up in or inclosed there for any other " reafon than to draw thence their nourifhment." It is true indeed, that by a certain, conftant, and immutable order of nature, we fee many forts of infects affixed to particular species of plants and fruits, to which the respective kinds fasten themfelves as it were by inftinct; but we are to know that they all come of the feed of animalcules of their own kind, that were before laid there; for these infects do thrust their feed or eggs fo deep into the plants, that they come to be afterwards as it were united with them, and the aperture or orifice by which they entered, quite clofed up and obliterated, the eggs being hatched and nourifhed within. We have often found the eggs of infects fo deeply funk into the tender buds of trees, that without hurting of them it was impossible to draw them out. Many instances he produces in feveral forts of infects making their way into plants, which, though they be well worth the reading, are too long to transcribe.

Secondly, That great and fagacious naturalift, and moft accurate examiner of thefe things, Signior Malpighi, in his treatife of galls, under which name he comprehends all preternatural and morbofe tumours and excrefcencies of plants, doth demonstrate in particular, that all fuch warts, tumours and excrefcencies, where any infects are found, are excited or raifed up either by fome venenose liquor, which together with their eggs fuch infects shed upon the leaves, or buds, or fruits of plants, or boring with their terebrae, instil into the very pulp of fuch buds or fruits; or by the contagious vapour of the very eggs themselves, producing a mortification or fyderation in the parts of plants on which 250

they are laid; or laftly, by the grubs or maggots hatched of the eggs laid there, making their way with their teeth into the buds, leaves or fruit, or even the wood itself of fuch plants on which their eggs were laid. So that at the laft he concludes; Erunt itaque gallae et reliqui plantarum tumores morbosae excrescentiae, vi depositi ovi a turbata plantarum compage, et vitiato humorum motu excitatae, quibus inclusa ova et animalcula velut in utero foventur et augentur, donec manifestatis firmatisque propriis partibus, quasi exoriantur novam exoptantia auram. " We conclude therefore that galls, and " other tumours of plants, are nothing elfe but " morbofe excrescencies, raised up by the force of " the eggs there laid, difturbing the vegetation and " temper of the plants, and perverting the motion " of their humours and juices; wherein the inclosed " eggs and animalcules are cherifhed, n urifhed, and " augmented, till their proper parts being manifest-" ed, explicated, and hardened or ftrengthened, they " are as it were new born, affecting to come forth " into the open air." In the fame treatife he defcribes the hollow inftrument (terebra he calls it, and we may English it, piercer) wherewith many flies are provided, proceeding from the womb, with which they perforate the teguments of leaves, fruits, or buds, and through the hollow of it inject their eggs into the holes, or wounds which they have made, where in process of time they are hatched and nourished. This he beheld one of these infects doing with his own eyes in the bud of an oak; the manner whereof he defcribes, page 47. which I shall not transcribe, only take notice, that when he. had taken off the infect, he found in the leaf, very little and diaphanous eggs, exactly like to those which yet remained in the tubes of the fly's womb. He adds further, that it is probable that there may be eggs hidden in diverse parts of plants, whereof

no footstep doth outwardly appear, but the plant remains as entire and thrives as well as if there were no infect there; nay, that fome may be hidden and cheristhed in dry places (not wanting any humour to feed them) as in fear wood, yea, in earthen vessels, and marbles themselves

Indeed to me it feems unreasonable that plants, being of a lower form or order of being, fhould produce animals; for either they must do it out of indifposed matter, and then fuch production would amount to a creation, or elfe they mult prepare a fit matter, which is to act beyond their ftrength, there being required to the preparation of the fperm of animals a great apparatus of veifels and many fecretions, concoctions, reflections, digeftions, and circulations of the matter, before it can be rectified and exalted into fo noble a liquor; and befides there must be an egg too; for we know ex ovo omnia; to the perfection whereof there are as many veffels and as long a procefs required. Now in plants there are no fuch veffels, and confequently no fuch preparation of eggs or fperm, which are the neceffary principles of amimals.

Thirdly, I hat worthy author of our own country, I mean, Dr Lifter, in his notes upon Geodartius In/ect. Numb. 16 p. 47. thath these words: Non enim inducor ut credam, hoc, vel aliud quodvis animal, modo quodam fontaneo e planta produci, et alii caufae cuicunque originem fuam debere quam parenti animali; i. e. "I cannot be perfuaded or in-"duced to believe, that this, or any other animal, "is (or can be) produced out of a plant in a fpon-"tancous manner, or doth owe its original to any other cause whatever, than an animal parent of its "own kind." And in his third note upon Infect. Numb. 49. these: Quoad fpontaneam erucae bujus aliorumque infectorum generationem, pro parte negativa jam fententiam meam tradidi, Gc. "As to the " fpontaneous generation of this eruca, and other " infects, I have already delivered my apinion for " the negative. This is most certain, that these " coffi are produced of eggs laid by animal parents : " it is alfo alike clear, that these diminutive cater-" pillars are able by degrees to pierce or bore their " way into a tree; which very fmall holes, after " they are fully entered, do perchance grow toge-" ther, and quite difappear, at least become fo fmall, " that they are not to be difcerned, unless by Lyn-" ceus's eyes. Add moreover, that perchance they " undergo no transformation, but continue under " the vizzard of [erucae] caterpillars for many years " which doth very well accord with my observations. " Moreover that this caterpillar [eruca] is propa-" gated by animal parents, to wit, butterflies, after " the common origination of all caterpillars." In all this I fully confent with the doctor, only crave leave to differ in his attributing to them the name of coffi ; which were accounted by the ancients a delicate morfel, and fed for the table; for I take those to have been the hexapods, from which the greater fort of beetles come; for that that fort of hexapods are at this day eaten in our American plantations, as I am informed by my good friend Dr Hans Sloane, who also prefented me with a glass of them preferved in fpirit of wine.

Having lately had an opportunity more curioufly to view and examine the great flefh-coloured, thinhaired English caterpillar, (which is fo like that fent me by Dr Sloane, that it differs little but in magnitude, which may be owing to the climate) I observed that it had a power of drawing its eight hind legs or flumps fo far up in its body that they did altogether difappear, fo that the creature feemed to want them, and of thrusting them out again at pleafure; whereupon I conjectured, that that infect of Jamaica fent me by the doctor (which

I took to be the coffus or hexapod, previous to fome large beetle) had likewife the fame power of drawing up its hind legs, fo that tho' to appearance it wanted them, yet really it did not fo, but had only drawn them up and hid them in its body when it was immerfed in the fpirit of wine, and confequently was not the hexapod of a beetle, but an eruca, like to, or indeed fpecifically the fame with that of our own country by me observed; and being eaten at this day by the inhabitants of Jamaica, is in all likelihood the fame with the coffus of the antient Romans, which was fed for the table, as Pliny affures us; especially if we confider, that Dr Lister found this eruca in the body of an oak newly cut down and fawed in pieces; on which tree Pliny faith they feed. Thus much I thought fit to add to Dr Lifter, and do the truth right, by retracting my former conjecture concerning the coffi.

3. My third argument against fpontaneous generation is, becaufe there are no arguments or experiments which the patrons of it do or can produce, which do clearly evince it. For the general and vulgar opinion that the heads of children, or the bodies of those that do not change their linen, but wear that which is fweaty and fordid, breeds lice; or that cheefe of itfelf breeds mites or maggots; I deny, and look upon it as a great error and mistake; and do affirm, that all fuch creatures are bred of eggs laid in fuch fordid places by fome wandering loufe, or mite, or maggot; for fuch places being most proper for the hatching and exclusion of their eggs, and for the maintenance of their young, nature hath endued them with a wonderful acuteness of scent and fagacity, whereby they can, though far diftant, find out and make towards them; and even lice and mites themfelves, as flow as they feem to be, can, to my knowledge, in no long time, march a confiderable

way to find out a convenient harbour for themfelves.

Here, by the by, I cannot but look upon the strange instinct of this noifome and troublefome creature a loufe, of tearching out foul and nafty cloaths to harbour and breed in, as an effect of divine providence, defigned to deter men and women from fluttishness and fordidness, and to provoke them to cleanlinefs and neatnefs. God himfelf hateth uncleanlinefs, and turns away from it, as appears by Deut. xxiii. 12, 13, 14. But if God requires and is pleafed with bodily cleanlinefs, much more is he fo with the purenefs of the mind. Bleffed are the pure in heart, for they shall see God, Matth. v. 10.

As for the generation of infects out of putrid matter, the experiments of Franciscus Redi, and fome of our own Virtuofi, give me fufficient reafon to reject it. I did but just now mention the quick fcent that infects have, and the great fagacity in finding out a proper and convenient harbour or matrix to cherifh and hatch their eggs and feed their young; they are fo acted and directed by nature, as to caft their eggs in fuch places as are most accommodated for the exclusion of their young, and where there is food ready for them as foon as they be hatched; nay, it is a very hard matter to keep off fuch infects from fhedding their feed in fuch proper places. " Indeed if an infect "" may be thus equivocally generated, why not " fometimes a bird, a quadruped a man, or even an " universe? Or, why no new species of animals now " and then ?" as my learned friend Dr Tancred Robinfon very well argues in his letters : " for there " is as much art shewn in the formation of those as " of thefe."

A fourth and most effectual argument against fpontaneous generation is, that there are no new

fpecies produced, which would certainly now and then, nay, very often happen were there any fuch thing; for in fuch pretended generations, the generant or active principle is supposed to be the fun, which being an inanimate body cannot act otherwife than by his heat, which heat can only put the particles of the paffive principle into motion; the paffive principle is putrid matter, the particles whereof cannot be conceived to differ in any thing but figure, magnitude and gravity; now the heat putting these particles in motion, may indeed gather together those which are homogeneous, or of the fame nature, and feparate those that are heterogeneous, or of a different, but that it should fo fituate, place and connect them as we fee in the bodies of animals, is altogether inconceivable; which if it could, yet that it thould always run them into fuch a machine as is already extant, and not often into some new fashioned one, fuch as was never seen before, no reason can be affigned or imagined. This the Epicurean poet Lucretius was fo fenfible of, that he faw a neceffity of granting feeds or principles to determine the species. For (faith he) if all forts of principles could be connected,

That is, \_\_\_\_\_ Thence would rife Vast monsters, nature's great absurdities; 256

Part II.

Something half beaft, half man, and fome would grow Tall trees above, and animals below, Some join'd of fifh and beafts, and every where Frightful chimera's breathing flames appear. But fince we fee no fuch, and things arife From certain feeds, of certain fhape and fize, And keep their kind as they increase and grow, There's fome fix'd reason why it fhould be fo.

The raining of frogs, and their generation in the clouds, though it may be attefted by many and great authors, I look upon as utterly falfe and ridiculous; it feems to me no more likely that frogs fhould be engendered in the clouds, than Spanish gennets begotten by the wind, for that hath good authors too; and he that can fwallow the raining of frogs, hath made a fair ftep towards believing that it may rain calves alfo, for we read that one fell out of the clouds in Avicen's time; nor do they much help the matter, who fay, that those frogs that appear fometimes in great multitudes after a shower, are not indeed engendered in the clouds, but coagulated of a certain fort of duft commixed and fermented with rain-water; to which hypothefis Fromondus adheres.

But let us a little confider the generation of frogs in a natural way. t. There are two different fexes, which must concur to their generation. 2. There is both a great apparatus of spermatick veffels, wherein the nobler and more spiritous part of the blood by many digestions, concoctions, reflections and circulations exalted into that generous liquor we call sperm; and likewise for the preparing of the eggs. 3. There must be a copulation of the fexes, which I rather mention because it is the most remarkable in this that ever I observed in any animal; for they continue in complexu venereo at least a month indefinitely, the

male all that while refting on the back of the female, clipping and embracing her with his legs about the neck and body, and holding her fo fast, that if you take him out of the water he will rather bear her whole weight than let her go; this I observed in a couple kept on purpose in a vessel of water by my learned and worthy friend Mr John Nid, Fellow of Trinity-college, long fince deceased; after this the fpawn must be cast into water, where the eggs lie in the midft of a copious jelly, which ferves them for their first nourishment for a confiderable while; and at last the refult of all is not a perfect frog. but a tadpole, without any feet, and having a long tail to fwim withal; in which form it continues a long time, till the limbs be grown out and the tail fallen away, before it arrives at the perfection of a frog.

Now if frogs can be generated fpontaneoufly in the clouds out of vapour, or upon the earth out of dust and rain-water, what needs all this ado? To what purpose is there fuch an apparatus of veffels for the elaboration of the fperm and eggs? fuch a tedious process of generation and nutrition ? This is but an idle pomp; the fun (for he is fupposed to be the equivocal generant or efficient by these philosophers) could have dispatched the bufiness in a trice; give him but a little vapour, or a little dry dust or rain-water, he will produce you a quick frog, nay, a whole army of them, perfectly formed, and fit for all the functions of life, in three minutes, nay, in the hundredth part of one minute, elfe must some of those frogs that were generated in the clouds fall down half formed and inperfect, which I never heard they did; and the process of generation have been obferved in the production of frogs out of dust and rain-water, which no man ever pretended to mark or difcern, . But that there can be no frogs

generated in the clouds, may be further made appear, t. From the extreme cold of the middle region of the air, where the vapours are turned into clouds, which is not at all propitious to generation; for did not fo great men as Aristotle and Erasmus report it, I could hardly be induced to believe that there could be one fpecies of infects generated in fnow 2, Becaufe if there were any animals engendered in the clouds, they must needs be maimed and dashed in pieces by the fall, at leaft fuch as fell by the high-ways, and upon the roofs of houses; whereas we read not of any fuch broken or imperfect frogs found any where. This last argument was sufficient to drive off the learned Fromondus from the belief of their generation in the clouds; but the matter of fact he takes for granted, I mean the fpontaneous generation of frogs out of dust and rain-water, from an obfervation or experiment of his own at the gates of Tournay in Flanders, to the fight of which fpectacle he called his friends who were there prefent, that they might admire it with him. " A fudden " fhower (faith he) falling upon the very dry duft, " there fuddenly appeared fuch an army of little frogs; " leaping about every where upon the dry land, that " there was almost nothing elfe to be feen; they were " alfo of one magnitude and colour; neither did it ap-" pear out of what lurking places (latibula) fo many " myriads could creep out, and fuddenly difcover " themfelves upon the dry and dufty foil, which they. " hate." But faving the reverence due to fo great a man, I doubt not but they did all creep out of their holes and coverts, invited by the agreeable vapour of the rain-water; this, however unlikely it may feen, is a thoufand times more probable than their inftantaneous and undifcernable generation out of a little dry dust and rain-water, which alfo cannot have any time to mix and ferment together,

which is the hypothesis he adheres to; nay, I affirm, that it is not at all improbable; for he that shall walk out in fummer nights when it begins to grow dark, may observe a great multitude of great toads and frogs crawling about in the high ways, paths, and avenues, to houfes, yards and walks of gardens and orchards, that he would wonder whence they came or where they are lurked all the winter and all the day time, for that then it is a rare thing to find one.

To which add, that in fuch frogs as we are speaking of, Monfieur Perault hath upon diffection often found the ftomach full of meat, and the intestines of excrement; whence he justly concludes, " That they were not then first formed, but only " appeared of a fudden, which is no great won-" der, fince upon a shower after a drought, earth-" worms and land fnails innumerable come out of " their lurking places in like manner."

In confirmation of what I have here written against the spontaneous generation of frogs, either in the clouds out of vapour, or on the earth out of dust and rain water commixed, endeavouring to prove by force of argument that there is no fuch thing, I have lately received from my learned and ingenious friend Mr William Derham, rector of Upminster, near Rumford in Effex, a relation parallel to that of Fromondus, concerning the fudden appearance of a vast number of frogs, after a thower or two of rain, marching crofs a fandy way, that before the rain was very dufty, and giving an account where, in all likelihood, they were generated by animal parents, of their own kind, and whence they did proceed. The whole narrative I shall give the reader in his own words.

"Some years ago, as I was riding forth one " afternoon in Berks, I happened upon a prodi-

" gious multitude creeping crofs the way; it was " a fandy foil, and the way had been full of duft, " by reason of a dry season that then was; but " an hour or two before, a refreshing fragrant " fhower or two of rain had laid the duft; where " upon what I had read or heard of the raining of " frogs, immediately came to my thoughts, as it " eafily might do, there being probably as good " reafon then for me, as I believe any ever had " before, to conclude that these came from the " clouds, or were inftantaneoufly generated; but " being prepoffeffed with the contrary opinion, " viz. that there was no equivocal generation, I " was very curious in enquiring whence this vaft " colony might probably come; and upon fearching " I found two or three acres of land covered with " this black regiment, and that they all marched " the fame way towards fome woods, ditches, and " fuch like cool places in their front, and from " large ponds in their rear; I traced them back-" wards even to the very fide of one of the ponds; " these ponds in spawning-time always used to a-" bound with much frogs, whofe croaking I have " heard at a confiderable diftance; and a great deal " of fpawn I have found there.

"From thefe circumstances I concluded that this vast colony was bred in those ponds, from whenceward they steered their course; that after their incubation (if I may so call it) or hatching by the fun, and their having passed their tadpole state, they had lived (till that time of their migration) in the waters, or rather on the shore, among the stags, russ, and long grass; but now being invited out by the refreshing showers, then newly fallen, which made the earth cool and mosist for their march, that they left their old *latibula*, where perhaps they had devoured all their proper food, and

" were now in purfuit of food or a more conve-" nient habitation.

" This I think not only reafonable to be con-" cluded, but withal fo eafy to have been difcover-" ed by any inquifitive observer, who in former " times met with the like appearance, that I can-" not but admire that fuch fagacious philosophers " as Aristotle, Pliny, and many others fince should " ever imagine frogs to fall from the clouds, or by " any way inftantaneoufly or fpontaneoufly gene-" rated, especially confidering how openly they act " their coition, produce fpawn, this fpawn tadpoles, " and tadpoles frogs.

" Neither in frogs only, but also in many other " creatures, as lice, flefh-flies, filk-worms, and o-" ther papillo's, an uniform regular generation was " very obvious, which is an argument to me of a " ftrange prepoffession of fancy in the ages fince " Aristotle, not to fay of carelessness and floth." So far Mr Derham.

In like manner, doubtless, Fromondus, had he made a diligent fearch, might have found out the place where those myriads of frogs, observed by him about the gates of Tournay, were generated, and whence they did proceed.

As for the worms and other animals bred in the inteffines of man and beaft, I have declared myself not to be fatisfied of the ways and means how their feeds come to be conveyed into those places, but yet that their generation is analogous to that of other creatures of those kinds, I doubt not; the conftancy of their species, their exact agreement and perpetual fimilitude in the shape and figure of their bodies and all the parts, their confiftence, temper, motion, and other accidents. are to me little lefs than a demonstration that they are not the effects of chance, but the products of a fettled and spermatick principle; I am at pre-

fent, till better informed, of opinion, that their eggs are fwallowed with the meat we eat; and I am the rather induced to think fo becaufe children in their first infancy, and as long as they are constantly confined to a milk diet, are feldom troubled with them.

After this was written I received a letter from my often remembred ingenious friend Dr Fancred Robinfon referring to this matter, part whereof I shall transcribe, as being very pertinent, inftructive, and confonant to my own thoughts. " I think it may be proved, that the vaft variety " of worms found in almost all the parts of diffe-" rent animals, as well terreftrial as aquatick, are " taken into the respective bodies by meats and " drinks, and there either lie still for fome time, " or elfe grow and alter by change of place and " food [not specifically, but accidentally, in mag-" nitude, colour, figure of some parts or the like.] "We know as yet but little of the numerous in-" fects bred in water, or indeed of those in roots, " leaves, buds, flowers, fruits, and feeds, which " we are continually fwallowing, and thefe too all " vary according to the climate [that is, the fame " fpecies of roots, leaves &c. do in different cli-" mates produce many different fpecies of infects, " though fome there be common to all] the long \* flender worms, as fmall as hairs, that breed be-" tween the fkin and the flefh in the ifle of Ormuz, " and in India, which are generally twifted out " upon flicks or rowlers, and often break in the " operation, are without doubt taken in by the " water they drink in those regions, as I could " prove by many and good experiments, had I " time. They who have leifure may find them s' in the collections of voyages and travels, espe-" cially in Monfieur Fhevenot. By this explica-" tion we may give a better account of the vomit-

"ing up to tadpoles, fnails, and other animals re-" corded in medicinal hiftories, than by any hypo-

" thefis of equivocal generation. As to infects found " in ftinking flesh or rotten vegetables, I could never " observe or find any of them different from these " parent infects which hover about or feed upon fuch " bodies."

If any shall object the infinite multitude of animalcules difcovered in pepper-waters, and defire an account of their generation; to him I shall fay, that it is probable that fome few of these animals may be floating in all waters, and that finding the particles of pepper fwimming in the water, very proper for the cherishing and excluding of their eggs, by reafon of their heat, or some other unknown and specific quality, they may fasten their eggs to them, and fo there may be a fudden breed of infinite swarms of them; but thefe being not to be difcerned by the most piercing and Lyncean fight without the affistance of a microscope, I leave the manner of their generation to future difcovery.

No lefs difficult is it to give an account of the original of fuch infects as are to be found, and feem to be bred in the bodies of others of different kinds. Out of the fides and back of the most common caterpillar, which feeds upon cabbage, colewort, and turnep-leaves, which we have defcribed in the catalogue of Cambridge plants, we have feen creep out fmall maggots to the number fometimes of threefcore or more, which fo foon as ever they came forth, began to weave themfelves filken cafes of a yellow fhining colour, wherein they changed, and after fome time, came out thence in the form of fmall flies with four wings; for a full defcription and hiftory whereof I shall refer the reader to the fore-mentioned catalogue. The like I have allo obferved in other caterpillars

of a different kind, which have produced no leffer number of maggots, that in like manner immediately made themfelves up in cafes. Others, inftead of changing into the aurelia's as in the ufual process of nature they ought to do, have turned into one, two, or three, or more fleth-fly-cafes, at least contained fuch cafes within them, out of which after a while were excluded flesh-flies. Other caterpillars, as that called the folitary maggot, found in the dry heads of teafel, by a dubious metamorphofis, fometimes changed into the aurelia of a butterfly, sometimes into a fly-cafe; you will fay, how comes it to pafs? Must we not here neceffarily have recourfe to a fpontaneous generation? I anfwer, no; the most that can be inferred from hence is, a transmutation of species; one infect may, inftead of generating another of its own kind, beget one or more of a different; but I can by no means grant this; I do believe that these flies do either cast their eggs upon the very bodies of the fore-mentioned caterpillars, or upon the leaves on which they feed, all in a ftring; which there hatching, eat their way into the body, where they are nourished till they be come to their full growth; or it may be the fly may with the hollow and tharp tube of her womb punch and perforate the very skin of the eruca, and cast her eggs into its body; fo the ichneumon will convey her eggs into caterpillars.

The difcovery of the manner of the generation of thefe forts of infects I earneftly recommend to all ingenious naturalifts as a matter of great moment; for if this point be but cleared, and it be demonstrated that all creatures are generated univocally by parents of their own kind, and that there is no fuch thing as fpontaneous generation in the world, one main prop and fupport of atheifm is taken away, and their ftrongest hold demolished;

## in the CREATION.

they cannot then examplify their foolifh hypothefis of the generation of man, and other animals at first by the like of frogs and infects at this prefent day.

It will be farther objected, that there have live toads been found in the midst of timber trees; nay, of stones, when they have been fawn asunder.

To this I anfwer, that I am not fully fatisfied of the matter of fact. I am fo well acquainted with the credulity of the vulgar, and the delight they, and many of the better fort too, have in telling of wonders and firange things, that I must have a thing well attested, before I can give a firm affent to it.

Since the writing hereof, the truth of these relations, of live toads found in the midst of stones, hath been confirmed to me by sufficient and credible eyewitness, who have seen them taken out; fo that there is no doubt of the matter of fact.

But yet, suppose it be true, it may be accounted for; those animals, when young and little, finding in the ftone fome fmall hole reaching to the middle of it, might, as their nature is, creep into it, as a fit latibulum for the winter, and grow there too big to return back by the paffage by which they entered, and fo continue imprisoned therein for many years; a little air by reafon of the coldness of the creature, and its lying torpid there, fufficing it for refpiration; and the humour of the ftone, by reason it lay immoveable, and spent not, for nourifhment; and I do believe that if those who found those toads had diligently fearched, they might have discovered and traced the way whereby they entered in, or fome footsteps of it; or elfe there might fall down into the lapideous matter, before it was concrete into a ftone, some fmall toad, (or fome toad-fpawn) which being not able to extricate itself and get out again, might re-

LI

266

main there imprifoned till the matter above it were condenfed and compacted into a ftone; but howèver it came there, I dare confidently affirm it was not there fpontaneoufly generated; for elfe either there was fuch a cavity in the ftone before the toad was generated, which is altogether improbable, and gratis dictum, afferted without any ground, or the toad was generated in the folid ftone, which is more unlikely than the other, in that the foft body of fo fmall a creature fhould extend itfelf in fuch a prifon, and overcome the ftrength and refiftance of fuch a great and ponderous mafs of folid ftone.

And whereas the affertors of equivocal generation were wont to pretend the imperfection of these animals as a ground to facilitate the belief of their spontaneous generation, I do affirm that they are as perfect in their kind, and as much art fhewn. in the formation of them as of the greatest, nay, more too in the judgment of that great wit and natural historian \* Pliny. In magnis siquidem corporibus (faith he) aut certe majoribus facilis officina seguaci materia fuit; in his tam parvis atque tam nullis, quae ratio, quanta vis, quam inextricabilis perfectio? " In the greater bodies the forge was eafy, the matter being ductil and fequacious, obe-" dient to the hand and ftroke of the artificer, apt " to be drawn, formed or moulded into fuch fhapes " and machines even by clumfy fingers; but in the " formation of these, such diminutive things, such " nothings, what cunning and curiofity ! what force " and ftrength was requifite, there being in them <sup>56</sup> fuch inextricable perfection !

To what proofs or examples of fpontaneous generation may be brought from infects bred in the fruits or excreffencies of plants, I have already made answer in my second particular, which con-\* Lib. 11. chap. 2.

tains the testimonies of our best modern naturalists concerning these things.

In my denial of the spontaneous generation of plants, I am not fo confident and peremptory; but yet there are the fame objections and arguments against it as against that of animals, viz because it would be a production out of indifposed matter, and configuently a creation; or if it be faid there is disposed matter, prepared by the earth, or fun, the heat, or whatever other agent you can affign; I reply, this is to make a thing act beyond its strength, that is, an inferior nature which hath nothing of life in it, to prepare matter for a superior, which hath fome degree of life, and for the preparation of which it hath no convenient veffels or inftruments; if it could do fo, what need of all that apparatus of veffels, preparation of feed, and, as I also suppose, distinction of masculine and feminine that we fee in plants? I demand farther, whether any of the patrons of spontaneous generation in plants did ever fee any herbs or trees, except those of the grass-leaved tribe, come up without two feed leaves? which if they never did or could, it is to me a great argument that they came all of feed, their being no reafon elfe why they should at first produce two feed leaves different from the fubsequent; and if all these species (which are far the greatest number) come from feed, there is not the least reason to think that any of the reft come fpontaneoufly; and this with what I have written before may fuffice concerning this point.

Whereas I have often written in many places that fuch and fuch plants are fpontanrous, or come up fpontaneoufly, I mean no more by that expreffion but that they were not planted or fown there induftrioufly by man. Having spoken of the body of man, and the uses of its several parts and members, I shall add some other observations, giving an account of the particular structure, actions and uses of some parts, either common to whole kinds of animals, or proper to some particular species, different from those of man, and of the reason of some instincts and actions of brutes.

First of all, The manner of respiration, and the organs ferving thereto in various animals, are accommodated to their temper of body, and their place and manner of living; of which I have observed in more perfect animals three differences.

1. The hotter animals which require abundance of fpirits for their various motions and exercifes, are provided with lungs, which indefinitely draw in and expel the air alternately, without intermiffion, and have a heart furnifhed with two ventricles; becaufe to maintain the blood in that degree of heat which is requifite to the performance of the action of all the mufcles, there is abundance of air neceffary. I fhall not now take notice of the difference that is between the lungs of quadrupeds, and birds, how the one are fixed and immoveable the other loofe and moveable; the one perforated, tranfmitting the air into large bladders, the other inclofed with a membrane.

It is here worth the notice taking, that many animals of this kind, both birds and quadrupeds, will endure and bear up againft the extremeft rigor of cold that our country is exposed to; horfe, kine, and sheep, as I have experienced, will lie abroad in the open air upon the cold ground during our long winter-nights, in the sharpess and severes frosts that ever happened with us, without any harm or prejudice at all; whereas one would think, that at least the extremities of their members should be bitten, benummed and mortified thereby. Confi-

268

Part II.

dering with myfelf by what means they were enabled to do this, and to abide and refift the cold, it occurred to my thoughts, that the extremeties of their toes were fenced with hoofs, which in good measure fecured them; but the main thing was, that the cold is, as it were, its own antidote; for the air being fully charged and feated with nirous. or fome other fort of particles (which are the great efficients of cold and no lefs alfo the pabulum of. fire) when inspired, doth by means of them cause a great accention and heat in the blood (as we fee fuel burns rashly in fuch weather) and fo enable it to refift the imprefiions of the cold for fo fhort a time as its more nimble circulation exposes it thereto, before it comes to another heating. From hence may an account be given why the inhabitants of hot countries may endure longer fasting and hunger than those of colder; and those feemingly prodigious, and to us fcarce credible ftories, of the fafting and abstinence of the Egytian monks, be rendered probable.

2. other animals which are of a colder temper, and made to endure a long inedia or fasting. and lie in their holes almost torpid all winter. as all kinds of ferpents and lizards, have indeed lungs, but do not incefantly breathe, or when they have drawn in the air, neceffarily expire it again, but can retain it at their pleafure, and live without refpiration. whole days together, as was long fince experimented by Sir Thomas Brown, M. D. in a frog tied by the foot under water for that purpose by him. . This order of creatures have but one ventricle in their hearts, and the whole blood doth not fo often circulate through the lungs as it doth through the reft of the body ; this manner of breathing is fufficient to maintain in them that degree of heat which is fuitable to their nature and manner of living; for to our touch they are

270

always cold, leven in fummer-time, and therefore fome will then put fnakes into their bofom to cool them.

3. Fifhes, which were to live and converse always in a cold element, the water, and therefore were to have a temper not excelling in heat, becaufe otherwife the conftant immediate contact of the water (unless some extraordinary provision were made could not have been supported by them, that they might not be neceffitated continually to be coming up to the top of the water to draw in the air, and for many other reasons that might be alledged, perform their refpiration under water by the gills, by which they can receive no more air than is diperfed in the pores of the water, which is fufficient to preferve their bodies in that temper of heat that is fuitable to their nature and the place wherein they live; these also have but one ventricle in their hearts.

But now though this be thus, the great and most wife Gon, as it were purposely to demonftrate that he is not by any condition or quality of place neceffarily determined to one manner of refpiration, or one temper of body in fishes, he hath endued the bodies of fome of that tribe of aquatick creatures with lungs like viviparous quadrupeds, and two ventricles of the heart, and an ability of breathing like them, by drawing in and letting out the open air, fo contriving their bodies as to maintain in the midft of the cold water a degree of heat answerable to that of the fore-mentioned quadrupeds.

Another remarkable thing relating to refpira-199 tion is, the keeping the hole or paffage between the arteria venofa and vena cavia, called foramen ovale, open in some amphibious quadrupeds, viz. the phoca or vitulus marinus, called in English, fea-calf and feal; and, as is generally held, the

beaver too. We have already given the reason of the twofold communication of the great bloodveffels in the foetus or young fo long as it continues in the womb; the one between the two veins entring the heart, by a hole or window; the other between the two arteries, by an arterial channel extended from the pulmonary artery to the aorta, or great artery; which was, in brief, to divert the blood from the lungs. The fame reason for keeping open the foramen ovale there is in these amphibious creatures, for, 1. The lungs probably being not extended, but emptied of air when they abide long under water, and flaccid, it is not eafy for the whole blood every circulation to make its way through them. 2. To maintain that degree of heat and motion in the blood as is fufficient for them while they are under water, there is not fo much air required as is when they are above, the blood then moving but gently, as doth that of the foctus in the womb.

Farther, in reference to respiration, it is obferved by the Parifian academists, that some amphibious quadrupeds, particularly the fea-calf or feal, hath his epiglottis extraordinarily large in proportion to other animals, it extending half an inch in length beyond the glottis, to cover it. I believe the beaver hath the like epiglottis, exactly clofing the larynx or glottis, and hindring all influx of water; becaufe in one diffected by Wepferus, that fuffocated itself in the water, there was not a drop of water found in the lungs; it is probable (fay they) that this is done more exactly to close the entrance of the aspera arteria, or windpipe, when the animal eats his prey at the bottom of the fea, and to hinder the water from running into his lungs. An elephant (as is obferved by Dr Moulins, I think, in the anatomy of that creature) hath no epiglottis at all, there being no danger of any things falling into their lungs from eating or drinking, feeing there is no communication between the oefophagus and it; for he thus defcribes the oejophagus or gullet; The tongue of this creature (faith he) had this peculiar in it, that the paffage to the ventricle was thro' it; for there was a hole near the root of it, and exactly in the middle of that part, which hole was the beginning of the oefophagus; there was no communication between this and the paffage into the lungs, contrary to what we may observe in men, in all quadrupeds and fowls, that ever I had opportunity to diffect; for the membrana pituitaria anterior reached to the very root of the tongue, below the oefophagus, and fo quite ftopt the paffage of the air into the mouth. But though there be no danger of meat and drink falling into the lungs, yet were they not fufficiently fecured from fmall animals creeping in there; for though, to fupply in fome measure the want of an epiglottis, by leffening the glottis, there grew to the outfide of the cartilages called arytenoides, another capable of motion up and down, by the help of fome muscles that were implanted in it, ftrong on both fides of the aspera arteria, but on the under fide, opposite to that of the oefophagus, very limber, wanting about two inches and an half of coming round the forefaid cartilages on the upper fide, or the next to the oefophagus; yet did not this cartilage fo thut up the way against them, but that even a moufe creeping up his probofcis might get into his lungs, and fo ftifle him : whence we may guels at the reafon why the elephant is afraid of a moufe; and therefore to avoid this danger, this creature (the elephant, which this author defcribed) was obferved always when he flept to keep his trunk (probofcis) fo clofe to the ground that nothing but air could get in between them; this

is a strange fagacity and providence in this animal, or elfe an admirable inftinct.

Again the Parifian academists observe of the featortoife, that the cleft of the glottis is strait and clofe; which exact inclosure I do rather believe is to prevent the water from entering into the windpipe when the tortoifes are under water, than to affift the effect of the compression of the air in the lungs, as they would have it; for they make the main reafon of refpiration, and use of the lungs of this creature to be to take in and retain air, by the compreffion and dilatation whereof, made by the mufcles, it can rife or fink itfelf in the water, as need requires; tho' I do not exclude this. But if this be the main use of the lungs and respiration in this animal. what is it in land animals, which have a like conformation of lungs and manner of refpiration as the cameleon, ferpents, and lizards?

But before I difmiss the tortoife, I shall add two notable observations concerning him, borrowed of the faid French academist, which feem to argue fomething of reason in him, and more than a bare inftinct. The first is in the land-tortoife; and it is his manner of turning himfelf, and getting upon his feet again when he is caft upon his back, which they defcribe in thefe words; " At the great aper-" ture of the shell before, there was at the top a " raifed border, to grant more liberty to the neck " and head, for lifting themfelves upwards; and " this inflection of the neck is of great use to the " tortoifes, for it ferves them to turn again when " they are upon their backs; and their industry up-" on this account is very admirable. We have ob-" ferved in a living tortoife, that being turned upon " its back, and not being able to make use of its " paws for the returning of itfelf, becaufe they could " but only bend towards the belly, it could help it-" felf only by its neck and head, which it turned Mm

fometimes on one fide, and fometimes on the other, by pufhing against the ground, to rock itself as in a cradle, to find out the fide towards which the inequality of the ground might more easily permit it to rowl its shell; for when it had found it, it made all its endeavours on that fide."

The fecond is in the fea-tortoife, As follows. Aristotle and Pliny have remarked, that when tortoifes have been a long time upon the water during a calm, it happens that their shell being dried in the fun, they are eafily taken by the fifhermen, by reason they cannot plunge into the water nimbly enough, being become too light; this shews what equality there ought to be in their equilibrium, feeing fo little a change as this, which may happen by the fole drying of the shell, is capable of making it useles. This easiness to be taken at fuch a time, these academists do not refer merely to the lightness of this creature's body (for he could eafily let air enough out of his lungs, to render it heavier than the water, and fo enable himfelf to fink) but to a wonderful fagacity and caution of this animal; for (fay they) it is probable that the tortoife, which is always careful to keep himfelf in this equilibrium, fo as other animals are to keep themfelves on their legs, in this cafe, by the fame inftinct, dares not let the air out of his lungs, to acquire a weight which might make him fpeedily to fink, becaufe he fears that his shell being wet it should be come fo heavy, that he being funk to the bottom of the water might never have power afterwards to re-afcend; if this may be the reafon why he exposes himself to the danger of being taken at fuch a time, rather than he will defcend fuddenly to the bottom, it is clear that he is endued with an admirable providence and fore-fight, and a power of argumentation.

That nature doth really defign the prefervation and fecurity of the more infirm creatures, by the defensive armour that it hath given to some of them, together with skill to use it, is, I think, demonstrable in the common hedge-hog, or urchin, and one fpecies of tatou, or armadillo. The hedgehog hath his back, fides and flanks thick fet with ftrong and fharp prickles, and befides, by the help of a muscle given him for that purpose, is enabled to contract himfelf into a globular figure, and fo to withdraw, inclose, and hide his whole underpart, head, belly and legs (which for the neceffities and conveniencies of life must be left deftitute of this armour) within his covert or thicket of prickles; fo that dogs, or other rapacious creatures, cannot lay hold upon him or bite him without wounding their own nofes and mouths. The muscle whereby he is enabled to draw himself thus, together, and gather up his whole body like a ball, the Parifian academists describe to be a. diftinct carnole muscle, extended from the offa innominata to the car and nofe running along the back-bone, without being fastened thereto. Olaus Borrichius, in the Danick transactions, makes it to be an almost circular muscle, embracing the panniculus carnofus, of a wonderful fabrick, varioufly extending its laciniae, or proceffes, to the feet, tail, and head of the creature.

The other creature which doth thus contract and draw up itself into a globular or oval figure for its defence, is the fecond fort of tatou, or armadillo, largely defcribed by Marcgrave, lib. 6. cap. o by the name of tatu apara, which is covered on its back and fides with a ftrong fealy cruft or shell, or a hard or bony substance, jointed like armour, or the feales of the tail of a lobiter, by four transverse commissions in the middle of the body, connected by tough membranes. When

276

it fleeps (as it doth for the most part in the daytime, going forth to feed in the night) or when one goes about to lay hold on it, gathering up its fore and hind legs as it were to one point, and drawing up its ears with its head inward, and bringing its tail to its head by reafon of the forementioned commiffures, it bends its back fo far till its head comes to touch its hind part, and fo with armour gather itfelf into a round ball, the lateral extremities of the fhell touching one another, and inclofing the body on the fides, and the fore and hind parts coming fo near together, that there is nothing to be feen but the armature of the head and tail, which, like doors, thut up the hole which the thells of the body left open; this it performs by the action of a notable muscle on each fide, of a great length, having the form of the letter X, made up of many fibres, decuffating one another long-ways, by the help whereof it can contract its shell, and hold it contracted with fuch a mighty force, that he must be a ftrong man indeed that is able to open it.

Had fuch a mufcle as this, and fuch an ability of contraction, been given to any creature that was covered with foft hair or fur, there might have been fome pretence to fancy that this was accidental, and not defigned; but feeing there is not one inftance of this kind in nature, it must be great stupidity to believe it and an impudence to affert it; neither will the atheifts usual xpnopuyerov, or refuge, " That " there were indeed at first fuch creatures produc-" ed, but being obnoxious to those that were strong \* and rapacious, they were by degrees deftroyed, and " the race loft," here help them out; becaufe fuch a muscle, and faculty of using it to that purpose, might as likely have fallen to the lot or chance of a ftrong and generous creature, which others dared not approach to hurt, who might for his own difport have thus contracted himifelf into a ball, of which kind we find none.

I have before mentioned the use affigned by the honourable Mr Boyle, of famous memory, lately deceased to the periopthalmium, or nictating membrane in brutes, wherein I could not fully acquiesce as to some quadrupeds, which were in no danger of having their eyes harmed by bushes and prickles, or twigs of trees; fince the writing whereof I have met with a different account of the use of that membrane, in the Anatomical description of several creatures dissected by the Royal Academy of Sciences at Paris, Englished by Mr Alexander Pitfield, p. 249. in the description of the Caffowar. Our opinion (fay those academists) is, that the membrane ferves to clean the cornea, and to hinder, that by drawing, it grow no less transparent. Man and the ape which are the fole animals wherein we have not found this eye-lid, have not wanted this provision for the cleanfing of their eyes, because that they have hands, with which they may, by rubbing their eye-lids, express the humidity which they contain, and which they let out thro' the dunctus lachrymalis ; which is known by experience, when the fight is darkened, or when the eyes fuffer any pain or itching; for these accidents do cease when the eyes are rubbed.

But the diffection has diffinctly difcovered to us the organs do which particularly ferve for this ufe, and which are otherwife in birds than in man where the *ductus* paffes not beyond the *glandula lachrymalis*; for in birds it goes beyond, and penetrating above half way on the internal eye-lid, it is opened underneath upon the eye; which is evidently done to fpread a liquor over the whole cornea, when this eye-lid paffes, and repaffes, as we obferve it to do every moment.

The artifice and contrivance of nature for the extending and withdrawing of this curtain of the periopthalmium in birds is admirable; but it is difficult fo to express it in words as to render it intelligible to the reader; for a multitude of words doth rather obscure than illustrate, they being a burden to the memory, and the first apt to be forgotten before we come to the last; fo that he that uses many words for the explaining of any subject, doth like the cuttle-fifh, hide himfelf for the most part in his own ink; and in the description of the figure and manner of the extension and contraction of this membrane, the Parifian academists are confirained to use fo many words, that I am afraid few readers patience and attention will laft fo long as to comprehend and carry it away; yet becaufe it is fo evident and irrefragable a proof of wifdom and defign, I could not omit it; their words are thefe: The particularites of the admirable firucture of the eye-lid are fuch things as do diffinctly difcover the wifdom of nature among a thousand others, of which we perceive not the contrivance, becaufe we understand them only by the effects of which we know not the caufes; but we here treat of a machine, all the parts whereof are vifible, and which need only to be looked upon to discover the reason of its motion and action.

This internal eye-lid in birds is a membranous part, which is extended over the cornea, when it is drawn upon it like a curtain or by a little cord or tendon, and which is drawn back again into the great corner of the eye, to uncover the cornea by the means of the very ftrong ligaments that it has, and which in drawing it back towards its origin do fold it up; it made a triangle when extended, and it had the figure of a crefcent when folded up; its bafis (which is its origin) was toward the great corner of the eye, at the edge or the great circle,

## Part II. in the CREATION.

which the fclerotica forms when it is flatted before, making an angle with its anterior part, that is, the cornea, which is raifed like a hill upon it; the bafis, which is that part immoveable, and faftened to the edge of the fclerotica, did take up more than a third part of the circumference of the great circle of the fclerotica; the fide of the triangle, which is toward the little corner of the eye, and is moveable, was reinforced with a border, which fupplies the place of the tarfus, and which is black in moft quadrupeds; this fide of the cye-lid is that which is drawn back into the corner of the eye, by the action of the fibres of the whole eye-lid, which parting from its origin, proceed to join themfelves to its tarfus.

To extend this eye-lid over the cornea, there were two muscles that were seen, when fix were taken away, which ferved to the motion of the whole eye; we found that the greatest of these two mufcles has its origin at the very edge of the great circle of the fclerotica, towards the great corner, from whence the eye-lid takes its original; it is very fleshy in its beginning, which is a large bafis, from whence coming infenfibly to contract itself by paffing under the globe of the eye, like as the eye-lid paffes over it, it approaches the optick nerve, where it produces a tendon round and flender, fo that it pafies thro' the tendon of the other muscle, which ferves for a pully, and which hinders it from preffing the optick nerve, upon which it is bent, and makes an angle, to pafs thro' it to the upper part of the eye, and coming out from underneath the eye to infert itfelf at the corner of the membrane which makes the internal eye-lid; this fecond muscle hath its original at the fame circle of the felerotica, but opposite to the first towards the little corner of the eye, and paffing under the eye like the other,

280

Part II.

goes to meet it, and embraces its tendon, as has been declared.

The action of these two muscles is, in respect of the first, to draw, by the means of its cord or tendon, the corner of the internal eye-lid, and to extend it over the cornea; as to the fecond muscle, its action is, by making its tendon to approach towards its origin, to hinder the cord of the first muscle, which it embraces, from hurting the optick nerve; but its principal use is to affift the action of the first muscle; and it is herein that the mechanism is marvellous in the structure, which makes that thefe two muscles joined together do draw much farther than if it had but one; for the inflection of the cord of the first muscle, which causes it to make an angle, on the optick nerve, is made only for this end and a fingle muscle with a starit tendon had been fufficient, if it had power to draw far enough; but the traction which must make the eve-lid extend over the whole cornea being neceffarily great, it could not be done but by a very long muscle, and fuch a muscle not being able to be lodged in the eye all its length, there was no better way to fupply the action of a long muscle, than by that of two indifferent ones, and by bending one of them to give it the greater length in a little fpace. Thus far the academists, who themselves reflecting on the length and obfcurity of this defcription, tell us that the infpection of the figure will ferve greatly to the understanding of it, which the novelty of the things renders obfcure in itfelf, and fo I fear it will be to most readers; howbeit in fuch a work as this, I ought not by any means, as I faid before, lo leave out fuch a notable inftance, wherein contrivance and defign do fo cleariy and undeniably appear.

The fame academists, as I remember, tell us, that they have found by experience that the aqueous humour of the eye will not freeze; which is very admirable, feeing it hath the perspicuity and fluidity of common water, and hath not been taken notice of, fo far as I have heard, to have any eminent quality difcoverable either by taste or fmell; fo that it must be of fome fingular and aetherial nature, and deferves to be examined and analysed by the curious naturalists of our times.

The providence of nature is wonderful in a camel or dromedary, both in the ftructure of his body, and in the provision that is made for the fustenance of it; concerning the first I shall instance only in the make of his foot, the fole whereof, as the Parifian academists do observe, is flat and broad, being very flefhy, and covered only with a thick, foft, and fomewhat callous fkin, but very fit and proper to travel in fandy places, fuch as are the defarts of Africa and Afia, we thought (fay they) that this fkin was like a living fole, which wore not with the fwiftnefs and the continuance of the march, for which this animal is most indefatigable; and it may be this foftness of the foot. which yields and fits itfelf to the ruggedness and unevennefs of the roads, does render the feet lefs capable of being worn than if they were more folid.

As to the fecond, the provision that is made for their fustenance in their continued travels over fandy defarts, the fame academists observe, that at the top of the fecond ventricle (for they are ruminant creatures, and have four stomachs) there were several square holes, which were the orifices of about twenty cavities, made like sacks, placed between the two membranes which do compose the substance of this ventricle; the view of these facks made us to think that they might well be the refervatories, where Pliny fays that camels do a long time keep the water, which they drink in great abundance when they meet with it, to fupply the wants which they may have thereof in the dry defarts wherein they are used to travel, and where it is faid

that those that do guide them are fometimes forced, by extremity of thirst, to open their bellies in which they do find water.

That fuch an animal as this, fo patient of long thirst, should be bred in such droughty and parched countries, where it is of such eminent use for travelling over those dry and fandy defarts where no water is to be had sometimes in two or three days journey, no candid and confiderate perfon but must needs acknowledge to be an effect of providence and defign.

Such animals as feed naturally upon flesh, both quadrupeds and birds, becaufe fuch kind of food is high and rank, do qualify it, the one by fwallowing the hair or fur of the beafts they prey upon, the other by devouring fome part of the feathers of the birds they gorg themfelves with, not electively, but becaufe they cannot or will not take the pains fully to plume them; and therefore the Parifian academists do rationally refer the death of one of the lions whom they diffected, to the feeding of him with too fucculent and delicate meat; for (fay they) we know that fome time before his death he was feveral months without going out of his den, and that it was hard to make him eat; that for this reafon fome remedies, were prefcribed to him, and among others the eating only the flefh of young animals, and those alive; and that those which looked to the beafts of the park of Vincennes, to make this food more delicate, did use a method very extraordinary; which was, they flead lambs alive, and thus made, him cat feveral; which at the first revived him, creating in him an appetite, and mak-

ing him brifk; but it is probable that this food engendered too much blood, and which was too fubtile for an animal to whom nature had not given the industry of fleaing those which he ate; it being credible that the hair, wool, feathers and scales, which all animals of prey do swallow, are a feasonable and necessary corrective, to prevent their greediness from filling themselves with too fucculent a food.

Though I have declared in the beginning of this work that the means whereby cartilaginous filles raife and fink themfelves in the water, and reft and abide in what depth they pleafe, is not yet certainly known; yet I shall propound a conjecture concerning it, which was first suggested to me by Mr Peter Dent, late phyfician in Cambridge, viz. That it is by the help of water which they take in and let out by two holes in the lower part of their abdomen or belly, near the vent, or not far off it; the flesh of this fort of fish being lax and fpongy, and nothing fo firm, folid and weighty as that of the bony fifnes, and there being a good quantity of air contained in the cavity of their abdomen, they cannot fink in the water without letting in fome of it by these holes (the orifices whereof are opened and thut at pleafure by the help. of muscles provided for that purpose) into the hollow of their bellies, whereby they preponderate the water, and defcend; and when they would afcend, by a compression wrought by the muscles of the abdomen, they force out the water again, or at least fo much of it as may fuffice to give that degree of levity they need or defire. If it be found by experience that the bodies of these fishes without this ballaft would naturally float in the water, and that they do really admit water into their bellies, then this conjecture may have fome probability or truth in it, otherwife not.

Upon the contemplation and confideration of those various ways and contrivances which nature (I mean the divine wifdom) hath made use of for preparing the chyle, feparating the nutricious juice from the groffer parts of the aliment, and the feveral humours and fpirits from the blood, I cannot but admire her great wildom, art, and curiofity; for fhe hath not only employed all those methods and devices which chymifts have either learned by imitation of her, or invented of themfelves, for analyfing of bodies, feparating their parts, the pure from the impure, and extracting their fpirits, &c. as maceration in the first stomach or paunch of ruminating creatures, and in the craws of birds; comminution, by grinding in the mouths of viviparous quadrupeds, and in the gizzards of poultry; fermentation in the ftomachs of most terrefirial, and all aquatick animals; expreilion and fqueezing in the omafus of ruminant quadrupeds, and in the inteffines of all creatures, by the motion of the midriff and other mufcles of the belly, forcing the chyle out of the faeces or excrements into the lacteal veins; ftraining or percolation. by all the vifcera of the body, which are but as fo many colanders to feparate feveral juices from the blood; and laftly, digeftion and circulation in the fpermatick parts and veffels, and perhaps alfo in the brain; I fay, it hath not only made use of thefe operations, but it hath quite out-done the chymists, effecting that by a gentle heat which they cannot perform without great ftrefs of fire; as for inftance, in the ftomach of a dog, preparing, a liquor that diffolves bones; and in the bodies of fome infects, a liquor which feems to be as highly acid and corrofive as oil of vitriol or fpirit of nitre, viz. that which is inftilled into the blood when they fting. It is an experiment I have met with in fome books, and made myfelf, that if you

put blue-bottles, or other blue flowers into an anthill, they will prefently be stained with red; the reason (which these authors render not) is, because the ants thrust in their stings into the flowers, and instill into or drop upon them a small mite of their stinging liquor, which hath the same effect that oil of vitriol would have in changing their colour, which is a sign that both liquors are of the same nature.

Cafper Bartholine hath observed that where the gullet perforates the midriff, the corneous fibres of that muscular part are inflected and arcuate, as it were a fphincter embracing and clofing it faft, by a great providence in nature, left in the perpetual motion of the diaphragm the upper orifice of the ftomach should gape, and cast out the victuals as fast as it received it; and Peyerus thinks he hath observed, that in ruminating creatures the connection of the gullet with the diaphragm is far straiter and ftronger than in man and other animals, to the end that there fhould not be more than one morfel forced out at once; for that external fphincter inhibits a too great diltation of the gullet, and doth as it were measure out the morfels, and fit them to the capacity of the oefophagus.

I fhall concude with a notable relation of Galen's, lib. 6. de locis effectis, cap. 6. concerning a kid taken by him alive out of the dam's belly, and nourifhed and brought up.

"Nature forming, failioning, and perfecting the parts of the body, hath fo brought it to pafs, that they thould of themfelves, without any teaching, fet about and perform their proper actions : and of this I once made a great experiment, bringing up a kid without ever feeing its dam. For diffecting fome goats great with young, to refolve fome queftions made by anatomifts concerning the oeconomy of nature in the formation of the foetus

" in the womb, and finding a brifk embryon [young " one] I loofed it from the matrix after our usual " manner, and fnatching it away before it faw its " dam, I brought it into a certain room, having " many veffels full, fome of wine, fome of oil, " fome of honey, fome of milk, or fome other li-" quor; and others, not a few, filled with all forts " of grain, as also with feveral fruits, and there laid " it. This embryon we faw first of all getting up " on its feet and walking, as if it had heard that " its legs were given it for that purpofe; next " shaking off the flime it was befmeared with from " the womb; and moreover, thirdly, fcratching its " fides with one of its feet; then we faw it fmelling " to every one of those things that were set in the " room; and when it had fmelled to them all, it " fupped up the milk ; whereupon we all for admi-" ration cried out, feeing clearly the truth of what " Hypocrates faith, that the natures and actions of " animals are not taught (but by inftinct.) Here-" upon I nourifhed and reared this kid, and obferv-" ed it afterwards not only to eat milk, but fome o-" ther things that flood by it. And the time when " this kid was taken out of the womb being about " the vernal equinox, after fome two months, were " brought into it the tender fprouts of shrubs and " plants, and it again finelling of all of them, in-" stantly refused some, but was pleased to taste o-" thers; and after it had tafted, began to eat of " fuch as are the ufual food of goats. Perchance " this may feem a finall thing, but what I shall " now relate is great; for eating the leaves and ten-" der fprouts, it swallowed them down, and then " a while after it began to chew the cud, which " all that faw cried out again with admiration, be-" ing aftonished at the inftincts and natural facul-" ties of animals; for it was a great thing that " when the creature was hungry it should take in

" the food by the mouth, and chew it with its " teeth ; but that it fhould bring up again into " the mouth that which it had fwallowed down " into its first stomach, and chewing it there a " long time, it should grind and smooth it, after-" wards swallow it again, not into the same sto-" mach, but into another, seemed to us wonderful " indeed. But many neglect such works of na-" ture, admiring only strange and unusual sights." So far Galen.

This pleafant and admirable ftory, should one confider all the particulars of it, and endeavour to give an account of them, as alfo all the inferences that might be drawn from it, one might fill a whole volume with comments upon it. All that I shall at prefent fay is this, that in all this occonomy, and these actions, counsel and defign doth fo clearly appear, that he must needs be very stupid that doth not difcern it, or impudent that can deny it. I might add, that there feems to be fomething more than can be performed by mere mechanism in the election, this creature made of its food; for before it would eat of any, it fmelled to all the liquors before it, and when it had done fo, betook itfelf to the milk, and devoured that; he doth not fay that the milk was the last liquor it fmelled to, or that when it had once finelled to that, it prefently drank it up. The like alfo he faith of all the fprouts and branches of plants that were laid before it. By the by, we may take notice of one thing very remarkable, that this kid of its own accord drank milk after the manner it had done in the womb. Whereas had it once drawn by the nipple, it would hardly have fipped the milk; and therefore in weaning young creatures, the beft way is never to let them fuck the paps at all, for then. they will drink up milk without any difficulty; whereas if they have fucked, fome will very hardly,

others by no means be brought to drink : but how do the young with fuch facility come to take the nipple, and to fuck at it, which they had never before used to do? Here we must have recourse to natural inftinct, and the direction of some superior cause.

Notice hath been already taken, in an observation communicated by my learned friend Dr Tancred Robinson, of the providence of nature in fo forming the membranes of the body, as to be capable of a prodigious dilatation and extension. which is of great use in some difeases; for example, the dropfy, to continue life for fome time, till remedy may be had; and, if not, to give time to prepare for death : but the wifdom and defign of this texture doth in no inftance more clearly appear, than in the neceffity of it for the womb in the time of gestation; for were not the womb in women, which during virginity is not bigger than a small purse, almost indefinitely dilatable, and alfo the peritoneum, not to mention the fkin and the cuticula, how were it poffible it fhould contain the child, nay, fometimes twins, with all their appurtenances, the fecundines, the placenta, the liquor or waters, and what elfe is neceffary for the defence, nutrition, refpiration, and foft and convenient lodging of them, till they come to their due perfection and maturity for exclufion? How could the child have room to grow there to his bignefs, and ftir and turn himfelf as is requifite? Add hereto another observation of Blafius's, particularly relating to this fubject; he hath observed that the vefiels of the interior glandulous fubstance of the womb are strangely contorted and reflected with turnings and meanders, that they might not be too much strained, but their folds being extended and abolished, they might accommodate themfelves without danger of rup-

ture to the neceffary extension of the uterine fubftance at that time.

Another remarkable proof of counfel and defign may be fetched from the formation of the veins and arteries near the heart, which I meet with in Dr Lower's treatife, de Corde. Just before the entrance of the right auricle of the heart (faith he) to it, where the afcending trunk of the vena cava meeting with the defcending, is ready to empty itself into the faid right auricle, there occurs in it a very remarkable knob or bunch [tuberculum] raised up from the subjacent fat, by the interpolition whereof the blood falling down by the defcending vein is diverted by the auricle, which otherwife encountering and bearing upon that of the afcendant trunk, would very much hinder and retard, the motion of it upward towards the heart; and becaufe in an erect fite and figure of the body there is a greater and more imminent danger of fuch an accident; therefore the vena cava in mankind hath this tubercle far greater and of more extent than it is in brutes ; fo that if you thruft your finger into either trunk, you can hardly find paffage or admittance into the other.

But in quadrupeds, as in sheep, dogs, horse. kine, in which the courfe of the blood from either extreme of the body is more equal, and as it were in a plainer level; and becaufe the heart by reafon of its bulk and weight hanging downwards, both, trunks of the vena cava have fome little declivity towards it, there is no need of fo great a bar and diversion in them, yet are they not altogether devoid of it.

Moreover, left the blood here in its conflux fhould make a kind of flood or whirlpool whilit the auricle being contracted doth not give it free ingrefs, therefore in this place the vena cava in great animals, as well man as quadrupeds, is

round about musculous, as well that it may be restrained and kept within its due limits of extenfion, as that it may more vigorously and strongly urge, and impel the blood into the cavity of the auricle.

Besides, there is no less providence and caution nied that the blood, when it is forcibly caft out of the left ventricle of the heart, be not unequally distributed to the fuperior and inferior parts; for whereas this gate or orifice of the heart opens right upwards, if that channel which receives the first impulse of the blood did lead in a strait line up to the region of the head, it could not be but that it must be poured too swiftly upon the brain, and fo the inferior parts of the body must needs be defrauded of their vital liquor and aliment; which inconvenience, that the divine architect of the body might wholly obviate and avoid in animals, whole hearts are more ftrongly moved, he fo artificially contrived the trunk of the aorta, which is next the heart, that the blood runs not directly into the axillary and carotid arteries, but doth as it were fetch a compass; for in the middle space between the ventricle and those arteries it is very much inflected or bent; whence it comes to pais that that crooked angle fuftains the force and first ftroke of the ejected blood, and directs the greateft torrent of it towards the defcending trunk of the aorta, which otherwife would ruth too forcibly into the fuperior branches thereof, diftending them immoderately, and foon oppress and burthen the head. So far Dr Lower.

To elude or evade the force of all these instances, and innumerable others which might be produced, to demonstrate that the bodies of men and all other animals were the effects of the wisdom and power of an intelligent and almighty agent, and the several parts and members of them design-

2919

#### in the CREATION.

ed to the uses to which now they ferve, the atheist hath one fubterfuge, in which he most confides, viz. that all these uses of parts are no more than what is necessary to the very existence of the things to whom they belong, and that things make uses, and not uses things.

-----Nil ideo natum est in corpore ut uti Possemus, sed quod natum est id procreat usum. Saith Lucretius, lib 4.

Part II.

And having instanced in several members, he concludes,

Ante fuere, ut opinor, eorum quam fuit ufus.

I shall give you their sense, together with the confutation of it in Dr Bentley's words, borrowed out of his fifth lecture, &c.

Thefe things, fay they \*, are miltaken for tokens of skill and contrivance, whereas they are but necessary consequences of the present existence of those creatures to which they belong; for he that supposeth any animals to sublist, doth by that very fuppofition allow them every member and faculty that are neceffary to fublistence; and therefore unlefs we can prove a priori, and independent on this ufefulnefs, now that things are once fuppofed to have existed and propagated, that among almost infinite trials and effays at the beginning of things, among millions of monstrous shapes, and imperfect formations, a few fuch animals as now exift could not poffibly be produced, thefe after-confiderations are of very little moment; becaufe if fuch animals . could in that way poffibly be formed, as might live and move, and propagate their beings, all this admired and applauded usefulnefs of their feveral fa-\* The atheifts.

bricks is but a neceffary condition and confequence of their existence and propagation.

This is the laft pretence and fophiftry of the atheifts against the proposition in my text (Acts xvii. 27.) that we received our life and being from a divine wisdom and power; and as they cannot justly accuse me of concealing or baulking their grand objection, fo I believe these following confiderations will give them no reason to boast that it cannot receive a just and fatisfactory answer.

1. First, Therefore, we affirm that we can prove, and have done it already by arguments a priori (which is the challenge of the atheifts) that thefe animals that now exift could not poffibly have been formed at first by millions of trials; for feeing they allow by their very hypothefis (and without ftanding to that courtefy we have proved it before) that there can be no cafual or fpontaneous motion of the particles of matter, it will follow, that every fingle monster, among fo many supposed myriads, must have been mechanically and neceffarily formed; according to the known laws of motion, and the temperament and quality of the matter it was made of, which is fufficient that no fuch monfters were or could have been formed; for to denominate them even monsters they must have had some rude kind of organical bodies, some stamina of life, though never so clumfy, some system of parts, compounded of folids and liquids, that executed (though but bunglingly) their peculiar motions and functions. But we have lately shewn it impossible for nature unaffisted to constitute such bodies, whose structure is against the law of specifick gravity; fo that the could not make the least endeavour towards the producing of a monster, or of any thing that hath more vital and organical parts than we find in a rock of marble or a fountain of water. And again, though we fhould not contend with them

about their monfters and abortions, yet feeing that they fuppofe even the perfect animals that are ftill in being to have been formed mechanically among the reft, and only add fome millions of monfters to the reckoning, they are liable to all the difficulties in the former explication, and are expressly refuted through the whole preceding fermon, where it is abundantly fhewn that a fpontaneous production is against the catholick laws of motion, and against matter of fact, a thing without example, not only in man and the nobler animals, but in the fmallest of infects and the vilest of weeds; though the fertility of the earth cannot be faid to have been impaired fince the beginning of the world.

2. Secondly, We may observe that this evalion of the atheist is fitted only to elude fuch arguments of divine wildom as are taken from things neceffary to the confervation of the animal, as the faculties of fight, and motion, and nutrition, and the like; because fuch usefulnels is indeed included in a general fupposition of the existence of that animal; but it miferably fails him against other reafons, from fuch members and powers of the body as are not neceffary abfolutely to living and propagating, but only much conduce to our better fubfiftence and happier condition. So the most obvious contemplation of the frame of our bodies, as that we all have double fensories, two eyes, two ears, two nostrils, is an effectual confutation of this atheiftical fophilm; for a double organ of thefe fenfes is not at all comprehended in the notion of bare existence, one of them being fufficient to have preferved life and continued the species, as common experience witneffeth. Nay, even the very nails of our fingers are an infallible token of defign and contrivance, for they are uteful and convenient, to give ftrength and firmnels to those parts in the various functions they are put to, and to defend the nume204

rous nerves and tendons that are under them, which have a most exquisite sense of pain, and without that native armour would continually be exposed to it; it is manifest therefore that there was a contrivance and forefight of the usefulness of nails antecedent to their formation; for the old stale pretence of the atheifts, that things were first made fortuitoufly, and afterwards their ufefulnefs was obferved or discovered, can have no place here, unless nails were either abfolutely requitite to the existence of mankind, or were found only in fome individuals or fome nations of men, and fo might be afcribed to neceffity upon one account, or to fortune upon another. But from the atheifts fuppolition, that among the infinite diverfity of the first terrestrial productions, there were animals of all imaginable Thapes and ftructures of body, all of which furvived and multiplied, that by reafon of their make and fabrick could poffibly do fo, it neceffarily follows that we fliould now have fome nations without nails upon their fingers, others with one eye only, as the poets defcribe the Cyclops in Sicily, and the Arimafphi in Scythia; others with one ear, or with one nostril, or indeed without any organ of fmelling, becaufe that fenfe is not neceffary to man's fubfistence; others destitute of the use of language, seeing that mutes also may live. One people would have the feet of goats, as the feigned fatyrs and panifci; another would refemble the head of Jupiter Ammon, or the horned statues of Bacchus; the Sciopedes and Enotocetae, and other monftrous nations, would be no longer fables, but real instances in nature; and in a word, all the ridiculous and extravagant shapes that can be imagined, all the fancies and whimfies of poets and painters, and Egyptian idolaters, if so be they are confistent with life and propagation, would be now actually in being if our atheifts notion were true; which therefore

may defervedly pafs for a mere dream and an error, till they pleafe to make new difcoveries in the terra incognita, and bring along with them fome favages of all thefe fabulous and monftrous configurations. Thus far Dr Bentley: who adds four confiderations more to confute this fancy, ex abundanti, granting the atheift all the abfurd fuppofitions he can make; for which, though they be very well worth the reading, yet being too long to transcribe, I refer the reader to the fermon itself.

I shall now farther prove by a notable instance that uses made things, that is to fay, that fome things were made defignedly and on purpofe for fuch an use as they ferve to; and that is, the tendrils or claspers of plants, because they are given only to fuch fpecies as have weak and infirm stalks, and cannot rife up to fupport themfelves, by their own ftrength; we see not so much as one tree, or shrub, or herb, that hath a firm and strong stem, and that is able to mount up and ftand alone without affiftance, furnithed with them, whereas had they been without defign fcattered (as I may fay) indifferently and carelefsly among plants, it could not poffibly have happened but among fo many thousand species they must have fallen to the lot of fome few, at least fome one of the ftrong, and not only of the weak; the fame hath been proved by the instance of the power given to the hedge-hog and armadillo, of contracting their bodies into a globular figure, and fo hiding and fecuring their tender and unarmed parts.

2 I shall prove by another eminent instance that things did not make uses, because there is a fort of creatures which have all the parts and organs which are fitted for a certain action, and employed for the exercise of it by another fort, and yet make no use of them for that purpose; that is, the apekind; the Parisian academists in their anatomy of fome animals of this kind tell us, that the muscles of the os byoides, tongue, larynx and pharynx, which do most ferve to articulate a word, were wholly like to those of man, and a great deal more than those of the hand, which neverthelefs the ape, which fpeaks not, uses with as much perfection as a man; which demonstrates that speech is an action more peculiar to man, and which more diffinguishes him from brutes than the hands, which Anaxagoras, Aristotle, and Galen have thought to be the organ which nature has given to man as to the wifeft of all animals, for want perhaps of this reflection; for the ape is found provided by nature of all those marvellous organs of fpeech with fo much exactnefs, that the very three finall mufcles which do take their rife from the apothefis ftyloides are not wanting, altho' this apothefis be extremely fmall; this particularity doth likewife fhew that there is no reason to think that agents do perform such and fuch actions becaufe they are found with organs proper thereunto; for according to thefe philofophers apes should speak, feeing that they have all the instruments necessary for speech; all this is confirmed and approved by the learned and accurate Dr Tyfon in his anatomy of the orang-outang or pigmy, he finding in the animal he defcribed (which was of the ape-kind) the whole structure of the larynx and os hyoides exactly as it is in man; and the reflection which the Parifians make upon their obfervation of these and the neighbouring parts, he thinks very just and valuable; and adds farther, that this is not the only inftance which may justify fuch an inference, though he thinks it fo ftrong an one as the atheifts can never anfwer.

It is farther confiderable, and adds to the weight of this inftance, that though birds have been taught to imitate human voice, and to pronounce words, yea, fentences; yet quadrupeds never, though they

296

have organs far more fit for that purpofe, and fome of them, viz. dogs and horfes, converfe almost perpetually with men; and others, as apes, are given naturally to imitate men's actions, as if providence had defigned purposely to confute this fond conceit of the atheists, by denying them the power to make use of these organ's of speech, which whether they understand what they faid or not, they otherwise might or would have done in imitation of man, and that to greater perfection than birds do, or are capable of doing.

Farther, To prove that those nobler faculties of the foul, reason and understanding, cannot be produced by matter organized, but must have a higher principle, he \* thus argues : it is an observation of Vesalius's, that the brain of man in respect of his body, is much larger than what is to be met with in any other animals, exceeding in bigness three oxes brains; whence he infers, that as animals excel in the largeness of the brain, fo they do likewise in the principle faculties of the foul; which inference the doctor cannot allow.

It is, faith he, a general received opinion, that the brain is the immediate feat of the foul itfelf; whence one would be apt to think, that feeing there is fo great a difparity between the foul of a man and a brute, the organ in which it is placed fhould be very different too; yet, by comparing the brain of our pigmy (the orang-outang, or wild man) with that of a man, and with the greateft exactnefs obferving each part in both, it was very furprifing to me to find fo great a refemblance of the one to the other, as nothing could be more; and that in proportion to its body its brains was alfo as large as a man's.

Since therefore (he proceeds) the brain of our pigmy doth in all refpects fo exactly refemble a

\* Dr Tyfon.

man's, I might here make the fame reflection the Parifians did upon the organs of fpeech, that there is no reafon to think that agents do perform fuch and fuch actions becaufe they are found with organs proper hitherto, for then our pigmy might be really a man; the organs in animal bodies are only a regular compages of pipes and veffels for the fluids to pafs thro', and are paffive; what actuates them are the humours and fluids, and animal life confifts in their due and regular motion in this organical body; but those nobler faculties in the mind of man must certainly have a higher principle, or matter organized could never produce them; for why elfe, where the organ is the fame, fhould not the action be the fame too?

Object Some may here object and argue: If the body of man be thus perfect, why did God make any other animals? For the most perfect being the best, an infinitely good agent, who wants neither wisdom nor power, should (one would think) only produce the most perfect.

Anfw. To which I anfwer: I. That according to this argumentation one might infer, that God must produce but one kind of creature, and that the most perfect that he is able, which is impossible; for he being infinite in all perfections, cannot act ad extremum virium, unless he could produce an infinite creature, that is, another God, which is a contradiction; but whatever he makes must want degrees of infinite perfection, of which he could still (if he pleafed) add more and more to it.

2. The inferior creatures are perfect in their order and degree, wanting no quality or perfection that is neceffary or due to their nature or condition, their place, and manner of living; now, why God might not make feveral fubordinate ranks and degrees of creatures, they being good, I fee no reafon.

3. Thefe feveral ranks and degrees of creatures

#### in the CREATION.

are fubfervient one to another, and the most of them ferviceable, and all fome way or other useful to man; fo that he could not well have been without them.

Part II.

4. God made these feveral orders and degrees and in each degree so many varieties of creatures, for the manifestation and displaying of his infinite power and wisdom; for we have shewn before by a familiar instance, that there is more art and wisdom shewn in contriving and forming a multitude of different kinds of engines than in one only.

Yet do I not think that he made all these 5 creatures to no other end but to be ferviceable to man, but alfo to partake themfelves of his overflowing goodnefs, and to enjoy their own beings. If we admit all other creatures in this inferior world befides man to be mere machines or automata, to have no life, no fense nor perception of any thing, then I confess this reason is out of doors, for being incapable of pleafure or pain they can have no enjoyment; upon this account alfo, among others, I am lefs inclinable to that opinion. I fhould now proceed to answer some objections which might be made against the wildom and goodness of God in the contrivance and governance of the world, and all creatures therein contained; but that is too great and difficult a tafk for my weakness, and would take up more time than I have at prefent to fpare were I qualified for it and befides fwell this volume to too great a bulk; only I shall fay fomething to one particular which was fuggefted to me by a learned and pious friend \*.

Object. A wife agent acts for ends. Now what end can there be of creating fuch a vaft multitude of infects as the world is filled with, most of which feem to be useles, and fome also noxious and pernicious to man and other creatures ?

\* Mr Robert Burscough of Totness, in Devon.

Anfw. To this I shall answer; 1. As to the multitude of species or kinds. 2. As to the number of individuals in each kind.

First, As to the multitude of species (which we must needs acknowledge to be exceeding great, they being not fewer, perchance more than twenty thou-fand) I answer there were so many made,

1. To manifest and difplay the riches of the power and wildom of God, Pfalm civ. 2.4. The earth is full of thy riches, fo is the great and wide fea, wherein are things creeping innumerable, &c. We should be apt to think too meanly of those attributes of our Creator, should we be able to come to an end of all his works, even in this fublunary world; and therefore I believe never any man yet did, never any man shall fo long as the world endures, by his utmost industry attain to the knowledge of all the species of nature; hitherto we have been fo far from it, that in vegetables the number of those which have been discovered this last age hath far exceeded that of all those which were known before: fo true is that we quoted before out of Seneca: Pusilla res est mundus, nisi in eo quod quaerat omnis mundus habeat. The world is fo richly furnished and provided, that man need not fear want of employment should he live to the age of Methufelah, or ten times as long; but of this, having touched it already, I shall add no more.

2. Another reafon why fo many kinds of creatures were made, might be to exercife the contemplative faculty of man, which is in nothing fo much pleafed as in variety of objects; we foon grow weary of one ftudy, and if all the objects of the world could be comprehended by us, we fhould with Alexander think the world too little for us, and grow weary of running in a round of feeing the fame things; new objects afford us great delight, efpecially if found out by our own induftry. I remem-

300

Part II.

ber Clusius faith of himfelf, "That upon the dif-"covery of a new plant he did not lefs rejoice than "if he had found a rich treafure." Thus God is pleafed, by referving things to be found out by our pains and industry, to provide us employment most delightful and agreeable to our natures and inclinations.

3. Many of these creatures may be useful to us whose uses are not yet discovered, but referved for the generations to come, as the uses of some we now know are but of late invention, and were unknown to our forefathers; and this must needs be fo, because, as I faid before, the world is too great for any man or generation of men, by his or their utmost endeavours to discover and find out all its ftore and furniture, all its riches and treasures.

Secondly, As to the multitude of individuals in each kind of infect; I answer,

I. It is defigned to fecure the continuance and perpetuity of the feveral fpecies, which if they did not multiply exceedingly, fearce any of them could efcape the ravine of to many enemies as continually affault and prey upon them, but would be in danger to be quite deftroyed and loft out of the world.

2. This vaft multitude of infects is ufeful to mankind, if not immediately, yet mediately. It cannot be denied that birds are of great ufe to us, their flefh affording us a good part of our food, and that the moft delicate too, and their other parts phyfick, not excepting their very excrements; their feathers ferve to ftuff our beds and pillows, yielding us foft and warm lodging, which is no fmall convenience and comfort to us, efpecially in thefe northern parts of the world; fome of them have alfo been always employed by military men in plumes, to adorn their crefts, and render them formidable to their enemies; their wings and quills are made ufe of for writingpens, and to brufh and cleanfe our rooms, and their furniture; befides, by their melodious accents they gratify our ears; by their beautiful thapes and colours they delight our eyes, being very ornamental to the world, and rendering the country where the hedges and woods are full of them, very pleafant and chearly, which without them would be no lefs lonely and melancholy; not to mention the exercife, diversion and recreation which fome of them give us.

Now infects fupply land birds with the chiefeft part of their fuftenance; fome, as the entire genus of fwallows, live wholly upon them, as I could eafily make out did any man deny or doubt of it; and not fwallows alone, but alfo wood-peckers, if not wholly, yet chiefly; and all other forts of birds partly, efpecially in winter time, as appears by diffecting their ftomachs.

As for young birds which are brought up in the neft, by the old, they are fed chiefly, if not folely by infects; and therefore for the time when birds for the most part breed in the spring, when there are multitudes of caterpillars to be found on all trees and hedges; moreover, it is very remarkable, that of many fuch birds as when grown up feed almost wholly upon grain, the young ones are nourished by infects; for example, pheasants and partridges, which are well known to be granivorous birds, the young live only or mostly upon ants eggs. Now birds, being of a hot nature, are very voracious creatures, and eat abundantly, and therefore there had need be an infinite number of infects produced for their suftenance. Neither do birds alone, but many forts of fishes, feed upon infects, as is well known to anglers, who bait their hooks with them; nay, which is more strange, divers quadrupeds feed upon infects, and fome live wholly upon them, as two forts of tamanduus upon ants, which therefore are called in English ant-bears; the cameleon upon

flies; the mole upon earth-worms; the badger alfo lives chiefly upon beetles, worms, and other infects.

Here we may take notice by the way, that becaufe fo many creatures live upon ants and their eggs, providence hath fo ordered it that they fhould be the most numerous of any tribe of infects that we know.

Conformable to this particular is the reafon my ingenious and inquifitive friend, Mr Derham before remembered, hath given of the production of fuch innumerable multitudes of fome aquatick infects.

I have often thought (faith he) that there was fome more than ordinary use in the creation for fuch infects as are vaftly numerous, fuch as the pulices aquatici, which are in fuch fwarms as to discolour the waters, and many others; and therefore I have bent my enquiries to find out the ufes of fuch creatures, wherein I have fo far fucceeded, as to difcover, that those valtly fmall animalcula, not to be feen without a microfcope, with which the waters are replete, ferve for food to fome others of the fmall infects of the water, particularly to the nympha culicaria [birfuta it may be called] figured in Swammerdam; for viewing that nympha one day, to observe the motion of its mouth, and for what purpose it is in such continual motion, whether as fifh to get air, or to fuck in food, or both, I could plainly perceive the creature to fuck. in many of the most minute animalcula, that were fwiming brifkly about in the water; neither yet do thefe animalcules ferve only for food to fuch nymphae, but alfo to another, to me anonymous, infect of the waters, of a dark colour, cleft as it were in funder, and fcarce fo big as the fmalleft pin's head; thefe infects hunt thefe animalcules, and other fmall creatures that occur in the water, and devour them ; and I am apt to think, altho' I have not yet feen it,

that the *pulex aquaticus arborescens* liveth upon these, or more minute and tender animalcules, and that it is to catch them that it so leaps in the water.

This to me feems a wonderful work of God, to provide for the minuteft creatures of the waters food proper for them, that is, minute and tender, and fit for their organs of fwallowing.

As for noxious infects, why there should be fo many of them produced, if it be demanded,

I anfwer, 1. That many that are noxious to us, are falutary to other creatures; and fome that are poifon to us, are food to them. So we fee the poultry-kind feed upon fpiders; nay there is fcarce any noxious infect but one bird or other eats it, either for food or phyfick; for many, nay, moft of those creatures whose bite or sting is poisonous, may fafely be taken entire into the stomach; and therefore it is no wonder that not only the Ibis of Egypt, but even storks and peacocks, prey upon and destroy all forts of stores, as well as locusts and caterpillars.

2. Some of the most venomous and pernicious of infects afford us noble medicines, as scorpions, spiders, and cantharides.

3. These infects feldom make use of their offenfive weapons, unless affaulted or provoked, in their own defence, or to revenge an injury; let them but alone, and annoy them not, nor disturb their young, and, unless accidentally, you shall feldom fuffer by them.

Lastly, God is pleafed fometimes to make use of them as fcourges, to chastife or punish wicked perfons or nations, as he did Herod and the Egyptians; no creature fo mean and contemptible, but God can when he pleafes produce such armies of them, as no human force is able to conquer or destroy, but they shall of a sudden confume and devour up all the fruits of the earth, and whatever might ferve

304

for the sustenance of man, as locusts have often been observed to do.

Did thefe creatures ferve for no other ufe, as they do many, yet thofe that make them an objection againft the wifdom of God, may (as Dr Cockburn well notes) as well upbraid the prudence and policy of a ftate for keeping forces, which generally are made up of very rude and infolent people, which yet are neceffary, either to fupprefs rebellions, or punifh rebels, and other diforderly and vicious perfons, and keep the world in quiet.

From that part of this difcourse which relates to the body of man, I shall make these practical inferences.

Infer. 1. Firfl, Let us give thanks to Almighty God for the pefection and integrity of our bodies; it would not be amifs to put it into the euchariftical part of our daily devotions : we praise thee, O God, for the due number shape, and use of our limbs and fenses; and in general, of all the parts of our bodies; we blefs thee for the found and healthful constitution of them, Pfal. c. It is thou that hast made us, and not we ourfelves; in thy book were all our members written. The formation of the body is the work of God, and the whole process thereof attributed to him, Pfal. cxxxix. 13, 14, 15. The mother that bears the child in her womb is not confcious to any thing that is done there, fhe understands no more how the infant is formed than itself doth; but if God hath bestowed upon us any peculiar gift or endowment wherein we excel others, as strength, or beauty, or activity, we ought to give him special thanks for it; but not to think the better of ourfelves therefore, or despife them that want it.

Now because these bodily perfections being common bleffings, we are apt not at all to confider them, or not to set a just value on them; and because the 306

worth of things is best difcerned by their want, it would be useful sometimes to imagine or suppose ourfelves, by fome accident to be deprived of one of our limbs or fenses, as a hand, or a foot or an eye, for then we cannot but be fenfible that we flould be in worfe condition than now we are, and that we should; foon find a difference between two hands and one hand, two eyes and one eye, and that two excel one as much in worth as they do in number; and yet if we could fpare the use of the lost part, the deformity and unfightlinefs of fuch a defect in the body would alone be very grievous to us. Again, which is lefs, fuppofe we only that our bodies want of their just magnitude, or that they or any of our members are crooked or distorted, or difproportionate to the reft, either in excess or defect; nay, which is least of all, that the due motion of any one part, be perverted, as but of the eye in fquinting the eye-lids in twinkling, the tongue in stamering, these things are such blemishes and offences to us, by making us gazing flocks to others, and objects of their fcorn or derifion, that we could be content to part with a good part of our estates to repair fuch defects or heal fuch infirmities. These things confidered, and duly weighed, would furely be a great and effectual motive to excite in us gratitude for this integrity of our bodies, and to effeem it no finall bleffing, I fay a bleffing and favour of God to us; for fome there be that want it, and why might not we have been of that number ? God was no way obliged to beftow it upon us.

And as we are to give thanks for the integrity of our body, fo are we likewife for the health of it, and found temper and conftitution of all its parts and humours; health being the principal bleffing of this life, without which we cannot enjoy or take comfort in any thing befide.

## Part II. in the CREATION.

Neither are we to give thanks alone for the first collation of these benefits, but also for their prefervation and continuance. God preferves our fouls in life, and defends us from dangers and fad accidents, which do befet us on every fide, that the greatest circumspection in the world could not fecure us, did not his good providence continually watch over us; we may be faid to walk and converfe in the midst of fnares; befides did we but duly confider the make and frame of our bodies, what a multitude of minute parts and veffels there are in them, and how an obstruction in one redounds to the prejudice of the whole, we could not but wonder how fo curious an engine as man's body could be kept in tune one hour as we use it, much lefs hold out fo many years; how it were poffible it should endure fuch hardships, fuch blows, to many fhocks and concuffions, nay, fuch violences and outrages as are offered it by our frequent exceffes and not be difordered and rendered ufelefs; and acknowledge the transcendent art and fkill of him who fo put it together, as to render it thus firm and durable.

Infer. 2. Secondly, Have a care thou doft not by any vicious practice deface, mar, or deftroy the workmanship of God; fo use this body as to preferve the form and comelinefs, the health and vigour of it.

1. For the form and beauty of the body, which mankind generally is fond enough of, and which mnft be acknowledged to be a natural endowment and bleffing of God, a thing defirable, which all men take complacency in, which renders perfons gracious and acceptable in the eyes of others: of which yet we do not observe that brute beasts take any notice at all : of this I shall obierve, that outward beauty is a fign of inward; and that handfome perfons are naturally well inclined till they do either

debauch themfelves, or are corrupted by others, and then with their manners they mar their beauty too; for a man may observe, and easily discern, that as perfons are better or worfe inclined, the very air of their vifage will alter much; and that vicious courfes, " defacing the inward pulchritude of the " foul, do change even the outward countenance " into an abhorred hue ";" as is evident in the vices of intemperance and anger, and may, by fagacious perfons, be observed in others also. No better cofmeticks than a fevere temperance and purity, a real and unaffected modefty and humility, a gracious temper and calmnefs of fpirit, a fincere and univerfal charity; no true beauty without the fignatures of thefe graces in the very countenance; they therefore who through the contrary vices do deface and blot out this natural character and imprefs, and do violence to their own inclinations, that facrifice this jewel to their lufts, that reject this gift of God, and undervalue the favour of man, aggravate their fin and mifery, and purchase hell at somewhat a dearer rate than others do; and those that have but a mean portion of this gift, are the more obliged by virtuous practices, not only to preferve, but to improve it. Virtue (as Cicero observes) if it could be seen with corporeal eyes, admirabiles fui amores excitaret; " it would excite a wonderful love of itfelf." By the fignatures it there imprefies, it is in fome measure visible in the faces of those that practife it and fo must needs impart a beauty and amiableness to them.

Diogenes Laertius in the life of Socrates, tells us, that the philosopher was wont to advise young men, ouveres xaron rpigeoBai, often to behold themfelves in their looking glaffes or mirrours. Grammercy, Socrates, that is good counfel indeed! will our young gentlemen and ladies be ready to fay: we \* Dr More,

308

### in the CREATION.

Part II.

like it very well, and we practife accordingly : and it feems we are injurioufly taxed and reprehended by divines for fpending fo much time between a comb and a glafs. Be not over hafty, take what remains along with you: mark the end for which the philosopher exhorts this, Iv' a men xados are, 'agios צואיטועדם, כ ל' מוס צרטו אמולכות דטע לטסכולכותע באואמאטאדטובא, "" That if they be handfome, they might approve " themfelves worthy of their form; but if they be " otherwise, they may by discipline and institution " hide their deformity;' and fo by their virtuous behaviour compensate the hardness of their favour, and by the pulchritude of their fouls make up what is wanting in the beauty of their bodies; and truly I believe a virtuous foul hath influence upon its vehicle, and adds a luftre even to the outward man, fhining forth in the very face.

2. So use the body as to preferve the health and vigour, and confequently prolong the life of it; thefe are things that all men covet; no more effectual means for the maintenance and prefervation of them than a regular and virtuous life. That health is impaired by vice, daily experience fufficiently evinceth; I need not fpend time to prove what no man. doth or can deny. And as for length of days, we find by the fame experience, that intemperate and diforderly perfons are, for the most part, short-lived; moreover, immoderate cares and anxiety are obferved fuddenly to bring grey hairs upon men, which are utually the figns and forerunners of death; and therefore the way to live long must needs be in all points to use our bodies fo as is most agreeable to the rules of temperance and purity, and right reafon; every violence offered to it weakens and impairs it, and renders it lefs durable and lafting. One means there is which phyficians take notice of as very effectual to the prefervation of health, which I cannot here omit, that is, a quiet and chearful

mind, not afflicted with violent paffions, or diffracted with immoderate cares, for thefe have a great and ill influence upon the body; now, how a man can have a quiet and chearful mind under a great burden and load of guilt, I know not, unlefs he be very ignorant, or have a feared confcience; it concerns us therefore, even upon this account, to be careful of our converfation, and to keep our confciences void of offence both toward God and toward men.

Infer. 3 Thirdly, Did God make the body? let him have the fervice of it, Rom xii. I. I beleech you, brethren, by the mercies of God; that you present your bodies a living facrifice, holy, acceptable unto God, which is your reasonable fervice. How we should do that, St Chryfoftom tells us in his commentary upon this place, Mnder oplances πornpor BAERETW, & yEyore Buoid מחלבי ה אמשדים אמאמידט מוד ארסט, ז אבאסינ האחשקסאם מחלבי ה אמף πρατίετω παρανομον, & γεγονεν ολοκαυτωμα, &c. Let the eye behold no evil thing, and it is made a facrifice; let the tongue speak no filthy word, and it becomes an oblation; let the hand do no unlawful action, and you render it a holocaust. Yet it is not enough thus to re-Arain them from evil, but they must also be employed and exercised in doing that which is good; the hand in giving alms, the tongue in bleffing them that curfe us and despitefully use us; the ear in hearkening to divine lectures and difcourses. I Cor. vi. 20. Glorify God in your body, or with your body, and in your spirit, which are God's; and that not by redemption only, of which the apoftle there fpeaks, but by creation alfo: Rom. vi 13 Neither yield ye your members as instruments of unrighteousness unto fin, but as instruments of righteousnels unto God. And again, ver. 19. Even to now yield your members fervants of righteoufness unto holiness I shall instance in two members, which are efpecially to be guarded and reftrained from evil, and employed in the fervice of God ; .

First, The eye, we must turn away our eyes from beholding vanity, as David prayed God would his, Plal. cxix 37. We must make a covenant with our eyes, as Job did, Job xxxi. 1. These are the windows that let in exterior objects to the foul; by these the heart is affected; this way fin entered first into the world; our first parent faw that the tree and its fruit was pleasant to the eyes, and so was invited to take and eat it. There are four fins especially for which the eye is noted, as either discovering themselves in the eyes, or whose temptations enter in by, and so give denomination to the eyes.

1. There is a proud eye, Prov. xxx. 13. There is a generation, O how lofty are their eyes! and their eyelids are lifted up. chap vi. 17. A proud look is reckoned the first of those fix things that God hates, Pfal. xviii. 27. God (the Pfalmist faith) will bring down proud or high looks. Pfal. ci. 5. Him that bath a high look and a proud beart (faith David) I will not fuffer. And in Pfal. cxxxi. 1. he faith of himself, that his heart is not haughty, nor his eves losty. By which places it appeareth that pride sheweth forth itself in the eyes especially, and that they are as it were the feat or throne of it.

2. There is a wanton eye, which the prophet Ifaiah fpeaks of in his third chapter at the 16th verfe, becaufe the daughters of Jerufalem walk with ftretchedout necks and wanton eyes. The apoltle Peter, in his fecond epiftle, chap. ii. 24 mentions eyes full of adultery; for by these casements enter in such objects as may provoke and stir up adulterous thoughts in the mind, as they did in David's; and likewise impure thoughts conceived in the heart, may discover themselves by the motions of the eye; and therefore in this respect we should do well with holy Job, to make a covenant with our eyes, and not to gaze upon any object which may tempt us to any inordinate appetite and desire; for our Saviour tells us, it were better to pluck out our right eye than that it should be an offence to us; which I suppose refers to this matter, because it immediately follows those words, He that looketh upon a woman to lust after her, bath already committed adultery with her

3. There is a covetous eye.. By covetousness I understand not only a defiring what is another man's, which is forbidden in the tenth commandment, but also an inordinate desire of riches, which the apostle John seems to understand in his first epistle, chap ii. 16. by the lust of the eye. And covetousness may well be called the lust of the eye, because 1. The temptation or tempting object enters by the eye; fo the feeing the wedge of gold and Babylonish garment stirred up the covetous defire in Achan. 2. Becaufe all the fruit a man reaps of riches, more than will furnish his necessities and conveniencies, is the feeding of his eye, or the pleafure he takes in the beholding of them, Ecclef. v. 11. When goods increase, &c. what good is there to the owners thereof, faving the beholding them with their eves?

4. There is an envious eye, which by our Saviour is called an evil eye, Mat. xx. 15. Is thine eye evil because I am good? that is, enviest thou thy brother because I am kind to him? And chap. vii. 22. one of those evil things which proceed out of the heart and defile a man, is an evil eye. Envy is a repining at the prosperity or good of another, or anger and displeasure at any good of another which we want, or any advantage another hath above us; as in the parable of the labourers in the vineyard, those that came in first envied the last, not because they received more than they, but because they received equal wages for less time; those that are subject to this vice cannot endure to see another man thrive,

in his heart.

and are apt to think his condition better than theirs, when indeed it is not.

Let us then fo govern our eyes that we discover by them none of these vices; let the humility and purity of our minds appear even in our outward looks; let neither pride nor lust manifest themselves in the posture or motion of our eyes; let us have a care that these members be neither the inlets or outlets of any of the fore-mentioned vices, that they neither give admission to the temptation, nor be expressive of the conception of them; let us employ them in reading the word of God and other books, for the increase of our knowledge, and direction of our practice; in dilligently viewing and contemplating the works of the creation, that we may difcern and admire the footsteps of the divine wildom eafily to be traced in the formation, difposition, and defignations of them; let us take notice of any extraordinary events and effects of God's providence towards ourfelves or others, perfonal or national, that as they are the iffues of his mercy or justice, they may stir up fuitable affections in us of thankfulnefs or fear; let those fad and miserable objects that prefent themfelves to our fight move us to pity and commiferation; and let our eyes fometimes be exercifed in weeping for the miferies and calamites of others, but efpecially for our own and their fins.

Secondly, Another member I shall mention, is the tongue, which as it is the chief instrument of speech, fo it may be well or ill employed in the exercise of that action, and therefore ftands in need of direction and reftraint. I remember I once heard from an ingenious anatomist of Padua this observation. That there are but two members in the body that hath a natural bridle, both which do very much need it, the tongue, and another I shall not name; the fignification whereof may be, that they are not to be let loofe, but diligently curbed and held in. That

314

the tongue needs a bridle you will readily grant, if you read what the apostle James hath writtten of it, chap. iii. 9 The tongue is a fire, a world of iniquity ; so is the tongue among our members, that it defileth the whole body, and setteth on fire the course of nature, and is set on fire of hell. For every kind of beasts, and of birds, and of serpents, and of things in the sea, is tamed, and bath been tamed of mankind; but the tongue can no man tame, it is an unruly evil, full of deadly poifon. For the better government of the tongue, I shall note fome vices of speech which must carefully be avoided; first of all loquacity or garrulity; this the contrivance of our mouths fuggefts to us; our tongues are fenced and guarded with a double wall or mound of lips and teeth, that our words might not rashly or unadvisedly flip out; then nature hath furnished us with two ears and but one tongue, to imitate that we must hear twice fo much as we fpeak. Why locquacity is to be avoided, the wife man gives us a sufficient reason, Prov. x. 19 In the multitude of words there wanteth not fin. And, Ecclef. v. 7. In many words there are diverse vanities. To which we may add another of great force with most men, viz that it hath been always efteemed an effect and argument of folly, Ecclef. v. 3. A fool's voice is known by multitude of words. And on the contrary, to be of few words is a fign of wifdom; and he that is wife enough to be filent, tho' a fool, may pass undiscovered. Besides all this, a talkative perfon must needs be impertinent, and fpeak many idle words, and fo render himfelf burthenfome and odious to company, and may perchance run himfelf upon great inconveniencies, by blabbing out his own or others fecrets; for a word once uttered, Jugit irrevocabile, is irrevocable, whatever the confequence of it be; great need therfore have we to set a watch over our mouths, and to keep the door of our lips, Pfal. cxli. 3. and not fuffer our

### in the CREATION.

Part II.

tongues *mporpe zeu rns Siavoias* \* as Ifocrates phrafeth it. Secondly, Lying, or falfe fpeaking. There is difference between *mentiri*, and *mendacium dicere*, that is, lying, and fpeaking of an untruth, or a thing that is falfe. *Mentiri*, is contra mentem ire, which, tho' it be no good etymology of the word, is a good notion of the thing; that is to go against one's mind or speak what one does not think.

#### " Ετερον μεν κευθαν ενι φρεσιν αλλο δε βάζαν.

As Homer expresses it, to conceal one thing in the mind, and speak another with the tongue; hence a man may fpeak an untruth and yet not lie, when he thinks he fpeaks the truth; and on the contrary, may fpeak what is materially true and yet lie, when he fpeaks what he thinks not to be true. The tongue was made to be the index of the mind, speech the interpreter of thought, therefore there ought to be a perfect harmony and agreement between thefe two; fo that lying is a great abufe of fpeech, and a perverting the very end of it, which was to communicate our thoughts one to another; it hath alfo an ill principle for the most part, proceeding either from bafenefs of fpirit, or cowardice, as in them that have committed a fault, and deny it for fear of punishment or rebuke; and therefore the antient Perfians, as Xenophon tells us in his Kupy raider, made it one of the three things they diligently taught their children, which were insteady, 3 TOLEVERY, & annoever. " to ride, to shoot, and to speak the " truth :" or from covetousness, as in tradefmen, who falfly commend their commodities, that they may vend them for a greater price; or from vanity and vain-glory, in them who falfly boaft of any quality or action of their own. It is odious both to God and man; to God, Prov. vi. 17. A lying tongue is one of those fix or feven things that are an abo-

\* Run before the underflanding or wit.

# The WISDOM of GOD

316

Part II.

mination to him; to men, as Homer witneffeth in the verfe preceding the fore-quoted.

# Εχθρος γαρ μοι κωνος ομως Αιδαο πυλησι, &c.

He that tells lies is as hateful to me as the gates of hell and death.—The practice of lying is a diabolical exercife, and they that ufe it are the devil's children, as our Saviour tells us, John viii. 24. Ye are of your father the devil, &c. for he is a liar, and the father of it. And, laftly, it is a fin that excludes out of heaven, and deprefies the foul into hell, Rev. xxi 8. All liars fball have their part in the lake which burns with fire and brimstone, which is the fecond death.

Thirdly, Another vice, or abufe of fpeech, or vicious action, to which the tongue is inftrumental, is flandering; that is, raifing a falfe report of any man tending to his defamation; this might have been comprehended under the former head, being but a kind of lying, proceeding from enmity or ill will; it is a very great injury to our neighbour, mens reputation being as dear to them as life itfelf; fo that it is grown to be a proverb among the vulgar, " Take away my good name, and take away " my life." And that which enhances this injury is, that it is irreparable ; we cannot, by any contrary declaration, fo clear the innocency of our neighbour, as wholly to extirpate the pre-conceived opinion out of the minds of those to whom our confeffion comes; and many will remain whom the calumny hath reached, to whom the vindication probably will not extend, the pravity of man's nature being more apt to fpread and divulge an ill report than to ftop and filence it. I might inftance in the flattering of others and boafting of ourfelves, for two abuses of speech, but they may both be referred to lying, the one to pleafe others, and puff them up with felf-conceit, and a falfe opinion, that they

have fome excellent quality or endowment, which they want, or have not in fuch a degree, or that they are better thought of by others than indeed they are, and more honoured; the other, to gain more honour than is due to ourfelves. Neither yet is boafting only of what we have not, but alfo what we have condemned and difallowed by God and men, as being coutrary to that humility and modefty that ought to be in us, Prov. xxxvii 2. Let another man praife thee, and not thine own mouth, a ftranger, and not thine own lips. And moralifts proceed fo far as to cenfure all unneceffary *mepicautohoyia*, that is, talking of a man's felf.

Fourthly, Obscene and impure words are another vicious effect of the tongue; those are principally the  $\sigma \alpha \pi \rho \alpha \lambda \sigma \gamma \sigma \alpha$ , rotten speeches the apostle speaks of, Eph. v. 29 such as chaste ears abhor, which tend only to the depriving and corrupting of the hearers, and are to be studiously and carefully avoided by all that pretend to Christianity, Eph. v. 3. But sornication and all uncleannes, let it not be once named among you.

Fifthly, Curfing and railing or reviling words, are alfo a great abufe of speech, and outragious effects and expressions of malice and wickedness, Pfal. x. 7. The Pfalmist makes it part of the character of a wicked man. that his mouth is full of curfing; which passage we have quoted by the Apostle, Rom. iii, 14. whose mouth is full of curfing and bitterness.

Sixthly, Swearing, and irreverently using the name of God in common difcourse and converse, is another abuse of the tongue; to which I might add, vehement affeverations upon flight and trivial occasions. I do not deny, but in a matter of weight and moment, which will bear out fuch attestation, and where belief will not be obtained without them, and yet it may much import the hearer or speaker that his words be believed, or where the hearer would not otherwife think the matter fo momentous or important as indeed it is, protestations and affeverations, yea, oaths, may lawfully be used; but to call God to witnefs to an untruth or a lie perhaps or to appeal to him upon every trivial occafion in common discourse, customarily, without any confideration of what we fay, is one of the highest indignities and affronts that can be offered him, being a fin to which there is no temptation; for it is fo far from gaining belief (which is the only thing that can with any fhew of reafon be pleaded for it) that it rather creates diffidence and distruit; for as multa fidem promissa levant, so multa juramenta too; it being become a proverb, He that will fwear will lie; and good reaton there is for it, for he that fcruples not the breach of one of God's commands is not likely to make confcience of the violation of another.

Lastly, (For I will name no more) fcurrilous words fcoffing and jeering, flouting and taunting, are to be cenfured as vitious abuses of speech.

This fcoffing and derifion proceeds from contempt, and that of all injuries men do most impatiently bear, nothing offends more or wounds deeper; and therefor, what greater violation of that general rule of Christian practice, to do to others as we would they should do unto us? This injury of being derided the Pfalmist himself complains of, Pfal. lxix. 11, 12. I became a proverb to them. They that fit in the gate speak against me, and I was the song of the drunkards. And Pfal. xxxv. 15. according to the church translation, The very abjects came together against me unawares, making mows at me, and ceased not. And the prophet Jerimiah, Jer. xx. 7. I am in derifion daily, every one mocketh me. And though there may be some wit shewn in scoffing and jefting upon others, yet it is a practice inconfiftent with true wildom. The fcorner and the

wife man are frequently opposed in scripture, Prov. ix. 8. and chap. xiii. 1, &c. It is a proverbial faying, The greatest clerks are not always the wisest men. I think the faying might as often be verified of the greatest wits. Scorning, in that gradation in the first Pfalm, is set down as the highest step of wickedness. And Solomon tells us, that Judgments are prepared for the scorners.

You will fay to me, how then must our tongues be employed? I anfwer, 1. In praifes and thankfgiving unto God, Pfal. xxxv. 28. And my tongue Shall speak of thy righteousness and of thy praises all the day long. Parallel whereto is ver. 24. of Pfal. lxxi. Indeed the book of Plalms is in a great meafure but an exercife of or exhortation to this duty. 2 We must exercise our tongues in talking of all his wondrous works : Pfal. cxlv. 5, 6. I will speak of the glorious honour of thy Majesty and of thy wondrous works 3. In prayer to God. 4. In confession of him and his religion, and publickly owning it before men whatever the hazard be. 5. In teaching, instructing, and counfelling of others. 6. In exhorting them. 7. In comforting them that need it. 8. In reproving them. All which particulars I might enlarge upon, but becaufe they come in here only as they refer to the tongue, it may fuffice to have mentioned them fummarily.

Thirdly, Let us hence learn duly to prize and value our fouls. Is the body fuch a rare piece, what then is the foul? The body is but the hufk or fhell, the foul is the kernel; the body is but the cafk, the foul the precious liquor contained in it; the body is but the cabinet, the foul the jewel; the body is but the fhip or veffel, the foul the pilot; the body is but the tabernacle, and a poor clay tabernacle or cottage too, the foul the inhabitant; the body is but the machine or engine, the foul that sudow m, that actuates and quickens it; the body is

but the dark lantern, the foul or fpirit is the candle of the Lord that burns in it : And feeing there is fuch difference between the foul and the body in respect of excellency, furely our better part challenges our greatest care and diligence to make provision for it. Bodily provision is but half provision, it is but for one part of a man, and that the meaner and more ignoble too, if we confider only the time of this life; but if we confider a future estate of endless duration after this life, then bodily provision will appear to be, I do not fay, quarter provision, but no provision at all in comparison, there being no proportion between fo fhort a period of time and the infinite ages of eternity; let us not then be fo foolifh as to employ all our thoughts and beftow all our time and pains about cherifhing, accommodating and gratifying our bodies, in making provision for the flesh to fulfil the lusts thereof, as the Apostle phraseth it, and fuffer our fouls to lie by neglected in a miferable, and poor, and blind, and naked condition. Some philosophers will not allow the body to be an effential part of man, but only the veffel or vehicle of the foul; Anima cujusque est quisque; The foul is the man. Tho' I would not be so unequal to it, yet I must needs acknowledge it to be but an inferior part; it is therefore fo to be treated, fo dieted and provided, as to render it most calm and compliant with the foul, most tractable and obsequious to the dictates of reason; not fo pampered and indulged, as to encourage it to caft its rider, and to take the reins into its own hand, and usurp dominion over the better part, the TO NYEMOVIXOV, to fink and deprefs it into a fordid compliance with its own lufts, Atque effigere humi di-

This is our duty; but alas! what is our practice? Our great partiality towards our bodies, and neglect of our fouls, fhews clearly which part we

vinae particulam aurae.

Part II.

320

prefer; we are careful enough of wounding or maiming our bodies, but we make bold to lash and wound our fouls daily; for every fin we commit. being contrary to its nature, is a real stripe, yea, a mortal wound to the foul; and we shall find it to be fo, if our confciences be once awakened to feel the fting and fmart of it. We are industrious enough to preferve our bodies from flavery and thraldom, but we make nothing of fuffering our fouls to be flaves and drudges to our lufts, and to live in the vileft bondage, to the most degenerate of creatures, the devil. We are thrifty and provident enough, not to part with any thing that may be ferviceable to our bodies under a good confideration, and we fo effeem them as that we will part with all we have for the life of them; but we make little account of what is most beneficial to our fouls. the means of grace and falvation, the word of God, and duties of his worfhip and fervice; nay, we can be content to fell our fouls themselves for a trifle. for a thing of nothing, yea, for what is worfe than nothing, the fatisfying of an inordinate and unreafonable appetite or paffion. We highly efteem and ftand much upon our nobility, our birth and breeding, though we derive nothing from our anceftors but our bodies and corporeal qualities : and it 'is useful fo far to value and improve this advantage, as to provoke us to imitate the good examples of our progenitors, not to degenerate from them, nor to do any thing unworthy of our breeding; and yet the divine original of our fouls, which are beams from the Father of light, and the immediate offspring of God himfelf TU yap & yeves serves, hath little influence upon us to engage us to walk worthily of our extraction, and to do nothing that is bafe or ignoble, and unfuitable to the dignity of our birth.

You will fay, how shall we manifest our care of

Ss

322

our fouls? What shall we do for them? I answer, the fame we do for our bodies.

First, We feed our bodies, our fouls are also to be fed; the food of the foul is knowledge, efpecially knowledge in the things of God, and the things that concern its eternal peace and happinefs; the doctrine of Christianity, the word of God read and preached, 1 Pet. ii 2. As new born babes defire the fincere milk of the word, that you may grow thereby. Heb. v. 12 The Apostle speaks both of milk and of ftrong meat Milk he there calls the principles of the Doctrine of Chrift. And again, I Cor. ii 3. I have fed you with milk, and not with meat ; for bitherto you were not able to bear it. So we fee in the Apostle's phrase, feeding of the flock, is teaching and inftructing of them Knowledge is the foundation of practice; it is impoffible to do God's will before we know it; the word must be received into an honeft and good heart, and underflood, before any fruit can be brought forth.

Secondly, We heal and cure our bodies, when they are inwardly fick, or outwardly harmed: Sin is the ficknefs of the foul. Mat, ix 12 They that be whole need not a phyfician, but they that are fick, faith our Saviour by way of fimilitude; which he explains in next verfe, I am not come to call the righteous but finners to repentance. For the cure of this difeafe, an humble, ferious hearty repentance, is the only phyfick; not to expiate the guilt of it, but to qualify us to partake of the benefit of that atonement which our Saviour Chrift hath made by the facrifice of himfelf, and reftore us to the favour of God, which we had forefeited, it being, as much as in us lies, an undoing again what we have done.

Thirdly, We clothe and adorn our bodies; indeed too much time and too many thoughts we beftow upon that; our fouls also are to be cloathed with

Part II.

holy and virtuous habits, and adorned with good works, I Pet. v. 5. Be cloathed with humility. And in the fame epistle, chap. ii. 2. he exhorts women to adorn themselves, not with that outward adorning of plaiting the hair, and wearing gold, &c. but with the ornament of a meek and guiet spirit, which is in the fight of God of great price : and in Rev. xix. 8. The righteoufness of the faints is called fine linen. and the faints are faid to be cloathed in white raiment. Mat. xxiii. 11. Works of righteoufnefs and a converfation becoming the gospel is called a wedding garment. Col. iii, 10. Put on the new man. And again, Put on therefore, as the elect of God, bowels of mercy, meeknefs, &c. On the contrary, vitious habits and finful actions are compared to filthy garments. So Zech. iii. 3. Joshua the high priest is faid to be cloathed with filthy garments; which in the next verse are interpreted his iniquities, either perfonal, or of the people whom he reprefented : I have caufed thy inquity to pass from thee, and will clothe thee with change of raiment.

Fourthly, We arm and defend our bodies, and our fouls have as much need of armour as they; for the life of a Chriftian is a continual warfare; and we have potent and vigilant enemies to encounter withal, the devil, the world, and this corrupt flefh we carry about us; we had need therefore to take to us the Chriftian panoply, to put on the whole armour of God, that we may withstand in the evil day, and having done all, may stand; having our loins girt with truth, and having on the breastplate of righteousnels and our feet shod with the preparation of the gospel of peace. Above all taking the shield of faith : and for an helmet, the hope of faivation, and the sword of the spirit, which is the word of God, Eph. vi. 13, 14.

He that with this Christian armour manfully fights against and repels the temptations and af-

faults of his spiritual enemies; he that keeps his garments pure, and his confcience void of offence towards God and towards man, shall enjoy perfect peace here, and affurance for ever. Tacitus faith of the Finni, a northern people, that they were fecuri adversus homines, securi adversus Deos. " They " need not fear what God or man could do to them becaufe they were in as bad a condition as could confift with living in the world; they could not be banished into a worse country, nor put into worse circumftances than they were in already. I might fay of the man that keeps a good confeience, that he is fecure against God and man; not in that fense the Finni were, but secure of any evil befalling him from either. God can do him no harm, not for want of power, but for want of will, which is regulated by his truth and juffice. He is alfo fecure in respect of men, because he is under the protection of the almighty; and if any there be that would do him harm, they shall either be restrained by the divine providence, or if they be permitted to injure him, it shall tend only to the exercise and improvement of his faith and patience, and enhancing his future reward at that great day, when the Almighty shall difpense aureolae to those champions who have fignalized their valour and fidelity by heroick actions, or patient fufferings of unworthy things for his fake. 3. A good confcience not only fecures a man from God and men, but from himfelf too; There is no peace for the wicked, faith my God, no inward peace: fuch a man is at odds with himfelf; for the commandments of God being agreeable to the nature of man, and perfectly conformable to the dictates of right reafon, man's judgement gives fentence with the divine law, and condemns him when he violates any of them; and fo the finner becomes an eaurovrimopumeros, a tormentor of himfelf. Prima eft. haec ultio quod se judice nemo nocens absolvitur.

No guilty perfon is absolved at his own tribunal, himself being judge.

Neither let any profligate perfon, who hath bidden defiance to his confcience, and is at war with himfelf, think to take fanctuary in atheifm, and becaufe it imports him highly there fhould be no God, ftoutly deny that there is any. For first, supposing that the existence of a Deity were not demonstrably or infallibly proved (as it most certainly is) yet he. cannot be fure of the contrary, that there is none. " For no man can be fure of a pure negative, name-" ly, that fuch a thing is not, unless he will either " pretend to have a certain knowledge of all things " that are or may be, than which nothing can be more " monftroufly and ridiculoufly arrogant; or elfe, un-" lefs he be fure that the being of what he denies " doth imply a contradiction, for which there is " not the leaft colour in this cafe; the true notion " of God confifting in this, That he is a being of " all poffible perfection," that I may borrow my Lord Bishop of Chester's words, in his discourse of natural religion, page 94

Now if he be not fure there is no Deity, he cannot be without fome fulpicion and fear that there may be one.

Secondly, " If there fhould be a Deity, fo holy, and juft, and powerful, as is fuppoled, what vengeance and indignation may fuch vile mifcreants and rebels expect, who have made it their bufinets to banish him out of the world, who is the great Creator and governor of it; to undermine his being, and eradicate all notions of him out of their own and other mens minds; to provoke his creatures and vaffals to a contempt of him, a flighting of his fear and worfhip, as being fuch imaginary chimeras as are fit only to keep fools in awe? Certainly as this is the higheft provo" cation that any man can be guilty of, fo fhall it " be punished with the forest vengeance."

Now a flender fuspicion of the existence of a being, the denial whereof is of fo fad confequence, must needs difturb the atheist's thoughts, and fill him with fears, and qualify and allay all his pleafures and enjoyments, and render him miferable even in this life.

" But on the other fide, he that believes and " owns a God, if there should be none, is in no " danger of any bad confequent; for all the incon-" venience of this belief will be, that he may be " hereby occasioned to tye himself up to some " needlefs reftraints during this fhort time of his " life, wherein notwithstanding there is, as to the " prefent, much peace, quiet, and fafety; and as " to the future, his error shall die with him, there " being none to call him to an account for his mif-" take." Thus far the Bifhop.

To which I fhall add, that he not only fuffers no damage, but reaps a confiderable benefit from this mistake; for during this life he enjoys a pleafant dream or fancy of a future bleffed state, with the thoughts and expectations whereof he folaces himfelf and agreeably entertains his time, and is in no danger of being ever awakened out of it and convinced of his error and folly, death making a full end of him.
